CHISLEHURST.—For seven cottages at Chislehurst, Kent. Messrs. W. A. Williams and Hopton, 156, Regent-street, W., architects:—

Lowe (accepted)	...	...	£1,500	0	0
-----------------	-----	-----	--------	---	---

CLAPHAM, S.W.—For two new shops, Grosvenor Lodge, High-street, for Mr. W. Grey. Mr. J. W. Stevens, 21, New Bridge-street, E.C., architect and surveyor:—

Macey	...	...	£735	0	0
Prestige and Co.	...	...	627	0	0
White and Co.	...	...	620	0	0
Peppiatt	...	...	595	0	0
Whitehead and Co. (accepted)	...	...	595	0	0
Creed	...	...	583	0	0

CLERKENWELL, N.—For laying out the parish churchyard as a public recreation ground, for the vestry:—

Bell, of Tottenham (accepted)	...	...	£948	0	0
-------------------------------	-----	-----	------	---	---

CUNNYNHAME HILL, ST. ALBAN'S.—For decorations, for Mr. Purrott. Mr. F. W. K. Tarte, 36, Farnival-street, E.C., and St. Alban's, architect:—

Pelley, Victoria-street (accepted.)

EAST BARRY, GLAM.—For the erection of a Congregational church:—

Richards, W., and Sons, East Barry (accepted) £800.

EAST DEREHAM.—For the erection of a mortuary, for the East Dereham Local Board. Mr. F. W. Skipper, Opie street, Norwich, architect and surveyor:—

Hubbard	...	...	£129	0	0
Mayer	...	...	128	5	7
Beeston	...	...	120	0	0
Mack	...	...	112	10	0
Larner (accepted)	...	...	112	0	0

EDINBURGH.—For the construction of a police-station in the Waverley Market, for the town council:—

Greig, D., and Sons, Edinburgh (accepted) £808.

HALIFAX.—For painting five new middle-class houses, Heath-avenue. Mr. T. L. Patchett, Halifax, architect:—  
Stringer, J., Halifax (accepted.)

LEDBURY.—For reconstructing conservatory, for Mr. M. Biddulph, M.P. Mr. A. H. Pearson, Ross, architect:—  
Perkins and Bellamy, Ross (accepted.)

LONDON.—For additions to No. 31, Endell-street, St. Giles', for Mr. W. W. Langley. Mr. E. P. L. Brock, F.S.A., architect:—

Patman and Fotheringham	...	£1,357	0	0
Patrick, M., and Son	...	1,338	0	0
Pusey and Lumley	...	1,290	0	0
Kynoch and Co.	...	1,241	0	0
Scott, M.	...	1,027	10	0

LONDON.—For additions to buildings at Acre-street, Wandsworth, for the Projectile Co., Ltd. Mr. Tolley and Son, 66, Cannon-street, architects:—

Shepherd, London	...	£1,236	0	0
Faulkner, London	...	1,137	0	0
Waddington, Sydenham	...	1,137	0	0

\* Accepted.

LONDON, E.C.—For constructing about 100ft. 4ft. 6in. by 2ft. 6in. brick sewer in portion of Myddleton-street, for Vestry of Clerkenwell. Mr. W. Iron, surveyor:—

Bell, G., Tottenham	...	£206	0	0
Mowlem and Co., Westminster	...	195	0	0
Pizzey, J., Haringay	...	194	0	0
Dickson, J., St. Alban's	...	170	0	0

Surveyor's estimate, £153.

LONDON, E.C.—For laying out churchyard of St. James's Clerkenwell, as a public garden, and also for throwing part of churchyard into the public way in St. James's-walk, for the Vestry of Clerkenwell. Mr. W. Iron, surveyor:—

Mowlem and Co., Westminster	...	£1,433	0	0
Benedict, W., Newington Butts	...	1,105	10	0
Bell, G., Tottenham	...	948	0	0

Surveyor's estimate, £1,033.

LOSTIFORD.—For St. John's Seminary, Lostiford. Mr. F. A. Walters, 4, Gt. Queen-street, S.W., architect. Quantities by Mr. J. B. Lofting, 6, Great Queen-street, S.W.:—

Patman and Fotheringham	...	£27,336	0	0
Colls and Son	...	27,200	0	0
Stimpson and Co.	...	27,130	0	0
Goddard and Sons	...	26,840	0	0
Marriage, Croydon	...	26,500	0	0
Silver and Sons	...	26,010	0	0
Sanders, Southampton	...	25,990	0	0
Gregory and Co.	...	25,777	0	0
Harris and Wardrop	...	25,622	0	0
Parnell, Rugby	...	25,497	0	0
Higgs and Hill	...	24,990	0	0
Thompson, Peterborough	...	24,975	0	0
Smith and Sons	...	24,767	0	0
Bottrill and Son, Reading	...	24,195	0	0
Longley and Co., Crawley	...	22,665	0	0

PENARTH.—For the erection of public offices, for the local board:—

Tape, H. M., Penarth (accepted)	£2,300	0	0
---------------------------------	--------	---	---

ORPINGTON.—For additions and alterations to the board schools, Orpington, Kent, for the Orpington School Board. Mr. St. Pierre Harris, A.R.I.B.A., 1, Basinghall-street, E.C., and Orpington, architect. Quantities by Messrs. C. Stanger and Son, 21, Finsbury-pavement:—

Lowe, R. A.	...	£2,497	0	0
Stevenson, G.	...	2,371	0	0
Simms, W.	...	2,302	0	0
Battley, R.	...	2,271	0	0
Marsland, M.	...	2,217	0	0
Knight, T.	...	2,211	0	0
Satchell, C.	...	2,195	0	0
Payne, D.	...	2,175	0	0
Holt, W., and Son	...	2,170	0	0
Akers and Co.	...	2,141	0	0
Somerford and Son (accepted)	...	2,132	0	0
Garnar, A. and W.	...	2,113	0	0
Grubb, W. A.	...	2,089	0	0

ROSS.—For building boundary walls, &c., at Caradoc Villa, Ross. Mr. A. H. Pearson, Ross, architect:—

Kemp, J. B.	...	£80	10	0
Lewis, J.	...	77	12	0
Aldom, G. (accepted)	...	68	10	0

All of Ross.

SHEERNESS-ON-SEA.—For the supply and erection of pumping machinery at the new well, for the local board:—

Moreland, R., and Son (accepted)	£4,161	0	0
----------------------------------	--------	---	---

SHEERNESS-ON-SEA.—For additions to the surveyor's office, for the local board:—

Hughes (accepted).

SOUTHAMPTON.—For the erection of a caretaker's dwelling at the Northam Schools, for the borough school board. Mr. Howell, architect:—

Dyer and Son, Southampton (accepted)	£287.
--------------------------------------	-------

SOUTHEAST.—For house, for Mr. G. Wood, Southend. Mr. C. Pertwee, Chelmsford, architect:—

Gozzett, H., Woodham	...	£2,762	0	0
Whur, T., Southend	...	2,649	0	0
Dark, S., and Son, Southend	...	2,550	0	0
Letch, W., Braintree	...	2,400	0	0
Dupont, J., Colchester (accepted)	2,375	0	0	0

STONE, STAFFS.—For making up Granville-terrace, for the local board:—

Swinton, J., Milwich (accepted)	£120	0	0
---------------------------------	------	---	---

SOUTH KENSINGTON.—For erecting a new proscenium to the stage of concert hall, and for redecorating, gilding, and other works to the ball, supper, and dressing-rooms; also concert hall at the Queen's Gate Hall, Harrington-road, South Kensington. Messrs. Rogers, Chapman, and Thomas, 50, Belgrave-road, South Belgravia, surveyors:—

Aldin Bros. and Davies	...	£353	0	0
Manders, W. R.	...	323	0	0
Douglas, J.	...	313	0	0
Smith, H., and Son	...	312	0	0
Hook, E. D. (accepted)	...	280	0	0

STUBBINGTON, HANTS.—For constructing water-works.

Jenkins, Leamington (accepted)	£632	13	0
--------------------------------	------	----	---

ST. PANCRAS, N.W.—For the erection of a cookery centre, laboratory, and drawing classroom on the Medburn-street site, St. Pancras, for the London School Board. Mr. Bailey, architect to the board:—

Mace, J. M., and Sons	£2,330	0	0	...	£2,399	0	0
Killby and Gayford	2,323	0	0	...	2,363	0	0
Cubitt, W., and Co.	2,305	0	0	...	2,360	0	0
Dove Bros.	2,280	0	0	...	2,345	0	0
Patman & Fotheringham	2,173	0	0	...	2,223	0	0
Lawrance, E., and Sons	2,091	0	0	...	2,128	0	0
Goodman, W., Hartham-road, Holloway	2,078	0	0	...	2,128	0	0

[ (a) Cost of school buildings only, including closets, £1,990; (b) tar pavement and playgrounds, £30; (c) extra depth of foundations, £58; building brickwork in cement, £50; total, £2,128. ]

\* Accepted.

SWANLEY.—For 17 cottages at Swanley, Kent, for Mr. Hutton. Messrs. W. A. Williams and Hopton, 156, Regent-street, W., and Bromley, Kent, architects:—

Herbert (accepted)	£2,720	0	0
--------------------	--------	---	---

WESTCOMBE PARK.—For the erection of the first portion of St. George's Church, Westcombe Park, for the Rev. W. H. K. Soames. Messrs. Newman and Newman, 31, Tooley-street, London Bridge, architects:—

Balaam Bros. (accepted)	£5,172	0	0
-------------------------	--------	---	---

(No competition.)

WHITEHALL GARDENS, ST. ALBAN'S.—For drainage, &c., for Mr. F. W. Silvester. Mr. F. W. K. Tarte, 36, Furnival-street, E.C., and St. Alban's, architect:—

Linney, Park-street (accepted.)

# HAWKSLEY'S PATENT TREADS.

Proprietor & Manufacturer: J. WESTWOOD, Jun.

NAPIER YARD, MILLWALL, E.

Telegraphic Address—"Westwood," London. Telephone No. 5065.

Recommended for durability, simplicity, firm footing, elasticity, and are perfectly noiseless; they excel lead, oak, teak, or stone; applicable to wood and iron staircases, new and worn-down stone stairs, spiral and other staircases, footpath flaps to cellars, covers for drains and coal-cellars, flooring for public buildings and aisles of churches, &c., &c.—The best and most durable Tread or Step yet invented.

## THE ARCHITECTS' REGISTRATION BILL.

THE second reading of the Architect's Registration Bill, in its amended form, is expected to take place on Wednesday next, the 19th inst., and those who have made up their minds on the subject ought to lose no opportunity of using their influence in promoting the measure. It is no longer a party question: it is simply, Which is the best and most desirable means of protecting the profession from the incompetent, and making the architect's status known to the public? The members of the Council of the Institute, who still maintain an attitude of opposition to the Bill, on the self-assumed pretext that they represent the opinion of the body of Fellows and Associates, have made known their chief ground of antagonism in a leading sessional note in the *Journal of Proceedings*. The chief argument is exceedingly weak and inconsistent. Their first ground of objection was the inclusion of engineers and surveyors; now they object to their exclusion. The Council in their statement urge that "the enforced registration of those only who call themselves architects could not include a vast number of surveyors, engineers, builders, and others who practise architecture as a branch of their business; and therefore such registration would be not only incomplete, but delusive." The injury that might follow by giving to incompetent persons the legal qualification of 'architect,' and by allowing every description of architect under the title of 'surveyor,' or of some other title, to practise architecture with impunity, provided only that he does not style himself 'architect,' is incalculable." Let us for a moment analyse this statement. The Council say that by enforcing registration on architects only, it would allow a large number of surveyors, builders, and others "to practise architecture as a branch of their business." Certainly they could practise it, but in the same manner only as the chemist can prescribe, or as any incompetent person may practise an art which he has no legal right to follow as a profession, and only in that sense. Are there not hundreds of medical quacks in spite of the Medical Act? And will not builders and engineers be able to design buildings and prepare drawings and specifications even after the most stringent law is in force? Of course they will practise, but at their own risk, and by the folly of those who employ them; and, furthermore, they will then be unable to recover in a court of law any charges they may make. We should like to ask one question—namely, To what an extent would the tests imposed by the Institute exclude these men from practising architecture? The argument, in fact, used by the Council, weak as it is, applies with tenfold more force against their own scheme than it does against enforced Registration. We are, at any rate, tempted to ask How much would the Institute scheme do to prevent "surveyors, engineers, builders, and others" from practising architecture as a branch? Can the Council say their scheme is more complete and less delusive? When they can do so, we shall be the first to relinquish what at present clearly seems to be the more comprehensive and practicable principle.

Again, the statement sent to the home members of the Institute observes that any "architect and surveyor" can avoid registration by simply dropping half of his pre-

sent ordinary title. This is merely begging the question. A practitioner, professing the double capacity, will have to register or exclusively confine himself to the surveying branch. By dropping the title of "architect," the practitioner may avoid registration, but he will not be a gainer in any way, because he will have to forego his architectural practice, except such as he can manage to retain surreptitiously. Everyone knows that the strictest registration or examination test will still permit irresponsible clerks in law, or unqualified men in medicine, to give advice and prescribe remedies to those who are either too ignorant to know, or are willing to run the risk of employing unqualified persons. But they will practise only at their own risk, and be subject to all the penalties to which unregistered practitioners are exposed. The arguments based on the defectibility of any legal scheme are therefore worthless, as if allowed there would have been no legally registered medical practitioners or qualified solicitors in existence, and the public would have been exposed to all sorts of charlatanism.

With the exception of this most untenable objection to the Bill, there is nothing worthy of notice. The opposition, indeed, has been prompted chiefly by party feeling; the chief offence committed by the promoters of the Bill has been that they were the first to practically deal with registration, and that while their opponents were cavilling and sleeping they were taking action and organising the profession. The unanimous opinion of the whole profession, not only in this country, but in France, in America, and Australia, is that the principle of Registration is the only practicable one to deal in a comprehensive way with the matter. As Mr. Hugh Roumieu Gough points out in his letter to us, the demand for Registration has spread to all the leading countries. The Secretary of the Ontario Association writes "that 93 per cent. of the whole profession in the province are in sympathy with the movement," and we hear of the same general approbation of the measure in the United States, in Australia, and in every other country where the State has not already provided protection for architects. It is well known that a large proportion of the members of the Institute are favourable to the measure, although some of them are waiting for the Institute to move in the matter, while others are timid of acting on their own judgment. At least 350 of the members favour the scheme, and we have good grounds for knowing that some of the Council themselves privately acknowledge that Registration is the only principle that ought to be adopted. Let them at least openly speak their minds on the question, for if they do that they will be promoting the best interests of the society to which they belong. Seventy-one of those who have obtained admission to the Institute by examination, 23 qualified for district surveyorships, and 15 prizemen and medallists have petitioned in favour of registration, and their opinion is of value.

So much for facts which speak with no uncertain sound of the growing recognition of a measure founded on legislative sanction. Of the Bill itself, its provisions are pretty well known to most of our readers. The framers of the Bill have met every serious objection that could have been urged against it. No one can object to the constitution of the "General Council of Architectural Education and Registration of the United Kingdom," referred to as the General Council. The Institute are empowered to send five from their own body, the Royal Academy, one; the Institute of Architects of Ireland, one; the Society of Architects, two; the Architectural Association, two; provincial societies, five; and registered practitioners in the United King-

dom, nine. The mode of selection and nomination of the Council, the members of which are elected for a term not exceeding five years, the rules and regulations and mode of voting, cannot be questioned, the whole of these rules being subject to the Privy Council; nor can any exception be taken to the powers conferred on the General Council in revising its constitution. Under the Bill, every Fellow or Associate of the Institute will be entitled to be registered under the Act without payment of a registration fee, and, so long as he remains a Fellow or Associate, shall be exempted from the payment of an annual fee; also every person practising architecture prior to the 1st day of January, 1884, or who has served as apprentice, assistant, or practitioner in architecture all or either for seven years in the aggregate after having attained the age of fifteen years prior to the passing of the Act. After the passing of the Act an applicant for admission must not be less than twenty-one years of age, and must have served as an apprentice for not less than three years with a registered practitioner, and have passed a qualifying examination. Any who before the passing of the Act has entered into an apprenticeship for a shorter term than three years with a master qualified to be registered may serve the additional period necessary to make up that term. The provisions in the Bill thus meet the case of any apprentice or assistant to an architect qualified to be registered, and who passes the necessary examination. The examinations required for the purpose of conferring the right of registration are provided to be held by the Institute, the General Council having power to secure the maintenance of a standard sufficient to guarantee the possession of knowledge and skill requisite for efficient practice. Other clauses provide for the registration by branch registrars, the publication of the names and addresses of registered architects, the non-recovery of charges in any court by unregistered persons, the right of only registered persons to hold public appointments, and other details to which it is unnecessary to refer, as copies of the Bill are easily procurable from Messrs. Eyre and Spottiswoode, or through any bookseller. Those who read carefully the provisions will see that there is nothing to which any reasonable person can take exception. The measure is comprehensive, as it provides for the whole profession, irrespective of members of representative bodies; it takes in all who can show that they have been in practice for a certain number of years, and who are willing to prove they are competent to practise the profession. The scheme of registration has in principle been adopted in France at National Congresses of Architects at Nice, Toulouse, and Hyères, as pointed out last Tuesday by Mr. Roumieu Gough in a paper on "Professional Practice," reported in this issue. The resolutions passed at those congresses were to the effect that every person practising must be provided with a compulsory Government diploma, certifying a minimum knowledge, and that all existing architects at the time when the diploma shall come in force shall be completely respected.

The Bill we have been discussing exactly provides for these requirements and no more, while in the next generation or two the effects of the measure, if carried, will be to guarantee to the public that every architect in practice is a qualified and educated man. Not less important is it to observe that any measure to be successful must have the force and sanction of an Act of Parliament. To believe, as some do, that a voluntary submission to an examination instituted by one of the bodies representing the profession, rewarded only by the right of membership to that society, will secure in time the adhesion of the senior members of the profession who have won a

position, no less than the rank and file, is too credulous an assumption to entertain for a moment. Where would the legal and medical qualifications have been if those professions had relied upon the voluntary system to do that which they have obtained only by the Legislature? Much as the Institute may do by its preliminary, intermediate, and final examinations for those who seek admission to its ranks, the fact remains that the bulk of those in practice will never avail themselves of the qualifying test as long as they are not compelled to do so by law, or so long as the benefits to be derived from closing the doors against the incompetent is not secured to them. For these obvious reasons the Registration Bill calls for the support of every loyal member of the profession, and, much more, for that of the general public and their representatives in Parliament, for the general public is, after all, more interested in its success than even the members of the profession who are wisely and disinterestedly promoting it.

#### THE ÆSTHETICS OF ENGINEERING CONSTRUCTION.

**P**RECEDENT and routine have been as powerful in enforcing adherence to certain types on the engineer as they have in the case of the architect. The latter may be more conservative in declining to introduce new methods of construction—more obstinate in clinging to old forms than the engineer; but it cannot be denied that the engineering formula is more binding and inelastic; that the iron rule of precedent has dominated the mind of the engineer in his conceptions, and that what may be regarded as a triumph of engineering skill is often merely the working out of a problem on a more gigantic scale. The latest feat of engineering science and enterprise, the newly opened Forth Bridge, naturally occurs to the reader as an instance of a principle of bridge construction that has of late years superseded the older forms of the cast-iron and wrought iron rib, the bowstring, and the open truss types. Composed of three immense double cantilevers, resting on three piers, the design holds rank as being the boldest attempt to apply the cantilever principle of construction to the requirements of a large span. It is, however, as an example of engineering simply that we must mention it. Though the principle of construction is comparatively new, it has been used before at a bridge at Niagara, at another on the St. John's River, New Brunswick, over the Hudson at Poughkeepsie, and in several in India as those at Sukkur over the Indus, and over the Hooghly. The engineer selects a type in every case, and thenceforward his work is to apply it to the circumstances. Our girder and open-truss bridges are examples of the pertinacity with which the engineer has followed a precedent. The details are his own, and in their design he may have shown much ingenuity, mechanical skill, and ability; but the actual design so much depends on the type that the details may, from an artistic point of view, be disregarded. The girder-bridge type, as the simplest and most static form, has received a great deal of attention from engineers; but in how few cases has there been any improvement in design? It may be argued that in the plate and lattice forms of girders there are little opportunities for improving the design, as the same members are necessary, the same economic disposal of material must be maintained. Very true, if the straight, rigid girder form is accepted as the best; but do not art and science both point to a curved or differently-shaped upper member? A further and stronger reason why the straight girder has so long been a favourite with engineers is that it saves trouble: it is considered the simplest and least costly form of bridge con-

struction. The straight-sided girder is a marketable type, moreover, and this goes a long way in commercial undertakings.

These are a few of the obvious reasons why certain types have been adhered to, why the engineer has been so slow to avail himself of more artistic and graceful designs; but there is one more potent influence which has interfered with the development of an architectural phase of bridge-building—we allude to the training and habit of the engineer. He does not make design a subject of study: his bridges, and girders, his embankments and retaining walls, his engine-houses, all his structures are the simple results of formulæ or calculation; they are the net results, nothing being added like flesh or muscle, or contour, to improve the lines or the ensemble. Confined to workshop practice, or to the routine of the civil engineer's office, no latitude is allowed to the imagination; every design is a simple question of practical data: so much capacity, so much resistance to stress; it is a matter of meeting certain forces or requirements in the most economical manner. In the design of a retaining wall, the engineer first finds out what the conditions and amount of pressure is, and then he determines by equation or certain rules founded on experiment the thickness of wall of a certain material or weight necessary to afford a safe resistance. The section or profile of the wall is quite immaterial from an æsthetic point of view: that which is given to it is generally the result of calculation or some graphical rule—graceful it may be; but that quality is generally the result of applying a curve based on mathematical principles, and in no way one of intention. On precisely similar lines the design for an iron bridge is made. Having fixed the piers from an examination of the bed of river, and therefore the spans, the type of girder or truss is determined. Having decided upon the type, the stationary and moving loads are calculated, and the proportions and outlines of the truss are governed by formulæ. At this stage the design might with propriety be handed over to the architect, for him to suggest improved lines and proportions; but, as a fact, he is called in after the construction has been practically decided upon to design the details and to "ornament the construction." The engineer's design is submitted to the architect after it is completed, when its form and type of construction have been decided, simply for ornament. What can be expected? The lattice bars may have ornaments placed at the intersections, such as gilded rosettes, huge terminal castings, and armorial bearings or trusses are fixed at the ends of the straight girders, like those we see on the Blackfriars railway bridge; the piers are improved by the addition of capitals or carved ornaments, as at Charing Cross and Cannon-street bridges; but the design in its totality is left bare, and looks a colossal unclothed skeleton, always offending the eye, and destroying the landscape or river scenery beyond. What can be claimed for the straight-plate, lattice, or trellis girder? The open, Warren type, single or double? Nothing in the way of ornamentation can make them agreeable objects. The curved class of girders are more inviting. The parabolic curve or bowstring girder is a pleasing outline in itself, and offers facilities for decorative effect; so do the varieties of suspension systems. The suspension bridge type is at least elegant; but the engineer has not been able to satisfy his mind as to its rigidity and strength under rapidly-moving loads. The flexibility of the chain under an unequal load is the difficulty. Sometimes the chain is connected by bracing to the platform to prevent the deformation of the chain and to produce rigidity, by the use of vertical and diagonal members which act as struts and ties. Then there is the Ordish system, in which the horizontal

girder is carried by inclined chains, themselves stiffened by vertical suspending members. These straight diverging chains extend from the abutments or piers to several points along the bridge, as in the Albert Suspension Bridge at Chelsea, the lines of which are at least agreeable to the eye, while the curved pendent chain is always graceful. The suspension chain with stiffening girder, in which the platform or girder partly rests below and partly above the chain, and the suspension with braced chains are types of bridge which were suggested for the Forth Bridge. These designs showed two spans each of 1,700ft., with a central pier. Sir Thomas Bouch's preliminary scheme had also the suspension principle, the chains being stiffened by radiating struts from the piers springing from the platform level. In all of these types the curvature of the chain was a graceful line which connected the piers. In the design selected and carried out on the cantilever principle, straight lines forming the top member connect the centre and Queensferry piers, and this upper member and bottom tubular member, forming the main arches, are connected by a bracing of struts and lattice ties, the platform of viaduct being carried between them. Undoubted strength and rigidity are given by the arrangement; but the outline of the bridge, composed of short horizontal and oblique lines, is devoid of beauty. Seen in perspective, the obtuse angles between the cantilevers and the horizontal girders are intensified; added to which, the massive inclined columns supporting the piers have a clumsy appearance. There is a sense of disproportion between these colossal raking piers and cantilevers and the load actually carried. We are tempted to exclaim why so much *tour de force*, such a colossal exhibition of strength in these cantilevers, for the small internal viaduct and its load they are intended to carry? These are reflections that the architect is likely to indulge in when he sees the colossal structure for the first time. The artist has at least the right to inquire why the same results cannot be obtained by more graceful lines. Not till engineers learn the physiological *rationale* of the sense of beauty in which the muscles of the eye are intimately concerned, as was pointed out by Mr. Albert Goodman in a recent paper, will they discern that there are certain lines and curves which produce pleasing effects on the mind, and endeavour to introduce them into their structures.

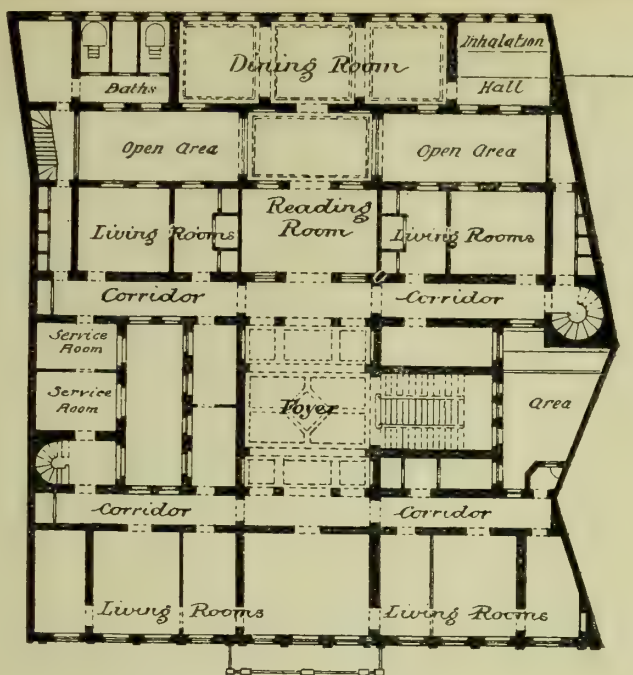

#### THE HYDROPATHIC ESTABLISHMENT AND ITS BATHS.—VI.

By R. OWEN ALLSOP, Architect.

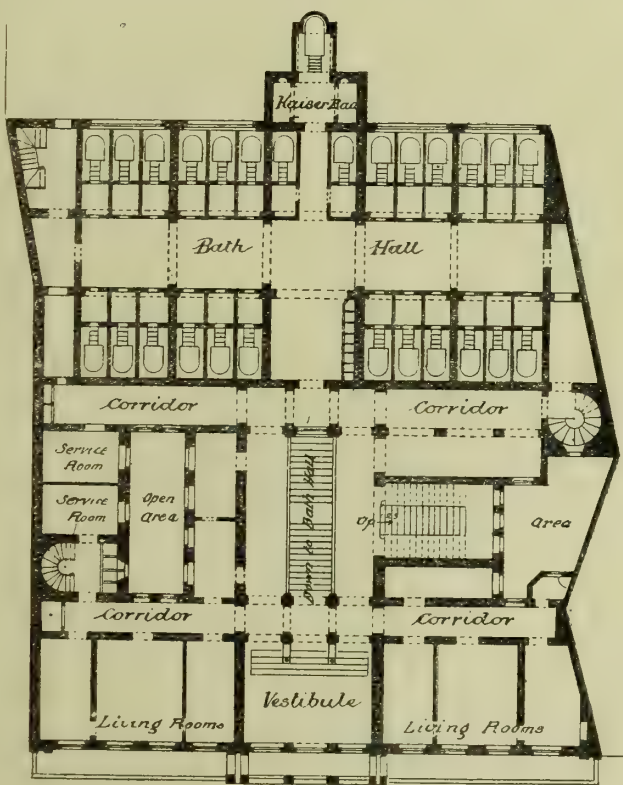

(Author of "The Turkish Bath: Its Design and Construction.")

**O**NE great principle to be observed in the planning and designing of true works of architecture would appear to be that, when any necessary, but at first sight unattractive and awkward, feature must be included in our scheme, we should not make endeavours to hide it away by every means in our power, but that we should strive, with equal ardour, to give it individuality and dignity. Now in many hydropathic establishments we shall find that the baths are treated in almost a shamefaced manner, being hidden away as much as possible, as if they were features whose presence, though a *sine quâ non*, is yet to be concealed and rendered, before all things, as unobtrusive as possible. We find them cramped and huddled away in dark basements, approached by undignified passages and staircases. This is quite the wrong principle to go upon. The baths are necessary; without them there would be no hydropathic establishment. All things are, in a measure, subordinate to the baths; they

First Floor Plan

Ground Plan

building, and in themselves comfortable, convenient, and attractive. Take, for example, the *Kaiserbad* at Aix-la-Chapelle—the well-known spa with thermal waters in Rhenish Prussia. Looking at the plans which are given herewith, and which have been prepared from illustrations kindly supplied me by M. Dremel, the proprietor, one cannot fail to note the importance attached to the bath-house of the establishment. It is true that this building differs somewhat from the ordinary hydropathic, as possessing a supply of hot mineral water, thus allowing a large number of baths of a special nature to be supplied. Nevertheless we may compare it with a hydropathic in our country, and point a moral that it would be well for the interests of all, that similar care and thought should be evidenced in planning the baths of our own buildings. From the plans, it will be seen that the bath-rooms and baths, and the great thermal bath-hall, are treated most architecturally, and that the cramping and meanness of the arrangements of many of our English hydropathics gives place to liberal planning and dignified architectural treatment, culminating in the central *Kaiserbad*—the elegant suite of bath-rooms reserved for the use of the German Emperor.

In the light of previous illustrations, the plans given will be intelligible to the reader. Continental habits and customs are, of course, evidenced in the arrangements. The building comprises ground, first, second, and third floors, and the bath-hall is in a basement, vaulted and top-lighted. The upper floors and portion of ground floor are devoted to the residential apartments, &c. On the first floor is placed a *vaporarium*, or inhalation hall. Each of the thermal baths has a small dressing-room attached, screened by a curtain from the bath-room. The baths are constructed of marble slabs, sunk, approached by steps, and fitted with douche and shower attachments.

(To be continued.)

#### THE ROYAL INSTITUTE OF PAINTERS IN WATER-COLOURS.

ALTHOUGH no very strong subjects or striking pictures are to be seen on the walls of the Institute in Piccadilly, there is a large number of small works of more than usual merit. Harry Hine, in his several views of Lincoln, with its splendid cathedral looming over the city, seen under various atmospheric conditions in early morning (100), under an evening sky (391), in sunlight and mist, displays his accustomed refinement of drawing and delicacy of colouring. No. 391 represents the cathedral towering above the mists and housetops, a majestic fane, the roseate glow of a sunset setting it off in its full splendour and proportions. No. 776 is a larger and more architecturally perfect view of the cathedral, showing its rich canopied screen or west front, and its cluster of three towers in perspective above a mass of houses. Sunlight and shadow break up the great edifice and its foreground of roofs. We also admire Mr. Hine's sketch, "The Seven Gables, Bucks" (256), "King's Lynn" (491), and the drawing of Ely (691). "A Rest on the Dunes" (9), by Hugh Carter, is full of poetic sentiment and delightful colour—a young girl and child on one of those sandhills which are found on the coast. A restful idea is conveyed by the artist; the rising ground and the silvery light of the sea are charmingly rendered. "A Fisherman's Home" (14), "A Grey Morning" (438), "An Irish Cabin" (448), and No. 591 are other subject pictures by the same hand—all sympathetic studies of nature and humble life. Full of atmosphere and colour is Edwin Bale's "Convent Terrace" (15). Keeley Halswelle's view "On the

must, therefore, be recognised as a feature of features, to be treated, as regards plan, design, and appearance, in as respectful a manner as their importance warrants. Instead of hiding them away they must be brought forward, and designed as something in which we take a just pride. Their approaches must be dignified, the position on the plan an honoured one, and their scope of a size calculated to produce a sense of respect. If these facts be borne in mind, over and above the reasons put forward in article No. IV., it may prevent the designer falling

into error and treating the baths as a wholly secondary matter, to accommodate themselves to the plan, and fill up any odd space that may become available.

There is more regard paid to this question of rendering the bath-house a feature on the Continent than in this country. In some of the institutions to be found there, of a class corresponding to our "hydropathic establishment," we see that the greatest attention has been given to the subject, and the baths are both carefully planned with regard to the residential portion of the

Mersey at Rochester" (17), his "St. Alban's" (21), and "Royal Windsor" (245) are welcome contributions. The melting mists, the liquid, mirror-like waters, irradiated by pearly hues, are, especially in the last picture, marvels of brilliancy and luminous colouring, mellow and subtle in their ever-varying gradation of tone, contrasting with the vigorous handling of E. M. Wimperis, whose "View at Aldborough" (34) hangs not far off. A nice bit of figure drawing and colour is Claude Hayes' "Corner of a Dutch Studio" (19). Frank Walton (23, 24) gives us charming studies of quiet waters and bays, broad in treatment, and on the values of light and shade. "October Woodlands," by C. W. Adderton (26), may be noted also for breadth of colouring. As a finished study of *genre*, Miss Eleanor G. Manly's "Lady Peggy's Birthday" (29) takes a place for its pretty and graceful childlike group of juveniles; the style of the room and the costumes of the children drawn with admirable skill. The wainscoted walls, sideboard, and ornaments make a rich background to the daintily-dressed group. R. Phené Spiers sends a cleverly-drawn sketch of the "Market-place of Rodez" (49). Of landscapes in this gallery we must accord praise to E. M. Wimperis's "Gathering Bait" (64), a strong and fresh work; to James Orrock's equally bold and vigorous "Common in Essex" (184). W. B. Wollen's "Capture of French Guns at Waterloo" (71) is animated, and some clever drawing is apparent; but the composition lacks repose, the colours are vivid and distracting in the extreme. Less painful are A. W. Weedon's "Dordrecht" (81), Arthur Severn's "Coniston Lake" (83), a riverscape by Stuart Lloyd (125), Anderson Hague (110), Thos. Pyne (111), J. Jackson Curnock (108), and W. H. Weatherhead (124). The latter's touching group of fisher-folk women and children by the seashore, anxiously looking for missing boats (126), is full of masterly tenderness. The anxious faces of the women, and their "weary and trembling" watchfulness by the saddened sea, are expressed with wonderful reality and pathetic power. Near it we notice one of John Fulleylove's scholarly architectural landscapes, "Greenwich Hospital" (127), and Edwin Haye's charmingly breezy seascape, "Dover Roads" (136). In the central gallery Keeley Halswelle's "Royal Windsor" (245), already referred to, is one of the chief pictures, though the walls are graced by many little studies. One of these is E. J. Gregory's classically-treated little study, "Esthetic Amenity" (302), a gracefully drawn figure of a girl seated in a tea-gown of blue and terracotta. Around her the same well-selected notes of harmonised colour and refined taste are evident. Frank Dadd is as harmonious as ever in his "Hawks Abroad" (303), representing a gentleman about to leave a country inn of the last century putting on his glove, while the waiter is holding his riding whip and cloak. He has just paid for a glass of wine; at a side table of the bar parlour sit two suspicious looking characters over their ale, one with a stall over one eye, both eagerly taking stock of the visitor's equipment. The workmanship, need we say, is excellent, and every little detail has been studied. Miss Bessie Spiers's little sketch of "Cavendish, Suffolk" (224), John Scott's "A Tiff," two carefully drawn figures of a lady and gentleman in 18th century costume, Henry J. Stock's "Sea-Born Venus" (420), and Charles Green's "Pickwick Club," to which we must add J. C. Dollman's clever picture "Hawks Dinna Pike out Hawks' Een" (427), a companion subject to "Your Humble Servant," comprise the chief works. It is needless to say that in Henry J. Stock's conception of Venus, in J. C. Dollman's drawing of mounted highwaymen, and in Charles Green's Pickwickian characters we have ample satis-

faction. Sir James D. Linton, the President, has a very scholarly study of a young lady "Waiting." Her intellectual and pretty face is enhanced by the large brown fur hat; she is shown resting her head on her arm, leaning against a deep crimson plush couch. We may be sure that Sir James's work is one of refined colour and exquisitely rendered textures, if there is little other motive. The fan held in one hand, and the loose sleeves make a very charming model. We cannot leave this gallery without remarking the very clever cattle subject of Miss Mildred F. Butler, "Coming Home," admirable in drawing and colour; also Hamilton Macallum's "Sheltered Nook" (466), Miss Maud Brewer's nice bit of colour, "Meadows" (437), E. M. Wimperis's particularly vigorous landscape, "The Hayfield," and Joseph Knight's "Marsh Land" (488), though there are many other pictures of merit, including W. Harding Smith's fine interior of the choir of St. Paul's, Antwerp.

In the East Gallery, Anderson Hague gives us some very strong, but rather impressionist, studies of landscape. "In the Heat of Day," "Baiting the Hook," and "January at the Marl," we have true effects, the "lights and shades" are cleverly distributed, and we cannot fail to perceive a mind realising the poetry of landscape. G. G. Kilburne's figure-picture "Mischief," a young lady in patterned-quilted satin petticoat, with overdress, behind a curtain, listening to the love converse of two guests who are seated near, is graceful in drawing and refined colour. Bernard Evans's "Byland Abbey," and "Rievaulx Abbey" (545 and 685), are solidly-painted pictures of delightful valleys. The first is a little too dark in the foliage of the vale, but the painter has striven, and successfully, to produce the delicious and umbrageous retreats of those great Yorkshire abbeys. W. Ayerst Ingram, in his "High Noon, Sidmouth" (558), E. M. Wimperis "The Winding River" (594), "Windy Day on Marsh" (662), John M. Bromley (661), Joseph Knight "In Sheltered Vale" (639), A. W. Weedon (699), and Edward Hargett atone for much poor work. The crowded figure subject of William W. Collins, "B.C. 85" (559); Edgar Bundy's cleverly-executed subject of historical *genre*, "His Last Descendant" (608)—a masterly work, in which true pathos and scholarly handling of textures and accessories are shown; F. M. Evans's admirable figure interior, "When Jack's at Home" (625); Thomas W. Couldery's "Sent out for Punishment" (707); C. MacIver Grierson's "Poacher" (718); and Walter Langley's "Knitting" are other pictures of the year which will make the exhibition remembered. The classically-conceived decorative compositions of Miss Gertrude Demain Hammond, including her "Harvest Festival," a frieze or panel treatment, which we have illustrated, are worthy of special mention for their graceful drawing and colour.

#### THE SOCIETY OF ARCHITECTS.

THE fortnightly meeting of the Society of Architects was held on Tuesday evening, Mr. William Allport, member of Council, in the chair.

#### PROFESSIONAL PRACTICE.

Mr. HUGH ROUMIEU GOUGH, F.R.I.B.A., Past-President, read a paper on this subject. In his preliminary remarks, the lecturer touched on the subject of the education and training of architects. He held very strongly that all desirous of entering the profession should have passed a compulsory examination. This could only be done by an Act of Parliament, and a movement in this direction was very general. In France, America, Canada, and Australia similar efforts were being made. The miserable petty jealousies so prevalent amongst our profession in England might retard the movement for a while,

but that sooner or later their efforts would be crowned with success he had not the slightest doubt. The machinery for carrying out the provisions of the Bill was already in hand. In the Architectural Association and its branches there was what could scarcely fail to become the recognised College of Architects, and the Royal Institute of British Architects must, he thought, be admitted by all to be the proper examining body. Mr. Gough quoted portions of the address by Mr. W. G. Storm, the President of the Ontario Association of Architects, to the annual convention held in the Canadian Institute in November last, in which emphasis was laid on the desirability of registration. Until compulsory education and examination were enacted, and some governing body was established with powers to enforce observance of rules of etiquette, Mr. Gough held that the dignity of the profession could not be upheld. Architects had at present no code of ethics to be observed amongst themselves, and towards their employers and the builders and others they were brought in contact with. They could, however, as a society, resolve among themselves to emulate the strict professional etiquette observed among doctors. The author recapitulated some of the rules which they are bound to observe. "Every kind of public laudation, whether it proceeds from the physician in question himself or from others, and continuous advertising in public papers, are to be reprobated. The public offering of medical assistance gratis, underbidding in concluding contracts for sick societies and the like, offering advantages of any kind to a third person in order to procure practice, are inadmissible. Any attempt of any kind on the part of a physician to intrude upon the practice of another is dishonourable, especially in the case of one who has acted as substitute or in consultation. A practitioner must by no means undertake the treatment of a case without the express consent of the previous physician. No physician is at liberty to make disparaging remarks to others about another physician." Were architects, he asked, in no need of some such code? Had no one ever heard one architect speak disparagingly of another, even to the other one's own client? Had they never heard of the case of one architect endeavouring to get, and taking, the work promised to another? Had they never heard of the case in which one architect had promulgated some work of public utility and another had stepped in and taken the execution of the work from him? Had they never heard of dishonest tricks in competitions? Let them look again at law cases. Had they never seen any of their professional brethren eager to be retained on one side or the other, and ready to give evidence to suit the requirements of the case? Were they not aware that by so doing the professional expert had made himself the laughing-stock of the Judges of the land, and that his evidence was set at naught? Was it not a fact that, if an architect's conduct was to be called in question, any amount of evidence would be got for or against him with perfect indifference, provided a guinea were given with the subpoena and the usual three to five guineas a day were allowed? What, then, should their code be? If the old and simple rules—"Do unto others as ye would they should do unto you"—and again, "By brotherly love, serve one another"—were observed between one architect and another, the profession would be a better, a higher, and a more enjoyable one. Mr. Gough next passed on to the relations between architect and employer, continuing:—The first duty of the architect is to ascertain his client's requirements, and the next to do his utmost to meet them. Unswerving loyalty to the client's interests, and perfect candour in dealing with him, are the only principles upon which a man with any self-respect should act. It will often happen that a client expects far more from a given outlay than it is possible for him to obtain. The only honest course to take in such a case is to tell him so candidly at the outset, instead of, as is often the case, leaving him to find it out when the tenders for the work come in. This is not honourable, and almost invariably leads to disputes as to payment. During the preparation of a design it often happens that a client will suggest various alterations and additions. Be careful to point out to him at the time that these will involve extra expense, if such be the case. When you are instructed to obtain tenders the law says that you

\* Extracts from a code of ethics adopted by the 17th Congress of German Physicians, 1888.

are justified, without the express sanction of the employer, in instructing a surveyor to take out quantities for the purpose. To do so without acquainting him of the fact and informing him of the cost may be legal; but it is a foolish thing to do, and often leads to disputes and unpleasantness. For the time being you are the custodian of your client's purse—remember also that he relies upon you to obtain for him a building which will answer his needs and purposes in as complete a manner as the funds which he places at your disposal will permit. It is not the slightest use erecting a building, however beautiful it may be, if it does not meet his requirements, and it is nothing less than a grievous crime, to provide one for him which is not perfect in its construction and in its sanitary arrangements, for, if these be defective, you may not only endanger his life, but the lives of others to come after him. It sometimes happens that clients are very unreasonable in their expectations, and sometimes we have unscrupulous ones to deal with: it therefore behoves us to have self-respect, and to uphold the dignity of our profession. So long as a building is in course of progress we should insist upon all being done under our direction, and, if any alterations are desired by the client, he should distinctly understand that the order must be given by the architect. It is of the utmost importance that in all our transactions we should be strict men of business. The unscrupulous client is often apparently a genial, warm-hearted companion, who poses as a friend, but rather shirks calling at your office, and prefers calling at your private house for a friendly chat, when he will casually mention some matter of business, and induce you to promise to prepare him some sketches. Shun all such men as you would the devil, is my advice. The unscrupulous client of the class referred to has a great objection to writing letters. The way to deal with him is to carefully note what takes place at interviews, and write to him to know whether you rightly understand his directions. Get him to confirm it in writing, and do nothing for him without written instructions. He knows the value of such so well that he will often give verbal directions to the builder or his foreman, and when the work is completed, repudiate payment, because no written authority has been given, as is required by the conditions of contract, and because, he says, he was so innocent as not to know that any extra cost would be involved. If the architect allows payment for it in his certificate, he will not hesitate to say that he has grossly neglected his duty, that he has failed to protect his interests, and will tell everyone he meets that his architect is not a man to be trusted and probably that he is in collusion with the builder. As you can never possibly know when you may meet with such a client as this, it is necessary to be thoroughly business-like with all you may have to deal with. The good client will respect you for this, the bad one will find he has neither a child nor a fool to deal with. I now come to the architect's relations towards the builder. In all our dealings we must be strictly just towards him, and insist upon his doing justice to our clients. We must bear in mind that we are not merely the agents of the employer, but, beyond this, and, in many cases, instead of this, we are arbitrators between the two. This distinction it is important to bear in mind, for in most contracts there are many matters left to the decision of the architect, and this places him in the position of an arbitrator. If he acts simply as an agent of the employer, and does not at the same time consider the fair and legitimate interests of the builder, any certificate or award he may make may be upset by a court of law. A few words seem necessary regarding the quantity surveyor. There should be a distinct contract between the employer, or the architect on his behalf, and the quantity surveyor, and it would be very much better that he should be paid direct by the employer, instead of, as usual, by the builder. In all large works the quantity surveyor should either work in the architect's office, or the architect should spend a considerable amount of time with him, because, however carefully drawings may be made and specifications written, in the process of taking off the quantities very many matters of detail occur to the surveyor, which should be noted at the time, and any necessary additions to the specification should then be made. The quantity surveyor is too often called upon to do his work in a short and insufficient time. However anxious

a client may be to get in tenders speedily, it should be pointed out to him that it is a great error to unduly hurry such an important work as the "taking off" of the quantities is. The architect should always have a copy of the dimensions, especially where the quantities have been prepared from  $\frac{1}{4}$ th scale drawings, in order that he may make his details correspond with the quantities, but it is only in works of a very small and plain character that  $\frac{1}{4}$ th scale drawings suffice. In the majority of cases the surveyor should be supplied with a general set of details drawn to a scale of  $\frac{1}{2}$ in. or  $\frac{3}{4}$ in. to the foot. In obtaining tenders, care should be taken in selecting fit and proper builders, and here the architect should be firm and refuse to allow any but those in whom he has reason to place confidence being allowed to tender. It is true that men with no reputation to lose will be likely to send in the lowest tenders, and clients often feel this to be so and endeavour to persuade the architect to add the names of men of no substance. This should be firmly resisted. If you refuse, it may be thought that you have some unfair interest in one nominated by yourself being chosen. To avoid this, my usual course is this: Say ten are to be invited to compete, I send my client the names of ten, leaving him to select five, and I ask him to do the same with me. If those he names are unknown to me I write for references to architects for whom they have worked, and select the best. Seeing that all sorts of unfair tricks are resorted to in making up tenders, I advise all architects to insist upon the priced bill of quantities being sent in with the tender, and that all tenders be rejected in which the prices against each item in the bill when added together do not tally with the amount of the tender, or in which the provisional amounts are not carried out, or are carried out at a less sum than stated, and all bills in which a discount is taken off at the end. The latter is a trick now often resorted to, but is a very dishonourable one. The object of having a priced bill deposited is that extras and omissions may be valued at the prices upon which the tender is based, but where a discount is taken off at the end of the bill, say 15 per cent., the builder serving you that trick will claim that extras are to be priced at the amounts named against each item in the body of the bill—that is to say, at 15 per cent. above his actual contract prices. The architect should have a written contract with his client. By contract I do not mean a document drawn up by a lawyer, ornamented with an expensive stamp, and accompanied with a pretty little "bill of costs." A contract consists of an offer and its acceptance, and may be verbal only, or in writing, and if the latter it may also be under "hand and seal." All that the architect need do is to write to his client informing him of the terms and conditions on which he consents to act, and on receipt of an acceptance, or orders to proceed, he has all that is required. The acceptance should be stamped within fourteen days of its date with a six-penny agreement stamp, otherwise it cannot be used in a Court of law without payment of a £10 penalty. Verbal instructions are sufficient to alter a verbal contract, but all variations to a written contract must be in writing, and, if under seal, all alterations must be likewise under seal. It is important to bear this in mind. When solicitors are employed to draw up building contracts they very often get the parties to put their hands and seals to them, which may be a source of considerable trouble to an architect, because any agreement made afterwards, to omit part of the work, or add to it, will require to be treated in the same manner. Again, solicitors frequently, in drawing up building contracts, insert conditions different to those contained in the specification and bill of quantities. These should always be made to agree before the contract is entered into. In common fairness to all parties the bills of quantities should be made the basis of the contract. The builder should not be expected to provide more labour or material than he has allowed for in his estimate, made upon the faith of the quantities supplied to him, and, on the other hand, should it be found that there is any excess in the quantities, the employer should not be called upon to pay for what he does not receive. This course is beset with many difficulties, necessitating, as it does, the very careful measurement of every part of the work at frequent intervals during progress, which can only be done at considerable expense; nor is this the only obstacle, for clients naturally wish to know

the precise cost before beginning to build, and therefore lump-sum contracts are invariably preferred. It is supposed by many architects that if the quantities are mentioned or referred to in the contract, that is sufficient to make them the basis of the contract. This is an utterly mistaken idea. If a builder agrees to carry out a certain work according to the drawings and specification, he is bound to do all that is shown on the one and described in the other—that is to say, he is bound by both documents. If the quantities also form part of the work he has undertaken to do, he is surely bound by all three documents, and not by the one to the exclusion of the others. I know of no decision on this point, but it is well known that where a thing is described in a specification and not shown upon the drawings (where these alone are referred to in the contract) the builder is bound to supply it; and further than this, it has been ruled that where a builder undertakes a contract for a house, that though such things as floors or doors are not shown on the drawings or described in the specification, it is reasonably and obviously to be inferred that they are required, and the builder is bound to supply them. I would advise no one to rely upon this to cover his carelessness or haste, but to prepare his drawings and specification with care and exactness, and thus avoid doing an injustice to the builder, causing annoyance to his client, and bringing discredit upon himself. It often happens that, on the completion of a work, a dispute arises as to the ownership of the drawings. By custom, and in all common fairness, these should remain the property of the architect, but here the law is against us. The Court of Appeal decided that the drawings for the Houses of Parliament should be given up by the architect. In my own practice I have for many years past inserted a clause in all my contracts to the effect that "the contract drawings and specification, and all copies thereof, are the property of the architect, and are to be returned to him and to be retained by him on completion of the works." Seeing that the contract is signed by the employer as well as the builder, this places the question beyond a doubt. If I specify that the contractor is to provide the sum of, say, £500, for marble work, or for stoves and chimney-pieces, I expect, and my client expects, him to provide that amount. It matters not whether you put prime cost or net; in fact, these terms are often misleading, for the practice has lately grown up amongst builders, whether you add these words or not, of expecting, or at all events claiming, a discount. Prime cost, or net, they will calmly tell you means the book price, and that they are entitled to the ordinary trade discount. If you specify that a builder is to provide 500 locks, you will certainly not be content to receive 20 or 25 per cent. less than that number, and if you specify that he is to provide 500 sovereigns, you have an equal right to see that he does supply that number and no less. In these days of keen competition, builders send in tenders at cost price, or even something less, trusting to make a profit somehow. We all know how they love to supply us with day-work accounts. In many cases we are powerless to check these—we know that the demand is utterly preposterous; but unless we have that *rara avis*, a thoroughly trustworthy clerk of works, we are at the mercy of the builder so far as day work accounts are concerned. These are cases which call for special conditions in the contract, if we would avoid contention. So far as provisional amounts are concerned, the surveyor should carry these out into the margin of the bill, and not leave the builder a chance of omitting them, or putting some less sum down than is specified. There should also be a clause in the contract to the effect that the employer and his architect reserve to themselves the right of deducting the whole or any portion of the provisional amounts as specified, and in the event of the contractor not being employed to supply the materials or perform the labour included in such amounts, the profit, if any, which he may have added to the same in his priced bill of quantities is also to be deducted. With regard to day work, a clause to the effect that none such will be allowed for unless from its nature it cannot be measured and valued in accordance with the prices in his bill of quantities, on which his tender is actually based, should always be inserted. It should also be distinctly stated that no day work will be allowed, or paid for, without the sanction for the same being given in writing by the architect, before the

same be commenced, and the account for the same be delivered within the week in which it is executed. I will now briefly consider the position of the clerk of works. There are no doubt many honourable men following this calling, but unless an architect has a practice sufficient to support a staff of such, upon whom he may rely, he is better without one. At the best, he occupies an anomalous position—he is the paid servant of the employer, and the agent of the architect. What he sanctions, therefore, the architect cannot condemn. I may be prejudiced against a class of men who ought to be an architect's most valued assistants, but I think this is not without reason. Some 25 years ago, I was employed in the Surveyor's Department of the War Office. I was ordered to report myself at an important station in the south to superintend as clerk of the works certain buildings involving an expenditure of £180 000. On arrival I was met by the contractor, who had a carriage and pair in waiting to convey me to the quarters he had secured for me. I told him at once that I intended to look out for lodgings for myself; however, he said he had ordered dinner, and we could discuss that afterwards. We drove to the best hotel in the place, and after dinner he told me he had secured rooms for me there, and that I had nothing to do but to send my bill to him every week, and so long as I contented myself with two or three bottles of champagne a week we should get on all right. I need say little more than that I reported this to headquarters, and was recalled to Pall Mall. Since then, in the course of my own practice, I have been frequently told by contractors that where a clerk of the works is employed they are bound to pay him. Many of those who have told me this are men in whom I have every confidence, and men who try to carry out my instructions faithfully; but they say the clerk of the works always expects to be paid by both sides, and, if he is not, will condemn good work and material in order to cause trouble. In my own practice, where possible, I ask my clients, instead of paying a clerk of the works, to allow me an extra fee for making frequent visits, and sending my assistants to do the same. I come now to the consideration of the payment of the architect. I have the greatest dislike and contempt for trade-unionism, and I have never been able to see any reason why the skilful and ignorant should be paid alike. Again, the payment by a percentage on the cost is utterly wrong in principle, leading our clients to suppose that it is to our interest to increase the cost of a building as much as possible. Better by far to name a fixed sum before the work be commenced, always on the understanding that if any material alterations are made an extra sum should be allowed, according to time occupied. The custom of a fixed charge, to be made by the good, bad, and indifferent alike, is wrong in principle, and quite as absurd as it would be to lay down a fixed charge of so much per foot superficial of canvas covered, whether it be by a Sir Frederic Leighton, an Alma-Tadema, or a village sign painter. In our own profession, the different degrees of talent are quite as wide apart. A certain Lord Chief Justice once said that the payment of architects by commission was a vicious system. He would have been wise had he stopped here; but he went on to say that they should be paid by time occupied, and admitted that three guineas a day was a recognised and fair charge. Now the absurdity of this is manifest. In a day or two a skilful and experienced architect will succeed in getting out the plan and main lines of the elevation of an important building, whereas a young and inexperienced man might puzzle his brains for a month or more, and then would probably not be able to produce anything nearly as good. It is absurd, therefore, to say that the experienced one should be paid, say, six or nine guineas, and the ignorant one ninety guineas or more. The payment by time, if all are to be paid alike, is a gross absurdity. The payment by commission on the cost has been pronounced to be a vicious system. It would be better, therefore, if we each one did as other artists do, and simply charged for each work we undertook such a sum as we know our reputation and ability warrant us in expecting and demanding. In this way the public would soon learn that if they wished to secure the services of the most eminent specialist, whether it be for a town hall, a church, or a warehouse, they would have to pay more than if they employed an untried man. The advantages of such to the profession at large would be enormous. The most eminent men, instead of taking

more work than they can possibly give personal attention to, and which they must perform hand over to able "assistants," would take less, but receive higher payment for it. Young, rising men would be eagerly sought for, and instead of becoming the drudges or ghosts of "eminent" ones, would soon secure commissions; in fact, work would be more generally distributed. I have lately been studying various schedules of charges of architects adopted in many different countries on the Continent and elsewhere; but they are all open to the fatal objection that they all suppose the experienced and inexperienced are to be paid alike. All these schedules are very elaborate, each giving half-a-dozen or more different classes of buildings and a graduated scale of fees for each, dependent upon the cost, varying as much as from 15 per cent. upon small work involving much labour, to as little as 2 per cent. upon large ones requiring little trouble. Most of these are so complicated that an architect would often be at a loss to know what he ought to charge, and it would be almost impossible to convince a client that your charge was a fair and proper one according to the schedule. Better by far adopt the simple rule of 5 per cent. with all its absurdities than enter upon an amended scale of this description.

Mr. G. Soudon Bridgman, of Torquay, proposed a vote of thanks to Mr. Gough for his interesting paper in an anecdotal speech. He

effect in the conditions of contract, looked ingenious, but was not safe, for the contract was made not between the architect and builder, but between the client and builder, and though the architect might for convenience sign it, he was not a party to it. An action, therefore, to recover possession of the drawings under such a clause would not lie.

Messrs. A. Howard and W. C. Fennings also supported the motion, and the Chairman, in putting it to the meeting, also spoke in strong terms against the strictures passed on clerks of works by Mr. Gough.

### BRICKS AND BRICKMAKING MACHINERY.

By M. POWIS BALE, M.Inst.M.E.; A.M.Inst.C.E.  
Author of "Woodworking Machinery," "A Handbook for Steam Users," &c.

#### SEMI-PLASTIC PROCESS OF BRICKMAKING.

WE now pass to the consideration of the plant used in the second great process of brickmaking—viz, the semi-plastic or semi-dry. As we have elsewhere remarked, this process has during recent years made very great progress, and this in the face of many difficulties and much prejudice. Although there is little doubt that greater skill and judgment are required in successfully introducing and working this as

FIG. 11.

heartily endorsed the lecturer's views as to the importance of registration, especially in provincial towns. Mr. Bridgman mentioned that after he had given a lecture on architecture at Torquay, a person living in that town, who

compared with the plastic process, we venture to predict that as its advantages become better known, its application will be much extended. As the beds of ordinary plastic clay become worked out in this country, shales and other

FIG. 12.

professed to practise as an architect, got up and asked what a young man should do before being articulated to arch-itecting?

Mr. S. C. JOHNS seconded the motion, which was supported by Mr. E. TIDMAN, who defended clerks of works as a body from the aspersions Mr. Gough had cast upon their integrity and reliability.

Mr. E. J. HAMILTON, of Brighton, having spoken, Mr. EDGAR FAIRMAN said Mr. Gough's plan for retaining the ownership of drawings in the architect's hands by putting a clause to that

materials will probably have to do duty, and these can be worked to great advantage by the semi-dry process. Although not nearly so largely employed in England as the plastic process, in the Colonies and abroad the semi-plastic process has of late made great headway. This is chiefly owing to its simplification, and to the great improvements introduced in the machines employed, whereby the skilled labour has been reduced to a minimum—a matter of much importance where the cost of labour is very high, as in the Colonies.

FIG. 13.

#### PLANT FOR PREPARING THE CLAY FOR THE SEMI-PLASTIC PROCESS.

Clays that will not weather or soak, or take much water, such as shale, fireclay, slate debris, and other refractory materials, are usually crushed dry to a fine powder directly from the heap, by means of perforated grinding-pans, or edge-runners. Where the plastic process is pursued the ground clay is then mixed with water in a mixing-pan and tempered before being made into bricks, the water being afterwards evaporated from the clay either by the atmosphere or in drying sheds. With the semi-dry or semi-plastic process the ground clay is usually raised by an elevator to the brick-moulding machine without any previous preparation; it is then subjected to great pressure, and this, together with any natural moisture found in the clay, is relied on to keep the various particles together when formed into a brick, and the bricks when made are immediately walled in the kiln for burning without any previous drying. In preparing hard or friable materials perforated grinding-mills are to be preferred, but for plastic or sticky clays horizontal crushing rollers are used. The whole process, from the crude clay to the finished bricks ready for the kiln, has been gradually simplified and improved so as to be now practically automatic, the clay being untouched by hand through the various operations.

#### PERFORATED PAN GRINDING-MILLS.

As already mentioned, for crushing hard clay, shale, ashes, and semi-dry materials, an edge-runner roller mill is used. This is usually arranged with two pans, the top one, which revolves, having a perforated path or bottom, so that when the clay is sufficiently crushed or pulverised it is allowed to fall through into a lower pan, which is stationary. Scrapers are attached to the under side of the revolving pan,

and sweep the material as it falls over apertures in the lower pan, through which it passes down shoots to be conveyed by elevators or otherwise where required. The perforated grates are made removable, so that grates of any desired mesh may be used according to the fineness of the grinding required. For very fine grinding, perforated zinc or iron sheets mounted on frames are used. In all machines having a vertical shaft on which there is great pressure, especial care should be taken in the construction of the vertical shaft bearing, or considerable loss and annoyance may arise. The usual plan is to form a steel toe on the end of the shaft, and let it run in a steel footstep bearing. This will work fairly well if kept constantly lubricated—a matter of some little difficulty, owing to the small area of the bearing, combined with the heavy pressure on it, which forces the grease out of it, and should the bearing ever be allowed to run dry, it will seize and rapidly cut itself out. To overcome this difficulty, the author has devised an improved form of bearing, which is applicable to all kinds of heavy vertical shafts which require a toe or footstep bearing. As will be seen from our sketch, Fig. 11, the system briefly described consists in extending the base of the shaft and causing it to revolve on balls or rollers confined in an oil-chamber. The balls have a circular traverse, are made smooth and hard, and their pathway is turned. The bearing is covered in with a cap, through which the oil can be supplied, or in certain cases a hole can be drilled up the shaft for the same purpose. By extending the base of the shaft the pressure is distributed, and by using the balls or friction rollers in an oil-bath, the friction is very largely reduced. I may add that I have had shafts carrying several tons running for a considerable period without giving any trouble. For supporting the centre shaft of ordinary mortar-mills, this plan is much to be

preferred to the ordinary cup footstep bearing, which is difficult to keep properly lubricated, and if allowed to run dry will give a great deal of trouble, and consume a considerable amount of power unnecessarily.

The upper pan should be fitted with a set of adjustable scrapers, to throw the material from the circumference and centre of the mill under the rollers, and also a set of solid false bottoms, which would enable the mill to be used for ordinary wet-grinding. The whole should be mounted on a strong cast-iron bed-plate, box section preferred. When these mills are driven from above, to avoid excessive vibration, it is important that the main standards and cross-piece be of massive construction. To lessen the vibration and wear and tear of working, the ends of the roller-axle may with advantage be mounted on strong spiral springs; these can be readily adjusted according to the nature and size of the material being ground. By fitting the roller-axle with loose collars, and altering their position, the path of the crushing rollers may be changed when necessary to equalise the wear of the bottoms.

All bearings should be carefully bored and fitted with covers, to exclude, as far as may be, dirt and grit. The rollers should be made of very hard metal. Sometimes the pans are made of wrought iron, the rims, &c., are thus readily renewable as worn.

We illustrate by Fig. 12 a perforated revolving clay-mill for grinding fireclay, marls or dry clay of any description. It is from the designs of Messrs. Bradley and Craven, of Wakefield. The pan is arranged to revolve, and is mounted on a centre vertical shaft working in a cup or footstep bearing. The centre of the pan on which the material is crushed is made solid, and the outer part is fitted with gratings of a suitable degree of fineness. As the material is crushed it is spread over and passes through the gratings,

the coarse being returned beneath the runners to be reground. The dust which passes the gratings is received in a fixed iron pan beneath, and is delivered to an elevator by means of a series of rotating arms. The crushing rollers are mounted on a stationary cross shaft, which is carried on two side cheeks with slotted guides, and so they are enabled to rise or fall as the charge of clay in the pan requires. Special arrangements are made so that the centre footstep bearing can be readily adjusted or repaired, and the mill altogether is of the most massive construction—a noticeable feature in all Messrs. Bradley and Craven's manufactures.

Our illustration, Fig. 13, represents a perforated pan grinding-mill, from the designs of Messrs. C. Whittaker and Co., of Accrington. It is especially adapted for preparing or grinding refractory material for the semi-plastic process, such as shale, brick, fireclay, slate debris, &c. As will be seen from the sketch, the side frames of the mill are strongly braced together and mounted on a box bed-plate. The body of the pan is divided and arranged with a separate top rim. The pan is fitted with twelve perforated segments, containing about 14,500 perforations for the discharge of the ground material when sufficiently reduced in size. A dead-plate for grinding, centre-piece and twelve under-scrappers fixed to twelve arms forming the pan body are also fitted. All these parts are so arranged that they can be readily removed or adjusted without disturbing the other parts. The crushing-rollers are bushed with long loose bearing-bushes, to keep them perpendicular in case of wear. The rollers work in suspension, and do not touch the pan. A compound footstep-bearing is fitted; this consists briefly of one steel disc fitted to the bottom of the shaft, and one at the bottom of the step, and between these is fitted a gun-metal disc with concave surfaces. Suitable oil chambers are provided, with screwjacks for lifting; and, taken altogether, this must be pronounced a very complete mill.

In lieu of crushing-rolls and edge-runners, in America various forms of disintegrators and pulverisers are used for preparing clay for the semi-dry process; but these hitherto have not found much acceptance in this country for this particular class of work. There is little doubt that, owing to the grinding action of refractory clays on the working parts of disintegrators, the wear and tear on them is considerably greater than is the case with crushing-rolls or edge-runners. At the same time, many of them will grind faster for a given power, and turn out a more even sample. If a disintegrator be used, one running at a moderate rate of speed is to be preferred to a high-speed mill. For crushing and grinding dry fireclay, &c., to a fine powder, revolving-ball mills have latterly been introduced with considerable success, the output, compared with the H.P. used, being large. High-speed disintegrators fitted with revolving arms or beaters, although occasionally used, are quite unsuitable, as the arms rapidly grind away and need constant renewal, and the gratings which regulate the fineness of the material are apt to become blocked.

#### TOMBS AT LAHORE.

STUDENTS of Saracenic art cannot do better in seeking for differences of style, both in construction and decoration, than carefully compare the Moslem tombs scattered over the countries which from time to time submitted to the influence of the Mohammedan religion. In regions so vast the exigencies of various climates are sufficient to account for great differences in domestic and ecclesiastical architecture; but the tomb being solely monumental is less likely to be varied in consequence of any such conditions. The origin of the domed Mohammedan tomb is a vast subject for inquiry, at present in the stage of conjecture, and, although great variations of shape exist in the Moorish, Egyptian, Turkish, Persian, and Moghul styles, yet certain peculiarities common to all point at some arbitrary laws ruling in a measure the plan and decoration. The glories of white marble and elaborate mosaic decoration and praise of generations of poets have probably caused undue attention to be centred upon the great Taj Mahal at Agra, to the disadvantage of buildings somewhat similar in form in many cities of Northern India, but, of course, inferior in size and costliness of decoration. The number of these square and octagonal tombs covered with a central dome and bastion corners

reaches many thousands, and, although influenced by the various styles and periods of Moslem art in India, and varying in size and importance, yet they are practically the same building. We illustrate two of these tombs from the royal city of Lahore. The drawings are from actual measurement of the buildings by students of the Government School of Art of that city, and have been kindly placed at our disposal by Mr. J. Lockwood Kipling, C.I.E., the director of that institution. Anyone turning to the plan of the Taj Mahal, and again to that of Mahmoud Shah's tomb at Bijapur in Fergusson's "Indian Architecture," will see that, although differing in magnitude, yet certain peculiarities of plan are repeated, and probably the Nawab Amir Khan's tomb at Tatta, although a comparatively modern building, shows one of the earliest forms from which the others are derived. Speaking from memory, both of these Lahore tombs are either of brick or stone of inferior quality, faced with stucco, their ornamentation principally panelling. So far as the interior and four external faces are concerned is Persian, but the Indian Moghul characteristics are more shown in the treatment of the domes, which, in India, are generally relieved by an acanthus band round its springing, and often, as in these, fluted to the apex, where a bell-based finial gracefully reverses the bulbous curve. The so-called Tomb of the Dancing Girl was most probably built for one of the ladies of the court of Runjeet Sing, although the style appears more modern than his tomb, which was built a few years later. The great thickness of the walls shown in the plan is not unusual in buildings of this class, and although of rubble of very wide-jointed brick, the very high quality of the mortar will preserve them for ages to come. The date of the Mohammedan tomb is unknown; the style is more pure, and belongs to the 17th century. To afford an idea of the quantity of Moslem tombs in India, at one place alone, the cemetery on the Makli-hill at Tatta, over a million tombs were counted and registered by the district officer. These varied from an ordinary grave with a simple head-stone, to buildings of the size of these Lahore tombs, in many cases with a mosque attached, the whole extending a distance of nine miles, by a width of a thousand yards.

We are indebted for these particulars to Mr. C. Purdon Clarke, C.I.E., F.R.I.B.A., of the Indian Museum, South Kensington, and the drawings

MUHAMMADAN TOMB NEAR MIAN MIR  
LAHORE

illustrated have been sent over by the Principal of the Government School of Art at Lahore, Mr. N. J. L. Kipling, for publication in our pages. They are the work of native students, whose names are given on the reproductions.

#### CHIPS.

The town council of Burslem proceeded on Wednesday week to elect a borough surveyor, and 81 candidates presented themselves, the salary offered being £200 a year. Mr. F. Bettany, assistant in the office of the town surveyor of Tunstall, was elected. Mr. T. R. Roscoe, of Hammersmith, being placed second.

The corner-stone of the new Science and Art Schools at Wakefield will be laid to-morrow (Saturday), by Sir E. Green, M.P. The new buildings are being erected on the site of the previous schools in Bell-street, and, as far as possible, the old structure will be worked in with the new building. The front will be of hard Huddersfield stone, the sides and back will be coursed with delph parpoints with stone dressings. The style is Renaissance. The whole of the contracts have been taken by Wakefield tradesmen. The architect is Mr. William Watson, of Wakefield, who is personally supervising the work as it proceeds. The cost will be over £5,800.

The memorial stones of new schools in connection with the Wesleyan Chapel, Union-street, Willenhall, Staffs., were laid on Monday week. The cost will be £1,800, and they will be used as day and Sunday schools. The contractors are Messrs. Guest and Son, of Brierley Hill, and the architect Mr. B. Baker, of Willenhall.

The large Perpendicular church of Hemingborough, near Hornden, in the East Riding, is about to be restored in accordance with a report prepared by Mr. J. L. Pearson, R.A., and at an estimated cost of £3,500. The chancel has recently undergone restoration, and the proposed works include new roofs to nave and transepts, the lowering of the floor levels, and reseating.

Mr. Ewan Christian's plans for the new building to house the National Portrait Gallery have been completed and are under consideration by Mr. Plunket, the First Commissioner of Works. The site is, it will be remembered, in Charing Cross-road, at the back of the National Gallery.

The committee of the Leeds General Infirmary, who recently selected, in competition, the plans of Mr. George Corson, of Leeds, for the extension of the building, have now approved Mr. Corson's modified design.

OUR LITHOGRAPHIC ILLUSTRATIONS.

STATUE OF ST. GEORGE, IN OR SAN MICHELE, FLORENCE.	
--	--

This figure was judged such a great masterpiece that Francesco Bocchi wrote a whole book about it. Donatello first executed a statue of St. Mark in 1411 for this same church at the commission of the Guild of Linen Weavers, and Michel Angelo said of it, "One could not fail to believe the Gospel preached by such an honest-looking man." Then the Guild of Butchers bade this sculptor fill another niche on the south side of the façade with a figure of St. Peter, and the Armour Smiths ordered St. George, now illustrated. So earnest and manly is the elder Apostle, and so bright and brave the young, youthful warrior saint, that Donatello's fame was made. Like Prometheus, Donatello was inspired by the life of his own work, and whilst engaged on it would often stand back, exclaiming, "Speak, speak!" His works bear the germ of that energetic, strong school which Michel Angelo brought to perfection. The breadth and vigour of his St. George is marked to a degree, and its repose well adapts the marble figure to the architectural purpose for which it was intended. The date of the statue is A.D. 1416.

ENGLISH CHURCH FOR GRASSE, ALPES-MARITIMES, FRANCE.	
---	--

The small church of which we give the south-west view is shortly to be erected at Grasse, about eight miles from Cannes, on a site bordering the National-road, a short distance from the town, and adjoining the charming property belonging to Mr. John L. Bowes, late of London and Liverpool. It has been mainly through the liberality, and entirely through the exertions, of this gentleman that the scheme of erecting an English church in this health resort and garden of sweet-smelling flowers has been carried out. The church is to be built of pitch-pine framework, filled in and backed with brickwork throughout. Externally the red bricks will be displayed up to the stringcourse of the windows, all spaces above that and between the framework being finished with hydraulic cement. The exposed woodwork will be stained dark brown and well oiled. The roof will be covered with red English tiles, which will be shipped along with the entire woodwork from this country. Internally the furniture and fittings will be of a simple and tasteful character, in keeping with style of architecture adopted, and the walls will be plastered and ultimately decorated. The roof will be open timberwork, with a good deal of turning introduced in the principals. The dedication of the church has not yet been decided. The architect is Mr. G. A. Audsley, F.R.I.B.A., of London, and he will probably be assisted in

the local superintendence of the work by Mr. E. Hewetson, F.R.I.B.A., of Cannes.

STABLING, LEE'S MEWS, GROSVENOR-SQUARE.

These stables have just been built for Mr. Samuel Lewis, of Grosvenor-square, under the direction and superintendence of Messrs. J. T. Wimperis and Arber, of No. 25, Sackville-street, Piccadilly. The site being small for the large amount of accommodation required, it was determined to make the basement into the coach-house; by this means the whole of the ground-floor was available for the horses. The large stable has nine standings, stalls, and boxes, and a separate two-stall stable is provided for the horses used in the evening, or it is convertible into a box for a sick horse. The basement is reached by a hydraulic lift, the lift table forming, when up, a single coach-house, also for use in the evening; the whole being lighted by gas and the electric light, and warmed by hot water. The first floor contains the coachman's residence and offices, besides the fodder and large harness room. The top floor contains the grooms' and helpers' mess rooms, offices, dormitory, and bedrooms. By these means, on a site of 75ft. by 20ft., accommodation is afforded for eleven horses, twenty carriages, the coachman's residence, and about a dozen grooms and helpers, besides the fodder, harness, cleaning places, and the other small offices. The contractors for the works were Messrs. A. Bush and Sons, the hydraulic lift by Messrs. Waygood, and the terracotta by Messrs. Doulton and Co., all of whom have carried out the work in a very excellent manner.

NEW GENERAL POST-OFFICE BUILDINGS, ST. MARTIN'S-LE-GRAND.

We fully described this important addition to the General Post-office, of which Mr. Henry Tanner, of H.M. Office of Works, is the architect, on p. 306 *ante*, when giving elevations and plans of the building.

ALTERATIONS AND ADDITIONS TO "LATCHMERE HOUSE," SURREY.

These alterations, which have recently been carried out for Mr. Joshua Field, constituted almost the entire remodelling of the house, the greater part of the old building having been, to some extent, altered or improved, and large additions having been made. The new work is so arranged, however, as to fit on to the old in such a manner as to harmonise with it and render the actual junction between the two as little apparent as possible. The exterior is of Suffolk facing bricks, with stone dressings, and the interior joinery is of oak wainscoat throughout, part stained and part fumigated and oiled. The work was carried out at a cost of about £5,000 by separate contracts for the various trades, under the superintendence of Messrs. Wylson and Long, architects, of 15, King William-street, Strand.

On Saturday the Master of the Skinners' Company laid the foundation-stone of the public library building, Skinner-street, Clerkenwell. The site is at the junction of Skinner and Whiskin-streets, and the building will have a frontage of 70ft. to each thoroughfare. The library is to be built of red brick with stone facings, and will be three stories high, with room for 30,000 volumes, and reading-rooms. The builders are Messrs. McCormick and Sons, and the architects Messrs. Karslake and Mortimer.

The County Council of Devonshire considered at their last meeting the appointment of additional county surveyors. A committee reported that they had arranged with the present surveyors for a redistribution of their duties and the rearrangement of their salaries. Mr. E. H. Harbottle had undertaken the superintendence of the bridges and main roads in the western division, and Mr. Little in the eastern division. As to the salaries of the present surveyors, the committee were of opinion that Mr. Harbottle's salary should be £355 a year, and Mr. Little's £325; these sums to include their work as surveyors of the county buildings (except police-stations) at present under their respective superintendence. The committee had taken steps to obtain application for the offices of surveyors of bridges and roads for the northern and southern divisions, salaries for these divisions being fixed at £250 each. Advertisements were accordingly issued, and applications had been received from 40 persons. The report was adopted, and Mr. F. C. Masterton, of Devonport, was elected for the northern division, and Mr. C. G. S. Acock, of Ashburton, for the southern division.

COMPETITIONS.

DORSET COUNTY ASYLUM.—This competition was advertised last November by the Dorset County Council, and brought together 16 sets of designs. The present asylum at Charminster, built about 20 years ago for 320 patients, is to be enlarged to give accommodation for 720 patients, including those now lodged in the old asylum at Forston. The new buildings comprise, in addition to rooms for 400 patients, a new administrative department, a detached chapel in the grounds, a large recreation hall, new laundry buildings, and various alterations to the old asylum. The committee appointed Mr. C. H. Howell, consulting architect of the Lunacy Commissioners, as assessor, who has awarded the first premium of £40 to Mr. George T. Hine, of Nottingham (the architect of the new asylum at Claybury, which is being built for the County of London), and the second premium of £20 to Messrs. Giles and Gough, of London. The committee have confirmed the award of Mr. Howell, and appointed Mr. Hine as the architect to carry out the work. The total cost is estimated at £48,000.

HARROGATE.—In connection with the Montpelier Baths competition, the Corporation of Harrogate have received 26 sets of designs, and they have appointed Mr. George Corson, F.R.I.B.A., Cobridge-street, Leeds, as assessor. It will be remembered that the estimated outlay is £50,000, and four premiums, amounting in all to £375, are offered.

PROPOSED MINISTER'S HOUSE, BOROUGH SYNAGOGUE, S.E.—A considerable number of drawings were received in this competition. The committee called in a professional assessor to assist them in coming to a decision. Acting on his advice, the design submitted by Mr. Sidney G. Goss, A.R.I.B.A., of 48, Finsbury-circus, E.C., was adopted, and he has consequently been instructed to prepare the necessary working drawings, and obtain tenders for the work as soon as possible.

SOUTHPORT.—The corporation recently invited local architects to submit competitive plans for a block of shops and business premises, to be erected in Eastbank-street; and at the last meeting of that body it was decided to award the first premium to Mr. C. Sydney Ingham, of Manchester and Southport, and the second to Mr. Goodwin S. Packer, of Southport.

CHIPS.

The Local Government Board have refused to accede to the application of the borough of Bolton for an extension of boundaries.

The new works of water-supply at Stone, Staffs, were inaugurated by the Earl of Harrowby, on Tuesday.

Mr. John D. Sedding has reported to the rector and churchwardens of St. Mary's, Stamford, on the condition of the tower of the church. He states that there are large cracks in all the walls, partly due to lightning, but chiefly to the pealing of the bells. He recommends that the bells should not be pealed, and that the cracks be carefully watched to see if they extend.

The partnership heretofore subsisting between Pincher and Long, of West Bromwich, architects and surveyors, has been dissolved.

At a special meeting of the township commissioners of Bilston it has been decided to adopt the plans of Messrs. Horton, architects, Wednesbury, for covering-in the market at an estimated cost of £3,500, and to seek the sanction of the Local Government Board to borrow £3,500 to defray the cost of the work.

The Local Government Board has sanctioned the amalgamation of Lillington and Milverton with Leamington. The borough will thus gain 4,000 inhabitants, and be increased in area from 1,570 to 2,900 acres.

The vestry of the City church of St. Swithin's, London Stone, recently proposed to repair the church in accordance with plans prepared by Mr. G. Elkington, their surveyor, at a cost of £750. At a vestry meeting held last week it was stated that Mr. Ewan Christian had inspected the fabric as surveyor to the Charity Commissioners, and estimated the cost of necessary repairs at from £410 to £430.

The committee for providing a new church for Hamstead, near Birmingham, have accepted a site at the junction of the Hamstead and the New Walsall-roads. The designs for the church, by Mr. Wm. Davis, of Birmingham, show an unpretentious structure seating 450 persons.

## WAYSIDE NOTES.

PROFESSOR AITCHISON said little new or worth much comment at the Academy this year till in his concluding lecture, when he informed the students that there are not ten architects in London earning a decent living by their profession. The Professor says he does not include surveyors and those engaged in business of a practical nature, but only architects who are designers of pure works of architecture. I don't know, of course, what pure Aitchisonian architecture is; but anyhow, this seems rather an invidious declaration, and one which, made with whatever goodwill to all, is calculated to leave an erroneous impression on the minds of the young students who were present at the lecture. For, as expressed, it would seem to infer that there was something derogatory about the business of the workaday architect and surveyor, whereas we know that these latter gentlemen, who compose the rank and file of the architectural profession, are of infinitely more service to humanity than the few who affect to pick and choose their commissions.

That the architectural profession is not a money-making one is an old cry. Those, however, who by their energy and talents are deserving of some measure of success can always get a "decent" living out of architecture, and, in spite of our good professor's *not ten*—which I will call *nine*—it remains a fact that some odd thousands of us manage to keep body and soul together, and make the two ends meet comfortably, by the exercise of such humble talents as kindly Nature has bestowed upon us. But when young architects commence to practise with the expectation of designing nothing but mansions, palaces, and churches, and turn up their noses at the duties of a practical architectural surveyor, they generally get their reward in chronic impecuniosity. No one who has ever been *above his work* has risen to a position of honour among architects any more than among other men. I warrant that none of the gentlemen who may be included among the nine earning their livelihood by pure architectural work have gained their positions by a process of dainty selection in their younger days. The truly high-class architect becomes so only by virtue of laborious struggles in the early portion of his career, and by engaging himself on any honourable work, be it ever so humble. It is the *snob* who affects to do without the odd jobs that fill the time of ninety-nine hundredths of our architects. And it is a fact that in many cases architects professing to be nothing but very high-art men, are all the time quietly engaged in earning their bread and cheese by occupying themselves with the despised surveying duties, either in the capacity of district surveyors, or in the execution of private commissions.

Wealth "beyond the dreams of avarice" is not given to any professional man—understanding the term "professional" in its proper sense. The riches of the brewer, merchant, and banker are to be gained by none whose income is dependent, primarily, on the exercise of their own brain-power; for even the most mercenary professional man must more or less vigorously put his own shoulder to the wheel. And although in every trade and calling the head and chief must do something to keep the business in a prosperous condition, this something is infinitely less in the case of the business man pure and simple than in the case of those following a profession. In some businesses all one has to do, having made a connection, is to sit at the receipt of custom. In others the thought and care of the principal are necessary, even if an army of assistants actually do the work. But, although it is thus evident that great riches are not for the architect, it remains patent to all that comfortable incomes are earned by those having the requisite energy, perseverance, ability, and integrity, and if architecture cannot be classed as a money-making profession, those professing it can, if they have their heads screwed on the right way, and are above the snobbishness of throwing away work not exactly to their taste, make a very "decent" living, and maintain, at the same time, their reputation as high-class architects.

Your correspondent Mr. Parminter, of Lille, occasionally sends you some exceedingly interesting communications, not the least of which is his

letter which you published last week on the French view of the Registration question. The main argument of the English Registrationist is that *bad planning*, as well as bad construction, and unscientific arrangement, are detrimental to the interests of the British public. Now, Mr. Parminter, writing either his own conviction, or placing himself in the position of an ordinary French architect, says: "A badly planned building or badly studied façade does not necessarily occasion anyone's death." The statement is perfectly correct; but the *harmfulness* of bad planning is a very real thing, and it would be easy to prove that a bungling and unscientific disposition of the various apartments of a house is at all times detrimental to the health of its inmates. As your correspondent puts the views of the French architects, they would appear to think too much of the art side of the question; whereas we, in England, know that this should have little or nothing to do with the case. The Registration question should be in France, as in England, an eminently practical one, dealing solely with evils that arise through the incompetence of some who adopt the title of architect, and whose manners and customs do not redound to the honour of the true architectural profession. Although the ultimate effect of making close the profession of an architect will be to raise the standard of design, I think that we have by this time said enough to defeat the ends of those persons who have been pleased to try and bring the Registration question into ridicule by proclaiming aloud that an artist cannot be tested by examination. Whether he can or cannot matters little, for the aim of the Registrationist is unaffected. The latter seeks to remove the evils arising from incompetency in practical matters. The weal of the public, and the honour of his profession, are his watchwords.

Mr. Joseph Lavender is evidently one of my friendly A.R.I.B.A.'s of whom I have great hopes. His letter, which you printed last week, is of a kind for which I have often looked. It is practically the identical appeal which I have frequently made to Associates of the Institute, only it comes from one of their number. I do hope that others will respond, and that an influential petition will be forthcoming. On this particular point I have already, at various times, said so much that it would be wearisome to reiterate. The Associates are now appealed to from amongst their number, and it remains for those in earnest to prove their earnestness by assisting in preparing the way for a successful promulgation of the proposed petition.

Admirers of Mr. Herbert Railton's beautiful drawings may have noticed during the past month or two a slight falling off in quantity of works produced by this prolific artist. Mr. Railton, unfortunately, has been suffering much from an aggravated form of writers' camp, which has prevented him, for the time, from maintaining the marvellous rate of speed with which he produces the black-and-white drawings of old architecture that we all so much admire. I am very glad to say, however, that our incomparable artist is now on a fair way to complete recovery from an affection of the arm that must have been most distressing to one engaged on the finest kind of pen draughtsmanship.

Though Mr. Railton's indisposition has led in some instances to his adoption of a remarkably bold style of drawing which, for my own part, I greatly admire, yet, judging from recently-published work, he has been able to maintain his old, grand combination of broadness and boldness with delicacy and refinement. In the current issue of *Scribner's Magazine* is a most pleasant essay, by Mr. Benjamin E. Martin, entitled "In the Footprints of Charles Lamb." Mr. Railton has illustrated it with five charming vignettes, which include the "Entrance to Christ's Hospital"—that charming view of Old London that we obtain from bustling Newgate-street—and that peep of Staple's Inn from Southampton-buildings, which I have long made up my mind is on a level, from a pictorial point of view, with anything in London. The drawing in *Scribner's* gives just the effect one likes to see; but it is rather small. In an edition of the "Pickwick Papers," published by Messrs. Macmillan in 1886, and illustrated by Mr. Railton, is this view of Staple's Inn nearer at hand, which shows what a glorious bit of the picturesque it

forms from all standpoints. This drawing, however, does not show the gates, which, when between the spectator and the hall, help the whole composition to an extraordinary degree. GOTH

## BOOKS RECEIVED.

*Practical Plane and Solid Geometry, including Graphic Arithmetic*, by Professor HENRY J. SPOONER, F.G.S., 3rd edition (Cassell and Company).—This is one of the Polytechnic series of Science Textbooks, and is intended to meet the requirements of the new Syllabus of the Science and Art Department. The author, Professor Henry J. Spooner, is director of the Polytechnic School of Civil and Mechanical Engineering. The geometry is sufficient for the requirements of the drawing office, and the diagrams and solutions clear and explicit. The problems on proportion, the construction of triangles, and areas of plane figures are practically treated. The explanation of scales, the section on graphic arithmetic, and the chapters of simple projection and solids, are very valuable parts of the treatise, and the author has succeeded in rendering these important functions of practical geometry interesting, by bringing before the student methods of treatment that are found to entertain as well as to instruct.

## CHIPS.

The late Mr. Michael Beveridge, who was Provost of Kirkcaldy, has bequeathed to its inhabitants the sum of £50,000 for the purchase of a public park and library.

The new swimming-bath at the Pump-room at Leamington was opened last week by the Mayor. The building measures 118ft. by 60ft., and the swimming-tank is 100ft. by 40ft. Mr. de Normandie, the borough engineer, was architect for the building, and was engineer for the filter, and for all the heating and ventilating appliances. Messrs. Heatherley Bros., of Coventry, were the contractors, and Mr. G. Atkins, of Leamington, was clerk of works.

The estate of Wilton Lodge, extending to 107 acres, has been purchased privately by the Hawick Town Council for £14,000. It is intended to transform a portion of it into a public park for the town, and to feu the remainder for the erection of factories, dwelling-houses, &c.

The parish church of Almondsbury, near Bristol, has been completely fitted with handsome carved oak seating, designed by, and carried out under the superintendence of, Mr. C. E. Ponting, F.S.A., of Marlborough. The work was intrusted to Messrs. Jones and Willis, of Birmingham and London.

The Town Council of Cardiff have accepted the tender of Mr. J. Allen, at £8,500, for taking down and reconstructing the market in St. Mary-street, in accordance with plans prepared by the borough engineer, Mr. W. Harpur.

Mr. Charles Edward, a well-known architect of Dundee, died at his residence at Broughty Ferry on Saturday evening.

The workhouse in King's-road, St. Pancras, is about to be reconstructed from plans by Messrs. A. and C. Harston. The St. Pancras Board of Guardians have accepted, for carrying out the work, the tender of Messrs. Kirk and Randall, of Woolwich, at £74,827.

The trustees of the poor for Maidstone have elected Mr. J. S. Anscomb, of that town, their surveyor, in succession to Mr. R. Troutbeck, resigned.

Messrs. C. Isler and Co. have recently completed Artesian bored tube wells on their principle at Messrs. Ellis, Warde, and Co., brewers, Ormskirk, obtaining a copious supply from the new red sandstone formation. Similar works have been carried out at Messrs. Barker's brewery, Huyton, near Liverpool; Messrs. C. Vaux and Son, Sunderland; Mr. E. Wells, Wallingford, where an abundant supply is obtained from the lower greensand formation; the Wantage Brewery Company (Limited), Wantage; Messrs. H. W. Carter and Co., Bristol; Messrs. R. White and Sons, Camberwell, at their Kingston-on-Thames works, and also at their Watford works. The following are a few of the works now in progress:—The Atlas Brewery Co. (Limited), Dewsbury; Mr. J. A. Chadwick, Wrexham; Mr. T. Kenward, Hartley-row, Winchfield, having reached the depth of 530ft. after passing 430ft. of the tertiary beds; the Pure Water Co. (Limited), Battersea; the Manchester Hotel, Aldersgate-street, E.C.; Messrs. A. M. Perkins and Sons (Limited), brewers' engineers, Regent-square, W.C.; the St. James's and Pall Mall Electric Light Co., Mason's-yard, Duke-street, W.; and at the Military Forts, Freshwater, Isle of Wight.

CARPENTRY AND JOINERY.—XXVIII.

FINISHING OF WINDOWS.

HAVING fixed the sash-frames, and fitted in and suspended the sashes, the finishing of the windows internally may be proceeded with, and as has been the usual custom in this series, taking the easy and elementary first, and going on from that to the difficult and better class of finishing.

The very simplest arrangement is that of nailing on a plasterer's stop on a solid frame with a plancier to form a rest for the side stops, they being mitred at the top. These stops should be fair with the outside of the frame, and in theory should be bevelled to form a key for the plasterer, but in practice this is seldom done.

Fig 193

1/2 Scale

Fig. 193 gives sections through stile and sill of frame in order to show the position of the plancier on the sill, and also of the stop on the stile and head; it has been stated that the stops are mitred at the juncture of stile and head-stops. The stops usually stand out 1/4 in., which is generally all that is allowed for plaster in cases where this very simple finish is adopted. Consider well even this primitive finish, as it contains the germ of (it may be stated) all further developed finishing for windows.

But this will be seen as we proceed. The plancier, be it observed, has its ends returned, showing the same projection behind the line of stops that it does in front of it. The stop is slightly developed when a simple kind of architrave is introduced instead of the stop, which consists of a band or strap, say from 2 1/2 in. upwards, chamfered at each edge as shown in Fig. 194.

Fig 194

1 Scale

In this illustration on the left side is seen the section of what has been just now described, and it will be obvious that this should be placed against the plaster, which would require the frame to stand out fair with the plaster, in which case this trimming would be put on after the plastering was done. The plancier would be put on first, the ends being returned (as in the first case) beyond the line of the chamfered band. The band would reach over unto the plaster a little way, so as to cover the joint between the plaster and the frame. On the right-hand is seen the method of joining at the upper corner, and take notice of the principle involved, as it often repeated. Instead of the mitre continuing through, it is only carried as far as the line of the internal chamfer, and the head is mitred to match, and the remainder forms a square butt with the upright piece. The chamfer is then wrought across the end grain of the upright or stile-piece. As work of this kind is usually painted, this is no objection, and it will be noticed a slight saving is effected in the length of the head, which occurring from a score to 1,000 times in one or a series of buildings, becomes very material. For kitchen and bedroom windows, a further advance occurs.

Examining Fig. 195, the sash-frame section is seen, and a moulding nailed on the inner casing to form an architrave, the moulding or bead of the batten-slip forming that of the architrave.

Notice that the square of the moulding forms a capping, and reaches into the brickwork nearly, and the plastering is finished close up against it. This style of finishing has a plancier for the moulding and capping to rest on, in fact the

Fig 195

1 1/2 Scale

capping is checked out, and is continued down to the under side of the plancier. The plancier has the nosing or rounding returned at the end, as in previous cases. The double line in the figure indicates the rounding or even chamfering of the plancier. The whole of this finishing is put on before the frames are taken from the bench, and these frames are built in, so that joiner work in such tenements may be described as a vanishing quantity.

Windows require to be blinded occasionally in order to shut out the light for various reasons, and

Fig 196

1 1/2 Scale

with the style of finishing shown in Fig. 195, very rough and ready arrangements are made for blinds (common sun-blinds). One method in use is to make two brackets to screw against the inner casings at the top, and the blind-roller is provided with long wire axles, which pass through holes in the brackets. Another method is to screw the little brass brackets supplied with the roller ends, against the pulley stiles in the space for the inner sash to slide in (this sash not being suspended), but, as will be found, this is only a shift at the best. A better method, and which is capable of many applications, will now be described.

On looking at Fig. 196, which gives only a

Fig 197

1 1/2 Scale

part section of pulley stile, it is seen that in the groove of the inner casing a jamb lining is inserted which should stand out 2 1/4 in. at least, so as to receive the blind roller ends, and also suffice to screw the brackets to for the support of the roller.

It will be seen by this plan the sun-blind or Venetian can fall perpendicularly, and on account

of the jamb lining being set back a little (say an inch) from the fair of the pulley stile, the blind is wide enough to prevent peepers from seeing into the room.

Now it will be obvious on account of the projection of the jamb lining and a double-faced architrave, which is the kind shown, either a window bottom must be adopted, or the architrave, &c., must continue to the floor. Both cases shall be dealt with. First, with a window bottom, the sill of the frame should have a groove for a tongue on the window bottom or board to pass into; this will help to bear the weight of the jamb linings, &c., and in the case of shrinkage will prevent an unsightly opening.

Fig. 197 shows a window bottom (board) with bed mould suitable for the finishing shown in Fig. 196. The window board and bed mould

Fig 198

1 1/2 Scale

should have their ends returned, as was stated in the simpler methods of finishing. To work the return it requires to be marked at the necessary length, and a piece of similar moulding is used for the purpose. Cut this piece 4 in. or 6 in. long, and scribe the ends of this piece so as to fit the moulding. This scribing is done by cutting with a saw in a cutting-box (as described for moulding doors), and when both ends have been so cut, one right and the other left hand, to the angle of 45°, the outline thus obtained is wrought to and at right angles to the back of the moulding. When this is done a scribe will be formed, which will exactly fit the bed mould. Place it on the bed mould, and, keeping to its extreme length (as it is supposed to be cut to the net length), mark and work the ends to this, and it will be right.

Fig. 198 shows a simple bed mould with window board, in order to show what is meant by returning the ends. The spectator is sup-

Fig 199

1 1/2 Scale

posed to be looking straight at it when in position. A very simple way with these returns, and which, in fact, in some kinds of hardwood must be done, is to mitre and glue on the returns. But, for painted work, this is not done, and a bed mould is usually outlined, so that it can be returned on the end grain.

In the case of the architraves continuing to the floor, a window back of some kind is required, sheeted or panelled; the jamb linings are continued to the floor also, and will be at least as broad as in the previous example (Fig. 196).

As sun-blinds are required, whether Venetian or other, the jamb lining requires to be of this width to suit them. The window-back will just fit in between the jamb linings for width, and its height, including a plancier capping upon it, will

reach to within, say,  $\frac{3}{4}$  in. of the batton slip on the sill of the sash-frame.

There is a *plinth* or skirting nailed against the back, similar to that around the room. The *capping* may either project beyond the face of the window-back or not, and the size of the panels of the back will be a matter of arrangement either to suit the width of boards or to match the door of the room, or suit the design of the furniture.

Fig. 199 gives a section in elevation of a window-back; a part of the front view is also shown, and it is hoped that the drawings will be readily understood. No attempt is made to show the jamb linings; these will be well understood by referring to Fig. 196, where also are seen two lines to indicate the window-back in plan. It will be readily understood that the height of a window-back will vary according to the height of the window-frame sill from the floor; and as windows are placed at different heights from the floor, according to the use the room is to be put to, the joiner will require to know the height from the floor of the room to the groove in the sash-frame sill before he can commence framing his window-back. He will, in addition, require to know the depth of skirting and the thickness of the capping; and for dimensions the other way, the distance between the jamb linings. It will be seen by reference to Fig. 196 that grounds or blocking is required in order to block out for the support of the jamb linings and architraves; there will be a ground nailed on the floor at each side, and as soon as the jamb linings are put up, and also the grounds, the back can be fitted in and nailed through the jamb linings, and then the remainder of the work can be proceeded with. The *lining* at the back of the architrave requires to be scribed to the plaster, and a small bead could be worked on it, to break the joint with the plaster.

#### ROYAL SCOTTISH ACADEMY.

[SECOND NOTICE.]

THERE are a few sea-pieces, but none of any outstanding interest or merit, and some very much the reverse. 331, "Making for the Harbour, Dunbar," by W. F. Vallance, is one among the best, where water and sky are excellently true. Animal studies are not very numerous, nor, with exception of one or two, of any importance. W. G. Steele has a number of vigorous pieces, of which 242, "Disturbed," is a very faithful portraiture of a mustard dandie. R. Alexander and J. Donovan Adam are both well represented.

In architectural pieces, P. W. Adam contributes some very interesting Italian sketches. 139, "Evening, near Venice," may be noticed as a curious picture, where the Bride of the Sea appears as a low white line on the horizon, with dark grey leaden sky and its reflections on the water, making up the greater part of the picture. It is not a very pleasing study, and one turns from it with satisfaction to his other somewhat panoramic view, "The Ducal Palace," which is bathed in the sunshine. The palace is not the only building, and its relation to other architectural surroundings is shown with great minuteness of detail, and apparently careful study of their relative positions. The colour is bright and warm on the building, and with the broken reflections on the water, it is perhaps a more faithful presentation of the subject than others which show more startling contrasts of local colouring. 165, "A Canal, Venice," is a gondola moored beside an old plain house; but it is an admirable piece of work as respects colour and movement of the boat, and its reflections on the water. 255, "Ponte Vecchio, Florence," is a very carefully drawn view of the old Mediceval bridge, with its many houses projecting from the sides. 447 and 462 are two curiously-framed canvases about 24 in. by 3 in. each, representing the view "looking up" and "looking down" Baxter's Close, one of the narrowest of the old wynds of Edinburgh. The perspective is more satisfactory in looking up than down. These pictures are by Mrs. Haycraft, and show a very masterly power of dealing with the various details which make up the visible parts of the close, and impress the spectator with a proper sense of the amenity of residences of ancient aristocracy of the city.

The water-colour section is large and of superior character, the pictures being moderate in size with a very few exceptions. One of the larger faces the visitor on entering, 629, a fancy

figure embowered in leaves of rather shadowy description, the only finished work being the hands and face. These, however, and the colouring and pose of the figure, show a masterly touch. 695, "Sunshine," a smaller but somewhat similar subject, is a highly-finished picture of the same ideal beauty by the same artist, E. A. Walton. 712, "The 92nd Gordon Highlanders Storming the Asmai Heights, Afghanistan," by W. S. Cumming, is an attractive picture with a number of figures in all attitudes, each a study of drawing and colour in itself. It is one of the larger pictures, and conveys a very vivid representation of the incident. Here a soldier finds himself wounded, another has fallen, and the Gordon tartan, very carefully painted, is making its way up a very precipitous incline. Every detail, and specially the foreground rocks and figures, are very natural. 686, "Run to Ground," is another large subject, by Thomas Scott. A fox-hunting scene, where the hounds and huntsmen are shown on the field, which is sharply and very effectively thrown into deep shadow, making a very sharp contrast with the landscape beyond, which is all ablaze with sunshine on hill and valley. 541, "The Harvest is Come," by R. Hume, is a very large picture, but with some good sky and tree painting; the field ripe for the harvest is but an indifferent rendering of the yellow corn. 558, "Autumn Morning," by Thos. Scott, is a very perfect work in every respect, representing a river and wooded bank in the clear sharp air of a bright morning sky, and very pretty touches of colour. Waller Paton contributes seven, all of the well-known characteristic aspect of his works. 701, "Braemar, from the Fife Arms," has more of the ordinary light—a very pleasant picture both in colour and composition. 670 is a view of "Castle Campbell" from the valley afar off, which may be contrasted with another "Castle Campbell" from a nearer point of view, by Agnes McArthur. This latter does better justice to both the castle and the landscape, and shows the richly-wooded Glen of the Ochills in its summer beauty. There are several Eastern studies by A. Melville, Thos. Scott, and others. 699, "Street Scene, Cairo," by W. Forrester, gives a good idea of the architectural detail and love of colouring, but the whole lacks warmth of tone.

To pass from the many water-colours to the architectural section. One of the most showy drawings is, somewhat in the Cairo style of colour decoration, 523, "View of the Main Entrance of the International Exhibition Building," now in course of erection. Three large semicircular, deeply-recessed, and lofty arches form the main features of the frontage, the central flanked by two slender towers with bands of red and white colour, and great expanse of glass. The *tout ensemble* is rather startling at first, and looks rather more gaudy than substantial. 526 gives a view of the offices, which is also fiery red, with brick-tiled roof, and in the English style of half-timbered construction.

Along with the architectural drawings there are a few excellent examples of etching by W. Hole and others. 436 "He is Coming," after Mavis, shows the lady in the foreground with head averted from the coming footfall of her lover, who appears in the avenue at her side. 432 is an etching, after Blaer, by F. Huth, jun. Both of these are remarkable for the clear and beautiful chiaroscuro. 480 "The Sawyers," by W. Hole, is a more important etching, with figures and landscape of more mellow tone than the work of F. Huth, which, however, could not be surpassed for the beauty of its work, the snowflakes falling thick around the figure of the lady. 439 "New Craighouse, Morningside," is a large drawing in black and white of the new asylum as seen from the north-east. It is a great undertaking, and will cost probably £70,000. The principal feature is a large and lofty square tower—which, however, is in the background and in shadow—relieving another somewhat lofty portion of the buildings at its side. Beyond this, west and east, but chiefly west, the main portions of the building extend. The style is chaste, and without any needless ornamentation, but with a little of the Queen Anne style of gabled decoration, which, in the eastern wing, is rather clumsily conspicuous, the ogee line having no projecting member to relieve it at the eaves line. The circular projections also are not improved by putting octagonal spirelet terminations as a crowning ornament on the top of their domes. The whole, if only from its size and situation, will make an important addition to the suburban

landscape. 475 comprises two interior views of the New Public Library, showing the details of entrances to juveniles' and news rooms. These are tastefully ornamented. 482 is a view of the exterior from George IV. Bridge, or rather a view of the turret built into the angle between the building and the staircase tower. 474 is the elevation of some offices and the Hope-street Arcade in Glasgow, built many years ago. The architecture is not on the outside, which is merely a monotonous arrangement of the ordinary windows and plain shop-fronts of a very substantial but ordinary street. 487 is a view of the New Stock Exchange, which looks better on the ground than as represented here. It is not much improved by the carved ornamentation, and the whole gives the impression of the unfinished structure which it really is. There are a number of large mansion houses among the more important drawings. 481, "Mansion for Allan Lane, Lanark," is illustrated on a large scale in three beautiful sepia etchings, giving different aspects of the edifice, which has the advantage of a very picturesque site, of which good use has been made. It is in the Scotch Baronial style, and forms a goodly pile. 427, "Meadow Croft, River Front," is a mansion on a smaller scale, with the principal rooms on the second floor, to which an outside staircase leads. This arrangement, by the contrast it provides with the more solid ground floor, has an excellent effect, though there seems little danger of any flooding from the river. 733, "Mauldslie Castle, Additions and Alterations"—this is a fine water-colour sketch of a very large and castellated mansion, in the English or Italian style, with large tower and lower buildings covering a great expanse of ground, with much variety of grouping and outline, but altogether different from the Baronial style and aspect of similar mansion houses in that style by the late D. Bryce, the architect of the original. The alterations have been made, whatever they may have been, with good effect as to the whole. 732 is an etching of "Pollok Castle Additions, and Restoration after being Burned in 1882." The main feature is the square keep or tower, with bartisans on one front, and a moderate equipment of corbelling and other features characteristic of the Scotch Baronial. Around it is a somewhat commonplace cluster of lower, crow-stepped, gabled buildings, and there has not been any attempt to evolve the picturesque in their arrangement.

Of churches building and to be built there are several in the South Room. Of these, the one most interesting to the general public is 429, the third and last edition of the design for improvement of the Old West Kirk. It is virtually a reconstruction, and to cost about £17,000. The view is from the north-east, and shows the building with new detail on the sides and east end. The style is the same as that of the old building, with a difference in being more elaborately decorated with Classical features of ornamental character. In addition, there is the suggestion of a transept and its pediment, two staircase towers at each eastern angle, and a slightly projecting apse. A correspondent of the BUILDING NEWS very lately discoursed, somewhat furiously and incoherently, on the Conservative instinct which desires to retain the church upon its present site, and so far as the sanitary objection is concerned, it may be safely assumed that not even a homoeopathic dose of phosphorus will ever enter the precincts of the church. His remarks on planting a costly architectural exterior in what is from all points of view a hole are better founded, and this last design is an improvement on its precursor, which was set aside as too expensive. But it is likely that a more simple treatment still would have sufficed. The church had excellent proportions in its height, and its defective aspect consisted in its want of length. The transept does not at all improve it in this respect, and this, with the elaborate architectural finishings of the towers, throw the balance of decorative detail far too much to one extremity of the edifice.

431, "First Design for the Crichton Memorial Chapel, Dumfries," is a highly-decorated Gothic building, apparently comprising a nave with ambulatory aisles, a western tower, an apsidal chancel, flying buttresses, pinnacles, &c. The tower has two lofty narrow lights, surmounted by some over-elaborated arched on the topmost stage, with octagonal lantern and spire above, which do not improve the tower. 438, "New Church, Craiglochart," is a pretty little village church with tracery in its windows and a tower

planted at the side at some distance from either end. It is illustrated by several etchings, of which the interior perspective is, it is to be hoped, no true representation of its aspect. The section of roof timbers shows no provision against stress, and is apparently out of all proportion to the space below. 488, "All Souls, Invergowrie," is a very effective water-colour drawing of a very pretty private chapel, with details of Decorated Gothic. The remaining subjects are of minor interest, architectural or otherwise, comprising parish halls, &c. 428, "New Commercial Bank, near Aberdeen," is a street-front executed with elaborate Perpendicular details. The sculpture is not noteworthy for any special work.

#### ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

**MANCHESTER ARCHITECTURAL ASSOCIATION.**—At the fortnightly meeting held on the 4th inst. a paper was read by Mr. T. Chadwick, A.R.I.B.A., the subject being a few recent notes in Holland and Belgium. The paper was illustrated by sketches made by Messrs. Chadwick, Col'ey, and Woodhouse during a tour in September last. The route taken was from Harwich to Rotterdam, Delft, Dordrecht, Malines, Brussels, Ghent, and Antwerp.

**THE EDINBURGH ARCHITECTURAL ASSOCIATION.**—A party consisting of from 70 to 80 members of this association visited, on Saturday afternoon, the University buildings of the Edinburgh University and the Edinburgh Free Library. At the University the visitors were received in the Senate Hall by Professor G. Baldwin Brown, who extended, on behalf of the Senatus, a cordial welcome to the Association. After inspecting the interesting collection of portraits contained in the hall, the party passed into the library, where Professor Brown sketched the history of the buildings, and exhibited the plans prepared by Robert Adam, and which were partially carried out before that architect's death. He also exhibited the drawings prepared by Playfair, who was entrusted with the work after Adam's decease, and indicated the deviations from the original designs which were, however, merely in detail, and not in spirit. The dome designed by Dr. Rowand Anderson, which now completes the building, was then referred to, and a visit paid to the museum it contains. The excursionists were admitted to the fine arts classroom, the natural history museum, and other places of interest. The party proceeded to the free public library, and were shown over the building by Mr. G. Washington Browne, the architect of the building.

**THE ROYAL SCOTTISH SOCIETY OF ARTS.**—At a meeting of this society, held on Friday in the hall, George-street, Edinburgh, Mr. D. M. Westland, M.I.C.E., vice-president, in the chair, a paper "On Lead, and its relation to the Science and Art of Architecture," was read by Mr. James Macdonal. He gave an account of the earliest uses of lead, and said it was during the middle ages that that metal began to assume the important character with regard to architecture which it still maintained. He pointed out the importance of a scientific knowledge of the properties of lead to plumbers, and proceeded to refer to what he termed the great want of a plumbers' laboratory in connection with technical classes in Edinburgh. Their system of teaching was not, he said, complete without provision being made for showing practical work. So much had that want been felt, that the governors of the Heriot-Watt College had granted funds for the fitting up of a plumbers' laboratory in that institution. It was to be hoped that their efforts in that direction would meet with the support they deserved. Classes where foremen and journeymen plumbers well advanced in the practical and theoretical knowledge of plumbing could become teachers would do immense good, and be largely taken advantage of by students and apprentice plumbers. The governors, however, had not the funds necessary for working the laboratory, and it was to be hoped that efforts would be made to meet that want by all parties interested in the building trades.

**SOUTH WALES ART SOCIETY.**—On Thursday evening, the 6th inst., a meeting of the South Wales Art Society and Sketching Club was held in the society's club-room at Cardiff. An address, practically illustrated, was given by Mr. Parker Hagarty, R.C.A., on "Rapid Sketching

in Oil-Colour." The club-room was crowded to its utmost capacity. Mr. Hagarty set himself to paint a picture from memory in oil in about one hour, and he chose a landscape subject from near Ross, in which the river Wye, some picturesque groups of trees, and distant hills were the chief features. He prefaced his work on the canvas with some very useful and practical information. A vote of thanks was proposed by Mr. T. H. Thomas, R.C.A., and seconded by Mr. E. Seward, R.C.A. A musical programme, carried out by members, succeeded.

**SUNDERLAND ARCHITECTURAL STUDENTS' ASSOCIATION.**—At the end of last year a few architectural students in Sunderland, with a view to the mutual advancement of themselves and other local students, called a meeting of students, and proposed the formation of an association. An excellent code of rules was drawn up and adopted, the co-operation of the local architects in practice was obtained, and the society was successfully inaugurated. The general meetings are held on alternate Fridays. At the first general meeting a paper on "The Study of Mechanics in their Relation to Architecture" was read by the President, Mr. Frank Caws, and, during the discussion which followed, it was arranged to have interim meetings for the study of the subject in detail, the president undertaking to conduct these interim classes on alternate Wednesdays, and give practical demonstrations on the blackboard. Considerable interest has been evinced by the students in this branch of their study, and encouraging classes are being held. At the following ordinary meetings papers have been read by Mr. H. Barnes on "The Use of Wood and Iron in Building," by Mr. F. J. Purvis on "Stone as a Building Material," and by Mr. T. R. Milburn on "Egyptian and Assyrian Architecture" have been read, the latter having been given on Friday last, while on the 21st inst. Mr. R. Cropton will speak on "Foundations." In addition to the classes for the study of mechanics, another class on alternate Wednesdays, meeting under the direction of Mr. W. Milburn, is engaged in the study of Grecian architecture. Mr. R. Elsey Smith, of London, has kindly lent the association a number of photographic slides taken by himself of Grecian buildings. At a meeting of this class the subject was divided into seven branches, and as many students each severally undertook to deal with the subject set against his name. The committee intend to further pursue this capital method of inducing all the students to share and take a lively interest in class-work, while sketching parties will be organised during the summer. The secretary is Mr. G. T. Brown, 17, Fawcett-street, Sunderland.

#### CHIPS.

The young woman who shot Major Isaacs, M.P., F.R.I.B.A., under circumstances which that architect has made sufficiently public, was acquitted by a Central Criminal Court jury on Tuesday of the charge of attempt to murder.

At the last meeting of the Trustees of Craddock Wells Charity, held at Cardiff, the resignation of Mr. Miles Aspinall, after seven years' service as surveyor to the charity, was accepted, he having received an appointment near Gloucester.

The North-Eastern Railway Company have appointed Mr. J. Wolfe Barry, M.Inst.C.E., London, as their consulting engineer.

A largely-attended and most successful smoking concert was held by the in- and out-door staff of Messrs. Perry and Co., builders, Bow, at the Great Hall, Winchester House, Old Broad-street, on Saturday last, the 8th inst., presided over by Mr. H. H. Bartlett. The vice-chair was occupied by Mr. T. Archer. The programme was well rendered, and included an interesting novelty in the shape of amateur minstrels, consisting of members of the staff.

A fire broke out on Sunday in premises at Brothock Bridge, Arbroath, occupied by Mr. A. S. Mathewson, painter, and Messrs. Carver and Symon, architects. The building is of two stories and attics, and belongs to Mr. Mathewson, who has his painting shop on the ground floor, the architects' office being on the floor above. The stock and paints in the painting shop, as well as the property in the architects' office, were destroyed; but the loss is covered by insurance.

A new art room has been added to the Lewisham Bridge Board School, and special attention has been paid to the ventilation, the latest improved form of Messrs. Robert Boyle and Son's patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

## Building Intelligence.

**WEST HARTLEPOOL.**—The schools which the West Hartlepool School Board have been erecting in Oxford-street are now completed. They comprise a mixed school for 360 boys and girls and infant school for 270. The former has an assembly hall 54ft. by 30ft.; five class-rooms, each 25ft. 6in. by 24ft.; master's room, 15ft. by 12ft.; and cloak-room, 30ft. by 20ft. The latter has infant school, 50ft. by 24ft.; two class-rooms, each 24ft. by 20ft.; marching hall, 44ft. by 14ft.; mistress's room, 15ft. by 12ft.; and cloak-room, 24ft. by 12ft. There is also a caretaker's house, with six rooms; and there are play-sheds and latrines, approached by covered ways to each department. The buildings are erected in brick, covered with slate, the wood-work being of pitch-pine varnished; the playgrounds are paved with compressed concrete flags. The total cost has been about £4,200, including caretaker's house, or about £6 a head for schools, after deducting the cost of such house. The design, selected in open competition, was that of Mr. J. P. Pritchett, of Darlington, who has carried out the work, with the assistance of Mr. Henderson, clerk of works; the contractor being Mr. Joseph Howe, of West Hartlepool.

**WEST WEMYSS.**—The memorial stone of a new church for the parish of Wemyss was laid on Friday by Lady Lilian Wemyss. The church is being built within the policies of Wemyss Castle, facing the main street of the village. It is cruciform and built in the Scottish Baronial style, the gables being crenellated. The exterior mason-work is of fine dressing, filled in with rubble work. In the nave are to be three-light windows, and red stone pillars support the arcades. The main gable contains a large rose window, which is to be filled in with tracery. In the chancel is a large three-light window, while the walls are to be panelled to the height of the arcades, the roof being open, showing the rafters. The floor is to be paved with wooden blocks, cathedral chairs instead of pews being provided for the worshippers, and the accommodation being for 600. The estimated cost of the church, not including the tower, is £1,600.

#### CHIPS.

The village of Heswall, Cheshire, is about to be sewered at an outlay of £4,600. The works will be carried out for the Wirral rural sanitary authority, from plans by Mr. C. H. Beloe, of Liverpool, and Messrs. Thomas and Co., of Liverpool, are the contractors.

Mr. Sam Timmins, F.S.A., of Birmingham, writes to the *Times* complaining that the rector of Stratford-on-Avon has decided to entirely close the chancel of his church, containing the memorial of Shakespeare, for three months, during the progress of a further section of the work of restoration now proceeding, and for which Messrs. Bodley and Garner are the architects, and Mr. Franklin the builder.

The death is announced of Mr. Frederic Campion, engineer for the southern division of the Midland Railway. The deceased, who was sixty-two years of age, had been connected with the Midland Company for over forty years. He took charge of the construction of the extension to London, including St. Pancras station.

A meeting of the National Sunday League was held on Wednesday evening in St. James's Hall, Mr. Lawson, M.P., in the chair, when, on the motion of Sir H. Roscoe, a resolution was passed in favour of opening the Museums and Art Galleries in London on Sundays, upon the condition that no officer shall be required to attend more than six days per week.

Prior to the commencement of morning service at Headingley Church on Sunday, the Bishop of Richmond dedicated the north porch, which has just been completed. This addition has been erected from the designs of Mr. J. L. Pearson, R.A., who was the architect for the church, by Messrs. Wilson and Sons, builders, the clerk of the works being Mr. E. T. Price.

We were unaware last week, when compiling our notice of the new Midland Station at Bradford, Yorks, that the "Broomhall" vitrified stoneware damp-proof and ventilating course was used in large quantities for this building—in the 1½in. thickness—supplied by the Broomhall Tile and Brick Co., of Queen Victoria-street, London, E.C.

The Burslem Corporation have appointed Mr. Fred Bettany as their engineer and surveyor, in place of Mr. P. J. Sheldon, who has obtained the Essex County Council appointment.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. FASSMORR EDWARDS.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 33fr. 30c.) To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

## NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII., XLVI., XLIX., L., LI., LIII., LVII., and LVIII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—B. and P.—C. and R.—W. R. S. A.—W. A. B.—C. B.—Co., Limited.

## Correspondence.

## THE ARCHITECTS' REGISTRATION BILL.

To the Editor of the BUILDING NEWS.

SIR,—The long letter from Mr. Parminster which you published last week was evidently that of a careful and thoughtful man, well acquainted with the architectural section of the Ecole des Beaux Arts, the working of which he describes. Unfortunately for himself, he does this so thoroughly as to show how greatly inferior is the result of the system of instruction in vogue there, even to what has been described as the want of system here. When a young architect has received his diploma, he is sent out to fight the battle of life as an architect with, as his weapons, the power of making an artistically-coloured drawing, and a purely academical knowledge of the "Five Orders." Old buildings he has never studied, and his work is lifeless; but, on paper, it is pretty, and that, he thinks, is enough! Of construction he knows nothing; yet who can design with real satisfaction unless his design be founded on his construction? Of materials, what knowledge he possesses is purely theoretical, and this, as all know, is most delusive. How, too, can he design with truth unless thoroughly acquainted with the properties of every material which he may employ? Of sanitation his knowledge is absolutely nil, and a similar cipher will denote the extent of his acquaintance with building law and general practice. In fact, he is an academical student, and not an architect. Thus Mr. Parminster's deduction is correct: to give to men trained in this way a monopoly to practise would be not only unwise, but criminal; it would be to give a monopoly to the incompetent to the exclusion of the competent.

In England we manage these things somewhat differently, and all that is needed is to regulate our want of system. Pupilage in the office of an

established man is a recognised institution here, and only requires to be made essential, and to point to certain definite and compulsory examinations, to lead to the best results. That this is the case has already been proved by the results of the R.I.B.A. examinations, and it is the extension of these examinations and of compulsory pupilage to all entering our profession, which the Bill now before Parliament would provide. A monopoly given to men trained thus would be most wise; it would be a monopoly to the competent to the exclusion of the incompetent, which anyone who made himself competent could enjoy. "In every case," to quote Mr. Parminster's words, but in the positive instead of the negative sense, "this would be a diploma given with the innumerable guarantees surrounding the medical profession—with its several examinations, its practice, organised and pursued, during a number of years."

On Wednesday next the "Architects' Registration Bill, 1890," is set down for second reading in the House of Commons. The support accorded to it is great, the opposition limited to that of the Council (I advisedly do not say the members, for their opinion has not been asked, though it soon will be, and may probably prove different from that of the Council) of the R.I.B.A. Yet, though the support is great, more is wanted, and I would ask all who read this and are favourable to the measure, as almost all your readers must be, to write to their local members—town and county—at once, asking them to vote in its favour, giving them the date of the second reading, a few concise arguments in its support. Do not let each man think that someone else will write and that he need not do so; but let all write, remembering that if a member receives five letters of the same tenour, he is more likely to attend to them than to one only. Also, if the Bill be not reached on the 19th inst., let every one repeat his effort every time that it is put down until it be discussed and passed.—I am, &c., G. A. T. MIDDLETON.

## THE BRICKS AT WOODFORD ASYLUM.

SIR,—It is the boast of Lord Rosebery, the chairman, that the London County Council have a passion for purity. The London County Council are at the present time having an asylum erected at Woodford. I should like to ask Lord Rosebery whether it is not a fact that the specification for the bricks says "London stock bricks"? Whether, instead of London stock bricks, bricks are not being sent from Peterborough? And whether the architect for the works at Woodford, under the London County Council, is not at the same time largely interested in the manufacture of Peterborough bricks?—I am, &c., ENQUIRER.

London, March 12th.

## BILSTON MARKET COMPETITION.—MORE DISCLOSURES.

SIR,—I think the outrageous way in which the above competition has been managed is a sufficient plea for the insertion of this letter.

As a consequence of my letter of complaint to the local press, a report of the meeting closed to the public (evidently gleaned from the minute book of the Bilston Commissioners) has been published in the Bilston paper, from which it appears at the conclusion of the reading of my letter, which elicited laughter, the clerk was instructed to acknowledge its receipt. The following resolution, proposed by Mr. Skemp, and seconded by Mr. Morrell, was then carried:—"That the board purchase the plans marked 2 by Messrs. B. Horton and Co., for roofing and works at the market for the sum of thirty guineas, they to supply for this sum, the further plans and sections, and working drawings necessary for executing the work, and full specifications of the works, bills of quantities, and of plans for the Local Government Board; to attend the inquiry of the Local Government Board in regard to the loan for the works, and to give evidence thereat."

The editor of the paper gives his opinion in a leading article, and says (with regard to the extension of time to one competitor only) "on the face of it, it really does seem unjust; but, after acquainting ourselves with the facts of the case," it was found it might have been worse!

Personally, I am heartily tired of the way in which competitions are conducted, and think it high time some definite action was taken in the matter. The thoughtless individuals who originated this particular competition should be

taught a lesson which would be beneficial, if not to themselves, at least to the gentlemen who have the management of competitions the kingdom through, a result which would be a "consummation devoutly to be wished."

Registration is doubtlessly desirable, and I sincerely trust the Bill may pass this session; but there is also needed some other kind of organisation which would put its foot down with firmness in cases like the one I have felt constrained to expose, and would say, "This is an injustice, and must be remedied."

Apologising for the length of my letter,—I am, &c., S. HENRY EACHUS.

Bank Buildings, Wolverhampton, March 12.

## ZINC CEILINGS.

SIR,—In reply to your correspondent "Inquisitive," we did execute the above at the Theatre Royal, Malta.

The ceiling was about 60ft. over all, and horse-shoe shape on plan. It was strongly made and very light, considering the size and general character of the design.

The work was very handsome and full of ornamentation; it was fixed with long iron bolts to main ribs of ceiling.

We did this some few years ago, so that it has been thoroughly tested and found to answer its purpose admirably, besides being a great improvement on the ordinary run of ornamental ceilings.

We shall be happy to give "Inquisitive," or any other of your readers, any further information about this or any other ornamental zinc or copper work of any description that they may require.—We are, &c., HOLDEN AND CO.

5, Wood-street, Westminster, S.W., London. March 13.

## CHIPS.

The council of the Surveyors' Institution have decided to give a prize to the value of £10, out of the interest arising from the Crawter bequest, to the candidate doing the best work in the field on Monday, the 24th inst., provided he obtains not less than 75 per cent. of the marks allotted to this branch of the surveying and levelling examination.

Christ Church, Clacton-on-Sea, is being enlarged at a cost of £500. Mr. N. Demaine, of Colchester, is the builder.

The Bridges and Roads Committee of the Kent County Council met at Maidstone on Wednesday week, and appointed the following five assistant county surveyors:—Mr. A. Dryland, borough surveyor at Deal; Mr. F. H. Phillips, of Cardiff, Mr. F. G. Maxted, of Willesborough, Ashford; Mr. W. Forrester, of Brackley, Northamptonshire; and Mr. A. F. Ginn, of Chelmsford.

The Bishop of Carlisle has fixed Thursday, April 24, for the opening of the restored parish church, Workington, which was destroyed by fire on 17th January, 1887. That building was rebuilt in 1770.

The Aberdeen Harbour Commissioners have resolved to use hydraulic power for the opening of the lock gates and bridges, at an estimated cost of £1,350; and they also agreed to make an extension of their fish wharf southwards for a distance of 200ft., at a cost of £1,600.

The parish church of Lewannick, Cornwall, which was greatly damaged by fire a few months since, is about to be restored from plans by Mr. O. B. Peter, of Launceston.

The notices issued by the Kentish brickmakers to close their works in consequence of the dispute with their bargemen came into operation on Friday. The notices have affected several thousand hands.

A meeting of the Munster district council was held on Friday at Cork at the mayor's office, Mr. J. Constantine, and subsequently Mr. Arthur Hill, in the chair. Also present:—Mr. B. C. Galvin, G. Browne, M. O'Brien, J. M'Kay, L. J. Philpott, and James Good, hon. sec. Letters were read from Mr. Coles, Worshipful Company of Plumbers. With reference to the educational branch of the movement, it was decided to forward them to the various city architects. Applications for registration were received and dealt with by the Registration Committee. A meeting of the By-law Committee was subsequently held, and several rules for the regulation of the movement were considered and adopted.

The tender of Mr. Alfred Groves, builder, of Milton-under-Wychwood, has been accepted for restoring the nave of Bourton-on-the-Water Church, and erecting a new south porch. The work will be commenced after Easter. Mr. T. G. Jackson, M.A., London, is the architect.

# Intercommunication.

## QUESTIONS.

[10247.]—**Speaking Tubes.**—Can anyone give me information as to the conduct of sound in speaking-tubes? Are there any rules regulating size for various distances, and how great a length may the tubes be in order that communication may be successful? Any information will be thankfully received. This is "the second time of asking."—Geo. B.

[10248.]—**Warming Apparatus.**—I have found that in severe weather the usual low-pressure system of warming buildings is not sufficient, and I shall be glad to hear if any of your readers have ever used the high-pressure apparatus in hospital buildings, either alone or as an auxiliary to other systems.—COMFORT.

## REPLIES.

[10234.]—**Radius of Arch.**—A slight correction is necessary in the formula given by "J. C. H. S." in last week's replies. The formula should be—

$$\frac{(\frac{1}{2}S)^2}{R} + R$$

It is the square of half the span which has to be divided by the rise. The formula previously given implied that it was half the square of the span—two very different quantities.—Geo. B.

[10234.]—**Radius of Arch.**—"Clerk of Works" can obtain the radius of an arch when the span and rise only are given by the following process:—Divide the sum of

the square of the rise plus the square of half the span by twice the rise. For example: Suppose AC in sketch to be 4ft., and BD 20ft. Then—

$$AE = \frac{AC^2 + BC^2}{2AC}$$

$$AE = \frac{4^2 + 10^2}{8}$$

$$\therefore AE = 14'5''.$$

This can be obtained trigonometrically, first by formula

$$\tan. BAC = \frac{BC}{AC} = \frac{10}{4} = 2'5.$$

Whence— $\angle BAC = 68^\circ 11' 55''$ .

Then by formula— $BE = AC \cdot \sec.^2 BAC$

$$BE = \frac{4 \times 2'692583^2}{2}$$

$$\therefore BE = 14'5.$$

—F. E. GAY, Bath.

[10234.]—**Radius of Arch.**—The formula for finding the radius of an arch is as follows:—

$$\frac{(\frac{1}{2} \text{ chord of arc})^2}{\text{versed sine}} + \text{versed sine} = \text{diam.}$$

$$\frac{1}{2} \text{ diam.} = \text{radius.}$$

This may be stated in words as:—Divide the square of half the chord by the versed sine (or vertical height); to the quotient add the versed sine, and the sum will be the diameter of circle. Example: Take the span as being 20ft., and the rise 5ft. To find radius of circle—

$$20 \div 2 = 10.$$

$$\frac{10 \times 10}{5} + 5 = \frac{100}{5} + 5 = 20 + 5 = 25\text{ft.}$$

$$25 \div 2 = 12\text{ft. 6in. radius.}$$

This same result may be arrived at geometrically as under.

—CHARLES BARKER, Surveyor.

[10234.]—**Radius of Arch.**—The rule to find diameter is—Divide the sum of the squares of half the chord and versed sine by the versed sine or rise, and the quotient is the diameter. Thus, if the span (or chord) of an arch be 6ft. and the rise (versed sine) 2ft., the diameter will be  $6\frac{1}{2}$ ft., half of which will be the radius.—G. H. G.

[10241.]—**Sundial.**—Perhaps a better method than compass variation would be to choose a starlight night, put two rods in the ground to the northward of the site

of the dial, attach a crosspiece to them, and from the crosspiece hang a plumb-line; then at a reasonable distance to the southward of the site hang another in a similar manner. Range the two lines with the North Star, and then stretch a third line horizontally from one to the other. This should give the Polar meridian, and will be more reliable than allowance for compass variation. If the dial is fixed on a pillar, the plate must be carefully levelled, and the angle formed by the edge of the gnomon must accord with the latitude of the place.—F. SMITH.

## LEGAL INTELLIGENCE.

IMPORTANT TO BUILDERS AND LOCAL AUTHORITIES.

—Messrs. John Grover and Son, of Wilton Works, New North-road, were summoned at the Highgate Petty Sessions in respect of an alleged breach of the by-laws of the Hornsey Local Board. Mr. Ricketts, solicitor, appeared for the board. From Mr. Ricketts' statement it appeared that the offence alleged by the board against Messrs. Grover was that they had not fitted trapped gully and grating at a house erected by them in Spencer-road, Hornsey, as was required by the board's 66th by-law. Under the 98th by-law the penalty for the offence was £5 with 40s. per day for each day of the continuation of the default after written notice had been given. Mr. Ricketts then proceeded to read a mass of correspondence on this matter that had passed between the complainants and the defendants. Mr. George Poole, building inspector to the Hornsey Local Board, said that at the building in question there were two traps to which he took exception; the one received the sink water and the other that from the lavatory. Notice had been given to Mr. Grover in the usual way. The receiver provided was simply a siphon trap, whereas the by-law required that it should be a trapped and grated gully, such as that produced. (The witness here produced a good-sized square gully, having a coarse grating and a moderately deep well, the outlet from which was a 4in. siphon trapped pipe. The defendant also produced a fellow receiver to those complained of. It consisted of an exactly similar siphon trapped pipe, set in a cement cube and a crown or head-piece, consisting of a separate block with a deep sink-like cavity, in which was a fine grating. It was explained that the upper block was cemented to the lower, so that when fixed in position it formed one entire block.) In cross-examination, Mr. Poole said Mr. Grover's trap was a trap only; but he subsequently admitted that it was also a gully to some extent. Mr. T. DeCourcy Meade, surveyor to the Hornsey Local Board, described Mr. Grover's appliance as a trap pure and simple, and as being so described in trade lists; he argued that to simply bend a pipe was not to form a gully. As to the contention that the fixing of the upper block formed a trapped and grated gully, he could not admit that this was so; he maintained that it did not come within the meaning of the by-laws. The tenant of the house was called to prove that the present receiver frequently overflowed. For the defendant it was contended that his appliance was more perfect and far preferable to the model produced by the board, and that as the by-law did not define the pattern, but simply required a trapped and grated gully, it had been absolutely complied with. The Bench inspected both samples, and one of the magistrates, Mr. Horsley, while admitting that Mr. Grover's gully might overflow more quickly than the other, said he considered it the better of the two; he had one like that produced by the board, and it often overflowed and required cleaning. Mr. Hyams (Emanuel and Simmonds), who appeared for the defendants, said the complainants had sought to put in a Doulton's list to prove that Mr. Grover's appliance was described as a trap; that very list gave an illustration of an exactly similar thing, which described it as being what the witnesses had just sworn it was not. Mr. S. Knight, F.R.I.B.A., architect, surveyor, &c., was called for the defence, and explained at length his reasons for considering Mr. Grover's gully the better of the two samples produced. After a lengthy hearing, the Bench decided to dismiss the summons and allow the defendant five guineas costs.

IN RE C. KILLINGBACK.—In this case the debtor, a contractor at Camden Town and Lee, has filed a statement of his affairs, which gives liabilities at £21,587, of which £10,311 are expected to rank, with assets £2,891. The Official Receiver states that the debtor commenced business twenty years ago with a capital of about £150; he attributes his failure to an estimated loss of £6,500 in respect of a contract entered into in January, 1889, for the construction of sewers at Lee. The Official Receiver states that his books are of an incomplete and imperfect character, and not such as sufficiently disclose the results of his trading or his financial position at any time. The Official Receiver adds that the greater part of the indebtedness appears to have been contracted within the last 12 months.

The name of George Priestley, of Manchester, surveyor, appears in Friday's list of adjudications in bankruptcy.

# Our Office Table.

THE Society for the Preservation of Ancient Monuments in Egypt will hold a meeting this (Friday) afternoon, at 5 p.m. at Oxford Mansions, W., to consider what steps can be taken to prevent the wanton mutilation of Egyptian monuments. The excision of portions of the well-known fresco paintings in the tomb of the Colossus on a sledge, dating from the Twelfth Dynasty, or between 2,000 and 3,000 years B.C., at Der-el-Barsha, the chipping out of cartouches of different Sovereigns from the Sixth Dynasty tombs at the same place, the mutilation of tombs at Beni Hassan, and the malicious removal of curious bas-reliefs of Tel-el-Armana are very recent acts of vandalism, of which the society proposes to take notice in order that a public expression of their indignation may be duly forwarded to the proper quarters. The mischief done at Beni Hassan has already been the subject of a question in the House of Commons, but it appears that, as usual, the Government have not any "official information" on the matter. Supported by representations from the society, it is hoped that the Foreign Office will be enabled to concert measures for the future security of the ancient monuments of Egypt.

NEXT Thursday, 20th of March, at the City and Guilds of London Central Institute, Exhibition-road, South Kensington, Mr. Harvey will explain a new method of covering the crossing of two semicircular barrel-vaults of unequal spans. This method gives a more elegant solution of the problem than any used till now, and will find its application in this year's R.I.B.A. Masonry Competition. All old pupils of the class of masonry, and others interested in the subject, are invited to attend.

THE lecture by Mr. James Orrock, the well-known landscape artist, collector, and connoisseur, on the claims of the British School of Art to a thorough representation in the National Gallery, given at the Society of Arts on Tuesday evening, gives expression to a popular grievance that the successive directors of our National collection have devoted too much space to Italian and Early Flemish ecclesiastical art, to the neglect of our own artists of all periods. This preference for foreign work has, as Mr. Orrock showed, not only resulted in national loss, but has done much to encourage foreigners in their declarations that the English not only have "no school," but are without taste or perception in artistic matters. Owing to noble gifts by private collectors, the Gallery is happily rich in examples of a few of our greatest men, of Hogarth, Reynolds, Turner, Constable, and Landseer; but the danger now to be dreaded is that the rapid and enormous rise of late years in the market value of English pictures and the threatened competition of American and Australian collectors, will soon make prices prohibitive. We possess but one slight example of Cotman, not a single example of David Cox's work in art, nothing of James Holland, only one specimen of William Müller; our only De Wints are at South Kensington; and we have no important example of R. P. Bonington. In regard to water-colours, "the Cinderella among the Arts," our treatment is still worse. Turner's "Liber Studiorum," and his hundreds of drawings in water-colours, are relegated to the cellars of the National Gallery, while Cox, De Wint, Fielding, Barrett, Holland, and Cotman are entirely unrepresented.

THE munificent offer of Mr. Henry Tate, of Streatham, to present to the National Gallery the cream of his splendid collection of modern pictures, places the trustees in an awkward dilemma, as Mr. Tate is understood to have stipulated that they shall accept all or none. The proffered gift has an estimated money value of £90,000, and includes some sixty works, all by British artists, among them being Millais's "Vale of Rest," "North-West Passage," and "The Knight Errant"; "Home with the Tide," and two others, by J. C. Hook; Orchardson's "First Dance," "Her Mother's Voice," and "The Tiff"; Waller's "Success"; two pictures by Alma Tadema, two by Jas. Gow, two Linnells, H. W. B. Davis's "Mare and Foal," and examples by J. Crome and Constable, P. Graham, Waterhouse, Frank Bramley ("Saved"), Boughton, and Lady Butler. Hitherto no works by living artists have been

accepted for the National Gallery, and the same salutary rule exists at the National Portrait Gallery, and while Mr. Tate's collection contains no works of dubious merit such as some of those in the Wynn-Ellis bequest, the Trustees naturally hesitate before closing with the offer, and thus creating a precedent which might, at a future time, place them in an ambiguous position.

"THE REVIVAL OF APPLIED ARTS" was the title of a lecture delivered before the members of the Leeds and Yorkshire Architectural Society, in the Law Institute, Leeds, on Monday evening, by Mr. Mervyn Macartney. Of the revival of applied art in England, said the lecturer, there was certainly no doubt so far as painting, sculpture, and architecture were concerned. Larger fortunes were made in those arts now in this country than ever before. But that did not necessarily show that the various arts were in a more flourishing condition than formerly. Painting was, or had been up to quite a recent date, very prosperous, as regarded material prosperity. That success was, to some extent, owing to State patronage, and to artists producing what was eminently adapted to the wants of the present. The revival in sculpture was due largely to the same cause. Relatively sculptors had reached the highest average of excellence; and that, too, in spite of their being followers almost to a man of the classic school, and not the popular realism of the Italians. As to architecture, he believed that there were never so many real architects as at the present day. He dwelt upon the relation of those arts to applied art, and referred to the dependence of the decorative crafts on architecture. People had found out that there was often more beauty in the thousand and one objects of every-day use than in the paintings that adorned their walls or the statues that graced the hall. The lecturer suggested that his hearers should form an art guild in connection with their society, and explained the aims and methods of similar societies of which he is a member.

MR. ALAN BRENNER, a member of the well-known firm of Messrs. D. and T. Stephenson, civil engineers, Edinburgh, died suddenly on Wednesday week, aged 63 years. Educated at the High School of Edinburgh, Mr. Brenner, before beginning his studies as a civil engineer, served a regular apprenticeship as a mason, and this gave him a thorough knowledge of building construction. In early life Mr. Brenner had considerable experience in railway construction, and afterwards was engaged by Thomas Stephenson as resident engineer at various harbour and lighthouse undertakings. Since 1854, Mr. Brenner has been connected with the design and execution of many important river, harbour, lighthouse, and other engineering works. He devoted special attention also to matters connected with lighthouse engineering, and among the lighthouse apparatus which he devised is the "optical projector," by means of which the prisms for lighthouses can be laid down in about half the time formerly required in protracting them. One of the last pieces of business Mr. Brenner was engaged in, with the other members of the firm, was the important suggested project of connecting the east and west coasts of Scotland by a ship canal.

DR. W. SIPPLICH, late Inspector-General of Forests to the Government of India, read an interesting paper on "Forestry in the Colonies and in India," before the Royal Colonial Institute on Tuesday evening. The direct usefulness of forests, he said, in so far as they yielded timber or other produce, represented capital, and provided labour, depended upon many things, such as the means of communication in a country, and with other countries, the quantity and quality of substitutes for forest produce available in the country, especially iron and coal, the value of land and labour, and the returns which land yielded if used for other purposes, the density of population, and the amount of capital available for investment. The British Empire, although it was so frequently represented as possessing more extensive forests than any other nation, paid every year something like £12,000,000 to foreign countries for timber alone. As under existing circumstances the imports of timber into the Empire would increase rather than decrease, there were reasons why State interference was more called for in the case of forestry than in most other branches of industry.

The Mayor of Sheffield on Saturday evening presided over a well-attended public meeting

held at the Firth College, Sheffield, for the purpose of discussing the National System of Registration and Training of Plumbers. The Mayor, who was supported by the Master Cutler and Archdeacon Blakeney, said that the movement for the Registration and Technical Education of Plumbers had his warmest support in the interest of the public health. The Master Cutler, in moving a formal resolution approving the system and the appointment of a district council to carry it out in the locality, referred to the affinity between the constitution and objects of the Plumbers' Company and the Cutlers' Company. It gave him great satisfaction to find that the Plumbers' Company were engaged in carrying out a work which entitled them to the gratitude of the whole community. Mr. Lockwood, Chairman of the Borough Hospitals Committee, having seconded the resolution, it was carried unanimously, and a district council elected, including the following, as representatives of the public:—The Mayor, the Master Cutler, Alderman Sir Henry Stephenson, Councillors Jackson and Merritt, Professors Hicks and Ripper, and Doctors Thompson and Sorby.

THE forty-first annual report of the Prudential Assurance Company (Limited), states that the large and rapidly increasing amount of the funds of the company has led the directors to the determination that in future the balance-sheet shall be subjected to an independent professional audit. For this purpose they engaged the services of Messrs. Deloitte, Dever, Griffiths, and Co., whose certificate is appended to the accounts. During the year ending Dec. 31st, 1889, the total assets of the company were raised from £9,302,007 to £10,946,156, being an increase of £1,644,149. In the Industrial Branch the premiums received were £3,336,742, the claims amounting to £1,285,409. There were 150,557 deaths, and the number of policies in force was 8,518,619. In the Ordinary Branch 43,792 new policies were issued, bringing the number in force to 177,208. The new policies assure the sum of £4,433,834, and produce a new premium income of £253,483. The premiums received during the year show an increase of £186,067 over 1888, the amount being £904,915. The year's claims in this branch amounted to £213,262.

#### MEETINGS FOR THE ENSUING WEEK.

- MONDAY.—Royal Institute of British Architects, 8 p.m. Society of Arts. "Considerations concerning Colour and Colouring," by Prof. A. H. Church, F.R.S. 8 p.m. Liverpool Architectural Society. Miscellaneous papers by members. 7 p.m. Leeds and Yorkshire Architectural Society. "The Work and Writings of Henry Aldrich," by Paul Waterhouse, M.A. 8 p.m. Institution of Civil Engineers. "Lough Erne Drainage," by James Price. 8 p.m. Society of Arts. "Brazil," by Jas. Wells. 8 p.m. Manchester Architectural Association. Paper by W. E. Potts.
- TUESDAY.—Institution of Civil Engineers. Students' Visit to the Richmond Main Sewerage Works. Meet at Kew Gardens Station, 1.30 p.m. Civil and Mechanical Engineers' Society. "Gold-mining in Merionethshire," by H. C. Paxton. 7 p.m. Carpenters' Hall Free Lectures. "The Construction of Walls," by Prof. W. C. Unwin, F.R.S. 8 p.m. Society of Arts. "Commercial Geography," by J. S. Keltie. 8 p.m.
- THURSDAY.—Architectural Association, Lyric Club. 7.30 p.m. Edinburgh Architectural Association. "Electric Lighting of Interiors," by Prof. F. Grant Ogilvie, M.A., B.Sc. 8 p.m.
- FRIDAY.—Royal Institution. "Electro-Magnetic Radiation," by Prof. G. F. Fitzgerald. 9 p.m. Sunderland Architectural Students' Association. "Stone as a Building Material," by F. Purvis. 7.30 p.m.

### Trade News.

#### WAGES MOVEMENTS.

KILMARNOCK.—The joiners of Kilmarnock went on strike on Monday, in consequence of the masters' refusal to grant an increase of a halfpenny per hour in wages, and a reduction of three working hours per week.

Holloway's Pills completely cleanse the blood, expel all oppressive accumulations from the bowels, and purify both solids and fluids. With the blood perfect, and all poisons purged from the system, regularity must prevail throughout the body, aches and pains must cease, healthful energy must supplant weariness, and the sickly nerves must regain their wholesome tone.

### BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

### GEO. FARMILOE & SONS,

Lead, Glass, Oil, Colour, and Varnish Merchants.

ALL LETTERS TO OFFICES AND WAREHOUSES:—

34, ST. JOHN STREET, WEST SMITHFIELD, LONDON, E.C.

Lead Works: Island Lead Mills, E. Sanitary Appliances and Plumbers' Brass Work Factory: Eagle Court, Clerkenwell, E.C. Stained Glass Works: 109, St. Martin's-lane, W.C. Wharf: Queen's Wharf, Wapping Wall, E.

**DOULTING FREESTONE.**  
**THE CHELYNCH STONE.**—The Stone from these Quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

**THE BRAMBLEDITCH STONE** is of the same crystalline nature as the Chelynych Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

### HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material. Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—

**THE HAM HILL STONE COMPANY,**  
NORTON, STOKES-UNDER-HAM, SOMERSET.  
London Agent:—  
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

**Faraday & Son's**  
**ELECTRIC LIGHT FITTINGS**  
3 Berners Street London W.

### ELECTRIC LIGHTING.

**COMPLETE INSTALLATIONS**  
**OR WIRING ONLY} ESTIMATES**  
GIVEN.

**STRODE & CO.** 42, Osnaburgh-st., N.W., and 67, St. Paul's Churchyard, E.C. LONDON.  
New Branch Showrooms:—188, PICCADILLY, W.  
Telephone No. 3958.

**WM. OLIVER & SONS,**  
MAHOGANY, WAINSCOT, WALNUT,  
TEAK, VENEER, and FANCYWOOD  
MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.  
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

#### TENDERS.

\* Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BECCLES.—For residence, Beccles. Mr. F. E. Banham, M.S.A., Beccles, architect:—  
Allen, F. J. ... .. £1,100 0 0

CLAPHAM.—For the construction of a new road and sewer on the Old Park Avenue Estate, Nightingale-lane, S.W. Messrs. N. S. Joseph and Smith, 45, Finsbury-pavement, E.C., architects:—  
Bottom, L., Wandsworth Common £722 0 0  
Mayo, R., and Co., Brixton ... .. 560 0 0

COLCHESTER.—For laying new drain to infirmary, for the Colchester Board of Guardians. Mr. J. W. Start, F.S.I., Cups Chambers, Colchester, architect:—  
Dupont, F. ... .. £79 0 0  
Cook, H. ... .. 77 0 0  
Mackenzie, D., Clacton ... .. 71 10 0  
Farran, G. ... .. 70 0 0  
Ward, T. J. ... .. 70 0 0  
Chambers, W. A. (accepted) ... .. 69 15 0  
Bowles, G. ... .. 69 13 6  
Rest of Colchester.

FAZAKERLEY, LANCs.—For the supply of a turret clock with bell at the Cottage Houses, for the West Derby board of guardians. Mr. C. H. Lancaster, Liverpool, architect:—  
Byrne, J., Liverpool (accepted).

### BUILDING ACCOMMODATION AND FLOOR SPACE.

A GOOD deal of guesswork naturally belongs to the domain of the architect. He has to prepare designs with very little to guide him, save in the way of models and such information as he can pick up from his clients, whether in their capacity as committees or individuals. The models within his reach are few, and when he finds them the particulars they give are not likely to be those he wants; his clients only furnish him with general and often unreliable data. When he sees a building that has cost a certain amount and accommodates a certain number, a useful idea may be furnished as to cost per individual; but it will be only of service to him under similar conditions to his own. That is to say, if he is commissioned to build a church in a certain locality—say in London—it would be of little use to him to obtain data of an edifice of similar size built in Yorkshire or Cornwall, where the materials and cost of labour are so different. In some parts of Yorkshire or Cornwall a church to hold, say, 1,000 worshippers would not cost more than half the amount necessary to build one in London of the same size, or even less than half; so that the bases or criteria of comparison do not hold. How useless, then, to quote a price per head or by the foot cube for buildings when the material and labour do not bear comparison!

One of the principal kinds of data of value to the architect is that relating to areas assigned for accommodation. As in every place people are of the same average size and stature, the area per person north of the Tweed will be the same as everywhere else; like a unit of measurement, it cannot alter; so the information once obtained for every kind of building is of fixed and permanent value. Yet, strange to say, no writer on architectural or building science has, to our knowledge, ever regarded the capacity or accommodation of a building with the attention it deserves. They have treated the question whether a given room or building should accommodate a hundred or two hundred persons more or less, as a matter of indifference. The architect seldom troubles to inquire, when he is planning his dining or drawing-room, or concert-room, about the number of persons that under exceptional circumstances will be accommodated therein; if it is as large as an ordinary reception-room or concert-hall it is enough, and if a few more score of people can be squeezed into it on an emergency, it matters very little. A room or hall perhaps 80ft. by 40ft., will accommodate 500 seats, though another 100 or more may be got into it. Or nearly double that number can be accommodated standing in the same area. Which of these numbers is really intended is one of the questions left to the architect to decide at his discretion. At any rate, it is only fair that he should know whether the room is to be provided for standing, as a crowded meeting, or for seating only a certain number. He can then give his room the dimensions required. The indeterminateness of these data is what one finds very often in competitions for public buildings. One competitor assumes a standing area, another a seating area, the consequence is that very different sizes are given for the same room. In either case the calculation must be more or less of guesswork, unless a given unit of area per person be stated. It ought to be fixed how many square

feet of flooring per head should be allowed for standing room, and how many for sitting room, and these are limits that can be easily determined by experiment. If we allow 2ft. 6in. or 3ft. area for standing per person, and 5ft. the sitting area, taking the usual dimensions for church seats as a guide, some definite rule might be followed, but of course a room may be packed, and a considerable addition made to the number accommodated.

A schedule of area, to be perfect, ought to give the minimum space for each individual in each class of building. These classes, roughly stated, may be said to embrace—(1) public meeting-rooms, such as those crowded to hear political addresses; (2) concert-rooms and theatres set apart for amusement; (3) churches and places of public worship. In each case a separate unit of area for every person may be allowed. Thus, for the first class of accommodation the minimum might be fixed at 2ft. 6in. superficial per person standing, exclusive of passageways, and 3ft. for seating; for concert rooms and theatres, not less than 3ft. superficial for standing, and 4ft. 6in. superficial for seating per person; and for churches and chapels a minimum of 5ft. superficial per person for seating. Taking the sizes usually recommended for theatres, 18in. is generally allowed for each person in length of seat, and a minimum distance between backs of 2ft. in the pit and gallery, and in the better parts of the theatre an area of not less than 30in. by 20in. For standing room 3ft. superficial is the minimum recommended, and these dimensions substantially agree with the figures we have suggested above.

Other units of area are required, about which authorities are silent. We allude to the accommodation necessary in schools, in picture-galleries, museums and reading-rooms, in public offices, committee-rooms, and council-chambers. Even in our private drawing and dining-rooms we can fix a limit to number, beyond which the room becomes unpleasantly close and uncomfortable to visitors. What superficial area per person should be allowed in each of these buildings is a question that can and should be determined. Not till it is settled can any rule be applied by the architect in calculating the areas required in any of these cases. The Committee of Council on Education have stated certain dimensions for schoolrooms, the length of desks and benches, and these are followed by architects in the design of schools. Quite as precise are the regulations of the School Board for London. The number of children taught by a certificated teacher and one pupil teacher is limited to sixty; the principal schoolroom is to be large enough to allow 80cu.ft. of space per child. Sizes of dual desk are given at 3ft. 4in. long, and gangways 1ft. 4in. are recommended. For infant-schools a superficial area of 8ft. to each child is provided. A certain number (40) is allowed for a class-room. For senior schools the seat accommodation is the leading guide, which gives roughly 10sq.ft. of floor space per child. One authority on school hygiene says there should be not less than 15sq.ft. of floor area per pupil in each class-room; each pupil should have 25 to 30cu.ft. of fresh air per minute. The space allowed for reading-rooms and public offices might with advantage be calculated on similar data, as readers and students as well as clerks have to remain for a considerable time in one room; though we are not aware of any reading-room having been planned upon any unit of floor area per reader, nor of any public office or council chamber regulated by any such considerations. We have often noticed the oppressive closeness and heat in council-chambers or vestry-halls when filled with its full quantum of members and a few visitors, though architects in planning these apartments seldom take into consideration the amount of floor area or cubic space to be allowed for a fully-attended board meeting.

No definite or maximum number of persons are stated, so that the room is often designed too small for the requirements of the borough or parish, and without any reference to growing requirements.

In some buildings the number of persons at any given time cannot be easily estimated; that is to say, during certain days or seasons the rooms may be almost empty, at other times crowded. Picture-galleries, museums, and some structures destined for recreation and amusements are of this description; the stream of visitors is ever moving—never remaining for any length of time in one place. These conditions render it more difficult to assign any areas as to the galleries. The available wall space for pictures will enable the designer to determine with some degree of approximation the maximum number of persons that ought to be accommodated added to those who pass through the galleries as passage rooms. The proper inspection of the pictures and the freedom of access necessary in passing in and out require, therefore, a somewhat larger unit of standing area per person than is necessary in a hall where people congregate and remain stationary. In a museum the maximum number of visitors should be regulated by the groups or cases, room being required to enable the objects in each case to be examined with convenience and comfort; and probably the same area of floor space to every person, as in a picture-gallery, would be sufficient. 10ft. to 15ft. superficial area to each person that can be accommodated would be the minimum allowance. Even the rooms of a private house, such as the dining-room or drawing-room, ought to be regulated in the dimensions; the larger the house, the greater ought to be the space allowed for guests. The dining-room, for example, should be designed with some reference to the dining-table, and the number of guests that can be conveniently seated round it, in addition to the areas occupied by furniture, the side-board, and the passage of those who wait at table.

It may be said that the architect ought not to be hampered by these considerations; that the number of persons admitted must always be adjusted by the space at command. The argument is plausible, and may be in some degree true, as far as private rooms go; but for public buildings, as those we have been discussing, it is necessary to design with reference to the number of persons that are likely to frequent or occupy the building. It is unjust to the architect to complain of the dimensions of a room after it is built, when he had to design his building according to the means at disposal, and without the slightest idea as to the number of persons it was intended to accommodate. We often hear, for example, complaints made about crowded and uncomfortable lecture-halls, club-rooms, and even churches, as if it were the fault of the architect; but it will be found that in several cases the building is made to do duty for nearly twice the accommodation it was intended to provide for. The maximum number of persons, or the least area of floor space per person, is a condition of building called for, not only on hygienic grounds, but also on those of safety. If we pack our churches and theatres with hundreds more people than they ought to comfortably hold, we must be prepared for those serious risks to life and limb that are constantly being brought to our notice during the panic caused by fire or the fall of a gallery. In concluding these observations we may also say that the study of requirements by the architect ought to be more complete than it usually is. Accommodation depends in a great measure on the skilful regulation and arrangement of seats and benches, cases and fittings, wall space, planning of entrances, and other details. How often we find wasteful arrangements of corridors and lobbies occupying positions

and areas that make it impossible to utilise to the full extent the available area at disposal.

#### PARTY-WALL REBUILDING.

A RECENT action for trespass for interfering with a neighbour's wall, tried in the Queen's Bench Division the other day, is of interest to those who contemplate erecting new premises, or raising their buildings in the Metropolis. The action was for trespass on the part of the defendant in cutting into the plaintiff's wall and building a house against and upon it. The facts were that the plaintiff, some five or six years ago, gave the usual statutory notice to the defendant that he intended to pull down and rebuild the party-wall between them. He thereupon pulled down the wall and rebuilt it, partly on his own and partly on the defendant's land, to a greater height than before. In the following year the defendant followed his example. After the usual notice, he pulled down his house, and rebuilt it to a greater height than before, and for that purpose cut into and used the external wall which the plaintiff had built. As half the wall was on the land of the defendant, he naturally concluded that it was a party-wall; but this contention the plaintiff disputed, he alleging that the wall so built into and upon was an external wall, and that, therefore, the defendant could not make use of it without paying for the portion of the wall cut into and used. Mr. Justice Matthews gave judgment for the defendant, saying that he could not find any grounds of the defendant's liability. The sections referred to by the earlier statutes of 14 George IV. c. 78, and 7 and 8 Vict. cap. 84, had been repealed, and, under the present Building Act, the only liability was that incurred by the building owner on the requisition of the adjoining owner, the latter being liable for all such expenses.

The facts of the case, apart from the legal points involved, are worthy of note. A., after giving notice, pulls down the party-wall (not a defective one) between his own house and that of B., and rebuilds his house higher than it was before—an operation which is common enough in London and all large towns. Such a wall is acknowledged to be a party-wall, each side having a moiety, and each of the owners having a remedy for any injury done to the portion of the wall standing on his own side. As a matter of common right, B. naturally expects his moiety of the wall to be rebuilt at A.'s expense. A. is obliged to carry the wall up to the roof of his house, and some portion of it overtops B.'s house. B., probably not liking to be overshadowed, raises his house to the same height, and in so doing makes use of the upper portion of the wall on his own land erected by A. Has A. any right to require B. to pay for the use of his moiety? Certainly not: it is unreasonable to expect B. to pay for his own half of the wall rebuilt by A. for his own convenience. After submitting to the inconvenience of one's party-wall being taken down and rebuilt, to be told that you cannot raise your house to the same height, unless you pay your neighbour for the portion built against, is rather a singular notion of justice, that would have accorded with that of the friend of Plato in his celebrated dialogue in the "Republic." But there are individuals who have not yet learned the ethics of party-walls or even party-fences. They imagine if for their own convenience they take down and rebuild, their neighbours have no right to the moiety on their own land after that event. In the case we have cited the plaintiff contended that the wall above the defendant's house was an "external" wall, and not a party-wall, and upon this ground the argument of the plaintiff chiefly rested. His counsel

argued that the wall, so far as it did not separate buildings, was an external wall; that part of 3 of the Metropolitan Building Act did not apply in the absence of a notice by the defendant specifying the wall cut into; that a wall might be a party-wall for some of its height, and above that the property of the adjoining owner—a dictum laid down by James L. J. in "Weston v. Arnold." But it seems unreasonable to make this distinction between a party and an external wall in the present case, for A., when raising the wall the whole thickness above B.'s roof, does so for his own benefit, to prevent the upper story of his house becoming damp. And B. has certainly the right to use the half built on his own land. The argument used by the judge in "Weston v. Arnold" does not support the contention of plaintiff A. In that case there was a wall which was the separate and undisputed property of the plaintiff (Weston), standing on his premises, and, therefore, he had a right to the use of windows in it, which was the contention in that case. Therefore, the reference made by counsel in the recently-tried action does not apply, for in his case the wall for its whole height was half on one neighbour's land and half on the other's, whereas in "Weston v. Arnold" the wall claimed as belonging to plaintiff was his separate property. Furthermore, he had windows in it for which he had acquired a right, and, therefore, it was unreasonable to suppose that his neighbour had a right to raise his building so as to darken those windows.

We have only been discussing the question on the principles of plain reason; under statutory enactments it ought to be clearer still, and the 84th and 93rd sections of the Building Act provide that whenever a building owner proposes to rebuild any party structure, the adjoining owner may require him to build certain chimney jambs, breasts, or flues, or piers for his convenience, and such costs incurred can be charged to the adjoining owner. The question of what is a party, and what a separate or external wall, does not occur in the bulk of the cases in the Metropolis. The third section of the Act, which defines the word "party-wall" as one "used or built in order to be used as a separation of any building from any other with a view to the same being occupied by different persons," clearly defines the term as one not of title or ownership, but of user. The public interests are considered primarily, not that of private owners, so that if the wall is decayed or faulty in construction it may be rebuilt as a separation between the two premises. The right of the owners is therefore limited. Were it otherwise, all kinds of vexatious objections would be made by building and adjoining owners, based on rights of ownership. But parties to litigation do not, or will not, see the intention of the Legislature, and hence the actions that are continually being brought into court, and which absorb a great deal of the time of the courts. When we have a court of appeal for building cases arising out of the requirements of the Building Act in the Metropolis, there will probably be fewer disputes of this kind to settle.

#### CONSTRUCTIONAL DETAILS OF THE LATE PARIS EXHIBITION.

By BANISTER FLETCHER, JUN., A.R.I.B.A.

##### [INTRODUCTORY.]

I DO not propose to say much as an introduction to this report, but rather to leave the report to speak for itself. One of the great lessons that the Exposition teaches is, in my opinion, that iron can be one of the most precious aids to modern architecture. It may be as well to point out here the three ways in which iron has been used in the Exposition. (1) Engineering ironwork, if one may so call it—that is, ironwork in which no attempt at ornamentation is made in the parts

composing the structure, the decoration being applied "après coup," or as an afterthought, and the Tour Eiffel has been pointed out as belonging to this class. (2) Ironwork in which the decoration is worked in the composition itself of the structure, by means of the members forming the structure. The example of this is the Palais des Machines, by M. Dutert, architect, which gained the prize of 100,000 francs. The Palais is a most original and successful building, the decoration being simply worked into the general design by the juxtaposition of voids and solids, as will be seen in the railing to the first-floor gallery, and in other parts: none of the ironwork is in any way concealed, the columns to the galleries being formed of plate and angle-iron, and the caps formed in a very original way. (3) The third way is in the application of a combination of iron and a second substance, such as terracotta, glazed faience, &c., which fits into the iron framework and forms a background. An example, of which there are several, of this, are the two palaces by M. Formigé—viz., the Palais des Beaux-Arts, and Palais des Arts Libéraux. The other methods of construction will be found under their different heads. It only remains for me now to perform a pleasing duty—viz., to thank those gentlemen who have been good enough, by introductions and indications, to help me in the somewhat large undertaking of reporting on this Exposition. And, firstly, I am indebted to Mr. Arthur Cates (V.P.R.I.B.A.), the founder of the prize, for his generosity in doing so, and also for most valuable introductions to M. César Daly and M. Marcel Daly; to Mr. Phené Spiers, F.S.A., I am also indebted for introductions to Parisian architects; and also to Mr. W. H. White (secretary, R.I.B.A.), and to Mr. John Hebb (F.R.I.B.A.); to the foreign architects I should especially mention M. César Daly and M. Marcel Daly, his son, to both of whom I owe an extreme debt of gratitude for the many kindnesses they showed to me in giving hints about the Exposition and in various other ways; to M. Dutert, the distinguished architect of probably the most original building in the Exposition (I refer to the "Palais des Machines") I am extremely indebted for the kindly way he explained his building, and also for a monograph on his work which he presented to me; to M. Formigé, the architect to the two Arts Palaces, I am also indebted for similar information on these two buildings; to M. Bouvard, and principally to his "premier inspecteur," M. Ulysse Gravigny, for diagrams and photographs, &c., of his chef-d'œuvre, the Dôme and Palais des Expositions diverses, I am also obliged, and to the following architects:—M. Bousard, architect to the General Post Office, Paris, and also the "Pavillon des Postes et Télégraphes at the Exposition," for photographs, &c.; M. Foulhoux, architect of the Annam and Tonkin Pavilion for drawings; to M. Ballu, the architect of the Argentine Pavilion, which gained the first prize for the foreign pavilions, for a complete set of plans, the large-scale sections and elevations of this building, and of his other building at the Exposition, the Algerian Palace; to M. Louis Dauvergne (Expert to the Prefecture of the Seine), architect of the Brazil Pavilion, for various information; to M. Hermant, the architect of the Portuguese Pavilion, for similar services; also to M. Contamin, the chief engineer of the Exposition, who very kindly went very fully into their construction, and authorised his "premier inspecteur," M. Grosclaude, to accompany me over the principal iron constructions in the Exposition; to M. Fouquiau, the architect of the Bolivia Pavilion; to M. E. Viollet-le-Duc, fils, for information as to the formation by his father of the celebrated Museum of Comparative Sculpture, and for various pamphlets concerning its foundation; to M. Yvon, for notes, &c., on his building, which contains the "Panorama du Tout Paris," and various others of the French architects for the various buildings in the Exposition. I should like to place on record the kindly way in which I was everywhere greeted as a *confrère*, and the great trouble and inconvenience which so many of the French architects put themselves to, in order to render me service. I should also mention that Mr. Purdon Clarke, C.I.E., F.R.I.B.A., was good enough to send some illustrations, which are embodied in the report, of his Indian Pavilion, for which I was extremely obliged to him. From the following professional papers I have derived much information—namely, *Le*

Science Civil, L'Architecture, and Engineering; and one of the illustrations have been taken from their pages, and will in each case be acknowledged.

The "Palais des Machines" is probably the most important work in the Exposition, and is the largest building ever roofed in a single span. Before proceeding to consider the building in detail, it may be as well to give the result of interviews, which I had with the architect (M. Dutert) and the engineer (M. Contamin). The roof of the hall, which rests on the solid ground, is constructed in wrought iron in ordinary sections (fer de commerce or fers courants) of T, angle, bar iron, and sheet iron; this was necessitated by the time at the architect's disposal, and also by the cost. The ironwork is painted yellow. M. Dutert, after explaining the trouble he had with the executive to get them to build a structure which was entirely different to anything that had been done before, and which therefore was opposed by the more timid section of the committee, touched upon the fact that he had prepared a design for completely clothing with stone-work bases, the bottoms of the great trusses where they meet the ground, in case he found that this small resting-point for the great trusses caused a feeling of insecurity to the public; but, since he found that the public rather liked, than otherwise, the non-concealment of the construction, he had determined to let it remain exposed. With regard to its being built in iron, it was on account of the expense that it was so built, instead of in steel as primarily intended. The stages which he design went through before the final one was adopted was very similar to that which often takes place in England—viz., with small beginnings. M. Contamin, in a long conversation, gave me these different phases. First of all it was proposed to cover the hall in several spans; but as this would have interfered considerably with the machinery, it was finally abandoned. An elliptically-formed roof was then designed by Monsieur Dutert, having raked ends at its two extremities; but this form, besides being more expensive, was considerably more difficult to calculate for the strains. Finally, a pointed arch, which practically takes somewhat the outline of a Tudor arch, springing from the ground was adopted, and the raked gable ends were done away with, because the engineers foresaw difficulty in their construction. The pointed arch form with an articulation at the centre, made the calculations comparatively easy, because it defined exactly where the strains were to come through. It will be best to study this building under different heads, and to commence with the plan. The plan (No. 1, from "Engineering") consists of one large nave, 1,380ft. long, and of 20 great principals, having a clear span of 375ft., and a height to the ridge of 141ft. 10in. Running along each side are galleries in two heights, of a width of 57ft. 6in. (These galleries continue round the inside of the gable ends.) The 20 principals divide the building into 19 great bays, the two end ones of which are 83ft. 2in. wide, the central one, in consequence of the great entrance vestibule, is 86ft. 7in. wide, and the remaining 60 bays are 70ft. 6in. wide. There is a semicircular staircase at the Avenue de Suffren end, and two straight staircases at the Avenue de la Bourdonnais end, which give access to the gallery on the first floor, access to which is also obtained by the staircase under the dome of the vestibule which connects the machinery hall with the 30-metre gallery. *The Foundations.*—The method of forming the foundations to the huge trusses is singularly instructive. They are formed of blocks of masonry in Portland cement (cement is mixed in the following proportions—one-third of cement to two-thirds of sand), entirely isolated one from another, and coming under the trusses which they are destined to support. Each of these foundations is able to resist a vertical load of 412,000 kilogrammes, or 405 tons 13cwt., and a horizontal thrust of 115,000 kilogrammes, or 113 tons. This is the weight put upon them by the trusses, and also takes into account the amount of pressure allowed for wind and snow (110lb. for snow and 266lb. for wind per square yard). The soil on which the foundations are laid is, generally speaking, bad, in consequence of the numerous excavations which have been made for former exhibitions. The builders were continually coming across old masses of concrete, drains, &c., remnants of former expositions, and to make matters worse, 660ft. by 196ft. of sand had been excavated in 1878 solely for the purposes

## THE MACHINERY HALL.

of building. Borings were made to discover what sort of a foundation there was, and the different borings revealed the following state of the ground on which trusses were to be laid, and which is shown in the section No. 2:—(1) A bed of filling varying 1ft. 9in. to 22ft., which was, of course, no good as a foundation; (2) a gravel bed varying in thickness from 22ft. 6in. to 1ft. 9in.; it was upon this bed that the lower masonry foundations were put; (3) a strata of clay 24ft. 6in.; a sheet of water 10in. thick was found deposited on the top of this bed; (4) a bed of quartz sand 4ft. 6in. thick; (5) another bed of clay 27ft. 6in. deep; (6) a bed of chalk varying in thickness from 65ft. The lower bed of masonry was therefore placed as shown in the section, on the first bed of gravel, or in case this was found to be not thick enough, piles were driven in just above this bed, and according to the difference of the thickness of this gravel bed, different descriptions of piling were used, and the section given above was the one which was used where the bed of sand was reduced to 1ft. 8in. The following is the description:—Twenty-eight piles 13in. diameter (fir wood from Jura), and about 30ft. long, were lowered by the aid of a steam hammer until they reached the quartz sand. On the upper ends of these piles, projecting 2ft. 7in. above the upper bed of sand, was placed a bed of Portland cement concrete (composed of cement mortar in the proportion of 1 of cement to 2 of sand, and the concrete composed of this same mortar and pebbles in the proportion of 2 parts of the mortar to 3 of the pebbles) about 37ft. by 27ft. by 6ft. thick; upon this concrete was placed a bed of hard stone, varying according to the depth of the foundation. Above this bed is placed the pier, formed of a rectangular block of walling 23ft. by 11ft. 6in. by 10ft. high, in which are buried, as it were, the bolts which hold in position the cast-iron shoe, on which the principals rest in position. The resistance to the earth in this case is about 3½lb. to 155sq.in. Ten piers out of the forty are constructed out of this type. When, as in the case of five of the piers, the gravel bed had a thickness of 4ft. 9in., a bed of concrete 36ft. by 19ft. 6in., and a thickness of 4ft. 4in. was put on this and the piles suppressed. The 25 remaining foundations were found to have a bed of virgin soil more than 9ft. 6in. thick; on this was placed a bed of concrete 2ft. 6in. thick, stretching about 10in. beyond the upper block of masonry all round. This upper block of masonry, 23ft. by 11ft. 6in. by 10ft. high, as shown in the section, is the same in all the piers, and receives the cast-iron shoe of the great trusses. In this last type, the pressure on the earth is 3 kilogrammes to the square centimetre (6½lb. to 155sq.in.) By again referring to the section, it will be seen that the excavations are made with sloping sides. This was done to avoid more excavation than was necessary, and also in the case of the pile-driving was necessary to prevent the earth falling in, in consequence of the shaking which took place during the driving of the piles. The size of these excavations can be understood when I say that they contained from 1,300 cubic yards to 1,560 cubic yards. The piles were driven diagonally in five lines, and were made out of fir from Jura. Care was taken that the heads of these timbers, on which the monkey descended, should be the base of the tree, just above the roots, as this part of the tree

was found to have less splitting tendency than any other part. They were bound round with hoop-iron at the top, and shod at the bottom with points in hardened iron. The hammering was stopped when the pile sank only 39in. (or about a little under ½in.) for every ten blows of the monkey weighing 23½cwt. It was found that trying to drive the piles deeper than this caused them to split. It took three days to complete one excavation—i.e., to sink 28 piles. A layer of sand 12in. thick was then placed between the heads of the piles, and on this was placed the bed

of concrete, which contained a cube of 131m. (170 square yards), while the cube of the masonry above averaged 163 square yards. The rods holding the shoe on which the principals rested in position, were inclosed and built up in the masonry as the work proceeded, the exact position of these being determined by a framework of timber to the required position; and in order that the position of the cast-iron shoe could be varied somewhat in fixing, the iron rods holding down the shoe were inclosed in the masonry, just above the lower bolting, in cast-iron pipes for 1ft. 8in. of their height, and then by stoneware pipes up to the level of the top of the piers, where they were bolted to the cast-iron shoe. This allowed sufficient play for the fixing. The side galleries have their foundations formed by sinkings of concrete connected by arches in stonework. (The size of these piers varies according

to the nature of the soil.) The foundations to these side galleries are not built with Portland cement, as are those to the main piers, but in hydraulic lime from Beffes, mixed in the following proportions—two of lime to five of sand. I have thought this outline description would be interesting, because there were many real difficulties to contend with, in that the ground had been very much disturbed in former exhibition times, and therefore especial care had to be taken in forming the foundations. The excavation, pile-driving (to the ten excavations which required it), and building of the foundations to the level of the shoe to take the principals were performed in six months.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A GENERAL meeting of the Institute was held on Monday evening, Mr. Arthur Cates, vice-president, in the chair.

#### THE INSTITUTE AND ARCHITECTS' REGISTRATION.

The following memorial was read by the Secretary, who mentioned that it was received without any accompanying letter:—

TO THE COUNCIL OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

GENTLEMEN,—We, the undersigned, being of opinion that it would be of advantage to the profession and the public also, if all hereafter seeking to practise as architects were compelled by statute to pass a similar examination or examinations to those recently established by the Institute with such signal success, desire to test, at as early a date as possible, the opinion of the whole body of professional members of this Institute.

We, therefore, send this recommendation under By-law 60 for a special general meeting to be held to consider the subject, and to propose the following resolutions:—

1. That at as early a date as possible statutory powers should be sought to establish, as in all other professions, a system of compulsory examinations to be held by the Institute, and to be extended to all architects hereafter entering the profession, whether as members of the Institute or not.

2. That when such compulsory examination comes into force, the position of all existing architects shall be completely respected.

Whether these be carried or not, we desire, under By-law 62—or, if that Rule not be operative, then by resolution—to propose:—

That a poll be taken by voting papers in order that, under any circumstances, the opinion of the entire body of professional members may be ascertained.

We have the honour to be, Gentlemen,

Your obedient servants,

GEO. GORDON HOSKINS, Fellow.  
ARTHUR B. PLUMMER, Fellow.  
EDWARD NEWBOLD, Fellow.  
THOMAS TILTMAN, Fellow.  
JOHN TILTMAN, F.R.I.B.A.  
EDWARD J. HANSON, Fellow.  
J. H. MORTON, Fellow.  
HUGH ROUMIEU GOUGH, Fellow.  
JOHN WREGHITT CONNOR, Fellow.  
CHARLES ROBERT CHORLEY, Fellow.  
STEPHEN ERNEST SMITH, Fellow.  
JOHN TWEEDALE, Fellow.  
SIDNEY GEORGE GOSS, Associate.  
W. H. HARRISON, Fellow.  
W. GILBEE SCOTT, Associate.  
OSWALD CANE WYLLSON, Fellow.  
CHARLES LONG, Associate.  
JAMES W. FRAZER, Associate.  
G. A. T. MIDDLETON, Associate.  
J. WILLIAM STEVENS, Associate.  
EDWIN SEWARD, Associate.

The CHAIRMAN stated that a special business meeting of members would be convened for that day fortnight, Monday, March 31st, to consider this memorial, and also the proposal that the Institute purchase the premises in which they meet, No. 9, Conduit-street, W.

#### BRICK BUILDINGS IN NORTH GERMANY.

Mr. ALFRED STRONG, Fellow, read a paper descriptive of the use of moulded and glazed bricks in North Germany. It was illustrated by a collection of ninety-nine drawings and eleven photographs, all to large scale, and all representing a series of twenty buildings, designed by Professor Otzen, of Berlin. Fifteen of these designs have been executed, and the others are either in course of construction or in contemplation. Among the completed ones were the Church of the Holy Cross at Berlin, which has cost £30,750, and is executed in red brickwork, with brown, green, and yellow glazing, and roof with glazed tiles, the upper part of dome being in yellow glaze; St. Gertrude's Church at Hamburg, executed in 1881-5, at a cost of £20,000, also in red brickwork, with stone dressings and glazed bricks: the spires are of stone, and the interior is plastered, with sgraffito and fresco; St. John's Church at Altona, where the red brickwork is carried inside and without, green and glazed bricks being used externally, and rich painting on coloured stone within. It was built in

1868-73, and cost £18,000. Other large red-brick churches were shown at Plagwitz, near Leipsic (cost £15,500); Eimsbüttel, near Hamburg (of similar cost); St. Jacob's, Kiel; the Mountain, Wiesbaden; St. Peter's, Altona; a design for a Lutheran Church at Berlin to cost £24,000, and also working drawings of Professor Otzen's private residence, a villa faced with red brickwork, interspersed with yellow glazed bricks and glazed tiles. Mr. Strong also showed some enlargements of his own sketches of old brickwork in Lübeck and other towns, showing the mode in which the effect was gained by rendering the ground between the moulded bricks, and the patterns were obtained by the use of a few moulds repeated. Stone is, and always was, Mr. Strong explained, a luxury in the North of Germany, and the architecture of the districts far away from the quarries of Saxon Switzerland and the Hartz Mountains is naturally developed out of the material readiest to hand. That, in the Late Gothic straining after effect, the limits of sound construction were often passed could not be denied—as, for instance, at St. Mary's, Lübeck, where brick mullions about 6in. wide were carried up to 60ft. or more, apparently only kept in their place by the saddle-bars to which the lead lights were attached. Still, in spite of these drawbacks, there were many examples of good work scattered up and down the North of Germany, and the student might, with advantage, examine both the ecclesiastical and the secular buildings from Hanover to well up the Baltic, and from its shores southward and westward. Professor Otzen's works showed, the lecturer thought, that he had carefully and exhaustively studied the works of his ancestors, as also the manner in which he had followed in their steps. Mr. Otzen was the first German architect to revive the free use of ornamental bricks in church architecture, and, the lecturer remarked, his first church in this style made sensation in 1880, architects being struck with the rich effect, not dark and gloomy, but rich and warm, which the use of well-blended colours and judicious glaze here and there produced; the example thus set had since found a certain amount of following, chiefly in the old Hanse Towns, where a limited use of moulded and coloured and glazed bricks had been made in warehouses and private buildings, adding life and interest to what otherwise appear somewhat prosaic compositions. Mr. Strong concluded by quoting the following remarks from a paper read before the Institute in November, 1873, by Mr. J. Tavenor Perry:—"I trust you will see that there are many points of excellence to be noted in these buildings, erected as they are of materials so similar to those at our own command, and that English architects may learn something from the Mediaeval brickwork of" the North of Germany.

Mr. HUGH McLACHLAN, in seconding the vote of thanks, which was proposed by Mr. CHARLES FOWLER, remarked that his own impression of Prof. Otzen's use of colour in brickwork was that it was too intense for English susceptibilities. In their use of terra cotta, the Germans employed a fineness of detail and brilliance of effect of which we had no idea.

Mr. J. M. BRYDON supported the vote of thanks, observing that the use of brickwork had awakened an immense deal of attention of recent years in this country. His impression of Herr Otzen's churches had been that the colours were very glaring, and the treatment was hardly Gothic to our eyes. For his own part he did not think that the specimens of Prof. Otzen's work on the walls could be compared with that executed by William Butterfield five-and-twenty years ago. He thought the use of colour upon brickwork was going the wrong way to work, and he thought ornaments upon bricks should be cut after they were burnt rather than be introduced as mouldings. There was one church in Hamburg, of the 17th century, in which the brickwork was cut, and the effect was more refined and reliable than the older moulded treatment in the churches of the same district, for those earlier mouldings were never true. As to the scheme of colour employed by Prof. Otzen, he felt that the greens were very strong, not to say crude, and he thought we had gone far beyond North Germany in any works of the kind.

Colonel LENNOX PRENDERGAST proposed a vote of thanks to Professor Otzen for lending so interesting and complete a series of illustrations. Owing to the labour movement, and the consequent increased cost of working stone, the use of

brick was, he remarked, becoming more general, while the expense and difficulty of carriage was being lessened, and the machinery and appliances for brickmaking were being developed and improved.

Mr. WILLIAM WHITE, F.S.A., seconded the motion, remarking that a definite and progressive style was apparent in the long series of drawings exhibited that evening. At the same time, he thought English architects had given a more correct treatment to brickwork than anything he had seen in North Germany. The subject divided itself into moulded arch and the finer cutting of bricks already burnt, and he had found that many clients preferred the more precise lines given by cut brickwork more pleasing than the irregular effects of moulded work. In the use of moulded brickwork, there were great practical difficulties arising from the different extent of shrinkage in large and small bricks.

Mr. ASTON WEBB said the use of brick was essentially an English question, for alike in the Tudor, the Elizabethan, and Queen Anne periods English brickwork was equal to anything that could be seen elsewhere.

Mr. BLASHILL having referred to the bond used in German brickwork, Mr. STRONG briefly acknowledged the vote of thanks.

#### THE GALILEE OF DURHAM CATHEDRAL.

Mr. WILLIAM WHITE, F.S.A., read a paper on the "Galilee of Durham Cathedral," which, he said, was a perfectly unique structure. The name of the Galilee was as well known as the cathedral, but not so its true meaning, or the purposes for which it was originally erected and used. The several and diverse traditions respecting it were not only at variance with each other, but no one of them accounted for certain architectural features found in it, or for its name. In many instances it had been called the Galilee porch, the Galilee chapel, or the Lady-chapel. The prevailing idea was that it had been built for a chapel; but the author considered that view untenable. Having given quotations from Canon Greenwell's history of the cathedral, and Davies's History, referring considerably to Hugo Pudsey's connection with the cathedral, the late Joseph Gwilt's opinion was alluded to, as was also a paper by Longstaffe, in the *Transactions* of the Archaeological Society of Durham. The alleged separation of the Galilee from the church for the first 200 years militated against the idea of its being recognised as a Lady-chapel. The word Galilee, which signified "Circuit," was originally applied to the circuit of the country around Kedesh Nathali, occupied chiefly by strangers, and Mr. White considered that the Galilee at Durham took its rise from that association of ideas and circumstances, it being the Court for causes extra-ecclesiastical. He believed Pudsey built the Galilee as a court external to the cathedral, though in contiguity to it, to serve not only as his Palatine court, but also for his regal court of justice. Although there existed in England several so-called Galilee porches, there was but one besides Durham, that at Ely; and Ely had also been the See of a Prince Bishop also Chief Justiciary. The recess within the great central portal of the Galilee at Durham was the prominent feature, architecturally, which first led the author to the opinion that the Galilee was erected as a court. The arch was of Pudsey's date, and its treatment such as was consistent with forming a recess for a tribune. The central division of the reredos was left with its rough plaster uncoloured to receive a dorsal hanging or canopied seat, which was not the treatment of an altar reredos at that period. Traces of similar treatment in the church of Old St. James at Dover were rendered visible 12 or 14 years ago; but they have since been covered with compositum and completely obliterated. The term Galilee had been applied in several instances to a building attached on the west of a cathedral, as at Lincoln and Peterborough, and at the New Chapel, Windsor, and St. Stephen's, Westminster. In several village churches in England there was at the west end a porch or small chamber external to the church which had by some been called a Galilee. These he considered might likewise have been built for the purposes of a court, as the manorial courts to which submission was made and fealties paid by the tenants must have required some recognised public place. As examples were mentioned: Melton Mowbray Church; Snettisham, Norfolk; Wigginton, Bucks; and Croyland Abbey. At Chuny and Vézelay it was very probable the 13th-

century tribune was for some such purpose as had been indicated at Durham. Whatever differences of opinion might exist as to the origin and uses of the Durham Galilee, all would agree that there was yet enough interest about it, both archaeologically and architecturally, to justify a record of its history.

Mr. BLASHILL proposed a vote of thanks to Mr. White for his paper, but could not concur in the conclusions at which he had arrived. He believed that originally a small chapel was built at the east end of Durham Cathedral, as in other cathedral churches, for the service of the Virgin Mary, and that as the service grew increasingly popular in the 12th century, especially amongst women, it was not found large enough nor sufficiently accessible, and, therefore, the chapel was added at the west end. This Galilee was therefore first a Lady-chapel, and while it might for convenience have been used as a consistory court, he did not think it was used for other purposes. He confessed he could not explain the meaning of the name "Galilee" for such an adjunct, but he believed this would account for the similar position of chapels of nearly the same date at Glastonbury and Ely, while at Worcester provision was made in the 13th century to gain access to the Lady-chapel by proceeding along the north gallery. The north transept at St. James's, Dover, evidently was not built as a court for the lord wardens, and was only so used by them in comparatively modern times.

Mr. WILSON seconded the motion, which was carried by acclamation, and was acknowledged by Mr. White.

#### CONTEMPORARY BRITISH ARCHITECTS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THIS assemblage of portraits represents some eight architects who have filled the position of President to the Architectural Association, including the present occupant of the chair. The sheet is the eighth of our series.

Mr. Leonard Aloysius Scott Stokes, A.R.I.B.A., was a pupil of Mr. S. J. Nicholl in 1874, and was born in 1858. In 1880 he was Pugin student, and two years later he obtained a silver medal in the Soane Medallion competition. For some year or more Mr. Stokes assisted Mr. T. Gandy, the well-known surveyor, after which Mr. G. E. Street, R.A., employed him as clerk of the works at Christ Church, Dublin, and he was then engaged for a time in this architect's office in London. Mr. Stokes has carried out the following works:—The Church of the Sacred Heart, Exeter (with Mr. C. E. Ware, M.I.C.E., as joint-architect); St. Joseph's Church, Maidenhead; schools at Woolston, near Southampton, and at Lynton; additions to Weyburn and Royal, both houses near Godalming; presbytery at Southend-on-Sea; Nazareth House, Southsea, and also two wings to the Head House at Hammersmith; the nave of St. Joseph's Church, Southampton; St. Michael's Home, Waterloo Ville, Hants; House at Palace Court, Bayswater Hill, W.; Church of Our Lady Help of Christians, with presbytery, at Folkestone (the original design for which obtained a silver medal at the late Paris Exhibition); St. George's Schools, Westminster Bridge-road, and schools at Northampton-place, Walworth; also St. Clare's Church, presbytery, and schools, Sefton Park, Liverpool, now rapidly approaching completion. Mr. Stokes's design for the Roman Catholic Church in Spanish-place was one of the most original designs submitted, as we remarked at the time the drawings were publicly exhibited. His photograph is by Mr. Barraud, of Oxford-street, W.

Mr. Herbert D. Appleton, F.R.I.B.A., was predecessor of the present President of the Architectural Association, which he now represents on the Council of the Royal Institute of British Architects. He is architect for the new buildings for the Epsom Union; St. Paul's Church, Forest Hill; chapels at Sutton and Beckenham; the bank at Sutton; Board Schools at Banstead and Sutton; factories at Clerkenwell; St. Paul's Vicarage, Forest Hill; Benfleet Hall, Haslegrave, and Sherwood, at Sutton; Branksomean, Beckenham; Bryer Heillog and Mannamend, Forest Hill; Shirleigh, Ewell; Anglesey, Warrington; stables, &c., Heath House, Banstead, &c. He was till within the last three months the editor of "A.A. Notes," which he originated, and is the hon. sec. of the A.A. Excursions Committee. The photograph is by Mr. Bassano, Bond-street.

Mr. Alfred Gotch, F.R.I.B.A., past-President of the Architectural Association, is well known as the author of "The Buildings of Sir Thomas Tresham," published a few years ago. He has also written a little guide to Haddon Hall, and another pamphlet of his is entitled "Holiday Journeys in Northamptonshire." He likewise is familiar to our readers as the author of papers read before the Architectural and Archaeological Societies on "Art and Costume," "Elizabethan Architecture," &c. He commenced practice at Kettering, and has built, among other works—British School at Bradninch, Devon; National School at Little Ilford, Essex (enlargement). In Northamptonshire we may name—Board School at Rothwell; Fuller Chapel School, Kettering (in conjunction with J. Gale); school at Corby (enlargement); school at Burton Latimer; farmhouse at Armston; houses at Kettering; shoe factories at Kettering; farm buildings at Slip-ton; lodge at Thorpe Underwood; Isolation Hospital at Kettering; Co-operative Stores at Desborough; shops at Kettering; drinking fountain at Burley-in-Wharfedale, Yorks; shop at Wimbledon, Surrey. Since entering into partnership with Mr. Saunders the firm have done—Victoria Hall, Kettering, North Hants; Liberal Club, Kettering, North Hants; Victoria Coffee Tavern, Kettering, North Hants; shops for Grammar School Estate, Kettering, North Hants; other shops in Kettering, several large shoe factories and various houses, and the Dairy Co.'s premises in the same town. They carried out the enlargement of Brigstock Manor House; a shoe factory at Rothwell; Oddfellows' Hall at Desborough; Salvation Army Barracks, Kettering; farmhouse at Slip-ton; and enlargement of Barwell Castle. The portrait is by Mr. Van der Weyde, of Regent-street.

Mr. Cole A. Adams, F.R.I.B.A., Past-President of the A.A., was honorary secretary to the Competitions Memorial presented to the President and Council of the R.I.B.A. by the late George Edmund Street, R.A., in May, 1880, and when the Council appointed a special committee to carry out the objects of the memorialists, Mr. Adams, in conjunction with Mr. Aston Webb, who has since retired, was appointed honorary secretary of it, and has done his best to promote the reform so urgently needed. Since the committee was appointed, some 1,450 adherents to the undertaking have enrolled themselves, and a large measure of reform has been secured. Mr. Adams has for many years been an active member of the A.A. In the year 1883 he was elected President, and again re-elected to that office in the following session, and was the first President to sit in that capacity on the Council of the R.I.B.A., which he did during two sessions. Whilst President of the A.A., Mr. Adams obtained the appointment of a special committee to consider how the work of that body might be revised and extended, and several important alterations and improvements were the result of their labours. During the past three sessions Mr. Adams has acted as Chairman of the Elementary Class for the study of ornament and colour decoration. Though quite a new class, it has proved a useful one, and the work of the students has attracted much attention. Mr. Adams's practice has been chiefly of a private character, and, among many other works, includes several houses and stabling at Wargrave, alterations and additions to other mansions and houses in the neighbourhood of Henley-on-Thames, mansion and stables near Maidenhead House, near Presteign, and various houses in different parts of London. Special internal fittings and colour decoration too have been designed by him for other residences. In conjunction with Mr. J. S. Westmacott, sculptor, Mr. Adams designed various houses. He has also devoted much time and attention to the study of the ornamental art of all nations, and thus finds much interest in illustrating his class lectures at the A.A. from original studies made from ancient examples. His portrait was taken by Mr. E. Smorthwaite, of Regent-street, W.

Mr. Richard Phené Spiers, F.S.A., F.R.I.B.A., Past President of the Architectural Association, is the Master to the Architectural School at the Royal Academy of Arts, which appointment he obtained in 1870. He studied at King's College School, and was elected an Associate of the College in 1857. A year later he entered the atelier of M. Questel, of Paris, and in 1861 he became a student at the Ecole des Beaux Arts. In 1862 Mr. Spiers entered Sir Digby Wyatt's office as an improver, and the same year carried

off Professor Cockerell's prize, given as President of the R.I.B.A. In 1863 he passed the first voluntary examination in Class of Proficiency. The same year he took Sir William Tite's prize and Medal of Merit at the Institute. In 1863 also he obtained the first-class Medal for Measured drawings at the Royal Academy, and also the Gold Medal and scholarship of £25 for two years. In 1864 Mr. Spiers passed the first voluntary examination in the Class of Distinction, and travelled through Sicily, and he was the Royal Academy Travelling Student. The following season he was awarded the Soane Medallion of the R.I.B.A. and Travelling Studentship, when he travelled through Germany, and wrote a report to the Academy on the various schools there; in 1866 through North of France, Egypt (and up the Nile to the second cataract), Syria, Constantinople, and Athens, returning home to work for the late William Burges, A.R.A., in his design for the new Law Courts, and for Sir Digby Wyatt on the National Gallery competition. In 1872 he obtained in competition and carried out two of the schools first built for the London School Board, after which he was engaged in carrying out a large mansion in Worcestershire for Mr. J. Corbett, M.P., in conjunction with M. Tronquois, a Paris architect. In 1877 Mr. Spiers was appointed Surveyor of the Royal Academy. Among his other buildings are a studio and residence for Mr. Thos. Faed, R.A., in Cavendish-road, St. John's Wood; various works in Barnsley, Yorkshire, including the laying-out of Lock Park and buildings therein, and additions to the hospital. Mr. Spiers was also architect of a large mansion on Chelsea Embankment built for the late Lord Justice Collier, who was raised to the peerage as Baron Monkswell. In 1882 he was elected Hon. and Corr. Member of the Sociedad Central de Arquitectos, Madrid, and in 1887 Hon. and Corr. Member of the Société Centrale des Architectes, Paris, and was Vice-President of the Conference of Architects at Paris in 1889. He is a member of the Council of the Royal Institute of British Architects. At the meetings of the Architectural Association Mr. Spiers has read the following papers, most of which have been reported in the BUILDING NEWS:—1862, "Architecture of Normandy"; 1863, "Architecture of Napoleon III."; 1867, "Egyptian Architecture"; 1868, "Study of History of Architecture"; 1869, "Belgian Architecture"; 1873, "Palace of Scaurus"; 1877, "The Roman Thermæ"; 1881, "Holland"; 1887, "Saracenic Architecture"; and at the R.I.B.A.: 1876, "The Restoration of the Chateau of Pierrefonds"; 1877, "Notes on the Condemned City Churches," a notice on the origin of the stalactite or honeycomb vault, and a notice of the French Diplôme d'Architecte. In 1874 he edited a second edition of Pugin's "Normandy," to which he added several chapters; and in 1887 he wrote a work on Architectural Drawing. His photograph is the work of Messrs. Fradelle and Marshall, of Regent-street.

Mr. Lacy William Ridge, F.R.I.B.A., Past-President of the Architectural Association, is well known also in connection with the Artists' Corps of the London Volunteers, in which regiment he is now Senior Major with the honorary rank of Lieutenant-Colonel. In 1871 Mr. Ridge was appointed surveyor under the Ecclesiastical Dilapidations Act for the Diocese of Chichester. He has erected or remodelled a considerable number of the parsonages of the diocese, while many of the churches have been intrusted to him for restoration, carried out in a conservative spirit, as at Pevensey Church; though in such cases as Midhurst and Lynch the works have amounted to a practical rebuilding. He has erected churches at Hurst Green and Ashurst Wood. Schools erected at Chichester in commemoration of the Queen's Jubilee were intrusted to Mr. Ridge, and he has carried out many similar works, as well as gentlemen's houses, in Sussex and the adjoining counties. He obtained, in the early competitions promoted by the School Board for London, schools at Bromley and Hol-loway, which, as well as the Dispensary at Islington, Mission-buildings at Camden-town, and works for private clients, have been carried out under his supervision. Mr. Ridge has read papers before the Architectural Association on "Rectory Houses and Parsonages," &c., &c. His portrait is from the studio of Mr. W. N. Malby, of Chichester.

Mr. Henry Cowell Boyes, F.R.I.B.A., is the Surveyor to the Grocers' Company, the Girdlers'

Company, and the Holborn Estate, in connection with which appointments he has carried out many important works. He has also been the architect for numerous blocks of offices and warehouses in the City; for Messrs. Seeley's publishing offices in Essex-street, Strand; Mr. Mocatta's house, at Englefield-green, and other country houses; and the swimming-bath and gymnasium at the Grocers' Schools, Hackney Downs. He is at present engaged on the rebuilding of Grocers' Hall, and the new church of St. Paul, Homerton. Mr. Boyes was President of the Architectural Association in 1876. He has been an active member, and is a Major in the London Rifle Brigade. He was born in 1846. His portrait was prepared by Mr. Barraud, of Oxford-street, W.

Mr. Thomas Henry Watson is a Fellow of the Royal Institute of British Architects, and was President of the Architectural Association in 1870-71. He is also district surveyor of St. George, Hanover-square, North, and surveyor to the Pentonville Estate. He commenced the study of architecture at an early age, under his father, the late Mr. John Burges Watson, and obtained three silver medals at the Royal Academy in 1860, the Gold Medal in 1861, and Travelling Studentship in 1863; the Medal of Merit and President's Prize, R.I.B.A., 1862, and Soane Medallion 1864. He graduated at the Institute in the Class of Proficiency in 1863, and in the Class of Distinction, 1866. His principal works are the north court and stable quadrangle to mansion "Somerhill," Kent (visited by the A.A. on their excursion to Tunbridge), and other buildings for Sir Julian Goldsmid, Bart., M.P.; Crowe Hall, Bath, for Mr. H. W. Tugwell; work at Dunraven Castle, &c., for the Earl of Dunraven; Rickmansworth Park, for Mr. J. W. Birch, Governor of the Bank of England; Newton Park, Somerset, for the Earl Temple; Höl-landen, Kent, for the late Mr. John Bald; house and studio, for Mr. Henry Corbould; studio, &c., for Mr. Phil Morris, A.R.A.; "Redstone," for the late Mr. John Linnell; lodge, &c., at Redhill, for Mr. William Linnell; churches of St. Mary, Loughton, and St. Luke, Deptford; and also the Villa Aurelia, Rome, for Major Heyland. Mr. Watson designed a house at Alexandria for Mr. Charles Royle; some new schools at Northaw, Poplar, and Loughton; vicarages at Kemsing and Nackington; and rectory house, Eltham; alterations and additions to "Knebworth," for the late Lord Lytton; to mansion, Belvoir, Ireland, for Sir Thos. Bateson, Bart.; Wressell Lodge, Wimbledon, for the late Sir H. Bartle Frere; Kent and Canterbury Hospital. Mr. Watson designed and carried out the water supply to Sir Julian Goldsmid's mansion, with tanks, &c., for storage, and system of fire hydrants; and also carried out special drainage and sanitary work for Lord Thurlow, the Earl of Dunraven, Sir J. Goldsmid, the late Marquis of Tweedale, the late Sir Geo. Burrows, and the Earl Temple. Amongst his smaller works are No. 10, New Bond-street, No. 25 in the same street, house and shop, Great Portland-street, and the loggia and studios at No. 164, Regent-street, for the Count Ostrog, "Walery." Mr. Watson's portrait is from a photograph by Messrs. Elliott and Fry, of Baker-street, W.

#### GOTHIC ARCHITECTURE.\*

PROFESSOR MOORE, of Cambridge, Mass., has just written a most able and clever book on the "Development and Character of Gothic Architecture," replete with diagrams and illustrations, which add very greatly to its interest and permanent value. The volume, though the work of an American author, has been printed in London, and is published by Messrs. Macmillan and Co., both here and in New York. By the courtesy of the publishers, we are enabled to present our readers to-day with a selection of the engravings from its pages. While thus unhesitatingly acknowledging at once the ability and brilliant character of the author's style, besides recognising him as a thoroughly-qualified student of the best period of Gothic art in Europe, who has evidently a personal knowledge of the buildings he more particularly describes, we cannot agree with many of his conclusions, and indeed must go so far as to say that the greater part of his deductions,

\* Development and Character of Gothic Architecture. By CHARLES HERBERT MOORE. (London and New York: Macmillan and Co.)

FIG. 7.

"if true, are not new, and if new, are not true." To sum up the whole matter, Professor Moore claims that there is no true Gothic but in France, and that all other architecture, in so far as it departs in style or falls short in scale from the Early French Gothic cathedrals, correspondingly ceases to deserve the name of Gothic. The leading English authorities on the development of Mediaeval architecture, such as Rickman, Edmund Sharpe, and Sir Gilbert Scott, are mentioned in very qualified terms, and even a French writer like De Caumont is stated to have equally misconceived the nature of Gothic art with the authors already named. The writer quotes Viollet-le-Duc for a profound and exhaustive illustration of Gothic, which he says is necessary in the midst of such imperfect apprehension as has thus far generally prevailed. The clear and unmistakable definition afforded by the *Dictionnaire Raisonné de l'Architecture*, whereby we may have a standard to estimate the degrees of Gothic quality that may appear in the Pointed architecture of different countries and at different epochs, is without doubt one of the most masterful ever produced by any writer; but our own authorities have equally recognised the constructive principles and growth of the arch style of buildings, and if English architects of the Gothic school have advocated our own national development of the Mediaeval type of design as being more suited to the scale and requirements of English architecture, it is equally true that a just recognition has always been accorded of the grandeur and magnificence of thirteenth century French Gothic work as the acknowledged parent of our own Pointed architecture. Thus Sir Gilbert Scott says of the Cathedral of Sens, after visiting it for the first time: "I had unconsciously entertained a certain feeling of jealousy towards it, arising from the exaggerated opinions constantly expressed as to the entire dependence upon it of our Pointed style; but my first exclamation on entering its noble nave was: 'Well, if our Gothic churches are all derived from this, they had, to say the least, a glorious parentage!'" And again he says, in his Royal Academy lectures, more than once, that precedence, without doubt, must be given to France among the nations in taking the initiative step which was necessary to generating a perfect form of arcuated architecture, though he further insists with historical truth that

Romanesque architecture went on uniformly and through its transition into the Pointed style in as distinctly national a method in England and Germany as in France, always acknowledging that precedence, as to the time at which the grand advance was made, must be awarded "not to France (for some parts of it were particularly tardy), but to that district of France round Paris, the focus of the royal power," "which seems to be the heart from which Gothic architecture diffused itself throughout Europe." The 13th-century buildings there erected are described as "the great standard and type of the style, demanding the closest and the most diligent study, and without a knowledge of these all architectural study of Gothic would be not only incomplete, but defective at the most vital part." "When you go abroad, begin with France; it is the great centre of Mediaeval art." Thus spoke Sir Gilbert Scott, with all his predilections for English work, and we quote his words because, if we read Mr. Moore rightly, he supposes English architects have never done justice to French Mediaeval building. We notice no mention in his pages of Wm. Burges, and his famous advocacy of the claims of the Gothic of France, while the drawings he published, and those by Mr. R. J. Johnson, in his celebrated folio, are not even alluded to.

The prepossession of one idea renders all the author's arguments and logical conclusions open to the charge of prejudice, thus rendering his otherwise admirable work, to this extent at least, unreliable as a textbook for the elementary student, which we can but mention with regret, seeing how thoroughly well he has brought together his information and illustrated his analysis. Indeed, perhaps, never before have the leading characteristics of Gothic building been more tersely set forth, and we give the writer every credit for his convictions, while we cannot fail to admire his manner of expression, even though we notice also an amount of self-consciousness peculiar to the American, which does not enhance the value of his remarks. We cannot quote from his pages so fully as they deserve for lack of space, but we may repeat his concluding definition of the style on which he treats:—"In fine, then, Gothic Architecture may be shortly defined as a system of construction in which vaulting on an independent system of ribs is sustained by piers and buttresses, whose equi-

FIG. 8.

librium is maintained by the opposing action of thrust and counter-thrust. This system is adorned by sculpture whose motives are drawn from organic nature, conventionalised in obedience to architectural conditions, and governed by the appropriate forms established by ancient art, supplemented by colour design on opaque ground, and more largely in glass. It is a popular church architecture, the products of secular craftsmen working under the stimulus of national and municipal aspiration, and inspired by religious faith." "This architecture in all its distinctive characteristics is native to France and to France only." We deny, of course, that Gothic is only adapted to church-building: the remains of Mediæval architecture refute the statement, and we cannot for a moment admit the truth of the concluding opinion which we have just quoted, in spite of all that Professor Moore has said in his treatise before us. We have also to remark that it is a mistake to so far underestimate the importance and essential value of inclosing walls in Gothic building, thus reducing its idea to a mere skeleton of balanced construction. He devotes a chapter to the "Gothic of France," one to "Pointed Construction in England," and then another to Germany, Italy, and Spain, coming back in the following one to "Gothic Profiles in France," while the next chapter treats of them in other countries. "Sculptures in France" are next dealt with, and then the same subject in England and elsewhere. The same method as to painting and stained glass is also adopted, and the work finishes with a general chapter of "Conclusions." Our choice from the illustrations herewith given has been made, not so much with an idea of necessarily showing how the author argues his case—for that would occupy more space than we can just now devote to the matter—but rather with a view of enabling our readers to judge of the style and thorough character of the drawings which enrich its pages. Fig. 1, though not so crisply delineated as many others, represents a notable piece of work—viz., the spire of the Cathedral of Senlis, erected early in the 13th century. Mr. Moore says it "marks the culmination of pure Gothic design in this feature. In constructive principle it presents all the excellences of the spire of Chartres; while for beauty of proportions, grace of outline, and refinement of details it is hardly equalled by any other spire of the 13th century." Fig. 2 is from a drawing by M. Boesviswald, a French Government architect, and represents one of the vaults of the aisle round the very early and interesting

apse of the Abbey Church of Morienvall, near Crépy-en-Valois. This rudimentary apsidal aisle has diagonal ribs to the vaults, pointed archivolts,

FIG. 10.

and even rudely-pointed transverse arches, though of these last arches one has no rib, while the other has a rudely adjusted and very heavy

round-arched one. The interest of this example lies chiefly in what it exhibits of experiment in the application of new principles as yet but feebly apprehended, and we have here a form of vault-construction hitherto, probably, unknown at that time—a form which, though imperfectly carried out, already contains some of the most characteristic structural features, and involves some of the most important principles of the Gothic vault. Fig. 3 shows a flying buttress and clerestory of Burgos Cathedral from Street's "Gothic Architecture in Spain." It is given by Mr. Moore as an undeveloped example of Gothic, and the opinion of Street that this church was designed by a Frenchman is objected to, the reasons for which the reader will do well to consult in the book itself. Fig. 4 gives the east end of Lincoln Cathedral, drawn by Mr. H. W. Brewer. The same artist did the next illustration, Fig. 5, a general view of Rheims Cathedral, "which presents a striking consistency and harmony of parts which is equalled by that of few other French cathedrals." Fig. 6 shows the earlier abbey church of St. Leu d'Esserent, in which we have the apse, the apsidal chapels, the eastern towers, and the choir, all of which date probably from about 1170. It is "one of the best remaining examples of the simple grandeur and purity of style of the Gothic monuments of the 12th century." Fig. 7 is the interior of the apsidal aisle of the same church. The combination of apse, apsidal aisle, and apsidal chapels called for a wonderful degree of structural ingenuity, and led to some of the most charming interior effects. This is an eminently typical example. Fig. 8, elevation of one bay of St. Michele of Pavia, exhibiting an alternate arrangement of piers. The central shaft finishing with a cap at the string level is hardly a feature worthy of being imitated. It should have been continued up, as in the Abbaye aux Hommes, to carry the groining rib of a sex-partite vault, or not introduced at all if a quadripartite arrangement, as here shown, was originally intended. Fig. 9, from the end of Mr. Moore's book, is a figure from the great Jesse window of Chartres Cathedral, and is a good example of the typical drawing in Early French pure pot-metal glass.

## CHIPS.

The annual dinner of old King's College students will be held on the 28th April, at the Holborn Restaurant, when the Right Rev. Bishop Barry will preside.

At a meeting of the Walton-le-Dale local board held on the 3rd inst., Mr. F. E. Dixon, P.A.S.I., was unanimously appointed to prepare plans for the sewerage and the disposal of the sewage of the district of the board, comprising an area of nearly 5,000 acres, and having a population of over 11,000 persons. Mr. Dixon, who acts as surveyor to the board, won the ten-guinea prize of the Surveyors' Institution, being placed second in order of merit at their annual examination.

At the monthly meeting of the Cardiff Union Rural Sanitary on the 12th inst., it was unanimously resolved to increase the salary of their surveyor, Mr. Wm. Fraser, to £250 a year.

The course of lectures in Modern Practice having been completed, the usual examination has been held, with the result that Mr. A. L. Jacob has gained the prize of the classes in architecture, University College, London, and he and Mr. Dendy Watney will receive first-class certificates, and Mr. H. R. Applebee and Mr. H. Helsdon will receive second-class certificates.

Col. Henry Luard, R.E., held an inquiry on Friday at Jarrow-on-Tyne into the application of the Town Council to borrow £500 for the works in connection with the recreation ground, and £3,868 for private street improvements and sewerage. The proposed works in connection with the recreation ground are to extend the lake, and to inclose an additional piece of ground. There was no opposition.

The Crystal Palace collection of casts and statues has just been enriched by the presentation by the Duke of Westminster of the original model, by Mr. G. F. Watts, R.A., of the colossal statue of the ancestor of the Grosvenor family, Hugh Lupus, first Earl of Chester. The statue, in bronze, is erected in front of Eaton Hall.

A stained-glass window in memory of the late Archdeacon Iles was unveiled on Monday by the Bishop of Lichfield at St. Peter's Collegiate Church, Wolverhampton. The window represents the four saints, Jerome, Ambrose, Augustine, and Gregory, and is situate in the eastern portion of the south aisle.

CONTEMPORARY BRITISH ARCHITECTS—ST. THOMAS OF CANTERBURY—THE PROVIDENT LIFE AND COUNTY FIRE OFFICE, BRISTOL—DESIGNS FOR A CABMEN'S SHELTER AND NEWSPAPER KIOSK—EXAMPLES OF GOTHIC ARCHITECTURE.

## OUR LITHOGRAPHIC ILLUSTRATIONS.

## CONTEMPORARY BRITISH ARCHITECTS.

(See description on p. 405.)

## ST. THOMAS OF CANTERBURY.

A CARTOON designed by Geo. S. Fayers, for the Maison Helbrunner, Ltd. One of a series of chancel wall-hangings, to be used on the great festivals of the Church. The original is very nearly life-size, and was hung at the recent exhibition of the Arts and Crafts Society.

## NEW BUILDING FOR THE PROVIDENT LIFE AND COUNTY FIRE OFFICES, BRISTOL.

THIS building occupies a corner site, upon which up till a short while ago stood a jeweller's shop, at the corner of Clare-street and St. Stephen's avenue. The building consists of basement and ground-floor, with three floors over. The ground-floor is occupied by the Provident Life Office and County Fire Office, whose headquarters are at 50, Regent-street, London. The building is a lofty and striking one, and there is about it an originality of treatment which is striking. The basement and first and second floors are arranged as offices. There are four good, well-lighted rooms with fireproof safes and separate lavatory and w.c. Accommodation is provided for each floor. These are arranged (although in the centre of the building) practically in the open air, as will be seen by reference to the plans. The floors throughout are of iron and concrete. The top floor is arranged for caretaker, &c. Outside the rooms there is a loggia or balcony. The work has been carried out by Mr. A. J. Beaven, Bedminster, Bristol; and Mr. F. Metjen has acted as clerk of the works. Mr. E. Henry Edwards, of 5, Clare-street, Bristol, was the architect.

CABMEN'S SHELTER AND NEWSPAPER KIOSK.

(For description, see p. 429.)

## WAYSIDE NOTES.

THERE is always a glorious uncertainty about the time at which Parliament will take in hand the reading of Bills set down for the order of the day. Although one looks forward in a hopeful frame of mind to the reading of the Architects' Registration Bill for the second time, which is now set down for April 19, one is equally prepared to face the contingency of its defeat. It would be a rare thing if a measure of the nature of that dealt with by the present Bill passed successfully through Parliament at only the second attempt. That it deserves to do so the Registrationist cannot have the shadow of a doubt, since the Bill that has risen with Phoenix-like persistency from the ashes of the Architects', Engineers', and Sur-

veyors' Registration Bill has had the features that proved objectionable to certain parties, expunged and as at present constituted, seems to have given satisfaction to all except those who quibble at details which it may reasonably be believed would have to appear in any Bill framed on the principles upon which we most of us hold a Registration Bill should be framed.

One feels, anyhow, a certain amount of confidence that what opposition the Institute Council may offer to the measure, will be rendered far less effective than it would otherwise have been, by the fact that on Monday evening last a number of its members, including many Fellows, and one representative of Societies allied to the Institute, presented a memorial to that body touching upon the Registration question. Although the number who, at the time of presenting, had signed this memorial was but small, the incident is yet of considerable moment, for it is difficult to see how, in the face of the memorial, the Council can possibly claim and aver through its Parliamentary advocates anything like a unanimous voice on the part of the members in whose interest it is supposed to act. The amount of discussion matters little, though, as a fact, we know that the few who on Monday had signed the memorial are only a fragment of the whole number who have in one way or another shown themselves to be in favour of the movement for once and all closing the ranks of the architectural profession.

I was particularly glad to hear of the action of the gentlemen who presented the memorial to the Council of the Institute, for, until it is correctly found what proportion of the members are in favour of Registration, I shall be devoured, it must be confessed, by much curiosity on the point. Whatever may be the result of the Parliamentary debate on the proposal to read the Bill a second time, I trust, with the memorialists, that a poll may be taken by voting papers, and the opinions of the entire body of professional members of the Institute ascertained. The subject is to receive attention, it is said, on Monday evening next, and I do not see how the council can refuse the request of the memorialists. Should the poll be taken, and the majority of members act according to secret conviction, and not on party considerations, the result would, I feel convinced, be very different from what the rabid anti-Registrationist imagines. And the matter stands on a different footing to that which it would do if the memorial had anything to do with the labours of the Registration Committee, or the Architects' Registration Bill. No reference was, I believe, made in the memorial to anything of the kind. Seeing that such is the case, there can be no excuse either for opposition to the memorialists' wish by the Council, or for the members not voting according to private conviction. If asked to support a Bill promoted by the Registration Committee, one can imagine that many would refuse so to do because the Bill was not fathered by the Institute; but as the request has been made in a general way, and in connection with no committee or Bill whatsoever, it will be impossible for any member to act honestly unless he regards it in an unbiased manner and gives his own opinion, and not that which he thinks would be the opinion of the majority of his fellow-members.

The matter is simple enough. The memorialists wish the Council to take steps to ascertain the views of every professional member of the Institute on the Registration question. Should the poll asked for be allowed, each member has to forget any of the unfortunate pettinesses that have been observable in connection with the subject, and putting out of his head any thoughts of Registration Bills, Registration Committees, and the like, simply to ask himself this question:—Is it desirable that the profession of the architect should be made close like that of the lawyer and physician? If so, then vote accordingly. If it be thought that it is desirable to preserve things as heretofore, act up to the conviction also; but when in a position to reflect upon the action, endeavour to put down in black-and-white the why and wherefore of the decision. If compelled, by some means or another, to substantiate one's opinion by logical reasoning, I rather fancy that there would be a very small minority bold enough to declare that Registration is undesirable.

The County Council got into hot water over its "London County Council Bill" when that measure was brought forward in Parliament for its second reading. The sandwiching of the objectionable clauses, upon which Mr. Ritchie fastened "tooth-and-nail," has aroused general indignation, and one may expect a general slating of the L.C.C. all round. Some of us, perhaps, would not object to the clause dealing presumably with sky-scrapers. I only wish that Sir Edward Watkins's proposed Eiffelian monstrosity could be brought under some such law. Notwithstanding the paragraph that appeared in the newspapers towards the commencement of the week, stating that many of the authors of the designs submitted had "contrived to combine beauty of outline with stability of structure," I still hold antagonistic views of the proposed tower. I believe a suggestion was made to Sir Edward, or for his benefit, that, having purchased Snowdon, he should erect on the summit thereof his iron observatory tower, and thus obtain a breezy elevation indeed. We certainly do not want the monster in London, however successfully its architect, or engineer, may have combined "beauty of outline with stability of structure."

If this is to be the only good point about any design that may be selected, it is nothing new. The most that people, viewing the structure as generously as they were able, can say of the Eiffel Tower is that it possesses "beauty of outline with stability of structure." A certain dignity has, in the Paris tower, been gained by the bold, sweeping lines of the angles of the building. But any beauty of this nature is a poor compensation for spoiling the outlook of a city for miles around. I doubt not but that there will be a petition against the Watkin Tower, as there was against the erection of M. Eiffel's design. Seeing the futility of the petition in a land where they are supposed to "manage these things better," one cannot hold out much hope in matter-of-fact England. The tower will probably be erected, and form the second specimen of the new genus "Eiffel." I did read, some time back, that great novelty characterised some of the designs, of which there was a kind of preliminary sampling last Saturday; but it may be predicted that nine out of ten start away on Eiffel principles. It is understood that the public will be admitted to view the designs as soon as the jurors have awarded the premiums, of which we should be glad; for, objectionable as the scheme may be in other ways, there cannot but be great interest attaching to the exhibition of the work of the "engineers and architects of the highest professional status in the United Kingdom, the Continent, America, Canada, and Australia."

The Strand Improvement scheme has been referred for consideration to a Select Committee of the House of Commons. The task before the Select Committee is not an enviable one. So much has been written about betterment and "worsement"—which I trust will not become a dictionary word—that the whole thing seems to have got into a hopeless muddle. From this condition of things the Select Committee will have to rescue the Improvement scheme. It will be no light task, and involve a good deal of painstaking inquiry and marshalling of facts. I followed the discussions and correspondence on the subject till it became wearying to a degree, what with equally positive assertions and arguments *pro* and *con*, the betterment clause, and the involved statements of legal gentlemen anxious to bring out some abstruse points of law. This lengthy discussion of the subject, however, has served a good purpose, drawing attention to the fact that there was something in the measures proposed to be taken by the County Council that did not give general satisfaction. For my own part, I feel less inclined to put faith in the betterment principle than at first, as the improvement, so far as widening the Strand is concerned, is evidently of such a nature as will be to the advantage of the general public. Betterment, or no betterment, however, in our corner of London, we shall all be glad when the improvement is effected; and for that reason I trust that, though involved in some difficulty, Parliament will quickly dispose of the questions that are now hindering further progress. **GOTH.**

**"BUILDING NEWS" DESIGNING CLUB.**

A CABMEN'S SHELTER AND NEWSPAPER KIOSK.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THIS is a style of building about which, in reviewing the designs submitted in the competition we set for last month, little need be said by way of description. The subject is, however, essentially useful and decidedly a good one, capable of considerable ingenuity and display of taste; but it is a "skanderlus fact," as Artemus Ward would say, that whenever anything out of the ordinary-beaten track of villas, schools, stables, and the like every-day class of buildings is set for our competitions, many members of the Designing Club fight shy of the problem, leaving the task of solving the difficulty to others, quite forgetting that by so doing they are neglecting an opportunity of self-improvement not likely to be afforded by any other means. We have always noted this in days gone by and we note it now, but at the same time we accord our praise to those students who have risen to the occasion and contributed the designs before us, most of which do considerable credit to their authors, while all show a serious endeavour to meet our wishes in the matter. The following is the text of the instructions printed for the guidance of members of our club:—

**Subject E.—A Cabmen's Shelter and Newspaper Kiosk with Illuminated Clock Tower between.** This building is for a site in the middle of a main thoroughfare of a large town adjoining a cabstand, and situated on a paved island or street refuge, 43ft. long by 13ft. wide. At one end of this site, in front of the kiosk, the paving is to be rounded, and the other end left square, next cabstand, the building being so placed on the island as to allow ample space for foot-passengers in front of the paper-kiosk. The shelter, which is to be of timber, filled in with panelling or V-jointed boarding, is to measure inside 20ft. long by 8ft. wide. Out of this a little kitchen place, 6ft. by 8ft., is to be formed, with a glazed screen dividing it off from the main part. The two entrance doors (2ft. wide, made sliding) are to be situated, one on either side, between the kitchen and the main refreshment place. A seat, 1ft. 6in. wide, is ranged along the sides, but not at the end, and the table is to be in the centre. A small American cooking stove is to be placed in the kitchen, with flue in tower wall, and a sink with plate-rack and cupboard for cups, &c. The shelter is to stand on a brick, or stone, plinth, 14in. high above pavement, and the floor is to be finished in cement or concrete. Provision for a dust-box outside to be made. Roof covered with red tiles. Ventilation to be provided for. The clock tower, 39ft. total height to finial, is to be of brick or stone, 9ft. square outside, on plan at base; upper part may be of timber, like the roof, which is to be covered with lead. Clock faces on all four sides. The kiosk for sale of newspapers is to be of timber, like the shelter, and to project from the other side of the tower, 4ft. 6in. inside by 6ft. wide, and rounded on plan to follow line of pavement. The base of the tower is to be open into kiosk, to be used by the vendor of papers, and his doorway into the kiosk to be in one of the flank external sides of the tower. Plan, three elevations and section; scale, 4ft. to the inch. Sketch and small-block plan showing position on island. Style optional.—"North Star" we place first, "Wallaby" deserves the second place, and we accord "Tyne" the third place of honour. Most of the designs fail because their authors are far too ambitious in their ideas, and many quite regardless of the object, evident by the site being on an island of narrow proportions, design a building suitable for the centre of a great square or market place, whereas, of course, the dimensions given in the conditions make it manifest that the shelter is intended for a restricted site in a crowded thoroughfare, such as may be seen in any large town. Others, again, have drawn their perspectives as if cabmen's shelters were wanted out in the country, with rural cottages and groups of trees evidently grown miles away from any centre of city activity. The great absurdity too of a newspaper kiosk out in a deserted village does not seem to have occurred to these competitors. Nearly all have made too much of the clock tower, and "Wallaby" is one of these. He also is among those who have shown their cabmen's shelter standing isolated in a sort of market-square. The crossing indicated in his perspective cutting through the circular-ended pavement is really too foolish to need pointing out, and were it not for the merits in the design itself, we should have been

inclined to take off more marks from "Wallaby" than we already have done; for this want of thought on his part is due to carelessness. Turning now to "North Star," whose design we give the post of honour, and illustrate herewith today, we think the perspective shows a very suitable building. The view of the tower is hardly warranted by the elevations, and its roof as there shown is scarcely in accord with the perspective, which is the more pleasing rendering of the two. The treatment of the shelter and kiosk part is not so fetching as in "Wallaby's" design; but the general effect of the whole is much better and more unassuming. His plan is convenient, and follows our instructions. "Wallaby," for that matter, leaves little to complain of in this respect, while by placing his doorway to the kiosk on one side he makes room for the vendor of papers to place a seat in, a point quite overlooked by "North Star." The dust place, too, in the second design is more practical than in the one ranked first, and the coal-bunker below the floor shows thought. The ambitious gabled tower is more fitted to a town hall, and, nice as the design is acknowledged to be, the shaped gables and general proportions are out of accord with so small a building as a cabmen's shelter. Further description 'is unnecessary, as the illustrations given herewith afford full details of both compositions. "Tyne's" tower is squat and square, in bands of stone and red brick, with an octagonal stage above, having round turrets with no roofs at the corners to mask the splay above the angles of the main structure below. A lead-capped ogee roof rises quaintly, but the whole thing is open to the objections enumerated above for the benefit of "Wallaby." The shelter by "Tyne," is simple, and fairly effective, though linen panels are not the best treatment for the outsides of such a building. The doorway to the tower is too pinched up and narrow, and the fireplace takes up too much room in the cookery part of the shelter, the kitchen being evidently big enough for a good-sized house for roasting joints. Such meals are not usually served in cabmen's shelters. The plaster gable end is not bad, but hardly agrees with the rest, and seems to have been suggested by some of Mr. Ernest George's work—a good model to follow if working in the same class of buildings. "Fiddler" is not "first fiddle" this time. His design, however, is marked by reserve and an endeavour to be quiet, an attempt which we praise him for, but his design is not a happy one. It looks like a village fire-brigade station, or an old lock-up, done in wood for a change. The country houses shown in the distance complete this effect, and give flat contradiction to the suggestion that a cabman's shelter is intended. The tower, all of timber, treated in a manner associated with the days of England's Four Georges, is covered with a domical roof of lead, rising above a regulation cornice. Inside is a regular staircase leading to the clock chamber, and the kiosk is treated like a shop, with a counter inside, and space for customers in front. The author has quite mistaken the object of the whole thing, in spite of the fact that he is a London student. "West Anglian" "piles on the agony" by making four dormers to his tower, cutting up the main roof into slips between them, and, for effect's sake like-wise, makes another "feature" of a cove above the kiosk windows under the eaves, and thus renders the upper part needlessly dark inside. The doors at the end of the cabman's shelter are contrary to the instructions. The kitchen arrangements are good, and the drawings are fairly well done. So are those by "Y" in a circle: but we cannot understand how anyone who can draw so nicely should select such a strange type of design, so overlaid, and so wanting in repose. The shelter itself and the kiosk are not so bad—indeed, these parts are, in the main, good architecturally; but the clock-tower! The entrance to the kiosk is in the wrong place, and should, according to the conditions, have been in the tower. The building is intended to be situated in the country, according to the view. "Glaucus" is more suitable in the matter of the clock-tower, and the upper part is constructed of timber with plaster panels. The door to the shelter is at the end, which is a mistake. The eaves oversail very much all round the building, and along the flanks are three gables with louvre boards in them, intended, no doubt, for ventilation. This arrangement would insure a very complicated piece of roofing on a very small scale, with a needless number of valleys. "Nox" builds up a tower in what we suppose he would call

a Renaissance mode, with a square flèche of timber in the centre, and turrets on either side of the pedimented and elaborate clock-face. This would cut the little tower terribly into tit-bits, well enough in their way done to a bigger scale, but toy-like in the extreme to such a scale as this. The woodwork of the shelter and kiosk is fairly satisfactory, and shows clearly that "Y," in a circle knows what good work is, in spite of his tower, which we are obliged to condemn. "Menelaus" is quieter than some others, and simplifies the tower; but he throws out bay windows to the shelter, and puts an open brick-built fireplace at the end, placing the table in the centre more like a parlour, and indicates by these and other details that he hardly knows to what uses such a building is actually put. His perspective is a very poor performance. "So and So," bent on the grandiose, introduces turned work in every odd corner, and bristles up his skyline with standard lamps carried by the main posts at the ends being run through the roofs! The one good feature in this design is the blank, plain base of the tower; but this is more than compensated for by the wonderful arrangement above with open square niches inclosed with turned posts, each having a bell suspended between, hung diagonally, we presume, judging from the elevations. The big bell for the hours has a crowning central turret all to itself. There is at least some originality in this composition. We can only enumerate the other designs in their order of merit. "K. W. T.," "Streona," with an Indian design having Turkish features, the tower with minarets at the angles, each one built with a column resting on the hip of the central roof; "Grafton," who has no knowledge, evidently, of perspective; "Mercury," having a rather better tower, and design more in keeping with the objects in view; "Coombe," "Finem Respite," with statues in niches round the tower; "Renaissance," "Attempt"—do not attempt such a tower again; "Lycidas," "Niger," bald, but somewhat suitable. Tower very commonplace. "Reference," carefully delineated plans, but tower looks as if it belonged to a timber-built railway station, designed by a mechanical engineer. The set-offs in brick at the angles of the tower are meaningless. "Horseshoe" tries hard, but wastes too much time copying figures from previously-published illustrations. His tower is very ugly, and his kiosk is not in agreement with our instructions. His drawings, however, are improving; but he will do well to study good men's work more. "Nightlight" has some useful points, and we have fully recognised them; but his tower is rather high-shouldered, so to speak, and heavy. The Pointed Gothic arch is out of place in such a structure, and the belvedere at top is not wanted. "White Star," "I Try," oh, what a roof to the tower, and what a chimney—big enough for a blow-hole to the underground railway! "Cleopatra," "Mac," "A. G." in a circle, "Pepper Arden," nicely drawn, with spirit and "go," but shows a poor design; "Serpa," with a circular tower; "X. Y. Z." in a circle; "Parenchyma," and "White Wings," whose design is quite unlike anything we have ever seen, particularly in perspective.

## ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Association was held on Friday evening, the President, Mr. Leonard Stokes, in the chair. Messrs. L. C. T. Moore, E. O. Cummins, W. H. Brown, J. J. Wilson, W. A. Sugden, A. Borisson, and H. M. Brown were elected as members.

The President announced that the Committee had prepared a petition against the Architects' Registration Bill, on the ground that it was not suitably drafted.

## MODERNISM IN ART.

Mr. HENRY HOLIDAY read a paper on this subject. The "modernism" dealt with was another name for pedantry, which, the lecturer urged, was enervating and depressing art in all its forms. What, he asked, is the true cause of pedantry in art? The proximate cause is obvious. It is the lack of vitality in our artistic powers, the paucity and poverty of our ideas. No one borrows ideas who has a wealth of them within himself clamouring for utterance. But this answer merely leads us to the next stage. What is the cause of this low vitality? Is man going irrecoverably down-hill? Is the deadly monotony

and hideousness of our streets, our costume, our furniture inevitable and permanent, or is there some assignable and sufficient cause? And, if so—finally—Is the ultimate cause one which we can reach? Can we, by getting at the root, restore health to the tree? Till these questions have been answered, all others seem by comparison to be academical. The lecturer saw no reason to despond as to an ultimate solution; no reason to suppose that the destitution, the vulgarity, and the squalor which desolate the everyday life of this age must endure and are without remedy. So long as we are aware of the evil and chafe under it, there is hope. There are many who deplore the ugliness of our life, and some who attempt to improve our condition. This discontent, this struggle against the haunting finery, the graceless luxury of our rich, and the crushing, brutalising misery of our poor, is the one string to our lyre, the still, small voice which must ultimately prevail. Let us, then, face the evils that beset us; let us see what they are, and whence they arise, for only so shall we be prepared to overthrow them. First, let them contemplate this pedantry, this substitute for art which is the resource of those who have nothing to offer of their own. How came men to utter this base coin, and how came men to accept it when offered? The Pugin movement in ecclesiastical architecture indicates how and why a course which may be necessary though regrettable in one case is followed in other cases where it is wholly objectionable. There can be no doubt that the movement originated in a sincere love of beauty; but when we come to figure decoration the whole question is altered. On this the movement had a most baneful influence. The revived admiration of Mediaeval, and particularly 13th-century, architecture, having become general, it was swallowed whole with all its accompaniments with a total absence of thought and discrimination that speaks volumes for the prevalent tastelessness of the time. A 13th-century stained-glass window or missal exhibits commonly a power of design, a splendour of colour, and a vigour of imagination and symbolism which may well excite our wonder and envy. What effect had these windows on the commercial decorators in the early days of the Gothic revival? They saw nothing of the beauty of colour, of design, or of imagination. One thing alone they aimed at (to judge by their results). Draughtsmanship in the 13th century was in its childhood. The figures in the best works of that period possessed a surprising vigour and spirit, but the technique was imperfect. Here was the thing to be imitated: Colour was of no consequence, the rawest and crudest that could be found would do; but a splay foot and a goggle eye would place the work at once on a par with an Early English window. The extraordinary fact is that notwithstanding all the great advance which has since been made in the quality and colour of the material, there are still respectable decorative houses who imitate the decorative works of the 13th, 14th, and 16th centuries, and seem to think they are producing works of art. Not only so, but there are people who treat these travesties of genuine work as if they had anything genuine about them. Happily, they are exclusively commercial productions. Art has not got so low even in this age that artists will descend to servile, avowed imitation of other men's ideas, designs, and even mannerisms, still less to imitate those of other ages. Nor is it expected that he should do so—outside a church. His powers may be great or small, his range of thought and conception high or low, but he is expected to give us the best has of his own, expressed in the most perfect manner of which he is capable. In the true work of art, where the *technique* is but the means of expressing ideas which had insisted on utterance, we respond to the influence of a master. In the hollow substitute for art, where the *technique* is but a mechanical imitation of something else, we find nothing but the drudgery of a slave tied down to a dull routine, on whom we can hardly even bestow compassion, for he parades his servitude with evident satisfaction. Surely it ought to be a truism to say that all genuine art was modern when it was produced; in no past age did men try to make their work appear to have been produced in an earlier age, and, except in decorative art, it is rarely done now. If this pedantry is absolutely indefensible on any rational artistic principle, how comes it, Mr. Holiday asked, to be permitted in any branch of art? If modernism is the characteristic of all the best art of other ages,

if we are most moved by the Giotto's, the Botticelli's, the Signorelli's, the Veroneses of the past, by all those, in fact, who expressed and led the sentiment of their respective ages, why do any of us now regard childish imitations of a past age with anything but the contempt which they deserve, and which they would have received at any other period—if such follies can be conceived as existing in any other period? Unhappily, the cause is only too obvious: the *cause*, not the justification. The poverty of the art of to-day is the reason why we pilfer from that of the past. It is only in our artistic poverty that I can account for the prevalence of that which is the greatest of artistic crimes; for under this vicious system we are training young draughtsmen into systematic deceit, and crushing every better impulse, every genuine faculty which they may have possessed when starting. Men who as students were doing hopeful work, go to one of these commercial houses, and there by degrees every faculty has gradually been blighted till no trace of any artistic perception remained. The method which originated in poverty ends in the destruction of what little we possess. If our artistic vitality is weak, this is the laziest and the most demoralising course we can adopt. So much I must say in strenuous protest against the demoralising principle that pedantry is justified by the feeble vitality of the artistic sense under which our age suffers; but now as to that weakness itself, what are its nature and extent? Is it merely that our decorative sense is imperfect? Is it merely that we are in the trough of the artistic wave, and may in another generation or so be on the crest? Is this all that is the matter with us? That genius is not so plentiful as in some other periods, but may become so again in the near future? Our case is much worse than this. It is not that geniuses are few—they may or may not be—but that society is corrupt, that the conditions under which we live are conditions under which art cannot possibly thrive. What we are concerned with is not paucity of geniuses, but the almost total absence of art in our present daily life, and the question we have to answer is, "What is there in our present condition which so stunts and suppresses that love of beauty which in every other age has been one of our dominant impulses?" I fear, with John Stuart Mill, that "the silly desire for the appearance of a large expenditure," on account of the consequence it gives us in society, causes us to surround ourselves with finery for the sake of display, instead of seeking beauty for the sake of enjoyment. The almost total absence of art in our present daily life is admitted on all hands. Outside certain isolated cases, where is the art of our daily life, the art in our houses, in our furniture, in our dress, in all our utensils, and in nineteen-twentieths of our pictures and statues and buildings? Whence arises that deadly uniformity, that depressing, all-prevailing greyness—that all-prevailing dinginess which fills our life, so far as its external conditions are concerned, and has filled it throughout this century? As a spontaneous growth taste is gone. If we walk down Gower-street, Westbourne-terrace, or Cromwell-road, we look in vain for a gleam of taste, for a glimpse of anything that can charm the eye or refresh the mind. Interminable rows of identical houses all cut down to one common type—mindless, joyless. Ornament there is, ghastly ornament, all done to order under heavy penalties, all alike, all representing—what?—the pleasure of the worker in fashioning it? Good heavens, no! It is done by machinery. It represents what is expected of the class of society to which the owners of the houses belong, or wish to be thought to belong. The same applies to the modern dress of the man of business. Gloom and the total absence of individuality are the characteristics of our system. Men are slaves, all working in chains crushed under the tyranny of two relentless Molochs, the great god Profit and the great god Snob. These two have chained up individuality and trampled her under foot. Beauty they have expelled from society. Each have their own weapons and instruments of torture. Some of the victims of Profit suffer so grievously that they dare even to make a show of resistance. But it is futile and short-lived. He has two clubs, called Supply and Demand, and these he swings about mercilessly, and the wretched slaves are soon cowed. Occasionally a feeble protest is made by those who groan under the rule of the god Snob; but

he also has two clubs—Respectability and Social Status. At the mere sight of them down go the slaves prostrate before their relentless idol. And meantime poor Individuality is wasting away in her prison. Alas! what can art do without individuality? They are inseparable, each without the other must languish. Society has taken up that liveried drudge, Ostentation and Art must keep her lonely state in a National Gallery while we are the slaves of slaves. The jerry builders and the fashion-books are the slaves of the gods Profit and Snob, and we are the slaves of the jerry builders and the fashion-books. But still we have got half-way in our inquiry into the ultimate cause of our almost extinct love of art. If the views advanced are so far sound, we have attributed the decay in our love of beauty to the growth of our love of social status, our "silly desire for the appearance of a large expenditure." So far we have only shifted the inquiry one step further back. If this degradation is the effect of external conditions, what are the conditions which affect us and which did not affect our ancestors? This differentiating factor is the intensity of the struggle for existence in our present crowded populations. Now, the pressure, instead of being, as in the past, just sufficient to produce a healthy emulation and to spur men on to distinguish themselves, has degenerated into a fierce competition for the highest profits—a struggle in which each man's one object is to get to the front and thrust his neighbour aside, and none has time to think of such frivolities as grace and beauty. In place of an inspiring emulation, we have a fierce struggle for life and death. This can only be avoided by substituting order for the present anarchy in our industrial systems. Our mistake has been in supposing that the haphazard system which did fairly well in thinly-populated countries can possibly succeed in the dense crowds of to-day. When feudalism died out and men obtained the right to compete freely in the industrial market, they believed that they possessed all that was necessary; that industry and ability would in the long run meet with its due reward, and that this principle would prove the surest incentive to the development of the best characters and the production of the best work. With some very serious qualifications it did something like this for a time. Inequalities not arising from greater or less industry existed, but these were partly the remains of feudalism. Time gradually, however, developed unjust inequalities arising from the system itself of so-called free competition—at first gradually, but, since the great development of machine power, with frightful rapidity, with the result that we have now reached the maximum of injustice. This, a monstrous condition of things, is intolerable to all humane and justice-loving persons, and thoughtful men perceive that unless we can remedy it in time, it must lead to some appalling catastrophe. It is not, however, the question of justice and humanity that concerns us directly to-night, but the influence of this industrial anarchy upon art. What has been the effect of the free fight for existence on art? This, that people have enough to do to live, they have no time for enjoyment of life. Their energies are exhausted in the struggle for food, clothing, and a roof over their heads. Having, some of them, got this, they then begin the struggle to have more than their neighbour; there is still no time to think of enjoying life: they have got to imitate the class above them. Snobbery is in every class the guiding impulse, profit-making the efficient machine. Sordid struggle for the necessities of life at the bottom of the scale, far more sordid struggle to outdo one's neighbour at the upper end of the scale. There is no time for either art or beauty. Will it pay? is the one question—not "Do I love doing it?" Is it worth having when done? Can art live in such an atmosphere? Now, if it is proposed to reform these crying evils, to liberate art from the stifling, noxious atmosphere which is all but destroying her, one is met with the cynical objection that you must regenerate human nature before you can alter these things, the objection being accompanied with a sneering scepticism as to the improbability of our nature. How do these objectors on their theory of the unredeemable baseness of human nature explain the past? Whence comes all the beauty bequeathed to us by our ancestors which we treasure in our museums, if it is an ineradicable part of our nature to prefer vulgar display to true beauty, the heaping-up

THE BUILDING NEWS, MAR. 21, 1890.

BRITISH ARCHITECTS

St. Oriel Window in Monmouth

The Chantry Chapel Tewkesbury Abbey

of profit to the doing of good work. We find in all parts of the world, and in every period of its existence, a prevailing love of beauty so strong that it has triumphed over the defects of our nature and the imperfect conditions of society. The sense of beauty varied much with place and time, but the love of it predominated everywhere. Scores of centuries teach us one great lesson: that human nature loves beauty rather than ugliness as surely as it loves health rather than disease, joy rather than sorrow. Against this vast mass of evidence we have one century offering a partial exception to the otherwise universal rule; and yet there are people so blind to all the teaching of history that they speak of beauty as if it were an acquired taste foreign to our nature, and that this nature must be wholly changed before we can attach any value to it. Is it not more rational to conclude that the spirit which prevailed for thousands of years is that which truly pertains to our real human nature, and that the partial exception exhibited by this century is a temporary aberration—a disease? What we have to do is to change this rotten, oppressive system, to substitute order for anarchy, and then, when men are not exhausted by the mere struggle to live, they will have freedom for the expansion of their natural faculties. How to get rid of this industrial chaos and to establish order in its place is the great problem which is engaging the earnest attention of many of our best thinkers, and which is rapidly becoming the most prominent subject of social interest. What we need is a righteously and wisely re-modelled industrial system, which shall insure to all the fruits of their labour, and leave to each the opportunity to assert his own individuality; which shall make worthy distinction and the gratitude of one's fellows the incentive to good work, instead of the debasing attraction of piling up more money and exhibiting a more vulgar display of brainless and graceless luxury than our neighbour. Some of us have probably read Mr. William Morris's "Signs of Change." Some years ago Mr. Morris's views appeared to the lecturer to lead to destruction with no principle of reconstruction to follow. Such a course as this is, in his opinion, worse than no solution at all. A revolution of violence, without even a clear scheme of just industrial reform in view, could only end in the re-establishment of the old tyranny on a firmer basis. He was very glad to note a totally different tone prevailing in this recent publication. It is largely constructive, and it deals chiefly with social reform in relation to industrial arts. The "Fabian Essays" published in January is a collection of most thought-

ful papers, wholly constructive in their aim, and these also deal ably with questions of taste and art. But the most popular, and the most daring, attempt to solve the great problem is that contained in Mr. Edward Bellamy's "Looking Backward." The main principles advocated in the book are not new, but they are exhibited and applied with extraordinary ability, and evince a most rare capacity for organisation. Mill has given us an emphatic opinion as to the practicability of the scheme propounded in the book as to the greater incentive to work it would provide, and its enormous superiority to our present system. A system such as that sketched in "Looking Backward," where all contribute to the production, and all receive their share in the distribution, is not a wild Utopian idea unworthy the notice of a political economist. Mr. Holiday had discussed the book with Mr. G. F. Watts, who is not merely a profound believer in the wisdom and justice of the social and industrial system advocated in "Looking Backward," but in the immensely favourable influence it would exert on art. The quick response of our sentient nature to the great mother Nature is love of beauty, and nothing can utterly destroy it. It has been universal, and is so still, where the foul monsters Profit and Snobbery have not established their corrupting rule. Remove these, let men work in comfort, and without sordid cares or corrupting motives, and they will naturally prefer to work well than ill. Add to this the powerful incentive of public esteem, and they will work with zest and vigour. What people call a routine in Mr. Bellamy's system is a simple series of inducements which, by insuring that each worker gets the full credit of his work, gives him the most powerful incentive to distinguish himself, by the excellence of his work or by the improvements he can effect. Moreover, the growth of brotherhood will give a great impetus to public spirit, and the system will exert an equally wholesome influence on its training and its ethics. In conclusion, Mr. Holiday observed:—I have feebly indicated the benefits which would be conferred on art by the substitution of a just system of production and distribution for the vicious one which now stifles it; but I hope I have said enough to show that the subject is one worthy of our careful study. I would go further, and say that the view is one the promotion of which is worthy of our most earnest efforts if we would see art recover from the paralysis which now afflicts it.

A short discussion followed, in which Messrs. E. C. Robins, F.S.A., Hugh Stannus, H. O. Cresswell, and F. R. Farrow took part, and a hearty vote of thanks was accorded to Mr. Holiday for his lecture.

#### SKETCHES AT TEWKESBURY AND MONMOUTH.

THE beautiful chantry chapel of which we give a sketch this week, is one of several surrounding the choir at Tewkesbury Abbey, and though much mutilated, is the finest of them. It contains the tomb of Richard Beauchamp, Earl of Abergavenny, and the chapel was erected to his memory by his young widow Isabel, the last of the Despencers. He was killed at the siege of Meaux in 1421. In 1423 she married the Fifth Earl of Warwick. Hence the chapel came to be called the Warwick Chantry, but erroneously so, as it should be more correctly described as the Beauchamp Chantry. We published illustrations of Tewkesbury Abbey in May 11, 1877, and August 12, 1881. The oriel window of Perpendicular work is a fragment of the old priory at Monmouth, which formed a portion of the apartment known as Geoffrey of Monmouth's study. It has of late been used as a schoolroom. We would refer our readers to a somewhat similar and beautiful window at Tewkesbury, of which we gave an illustration in the "B. N.," August 12, 1881.

A new Free Church at Fort William, N.B., was opened on Sunday. The church consists of a nave and aisle, and measures internally 71ft. by 56ft., the aisle being separated from the nave by an arcade carried by octagonal pillars, with traceried spandrels. There is a tower at the north-west angle, forming the vestibule and staircase to the gallery. The church is seated for 460. The architects were Messrs. Sydney Mitchell and Wilson, Edinburgh.

A recital was given in St. John's Parish Church, Victoria-street, Edinburgh, on Friday night, to inaugurate an organ which has just been introduced into the church. The instrument has been built by Messrs. Harrison and Harrison, of Durham. The case, designed by Messrs. Blanc and Gordon, architects, is constructed of yellow pine wood, carried out in panel and carved work.

The Mersey Docks and Harbour Board had under discussion on Friday a scheme, submitted by the Works Committee, for the improvement of the Canada Basin Dock and Lock, the construction of a new branch dock out of the Canada Dock, and of a new deep water vestibule or half-tide dock on the present site of the Sandon basin and the Wellington half-tide dock. The scheme is calculated to cost a million of money. It was decided that that portion of the scheme which related to the Canada Basin Dock and Lock be carried out forthwith at an estimated cost of £470,000.

The London County Council have declined to purchase the Hilly Fields, Brockley, containing 57½ acres, as an open space, on the ground that the price asked, £43,675, is too high.

## Building Intelligence.

**CHARING CROSS-ROAD.**—The memorial stone of the new municipal buildings for St. Martin's-in-the-Fields was laid on Tuesday by the Prince of Wales. The buildings will include a town hall, free public library and reading-room, and are situated at the south-east corner of Charing Cross-road, next the Garrick Theatre, and facing the site of Mr. Ewan Christian's projected National Gallery. The town hall buildings will contain, on the ground floor, offices for the vestry clerk and surveyor's department, entrance hall, vestibule, committee-room, medical officer's, sanitary inspector's, and analyst's rooms. On the first floor will be placed the vestry hall and public rooms, waiting and retiring rooms, and large committee-room. Additional accommodation will be provided in the basement for public meetings, &c. The free library is placed on that part of the site facing St. Martin's-lane. The style adopted is Classic Renaissance; all the elevations are being built in Portland stone, and the total cost is estimated at £30,000. Mr. Robert Walker, F.R.I.B.A., of St. Martin's-place, W.C., is the architect, and the builders are Messrs. John Mowlem and Co.

**NEW THEATRE FOR WALSALL.**—Mr. W. H. Westwood, of the Gaiety, is about to demolish his present premises, and those occupied by Mr. J. Greenslade, outfitter, adjoining, and to erect a more commodious theatre at the corner of Station and Park streets. The new building will be fitted up with the most modern requirements for the comfort of the public, and in the best practical and convenient manner for professionals and employés. The structure will be of substantial character, and one of the safest theatres in the Midlands. Every precaution for the protection of the audience has been adopted in the provision of a fireproof drop curtain, fireproof and spacious staircases, and commodious entrances and exits; the lighting, heating, and ventilation also have been fully considered, with a view to make the building worthy of its purpose. The auditorium comprises stalls, pit, dress-circle, private boxes, and gallery. The exterior of the building is in the Romanesque style of architecture. The wallings will be principally of red brick, relieved with stone and sculptured Shakespearean figures. At the circular angle of Station and Park streets will be a turret, partly covered with lead and copper, with lunettes for electric lights, and finished on the top with gilded figures. The side next Station-street is to be of a plainer character. The ground floor of the building will be occupied principally by bars and smoke-rooms. The total cost of the buildings and fittings complete it is estimated will be about £14,000. The architect is Mr. Daniel Arkell, of Temple-road West, Birmingham.

**SCARBOROUGH.**—There have just been presented to the Holy Trinity Church, Westbourne-grove, three stained-glass windows, each containing two subjects. The windows have been presented by the family of the late Joseph Padbury, the contractor for the church. The windows are placed in the circular apsidal east end. The centre one represents "The Crucifixion," and "The Ascent to Calvary." The window on the left side is entitled "The Judgment Hall of Pilate," and "The Agony of Our Lord in Gethsemane," while the window on the right hand is "The Descent from the Cross," and "Christ Preaching to the Spirits in Prison." The windows were designed and painted by Mr. C. E. Kempe, and are in the 15th-century style. The church was built about 10 years ago, with the exception of the tower and spire, from the design of Mr. Ewan Christian, in the style of the middle 13th century, and is fitted to the irregular and sloping nature of the site. The tower and spire were added last year, and dedicated by the Archbishop of York at Christmas. The spire is upwards of 50ft. high, of square design, of timber construction, with four pierced dormers, and the whole is covered with cast lead with welted rolls forming diminishing continuous zigzag panels all round it, all points radiating towards the gilded vane which surmounts the cap of the spire. The whole of the works in connection with the church, with the exception of the foundations, have been carried out by Messrs. Jos. Padbury and Sons, of Scarborough.

Canon Argles has offered to give a marble floor for the choir of Peterborough Cathedral.

### COMPETITIONS.

**LEITH.**—The Edinburgh Architectural Association have addressed a letter to the School Board for Leith with reference to an advertisement, which recently appeared in the local papers, inviting designs from architects for a new Board School at Craighall-road, Trinity. The Association draws attention to certain features of the conditions, which, if adhered to, will necessarily prevent many members of the profession from responding to the invitation. The first point is the reservation by the Board of the power of final selection, thus neutralising the excellent intention of consulting a professional referee. A second is that no guarantee is afforded that the author of the first premiated design will be engaged as architect for the erection of the building, the condition implying an entire reservation in this matter. A third point is that the sum offered as an inclusive fee is not only totally inadequate as remuneration for the labour which will be involved in carrying out a work which, at the usual rate per head of scholar, and taking into account also the conspicuous position of the site, will range between the sums of £12,000 and £13,000; but it amounts also to less than one half the rate of commission laid down by the Royal Institute of British Architects, and recognised by all professional and public bodies throughout the country.

### CHIPS.

The new hospital, Rosario, Argentine Republic, is being warmed and ventilated by means of Shorland's patent open fireplace Manchester stoves, with descending smoke-flues, the same being supplied by Mr. E. H. Shorland, of Manchester.

A new Liberal Club is being built in Quebec-street, Leeds, from designs by Messrs. Chorley and Connon, of that town. It will be Renaissance in style, the external walls being of red or buff brick-work, and the dressings of terracotta. Accommodation will be provided for 1,600 members. The contracts have all been let to local firms.

At a special meeting of Dundee Police Commission on Monday, a long discussion took place in regard to the litigation by Mr. Will, contractor for the Esplanade. By a large majority it was resolved to offer to take the contract off Mr. Will's hands, paying him contract rates for the work he has done, and taking over at valuation the materials he has prepared for the work.

A new cemetery chapel has been built at Camborne, from plans by Mr. Sampson Hill, of Redruth. The builder was Mr. Arthur Carkeek, also of Redruth.

While excavating for sewerage purposes in Bedford-square, Tavistock, on Monday, workmen brought to light a number of encaustic tiles, which evidently formed part of the flooring and mural decorations of the former Abbey Church, and also what appeared to be the keystone and other pointed stones of a small arch. They likewise unearthed a quantity of human bones.

Mr. Browne, the surveyor and architect of the Bellaggio Estate, who is leaving East Grinstead, has, the local newspaper reports, been made the recipient of several gifts.

The Duke of Westminster has given Mr. William Haswell, mason, of Chester, instructions to carry out, from designs by Mr. R. W. Edis, F.S.A., a memorial tablet in dove and statuary marbles, to be erected in Halkyn Church, near Chester, and to bear the following inscription:—"To the memory of George Hughes, friend of the Marquis and of the Duke of Westminster, agent of the Halkyn estate from 1848 to 1889. Died August 7, 1889, aged 74 years."

The great tower of the Cathedral of Ulm is at last on the eve of completion, together with the other repairs and works of restoration. The tower when finished will be 524ft. high, which exceeds the height of St. Paul's in Hamburg. The celebration of the completion of the restoration will take place on the 30th of June next.

Mr. Wm. Chatham, Assoc. Mem. Inst. C.E., of the dock engineer's office, Bristol, has been appointed executive engineer to the colony of Hong Kong by the Crown agents for the colonies, at a salary of £750 a year. This is the second responsible and lucrative appointment secured by members of his staff during the last few months.

The organ of Eccles parish church is now being taken down prior to its removal to the parish church of West Leigh, Lancs. A new organ, which is to occupy both the north and south sides of the chancel at Eccles, is being built by Messrs. Binns, of Leeds. It is proposed to seat the present organ-chamber, which adjoins St. Katherine's Chapel.

### ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

**MANCHESTER ARCHITECTURAL ASSOCIATION.**—The last ordinary meeting was held at the Diocesan Buildings on Tuesday, Mr. T. Chadwick in the chair. The following gentlemen were elected as officers for the next session:—President, T. Chadwick, A.R.I.B.A.; vice-presidents, E. Hewitt, A.R.I.B.A., and J. D. Mould, A.R.I.B.A.; treasurer, A. H. Davies Colley, F.R.I.B.A.; librarian, J. S. Hodgson; registrar, J. H. Woodhouse; secretary, J. D. Mould, A.R.I.B.A. Committee: P. E. Barker, A.R.I.B.A.; P. Hesketh, A.R.I.B.A.; E. P. Hinde, A.R.I.B.A.; J. Horsfall, F. W. Mee, W. E. Potts, A.R.I.B.A.; F. B. Smith, E. H. Stelfox, A.R.I.B.A.; and G. H. Willoughby. Mr. W. E. Potts read a paper entitled "Creeds in Architecture." He contended that architects voluntarily fettered themselves, and limited the possibilities of their achievements by subscribing to certain traditions which, in course of time, had crystallised into creeds. This resulted in the perpetuity of some traditions, as, for instance, the cruciform plan in churches, which in many cases was not now suitable to the present form of worship. The paper pleaded for wider sympathies, a cultivation of an open-minded ability to discover merit wherever it might exist, and a struggle against prejudices. Messrs. Mee, Colley, Ross, and Hodgson took part in the discussion which followed.

Mr. P. A. Muntz, M.P., last October promised to present a mayoral chain to the borough of Tamworth. The chain has just been completed by Messrs. T. and J. Bragg, of Birmingham. It is in 18-carat gold, and designed in the Renaissance style. Every alternate link is arranged to receive a mayoral record; the others are filled with enamelled shields representing the historical associations of the borough, which date back to the grant of civic privileges by King Canute; the centre link of the chain bearing the arms of the donor, and from this depends a suitable badge.

A stained-glass window has been placed in Mold Church to the memory of Richard Wilson, R.A., the famous artist, whose remains were interred in Mold churchyard, of which parish his father became vicar soon after the birth of his talented son. The design of the memorial window is that of the four patron saints of Wales, England, Scotland, and Ireland, with the arms of the countries below, and in the tracery angels and Tudor badges, to harmonise with the architecture of the church. The work has been carried out by Messrs. Burlison and Grylls, of London.

A bakery and suitable accessory buildings is about to be erected at Woolwich for supplying the garrison (reckoned at about 7,000 men) with bread made by soldiers of the Army Service Corps. The buildings were designed last year by Mr. A. O. Giles, R.E., and will be erected by Messrs. G. E. Wallis and Sons, of Maidstone, whose accepted tender amounts to £2,625. Messrs. Johnson and Co., 10, Balloon-street, Manchester, have been selected to supply and fix the steam ovens, some of the latest improvements in which have been patented by that firm. Mr. W. Menzies, R.E., will be the clerk of the works, under Capt. Leslie, R.E., the officer in charge of the division in which the work lies.

Mr. Bonney, surveyor to the Rugeley local board of health, died last week at the age of 49. He was the fourth son of the Rev. T. Bonney, a former master of the grammar-school at Rugeley, and was employed in early life on railway construction in Leicestershire and Staffordshire. He afterwards commenced practice as an architect and surveyor, and was until his death one of the diocesan surveyors for the archdeaconry of Stafford. He was buried on Friday with military honours, being a major in the local volunteer corps, in Rugeley Cemetery, which was laid out from his designs as surveyor to the burial board.

The mausoleum of the Emperor Frederick, next to the Friedenskirche in Potsdam, is completed externally, with the exception of the copper roof of the cupola. In the interior the stonemasons and sculptors are briskly at work. The decorations of the interior are carried out entirely in light grey Silesian sandstone, with dark green Syenite pillars. Over the opening of the altar niche an escutcheon has been placed, over which the Imperial eagle soars with outspread wings. This is flanked on both sides by figures of angels holding religious symbols in their hands. The spandrels of the upper gallery are adorned with cherubs. The mosaics in the cupola and on the ceiling of the altar space are about to be carried out from designs by Professor Ewald, after Early Christian works. The cupola will have figures of angels on a gold ground between palms.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

## NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII, XLVI, XLIX, L, LI, LIII, LVI, and LVII may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—J. A.—R. F. V.—L. and D.—J. T.—W. O.—S. L. B.

## LOW SIDE WINDOWS IN CHURCHES.

To the Editor of the BUILDING NEWS.

SIR,—Adverting to some interesting disquisitions on low-side windows, quoted in your issue of the 7th inst., I conclude that the very charming example of such windows existing in the chapel or oratory of Prior Crauden, within the precincts of Ely Cathedral, was at least not forgotten by some of those who took part in the discussion. The chapel, a little gem of the Edwardian period, is abundantly lighted by large eastern and western windows, as well as by two tall windows of two lights each on the north and south sides. In addition to this ample provision for the admission of light, however, the architect (probably the illustrious Alan de Walsingham) has introduced two lovely low windows, one on each side, west of the tall side windows just mentioned. They are under ogival canopies, profusely enriched with delicate sculptured leafage. [See two illustrations in Murray's "Hand-book to the English Cathedrals."] The interior sills of these low windows are about 2ft. 6in. from the floor of the chapel, and each of them has a stone ledge, not a seat, within its recess; but the external sills are some 10 or 12ft. from the ground, the chapel being built upon a large undercroft or crypt, and occupying the "first floor" (to borrow a secular term) of an edifice with two stories. This fact disposes at once of the explanatory hypothesis suggested in the conference quoted from the *Antiquary*. There could be no looking in from the outside by lepers, penitents, or ordinary witnesses of the sacred rites; and it is most unlikely that a sanctus-bell would be rung at an open window of this private oratory, an appendage of the residence of the Prior, attended, doubtless, only by himself and his household, and within a stone's-cast of the vast church of the abbey. For my own part, I suspect that we must fall back upon a very prosaic explanation of these

low windows—namely, that the Prior, elderly and dim-sighted, wished for light thrown directly upon his Breviary, when he heard Mass said by his chaplains; and that his friend Alan the Sacrist, met his wishes by the insertion of these exquisite windows.—I am, &c.,

W. E. DICKSON,  
Sacrist of Ely Cathedral.

## PROVISIONAL AMOUNTS.

SIR,—So much unpleasantness frequently arises in the adjustment of these amounts in modern contracts that the question naturally suggests itself, Why is some combined effort not made to place the matter on a more satisfactory footing?

The remarks made by Mr. Gough in his paper reported in your last week's issue show the way some architects look at the matter, but there is also a builder's view to be considered. The whole question seems to turn upon the proper interpretation of the terms "prime cost" and "nett" when applied to these amounts. Some architects maintain that the terms mean the exact out-of-pocket cost to the builder, though they generally omit to say so in their specifications; while the builder maintains that they mean prime cost or nett amount the client would have to pay, supposing he went to the showrooms or warehouse and purchased the goods on his own account.

To show that the latter is the proper view, let us examine the theory of these amounts. In the first place, it will be noted that they are only applied to goods the value of which cannot adequately be described in any other way—viz., stoves, chimney-pieces, wall-papers, &c., or special work of any description; the theory being, that if the value of these goods was left to the builder to price, he, in his anxiety to get the job, would provide a totally inadequate amount for the kind of goods the client required. Hence the client, through his agent the architect, instead of saying the number of chimney-pieces or stoves he requires, puts also a value to them as a guide to the builder in making up his estimate.

Now suppose the client consulting the architect as to these prices, or *vice versa*, a manufacturer's or trade catalogue is naturally referred to, and the several prices agreed—i.e., the catalogue prices, or prices to the general public, of which he (the client) is one; the trade discount or builder's profit does not concern the client any more than the manufacturer's profit. Why then should his agent, the architect, wish to interfere with it?

Taking the illustration advanced by Mr. Gough, that if 500 locks were specified, the builder would be bound to supply them, and that, therefore, if 500 sovereigns are specified, he should be made to supply them also, the fallacy of this argument is in supposing sovereigns to be mere goods to be supplied, whereas they imply £500 worth of goods, a totally different thing, for the amount is put in to guide the builder—in fact to price it for him. In the case of the locks, the builder puts his own value, which is the value to the client or general public; but in the case of the other goods, which the builder has no means of knowing what is required, the architect puts the value at £500 in a lump sum for a quantity of them, and this value should be the same as the builder's—i.e., include his profit. All that the architect can rightly insist on is the vouchers showing the amount which would have been expended supposing the client had bought them; the out-of-pocket expense to the builder cannot concern him in the least, unless he is jealous of the profit which is made.

If the principle is once conceded that an architect has a right to know the exact prime cost to the builder of any article supplied by him, in order that he judge whether his client has been overcharged, then, according to the ordinary rule of logic, he could claim the right to know the prime cost of the whole job for a similar reason; and this shows the absurdity of the claim.

The terms "prime cost," or "nett," having two different interpretations, are therefore best left alone, and their place should be taken by the word "value," which expresses in a far better manner what the provisional amount is intended to be.—I am, &c., A BUILDER'S MANAGER.

## THE BRICKS AT WOODFORD ASYLUM, &amp;c.

SIR,—The letter of "Enquirer" in your last issue directs attention to a subject of far greater

interest than may be supposed by those unacquainted with the extensive nature of asylum works.

He asks "Whether it is not a fact that the specification for the bricks says 'London stock bricks?' Whether instead of London stock Bricks, bricks are not being sent from Peterborough? And whether the architect for the works at Woodford, under the London County Council, is not at the same time largely interested in the manufacture of Peterborough bricks?"

Now, in the first place, it has been stated recently that between five and six millions of bricks have been used in the foundations and subways of the Woodford Asylum, and that twenty-two millions of bricks are to be used in the construction of the superstructure; therefore your correspondent may well desire to ask Lord Rosebery and the London County Council why bricks are being brought from so great a distance to the presumable disadvantage of brickmakers nearer to Woodford, especially as the latter are so very badly circumstanced as to find it worth their while to "lock out" their employés, to the detriment of London ratepayers.

With your kind permission, I propose, at some length, to supply your readers with particulars possibly not known to many of the London County Councillors, who had nothing to do with these asylum works until the foundations were nearly complete. At the same time, the London County Council is responsible, for the selection of twenty-two millions of bricks for the superstructure.

Early in 1887 the architect of this asylum estimated that the total cost thereof would amount to the sum of £290,000, or thereabouts: the total accommodation he gave at 2,025 patients, and the average cost per bed at about £143. In his report to the magistrates of the old county of Middlesex, he stated:—"I have not attempted to cut down my estimate for the sake of making it a feature in the design; at the same time I quite believe it would be possible to complete all the buildings shown on my plan for less than the sum named."

Now the following appeared in a publication of November 23 last respecting this Woodford Asylum:—"The original design made two years ago is, in respect of its general arrangement and accommodation, almost identical with the ground plan to which we devote one of our illustrations; but some of the blocks occupied by patients were somewhat amended in point of detail, when submitted to the approval of the Lunacy Commissioners."

I therefore ask, How is it that the cost of the foundations and superstructure of these "almost identical" buildings has been recently stated at nearly £390,000, of which amount £337,945 has been sanctioned by the London County Council? the total excess so far being about £100,000, and the cost per patient being raised (so far) from £143 per bed to about £200?

What the final cost per bed will be it is useless to surmise upon such data as the foregoing, and it must be remembered that the foundations and other sundry works were to cost (according to the estimate given to the magistrates of the old county of Middlesex) the sum of £28,000, and not £50,000. The first-named sum was also to include for sewerage-tanks and main drains. Have these works been carried out within the £50,000?

We will assume that the total cost will only be £100,000 in excess of the original estimate, or, say, not more than £200 per bed, and will compare the prices with what the same architect has recently promised to do at Dorchester.

This architect has just been appointed to carry out asylum extensions at Dorchester, for 400 patients, "together with a new administrative department, a large recreation hall, a detached church in the grounds, new laundry buildings, and various alterations to the old asylum," which latter accommodates 320 patients. All this work is estimated to cost from £40,000 to £50,000, or from £100 to £125 per patient for the 400 patients, or considerably less if the alterations for the benefit of the 320 former patients be taken into account.

The Brookwood Asylum cost (including also architect's commission) only £126 10s. per bed, and not being one of the very large asylums, one would naturally expect that it would have been more costly (in proportion) than Woodford Asylum, particularly in reference to the administrative portions.

Why should it be necessary to expend so much as £200 per bed upon Woodford Asylum and only £100 upon each bed for the asylum near Dorchester, the architect being the same for both buildings?

It is a fact that certain asylums (by reason of mismanagement or ignorance) have in the past cost enormous sums.

Churches are arranged for in connection with the asylums at Woodford, Dorchester, and elsewhere (the first named to cost about £8,500, I believe). Now, is it not very unfair to many of the ratepayers of the counties of London and elsewhere that buildings for the Church of England services should be erected at the cost of persons belonging to other denominations? As an alternative, the recreation halls and day-rooms might be used for the services of those denominations mustering practicable congregations of patients, the attendants arranging for their own places of worship when off duty.

Insanity is too often based upon some religious question or delusion; but patients in asylums do not always become so insane as to forget the creed they were taught to adopt, or cease to appreciate it. For this reason I am of opinion that insane patients should not be compelled to attend Church of England services if these are not what they have been accustomed to, and ratepayers throughout the country might save large sums of money by declining to erect churches or chapels for insane paupers out of the public funds. If provided at all, those should be supplied by each religious body concerned; but probably a majority would prefer to expend money upon a church in some poor neighbourhood, with a view to the consolation of those whose poor homes are in striking contrast to the costly pauper lunatic asylums, and whose responsibilities and troubles have not, as yet, driven them beyond that border-land where reason ceases to be and madness reigns omnipotent.

I have no doubt but that if the London County Council were to appoint an architectural officer, acquainted with asylum works, to regularly examine the plans and papers belonging to the various asylums under the care of the Council, and to periodically visit those asylums, and report accordingly to the Asylums Committee upon the structures, not many "Peterborough bricks" would be found on the new jobs.—I am, &c.,

March 17. A LONDON BRICK.

#### CHARMINSTER ASYLUM COMPETITION.

SIR,—With a view of petitioning the Committee of Visitors to make public the assessors' report and let the premiated designs be on view, will the candidates who think this should be done kindly send their names to me on an early date?

REGINALD PINDER.

Avenue Chambers, Bournemouth, March 19.

The town council of Buckingham have adopted, subject to the sanction of the Local Government Board, a scheme for proposed new sewerage and water supply works, the plans and specifications for which have been prepared by Mr. Baldwin Latham. The estimated outlay is £18,300.

A new reredos, the work of the members of the village carving class, was opened on Sunday in St. Oswald's Church, Burnside, by the Bishop of Carlisle. The reredos is of oak, and is the result of four winters' work by the carvers. The length of the reredos, which is composed of panelling and tracery, is about 12ft., and the top of it reaches to the stained glass of the east window.

The members of the locomotive department upon the South Western Railway at Exeter have just erected a memorial over the remains of Mr. E. A. Towning, of that city, who was killed by a fall from his engine in November last. The stone is of fine-grained yellow magnesian limestone, and has on it a fac-simile in high relief of the engine and tender Towning was driving at the time of the accident, No. 497. The memorial is the handiwork of Mr. Harry Hems, of Exeter, and has been erected in the cemetery at that city.

The Plume of Feathers Inn at Winchester, which adjoins the ancient Westgate, to which it formed the porter's lodge, has just been enlarged, from designs by Mr. A. W. Galbraith. The inn was partially rebuilt in 1685, when the tenant was ordered by the corporation of the city to consult Sir Christopher Wren whether His Majesty (Charles II.) would require the site for his projected (and never executed) Winchester Palace. The new adjunct consists of an assembly-room, and is built in a style to correspond with the Westgate in red Corsehili and blue Robin Hood stone. Mr. John Fielder, also of Winchester, was the builder.

## Intercommunication.

### QUESTIONS.

[10249].—**Beam.**—A beam 9in. by 6in. spans a certain opening. It is supported by two columns, the three spaces being equal. If the columns are taken away, what size must the beam be to carry the same weight?—GILBERT.

[10250].—**Seasoned Timber.**—Is it not a difficult matter to decide by inspection whether woodwork is properly seasoned? Pitch pine especially is often very disappointing. Any hints on the subject useful to an architect would be esteemed.—P. P.

### REPLIES.

[10241].—**Deviation of Compass.**—The readiest way of finding the "deviation of the compass" or the variation of the magnetic north is to take the compass bearing of a distant object, and then compare it with the bearing of the same object on an Ordnance map. The difference is the variation. Ordnance maps are all plotted to the true meridian. Standard textbooks on the subject give many ways of finding the variation by observation of celestial bodies; but they are all difficult or impracticable to the inexperienced. The method described above, which consists simply in using the information supplied to us by experts charged with the National Survey and State map-making, I have not seen referred to or heard described. A short time ago, being suddenly called upon to state the magnetic variation, I found it in two or three minutes with a circumferentor and an Ordnance map from my office window. Failing an Ordnance map, the plainest instructions I know of are in Rankine's "Civil Engineering," article "Finding the Meridian." The method given on p. 399, BUILDING NEWS, March 14, is not quite correct, inasmuch as the North Star (*α Ursæ Minoris*) is due north only when it is midway between its two elongations.—GILES WREXHAM.

[10247].—**Speaking Tubes.**—In reply to Geo. B., perhaps the following, from Hurst's "Architectural Handbook," may give him some information:—"The velocity of sound through tubes is nearly the same as through air. Pipes of copper, alloys of lead and tin and zinc transmit sounds to greater distances than iron. Moisture in a pipe tends to confuse or annihilate sound. Bends diminish the intensity. A wrought-iron pipe 1in. diam. with four quadrant bends, transmitted words distinctly for 250ft., but failed at 420ft. The author says he has spoken through a wrought-iron pipe with two bends 1½in. internal diameter and 450ft. long, but failed to be heard when the pipe was lengthened to 600ft. Lead pipe ½in. diameter can be used up to 250ft., and a tube of gutta-percha 1in. diameter answered satisfactorily when 200ft. long." Lead or composition gas-pipe, say, ½in. diameter, with a suitable mouthpiece, is perfectly satisfactory under any ordinary circumstances.—BUD.

### CHIPS.

The Edinburgh Town Council have adopted plans prepared by Mr. T. Morham, city superintendent of works, for a proposed police station to be erected at the north-west corner of the Waverley Market, with an access from Princes-street.

New stables have been erected at Southampton for the Corporation, and special attention has been paid to the ventilation, which is carried out on the Boyle system.

Works of water-supply for Stone, Staffs, which have been carried out from plans by, and under the direction of, Mr. G. D. Harrison, were formally inaugurated on Tuesday week. The outlay has been £7,000. The reservoir, which holds 3,000,000 gallons, is placed in Stone Park, at an elevation of 300ft. above the level of the Market-place.

A new Bible Christian Chapel is being built in Tregonissey-road, St. Austell, from plans by Mr. F. May, of that town. It is of granite, with Bath-stone dressings, and will cost about £11,300. The contract for masonry has been undertaken by Mr. Samson Hunkin, of St. Austell, and that for carpentry by Mr. W. Blamey, of Veryan.

The annual report of Manchester New College contains a description of the proposed new buildings at Oxford. They will be in the form of a square, surrounding a "quad" of about 96ft. by 60ft. The chapel is planned to contain 253 sittings. The library, on the first floor of the main building, will be 80ft. by 32ft. It is estimated that the buildings, with fittings and furniture, will cost £30,000.

Before leaving Cannes on Saturday the Duke of Cambridge inspected the recumbent figure of the late Duke of Albany, upon which a sculptor, Signor Pelligrini, has been working for two or three years from Sir E. Boehm's model. The Prince of Wales is expected to visit Cannes and unveil the statue in St. George's Memorial Chapel.

The railings surrounding St. Giles's Cathedral Church, Edinburgh, are about to be removed, the three authorities concerned—the Ecclesiastical Commissioners, the City Council, and the session of St. Giles—having given their consent to the alteration.

A new Wesleyan chapel was opened last week at Brentford by the Rev. C. H. Kelly, President of the Conference. The building is a Gothic one of stone, designed by Mr. Charles Bell; it will seat a thousand persons, and has cost, exclusive of site, £4,500.

### LEGAL INTELLIGENCE.

CAN AN ARCHITECT CHARGE FOR TIME?—**HAWARD V. KITCHING.**—The question whether an architect is entitled to charge for time in superintending works at a distance, in addition to commission, was raised in an action heard on Friday by Lord Justice Fry. The plaintiff, an architect in London, sued the defendant, a gentleman residing at Darlington, for a sum of £166 18s. in respect of commission and work done there, and £160 19s. 8d. in respect of railway fares and other travelling expenses and charges for time. The first sum the defendant had paid into Court, and of the second he had paid £72 2s., which he considered sufficient. The only dispute now was as to the plaintiff's right to charge for time occupied in superintending the work at Darlington, in addition to the commission, which was 5 per cent.—Mr. Montague Lush was counsel for the plaintiff, and Mr. C. C. Scott was for the defendant.—Lord Justice Fry asked if the plaintiff was suing under a special contract.—Mr. Lush: No.—Lord Justice Fry: I doubt whether you will get me to give you this amount charged for time.—Mr. Lush hoped he should be able to induce his Lordship to do so. His case was that, according to the rules of the Royal Institute of British Architects, if a member of the profession was required to go a long distance from his home the 5 per cent. commission did not cover the charge for his time.—Lord Justice Fry: Can you say the employer is bound by the rule?—Mr. Lush said he should put his claim on the ground that it was a customary and proper charge, and he should prove it. The contract was made in 1885, and was carried out in that and the three following years, the works consisting of alterations to Bransome Hall, and designs for stables there. The plaintiff went to Darlington in connection with the work 17 times, and stayed there three or four days on each occasion, and he charged only £1 11s. 6d. per day for his time, although the fee named by the Royal Institute of British Architects was three guineas per day.—The plaintiff, in cross-examination, said he was not a member of that Institute.—Mr. White (Secretary R.I.B.A.) proved that three guineas a day was the usual charge for time. Half the 5 per cent. commission was for plans, specifications, &c., and half for superintending the execution of the work. He was not prepared to say whether an architect should charge for the time he was away.—Mr. Charles Barry, architect, said it was the usual custom, though not the universal practice, to charge three guineas a day for time in respect of the days of actual travelling to and fro, but nothing was charged by architects for time in superintending the work.—The defendant said the plaintiff worked for him as a builder, and not as an architect.—Two architects gave evidence for the defendant to the effect that it was not their practice to charge anything for time in respect of work executed at a distance beyond the 5 per cent. commission, except by special agreement.—Lord Justice Fry, without laying down any general rule as to architects' charges, thought the defendant had paid enough into court, and gave the defendant judgment, the plaintiff to have costs down to, and the defendant to have costs subsequent to, the payment into Court.

NOTICES UNDER THE BUILDING ACTS.—**C. F. HAYWARD, DISTRICT SURVEYOR OF ST. GILES AND ST. GEORGE, BLOOMSBURY, V. CULLIS, BUILDER.**—An important decision was given at Bow-street Police-court last week by Mr. Vaughan, on the subject of notice to be given to the district surveyor for "necessary repair (under Clause 9) affecting the construction of any external or party-wall." The necessity for the notice as required by the district surveyor (in accordance with the various clauses of the Act, 31, 38, and 39) was disputed by the builder, the architect of the work being Mr. F. Vincent Stokes, architect, of Great James-street. The work was being done at No. 6, Woburn-place, consisting of repairs to, and partially rebuilding the chimney jambs, breasts, and portions of the party-wall in basement, and also in taking down and rebuilding arch and jamb of kitchen-area entrance, being part of external wall in front. Mr. W. F. Stokes, the solicitor for the defendant, brought Mr. G. Pearson, surveyor, as a witness as well as the architect and builder. The district surveyor called several witnesses, particularly Mr. F. Wallen (the district surveyor for St. Pancras West), and Mr. William Waine, the surveyor to the Duke of Bedford. The matter was adjourned several times; the magistrate went to view the premises. The result was in favour of the contention of the district surveyor, to whom was awarded costs, and a modified penalty of £5 was inflicted on the defendant. It will be noted that special reference was made in the defence to the well-known case of *Badger (D.S.) v. Denn (1858)*, on which it seemed the defendant mainly relied for his contention that no notice was required to be given, though there were admittedly numerous points involved in carrying out the work to which the rules of the Act applied, and to which the duty of the district surveyor was to see that the rules were properly observed. Mr. Vaughan's judgment

was as follows:—This case of Badger v. Denn ought not to be construed to prevent the supervision of any work by the district surveyor as required by the Act, Clause 31, &c., including that of repairs, which in that case were merely superficial, the total being only as described in the report of the case, showing that the work done seemed in the nature of a casing or skin. But in the present case now before him, however, the section requiring notice does certainly apply, and it is not merely repair—even if it were only necessary repair, notice would be required all the same, for otherwise it might be held that the whole wall might be taken down and rebuilt without notice, which would be obviously wrong, as the district surveyor could not carry out his duties of supervision properly. He would not care to extend the judgment of the case of Badger v. Denn to a case where the facts are not compatible, and here the works done to the external wall have been proved to be 4½ in. thick, and 9 ft. 6 in., or more longitudinally. But this is a small part of the case, for there are the chimney breasts and jambs in the kitchen; some of the work is proved to be, from the bottom to within 10 in. of the ceiling, entirely removed, and new brickwork put up. This is not repair, but rebuilding—entire reconstruction. All evidence, even that of the defendant's witnesses, especially Mr. Stokes the architect, shows that the work done did affect the party-wall bonding in the new brickwork to the old. Again, on the left-hand side of the chimney breast, the builder admitted he had built about 3 ft., and, though others proved more, that is enough to show the case does not come within the exemption intended by Clause 9 for work of necessary repair not affecting the construction of the wall. Penalty, £5 and costs, £3 3s.

### WATER SUPPLY AND SANITARY MATTERS.

STAFFORD.—The new waterworks at Stafford were opened with much ceremony on Monday. After 13 years of anxious and fruitless search the corporation of Stafford at last found an ample supply of water at Milford. Three sites were successively tried, but without success, as in two cases the water was found to be impregnated with salt, and in the other there was not a sufficient supply. In these attempts and in the provision of the present works a sum of £12,000 has been spent. About twelve months ago the corporation decided to make another attempt, and a corner of Cannock Chase was the spot selected. A well a few feet deep was sunk, the result being that an ample supply of good water was discovered, and a site for the pumping-station and reservoir was purchased for £600. The work of erecting engine-house, constructing reservoir, and laying the mains was then proceeded with. The buildings at the pumping-station were erected by Mr. Espley, his contract being £3,295; the reservoir was constructed by Mr. A. F. Whitmore, of Stafford, at a cost of £2,692, and is capable of holding 577,575 gallons. It is situated on the top of a hill, just above the pumping-station, and is 468 ft. above sea level and 213 ft. above the level of Stafford Market-square. The distributing mains—about 7½ miles in length—were laid by Mr. C. J. Nevitt, of Stafford, whose contract was £5,962.

### PARLIAMENTARY NOTES.

THE ARCHITECTS' REGISTRATION BILL.—The second reading of this measure should have been moved by Mr. Noble on Wednesday last; but the Bill was not reached, owing to the long discussion on a Bankruptcy Bill and an Irish Leaseholds Bill. It stands second on the list of private measures to be taken on Wednesday, the 15th April.

New Wesleyan Sunday-schools were opened at Liskeard on Friday. They are placed between the chapel and the temperance-hall, and consist of two assembly-rooms, one above the other, with classrooms. The building is of local stone, with granite dressings. Mr. T. Wonnacott, of Falmouth, was the architect, and Mr. John Reed, of Plymouth, the builder.

"Venus and Cupids," a work by Pietro di Cortona, an early 17th-century Italian painter, has this week been presented to the Art Gallery at Leeds by Major Bousfield.

At the last meeting of the Leeds School Board tenders were accepted for a school for 1,400 children, to be built at Harehills, at £14,023, or £9 18s. 10d. per head, exclusive of site, and also for a day industrial school for 260 children. The latter will cost no less than £25 per child; but the chairman of the committee stated that this will be cheaper than similar institutions provided in other large towns. Thus, the industrial school at Bristol, opened 12 months ago, cost £29 16s. 1d. per head; at Liverpool, the cost for the existing school in Queensland-street was £37 18s. 8d. per head, and the cost of a school now building will be £33 6s. 8d. per head; while at Manchester they have spent £26 8s. 4d. per head.

## Our Office Table.

THE Committee acting for the architects of Scotland have published a reply to the memorial recently addressed by the Royal Scottish Academy to the Privy Council in reference to the proposed grant of a supplementary charter to the Academy. The architects maintain that the Academy's answers to the averments in their original petition do not make inquiry into the Academy's administration less of a necessity than it was before, and reassert that, save by the establishment of exhibitions and a life school, the R.S.A. has done little or nothing to promote the fine arts in Scotland. They point out that, as now constituted, the Academy has practically no connection with architecture, and even if this is due to the fact, as alleged on behalf of the Academy, that this is because architects stand aloof from the body and ignore and slight it, the significance of this state of things is by no means lessened. The Architects' Committee, however, contend that the members of their profession take a deep interest in the Academy and in the promotion of art.

SIR JOHN C. ROBINSON, her Majesty's surveyor of pictures, in a letter to the *Times*, strongly advocates the utilisation of Kensington Palace as the site for a comprehensive and complete gathering of works of British art, to include not only painting, but also engravings and sculpture. The National Gallery will, he points out, eventually require every inch of available space for prospective additions in the categories of ancient art, and as the Portrait Gallery is in its nature a constantly increasing gathering, the time will arrive—it is indeed within measurable distance—when the accommodation will not suffice for both. The National Portrait Gallery will then probably be shunted off from the site just acquired, and left to clamour as before for a house of its own. Sir John Robinson despairs of any Government voting an adequate sum of money for realising the proper representation of British art, but suggests that the Academy and kindred institutions might well take up the project. As a nucleus of a fund he states that a wealthy lover of art has offered to give £10,000.

### MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Society of Arts. "Considerations concerning Colour and Colouring." Cantor Lecture No. 2, by Prof. A. H. Church, F.R.S. 8 p.m.

Surveyors' Institution. Discussion on "Betterment." 8 p.m.

TUESDAY.—Society of Architects. "Influence of Material on Design," by G. A. T. Middleton. 7.30 p.m.

Society of Arts. "Engravings in Wood, Old and New," by W. J. Linton. 8 p.m.

Historical Association of Ireland. Papers by Rev. Denis Murphy, Rev. L. Hassé, W. F. Wakeman, and J. Coleman. Lecture Theatre, Kildare-street, Dublin. 8 p.m.

WEDNESDAY.—Society of Arts. "Carriage Building and Street Traffic in England and France," by G. N. Hooper. 8 p.m.

FRIDAY.—Architectural Association. "Hospitals," by Keith D. Young. 7.30 p.m.

Royal Institution. Lecture by Lord Rayleigh, F.R.S. 9 p.m.

Architectural Association, 9, Conduit-street, W.—March 28, paper by Mr. A. E. Bartlett, "A Travelling Student's Notes." 7.30 p.m.

FRED. R. FARROW. } Hon. Secs.  
ERNEST S. GALE. }

### Plumbers Registered Since Last List.

LONDON MASTERS.

Stedman, J. M., 272, Clapham-road, S.W.

LONDON JOURNEYMEN.

Armes, J. G., 8, Gordon-terrace, East Molesey.

Elliott, G. W., 47, Grove-road, Holloway, N.

Glanfield, C., 55, Teviot-street, Bromley, E.

Hewat, F. W., 35, Roderick-road, Kentish Town, N.W.

Nichols, F. F., Grove House, Alwyne-road, Canonbury, N.

Simpson, J., 2, Charlton King's-road, Kentish Town, N.W.

PROVINCIAL JOURNEYMEN.

Reid, M., 22, Foster-street, Bedford.

MASTER.

Lowe, T., 7, Rue-de-Roses, Cannes, France.

The Marquis of Ripon has presented a copy of Sir Thomas Lawrence's portrait of his father to the Corporation of Ripon, of which the late Earl of Ripon was Mayor, and also its member in Parliament.

## Trade News.

### WAGES MOVEMENTS.

POTTERIES.—In the building trades of the district of the Potteries and Newcastle-under-Lyme the carpenters and joiners gave notice at the close of last year that they should require an increase of wages of ½d. per hour from the 1st of May next, making their wages 7½d. per hour. The bricklayers also requested an advance of ½d. per hour (from 7½d. to 8d.), and a slight reduction of working hours. The master builders declining to grant these demands, the question has been referred to an umpire. Mr. C. Whitwell, of Birmingham (of the firm of Thomason and Whitwell, architects), was asked to undertake the duty of adjudicating, and, after meeting the representatives of the three parties at the Town Hall, Hanley, has issued his award, giving to the carpenters and joiners the advance claimed, and to the bricklayers also an advance of ½d., their hours to continue the same.

### CHIPS.

Mr. William Stevenson, wood broker, surveyor, &c., has removed from Fern Bank House, Scarborough, to 15, John-street, Kingston-square, Hull.

The Accrington Town Council, at their last meeting, advanced the salary of their borough engineer, Mr. Wm. J. Newton, Assoc.M.Inst.C.E., £100, making the total emoluments of the office £360 per annum. Mr. Newton has done a great amount of work since his appointment two years ago, and is now engaged in the construction of public abattoirs, stables, &c., designed by him, and estimated to cost about £15,000. The council spoke very highly of Mr. Newton's services and ability.

Mr. Weinberg has presented to the Dundee Fine Art Gallery a picture by David Murray, A.R.S.A., entitled "Dewy Eve," hung at the recent exhibition. "Kiomet," by Tom Graham, H.R.S.A., and the "Holy Isle, Arran," by the late Sir George Harvey, have also been given to the Gallery by one of the members of the executive committee. The original picture of "The Executive," a group of Dundee citizens of the olden time, by Henry Harwood, has been presented by Mr. Charles Lyell.

Mr. Thomas Beckwith, one of the intended labour candidates for Newcastle-on-Tyne, died in that city on Saturday, aged 50. A joiner by trade, he served his time with Mr. Ronds, of Bradford, but has been widely known in the North of England during recent years as a temperance lecturer.

A new drill-hall has just been erected in St Mary's-road, Southampton, for the 1st Hants A.V., from plans by Mr. W. H. Mitchell, of that town.

The public memorial of the late Lord Napier of Magdala will take the form of an equestrian statue, to be erected in London.

At the last meeting of the Bath City Council considerable discussion arose upon the proposal to increase the salary of Mr. C. R. Fortune, city surveyor, who is now receiving £250 a year, Mr. Parfit, the ex-consulting surveyor, drawing £150. A proposition was made that an addition of £100 a year be made to the surveyor's salary. An amendment that no increase be granted was lost by 22 votes to 14; a subsequent amendment that the salary be increased by £50 was lost by 21 votes to 13, and then the original motion was carried by 19 votes to 16.

The local board of Widnes proceeded on Tuesday to elect a surveyor. A salary of £250 a year was offered, and 167 candidates came forward, from among whom seven were recommended by a committee. Mr. John S. Sinclair, assistant surveyor to the Bootle town council, was elected.

The Bishop of Chichester (Dr. Durnford) was presented with his portrait at the Royal Pavilion, Brighton, on Friday. The painting is by Mr. W. W. Oules, R.A., and depicts his lordship arrayed in his robes, in a sitting posture, with a Bible upon his knees. It cost about £700, and is to be preserved as an heirloom in the palace.

A Primitive Methodist church, situated in Westoe-lane, South Shields, was formally opened on the 13th inst. The building has been designed in the Early Gothic style by Mr. T. E. Davidson, of South Shields, and the contract has been carried out by Messrs. R. Goodwin and Son, of the same town. The site forms the corner of Westoe-lane and Chichester-road, and the block comprises the church, lecture hall, vestry, &c. The church provides sitting accommodation for 450 persons, and a circular gallery affords additional seats for 200 people. The exterior is of Sherburn bricks, with Newbiggin redstone dressings, and the roof is covered with Westmoreland green slates. The seats are open pitch pine benches, and the rostrum is of Oregon pine. The total cost of the building is £3,500.

**Holloway's Pills** offer relief in all the disturbances of digestion, circulation, and nervous tone which occasionally oppress a vast portion of the population. These Pills possess the highly estimable property of cleansing the entire mass of blood, which, in its renovated condition, carries purity, strength, and vigour to every tissue of the body.

## W. H. LASCELLES and CO.,

121, Bunhill Row, London, E.C.

TELEPHONE No. 270.

**HIGH-CLASS JOINERY.**  
**LASCELLES' CONCRETE.**  
**Conservatories & Greenhouses.**

## A GOOD TIME COMING—IS IT?

IT appears to us that the question of Registration and the relation of the Institute thereto has entered upon a new, and we earnestly trust a happy phase. Hitherto the battle has most unfortunately been fought between the promoters of the Bill and the Council of the Institute; but, if (and there seems reason to believe it is so) there is a large party within the Institute itself friendly to the cause of Registration, yet not willing to join the promoters of the present Bill, desirous of extending the qualification tests, but still not unnaturally determined to support the Institute, there seems to be no reason why, if any courtesy or consideration is shown next Monday at Conduit-street, the younger of the two representative bodies, which so far has done the work, should not frankly and cordially come to terms with the elder, and give over to its custody the work so well begun.

The requisition for a special general meeting which has been fixed for next Monday at the Institute, and which we published in our last issue, calling upon the Council of that body to consider the subject of a compulsory examination by statute of all architects, whether members of the Institute or not, is a course of action that might profitably have been taken long ago. At last we trust we see the beginnings of wiser counsels, and we hope that the discussion will bring about some mutual arrangement. As our readers will see, the memorial is couched in moderate terms, and asks the Institute that a poll shall be taken of the entire body of professional members. The resolutions proposed are:—1. "That, at as early a date as possible, statutory powers should be sought to establish, as in all other professions, a system of compulsory examinations to be held by the Institute, to be extended to all architects hereafter entering the profession, whether members of the Institute or not." 2. "That, when such compulsory examination comes into force, the position of all existing architects shall be completely respected." The memorial is signed by twenty-one members, fourteen of whom are Fellows, and seven Associates. Those favourable to the movement—and we have good reason to know that they include a considerable number of the provincial members—should at once make known their views. A large number have held back, not because they find fault with the principle of Registration, but only because they do not wish to strengthen the hands of the Society. These grounds of hesitation no longer exist—the memorial is itself a witness to the *bonâ fide* intentions of the promoters. All they ask for is for the body of professional members of the Institute to declare their opinion in the only possible way that they can be recorded by voting papers. It is further an acknowledgment that the memorialists regard the Institute as the properly-constituted body to undertake any measure of this kind, and that, if it is willing to undertake to establish examination by statutory powers applicable to all practising architects, they, the promoters of the Bill, will wisely forego any further efforts as a separate body. Their labours, in fact, will have been accomplished. They will have done good service in bringing the question to the front; they have formulated a Bill which, whatever its faults may be, is framed in the broadest and most comprehensive spirit, and which has been eulogised by all capable of a

dispassionate judgment; they have asked the Institute to undertake the examination. Beyond this point, it appears to us, they cannot go. If the Institute Council decline to undertake the work, the responsibility will not rest with them. On the other hand, if the Institute will undertake to promote a Bill to secure the desired protection for the profession by a system of compulsory examination to be extended to all architects, the *raison d'être* of the promoters of the Registration Bill will have disappeared. The Society of Architects, which has supported it, might in that case be merged in the larger and older body, adding materially to the strength of the profession by uniting their separate forces. As "Member of the Royal College of Surgeons" is the title of all qualified medical practitioners, so every qualified architect ought then to join the Institute as the recognised examining and testing body.

The time has now arrived when the position of affairs has made it evident that only delay can be the result of further contention. The question has been too long fought on party lines, and it is now evident that the members of the profession who have remained neutral are only waiting for some definite action to be taken by the senior body to undertake the statutory protection of architects. The meeting of the Institute on Monday next, if largely attended, which we hope it will be, should certainly arrive at some desirable conclusion that will satisfy the whole profession. We trust it will be so. We hope the Institute will seize the opportunity; it has the matter in its own hands for the moment. If there is any statesmanship—any wisdom among its members, it may within twelve months enjoy the prestige and position it at present lacks; it may unite the profession, blot out the schism of the past six years, and within three years treble its present membership; besides securing for every architect a legal recognition of his status and the exclusion of the miserable pretenders who now distract the public and rob qualified men of the work they alone are fitted to undertake.

## PUPILAGE AND PRACTICE.

RECENT discussions in architectural circles on the future education and training of the architect centre in the pupil. What he is and ought to be? what are his prospects? how he should be taught and his acquirements tested? are questions that have come to the front. The pupil may well turn round and ask his censors and masters what he has done to require all this sudden solicitation on his behalf—when former pupils, who occupy the position of masters and heads of firms of repute, many of whom tack initials to their names as members of architectural societies, have found their way into practice and have reached the highest rank of the profession without any of these tests and safeguards being imposed. To his unsophisticated mind it appears very much as if those who had become successful were endeavouring to close the doors behind them and prevent the younger aspirants from obtaining the chances and loaves of office quite so easily as they have. Why cannot the rising generation of young men, who are more numerous and have fewer chances of promotion open to them than their predecessors, have quite as much, if not more, freedom instead of less?—why called upon to pass qualifying tests which none of their masters underwent? These reflections have already arisen, and no doubt will still arise, in the minds of many who view with some dismay the ordeal of examination or registration. When we look at the very different motives which have induced young men to enter the ranks of the profession—many because success in other professions was less

apparent, or admission was less easy; some because they possessed abilities for art; others because the vocation was more congenial and less arduous than those of law or medicine—we shall find some ground for the division of opinion. A hard and fast line, some say, cannot be drawn between those who should be permitted to enter and those who should not, as in the vocations of law and medicine. As an artistic profession, it would be prejudicial to introduce any test, as artistic faculties cannot be gauged by any process known to examiners. Others maintain, with some reason, that as there are so many different grades of practising architects, some of higher, others of lower degree, any test would be absurd. To these and other objections it is needless here to reply, as they have been answered. The increasing number of branches that an architect is expected to know something about, and the large number of young men who are induced to enter a profession open at present to all comers, are in themselves sufficient reasons for instituting some test. Fifty years ago only a few availed themselves; now the higher qualifications demanded in the learned professions have driven numbers into the only vocation open to them. The consequence is that many unsuitable and unqualified men enter. The "taste-for-drawing" qualification, formerly the incentive, now no longer operates. The antecedents of those who join the ranks are of a very miscellaneous order. Builders' clerks, clerks of works, house-agents swell the number, and add to those who enter the profession by the ordinary channel of apprenticeship. So that, when all these things are taken together, there is more reason to draw a line than is imagined by the pupil, who is content to follow the old régime, and is asking "Why these changes?" Circumstances have quite altered since the days of the elder Barry, Scott, and their contemporaries.

To point to some of the weaknesses and merits of the pupilage system. It cannot be denied that the pupil commences his term of apprenticeship under the idea that at its termination he will be prepared to begin practice on his own account. In most other businesses or trades the apprentice who has served his time is fairly competent to do so; but it is certainly not the case in architecture. After a three or five years' term, a youth whose work has been chiefly confined to the office has only entered the threshold of his profession. Very rarely is he competent to design a decent-sized house, much less able to prepare specifications and working drawings for a contract. His knowledge of practical building is confined to what he has casually learned in visits to buildings in progress and from a few textbooks. He does not know much of materials, and could scarcely perhaps tell the difference between a sandstone and a limestone, or distinguish the characteristics of good Dantzic, and Memel, and Swedish timber or deals. Now it is this want of knowledge of facts which is conspicuous in the architect's pupil. The young man and his parents or guardians imagine that because a premium has been paid for three or five years, the pupil is guaranteed to be turned out a qualified architect. The incompleteness of the training is more evident to the pupil himself after he has learned to know his own shortcomings. His resources fail him directly he gets his first commission. He has not formed any principles upon which to work out his designs; the specification is a task he has few qualifications for. Knowing nothing of the law as it affects buildings, easements of light, and contracts, he cannot accept duties which are profitable. Evidence of this incompetence is known to most architects. A considerable percentage of those who pay premiums and serve their articles fall out of the ranks and seek other

vocations. Not a few of them have found out that architecture is more arduous than they anticipated; others have quite mistaken their vocation. Yet we still find parents and guardians simple enough to think that the deed of apprenticeship secures competency, and binds their charge to a profession which he can follow if he likes. The taking of pupils is unfortunately often found to be in a direct proportion to the slackness of professional work. It is usual to find those who have nothing to do take several pupils—not that there is anything very grievous or dishonest in such a proceeding, as some parents think who have paid a large premium to a man who has no practice, for in many cases the pupil is more likely to be taught and attended to; but it is unfortunate, because he has not the advantage of being taught practically the business, or of seeing works in progress. The experience of many young men who have served their term to a busy architect is that they learn very little, that the paid assistants have the profitable kind of work given them to do, while they are reduced to machines; but in the office of the "briefless" architect the pupil has the undivided time of the principal, he has more time to devote to private study, his one complaint being that he sees very little of buildings. Thus, there are compensating advantages in each case. On the whole it may be thought that the pupil of the busy practitioner is the gainer, no doubt the office routine is of value in after life, yet it is surprising to know how little intelligent knowledge is picked up in the scramble of office work. A test of knowledge at the beginning of the articleship and at the end of the term appears the only way of securing to the pupil that modicum of acquirements that he ought to possess. These examinations must, of course, be binding both on the principal and the pupil, and be provided for in the deed of apprenticeship. A coercive discipline, one sustaining the attention of the pupil during the term is the great requirement. From lack of it English pupilage fails; those who have little to do in the office except trace, copy out valuations, dilapidations, and other sundry documents, lose their interest in the work, and lapse into something else, the master turns his attention to literature or speculation in some undesirable form.

When we compare the system with that in vogue in France, and which our correspondent Mr. Arthur J. Vye Parmenter so thoroughly described in our columns (March 7th), we begin to see the essential difference between the two disciplines. The academical training of the French student is, on the other hand, one of teaching and instruction; the pupil is at once taken in hand, he enters a school, follows a course of lectures on his art, commences to design or draw in one of the "ateliers" on his own account. The entrance examination required in the "École des Beaux Arts," presupposes that the novice has been prepared for his training in the ordinary school; it exacts a knowledge of drawing from the round, modelling, and the rudiments of Classical design. Mathematical studies and the history of architecture follow, after which he is allowed to occupy his time in designing from specially prepared programmes, his atelier work being alternated with lectures on different branches of construction and applied science. Values are assigned to his designs and studies; he passes to a higher stage, and can then enter an architect's office to learn the practical part of his profession. The competition for the Grand Prix de Rome, which entitles the winner to a three years' study at Rome, or preparation for the Government diploma, for which a design and details of an important building are necessary, is the goal of his labours. There is thus a graduated course leading to State recognition; the pupil is taught,

instead of being allowed to shift for himself as a clerk in a very one-sided manner. The diploma enables the possessor to practise; it confers upon him an exclusive right of exercising the profession. The artistic side of the profession is developed, no doubt, at the cost of the practical, yet it must be seen that the student is instructed by the school course, and is only very partially instructed by the office training that he receives in an architect's office.

A young architect ought to pursue both courses, the theoretical and practical, and these should be taken as far as practicable together. It will be conceded that the examination tests as proposed by the Institute are not altogether satisfactory, inasmuch as they are conducted independently of the student's education; a proper course can only be followed when the teaching and examining bodies are united. The French diplomas, as well as the examination tests, are based on the school instruction; the lectures and atelier studies prepare the pupil for the tests; the programmes given for designs enable him to realise mentally the requirements of the examiners. Not so with tests which are independent of them, arbitrarily imposed by the examiners, and which have no reference to the instruction. Life in the studio, contact with painters and sculptors, artists in various materials such as wood, stone, and metal, are necessary conditions to an examination. The apprentice in an architect's office is in like manner unprepared for an examination in the theory of his profession, and any course of book-reading must be of the nature of a "cram." Under the present system of pupilage which leaves the young man entirely to his own resources, there is some reason for his taking badly to a new regime. The establishment of grades is far more likely to give satisfaction under the present system—that is, distinctions conferred on students and practitioners who have made special branches their study, and who desire to pursue a particular branch. Architectural practice is still in a very disorganised state. There are many who think that anyone qualified by experience to superintend buildings is entitled to the designation of architect; those who regard the surveyor's qualifications sufficient for that title; others who think that the expert draughtsman or designer has a proper claim to the distinction. These several views are owing to the varying kinds of training found in the practice of the profession; to the very different grades of men who take pupils; and to the want of recognition of a standard of architectural education.

### ARCHITECTURAL BRICKWORK.— XXXI.

#### GEOMETRICAL CONSTRUCTION OF ARCHES.

WE now give a few examples of the manner of striking and forming arches. The elliptical arch, of which we show an illustration in Fig. 1, can be formed of various proportions and by different methods. The diagram indicates by the dotted arcs and lines one example. The main arc or crown of arch is struck from a centre some distance below the springing line, generally equal to the minor axis; the side arcs form portions of two circles which touch each other in the centre, and the radius of which is equal to one-fourth part of the width of arch. The result is rather a flat curve. The mode of drawing an ellipse by a string with pins in each focus is described in every work on practical geometry, and is by far the most satisfactory method of drawing the curve; here the major and minor axes are given. The trammel is probably the safest and best mode of striking an arch. Approximate means are, however, most useful to the architect in designing his work, and to obtain the curve

of an elliptical arch with arcs and circles, such as in the example, is at least the most convenient method when we employ instruments. A well-proportioned arch is obtained by dividing each half-span into six parts. The fourth division from each end gives the two foci for springing curves. The main upper curve is struck from centre made by taking four parts in compass as radius, and, with foci as centres, describe arcs exactly in point. Another pleasing curve is obtained by intersecting arcs, and then drawing by hand the curve through the intersections; it is a truer way of setting out a large arch than the approximate method by arcs of circles, for it must be remembered that no portion of the curve of an ellipse coincides with an arc of a circle. Hence the value of the method of the trammel and that of the intersecting arcs.

The ogee label above is formed in the manner represented by the dotted lines. There are five centres, the arcs being limited by the straight dotted lines. Another method producing a pleasing curve is to divide the span into three parts, the two middle centres or foci describing the springing arcs on each side, and the external or contrary curves being struck from centres, which are formed on lines drawn from the same foci, which lines also limit the contrary curves. The proportion is determinable by the length and direction of the limiting radii, or the line joining the main arch curves with the upper contrary curves. The sketch represents a moulded arch over window of a villa in a western suburb.

#### GOTHIC ARCHES.

In describing pointed arches, the same variety of proportion may be obtained. Those described by two centres being either acute or pointed, as the centres are placed upon or external to the curves or arches, or are within them. Fig 2 shows how the centres of an ordinary pointed arch can be formed. The formation of the key is important in brickwork. In this example the joints radiate to the natural centres of the arcs, producing a wedge-shape space at the apex, which has to be filled up with two triangular shaped bricks. The arch bricks, radiating to the proper centres, make a true arch.

#### ARCH BRICKS RADIATED TO ONE CENTRE.

To avoid the unpleasant appearance of the wedged-shaped key, many bricksetters prefer to radiate the joints to the centre, as shown in the next figure. The "key brick" is cut as shown, the angle of the two arcs being cut in the brick. This form of key is said to be "birdmouthed." The arch has an uneven number of bricks; certainly the arrangement is more pleasing to the eye, though the principle of the arch is absent. The plan sometimes adopted of making a joint at the apex is objectionable. The bricks are cut to varying bevels and length, as in the camber arch.

#### VENETIAN POINTED ARCHES.

To add to the strength as well as to improve the ornamental effect, pointed arches are sometimes formed having the extrados struck from centres outside those of the arcs forming the intrados; that is to say, the inner and outer curves of the arch are not struck from the same, but from different centres. Figs. 4 and 5 represent two forms of this kind of Venetian arch; the former is a sketch of an arch in the tower or campanile of Christ Church, Streatham, a church designed and carried out entirely in brick. This form of arch occurs over the main entrance at the west end, in all the aisle and clerestory windows, and also in the circular apse. The church is one of the few designed on the basilican plan in which Italian and Oriental features are introduced. The arch shown, which is of considerable depth and thickness, occurs in the entrance to tower on the south side,

which is a bold campanile-shaped structure rising uninterruptedly in unbroken lines slightly battered. Stopping the aisle, and at the upper end of church, this tower is a picturesque object. The arch is worked in voussoirs composed of red brick, as shown by the hatched lines placed in pairs with a white brick between. The intermediate or light voussoirs are of white bricks with a centre yellow or buff brick between.

#### THE INFLUENCE OF MATERIAL UPON DESIGN.

AT the ninth ordinary meeting of the Society of Architects, held at St. James's Hall, Piccadilly, on Tuesday evening, the president, Mr. Robert Walker, of Cork, in the chair, a lecture on "The Influence of Material Upon Design" was delivered by Mr. G. A. T. Middleton, the secretary of the society. The address was illustrated by numerous limelight views of typical buildings described. Mr. Middleton formulated the theory that the progress and development of architecture in all ages and countries have been more largely dependent on the limitations and restrictions enforced by the building materials to hand than has been generally admitted by writers on the styles and orders. Beginning with Egypt, he showed that

the two modes of architectural treatment there adopted were due to the use of burnt clay and reeds in the Nile Valley, and of hard stones, especially granite, in the hill districts on either side. In Assyria the inhabitants found themselves in a clay country, the only accessible stone in the neighbourhood of the plains being a soft, easily-worked alabaster. They, therefore, adopted sun-dried and stamped bricks for building, veneering these both within and without with a casing of alabaster, which was afterwards elaborately carved. Such a treatment of brick-work, with a veneer of a better but more perishable material, was, he thought, quite permissible. Passing on to Greece, the lecturer showed how the presence of a fine-grained, almost translucent marble stimulated the builders to the greatest refinement of detail and carving, while their ability to obtain large blocks developed the employment of trabeated forms. The Parthenon and the Temple of Niké Apteros were selected as typical examples of the Doric and Ionic orders. It was a common error to suppose that the Romans also used a trabeated mode of treatment almost exclusively; as a matter of fact, the smallness of the stones necessitated an arcuated style, and we found in early works, such as the Aqueducts, arches used for constructional purposes; while it was only in later days, when the influence of Greek ideas had permeated the minds of the Romans, that the lintel and post treatment

prevailed. The circular body of the Pantheon, one of the older structures, was constructed of brick-work, with a circular drum above the walls carrying a dome constructed of the light concrete formed from the local pumice-stone; in front was a later portico, built up of large stones. Mr. Middleton showed that the use of light pumice-stone led to domical construction; while at Constantinople, the necessity for building St. Sophia's in fireproof material, after it had been destroyed by fire for the fourth time, resulted in the development of the domical Byzantine style. The presence of free stone and soft timbers in Russia resulted in the deterioration of this style, its decadence in bizarre forms and barbaric ornamentation being reached in the Cathedral church at Moscow. The author went on to show how the Romanesque style was influenced in its developments in various countries by the materials available, and proceeded to illustrate the local varieties of Gothic work to be met with in England, also due, he claimed, to local materials. Thus in Essex, Suffolk, and Norfolk we found large use made throughout the Mediæval ages of flint and freestone panel work, one of the earliest examples of the exclusive use of local materials being St. Botolph's Priory at Colchester, in which Roman bricks were interworked with river flints. The Gothic styles of the sandstone and limestone districts of Yorkshire were quite different in treatment, while wherever, as at Exeter, Salisbury, and Bath, soft stones were used, we found a freedom and elaboration of decoration and a profusion of surface carving unknown elsewhere. Again, in the south-west, granite was worked with bold but shallow carving, as in the well-known porch of Launceston Church, entirely different to the forms given to such work in the soft Caen stone as Henry VII.'s Chapel at Westminster. The effect of the love of stained glass both in enlarging our window openings, filling them with tracery, and finally reducing their mullions and transoms to mere horizontal and vertical lines, and leading to the use of the vaulted roof and bay windows, was well recognised, and had often been commented on; but a like development went on in France, although there it assumed different phases. He thought it possible that another cause had somewhat more to do with the development of our Perpendicular style than was generally recognised—the use of hard timbers. Having alluded to the Renaissance, Mr. Middleton closed by referring to modern materials—iron and steel, employed under a stone, brick, or timber mask, to carry all our large shop-fronts, a use condemned by the lecturer as false construction, and terracotta, which had been successfully dealt with by Mr. Waterhouse. In the present day, he remarked, the architect could procure and introduce into his design any material he chose to employ, and therefore the responsibility lay the more strongly upon him to select his materials carefully, to use them in consonance with their character, and to decorate his buildings suitably.

At the close a vote of thanks was accorded the lecturer on the motion of Mr. H. R. Gough, seconded by Mr. Ennals, and supported by Mr. William Woodward.

#### CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—II.

By BANISTER FLETCHER, JUN., A.R.I.B.A.

INTERIOR OF THE PALAIS DES MACHINES.

IT will be as well, before beginning to describe in detail the great trusses, &c., of the interior, to give a short and general outline of its disposition. As stated last week, there are twenty principal trusses of a Tudor arch form. These are articulated at the centre and over each pier (three articulations). They are bound together by five deep purlins on each side of the centre—the two nearest the ridge on each side carrying the examining platform fixed above the ridge. There is a smaller purlin which carries the main eaves-gutter on each side. The purlins are framed in the thickness of trusses. Resting on these purlins, and to the number of three, between each truss come the principal rafters which carry the secondary purlins, supporting the rafters which carry the glass, which goes down to the fifth purlin. The side galleries join the main hall, and are covered with segmental roofs covered with zinc squares, as will be explained. Having given a general description of the dis-

FIG. 3.

FIG. 4.

tribution of the parts, we will examine them in detail.

*The Great Trusses.*—The methods of raising these great trusses into position, adopted by the two different companies who were the successful

contractors, is interesting and curious, because two entirely different methods were employed. I give three woodcuts from *Engineering* which will show the methods sufficiently well without much explanation. It will be seen that the "Fives

Lille Company" (No. 4) raised the complete truss in four pieces, previously riveted on the ground, and therefore only two joints were required to be riveted on the scaffolds, which ran along the interior of the hall on wheels. MM. Cail et Cie

FIG. 7.

FIG. 8.

(No. 3) adopted an entirely different method, hoisting the parts of the truss, weighing not more than 3 tons at a time, and riveting upon the scaffold, a centring being formed to the shape of the roof. The proposed method of erecting the roof (No. 5) is also given, but evidently the contractors could not see their way to adopt it. The reasons why the roof is articulated at three points is because, as stated above, it reduces and defines the points where the strains have to be calculated, and therefore simplifies the construction, and the smallness of the points of support at the base simplifies the problem of resistance. The outline of these great trusses takes the form of an elliptically pointed arch. (No. 6. from *Le Génie Civil*.) The most interesting part of the roof, undoubtedly, is its jointing. It is

articulated at three points—at the crown of the arch where the two half-trusses meet, and at the springing of each half-truss, which being reduced, as it were, to a point (No. 7A), rest on a roller-plate of cast-iron (No. 7 from *Engineering*), which, in its turn, is fitted to the cast-iron shoe which is bolted through the stone foundation. The strains, therefore, are taken right through the centre of the cast-iron roller-plate and down the centre of the foundation pile, described under "Foundations," by means of forming the lower part of the truss, as shown. The lower part, the part immediately above the roller-plate, is formed in cast iron, and rests immediately on the roller-plate, which it fits exactly. This semi-cylindrical block, or roller-plate, is fitted into a cast-iron

shoe, which rests on a foundation plate, 2 1/2 in. thick, which plate is secured to the stone foundation by six strong tie-rods, secured by bolts. Having considered the jointing at the base, the articulation at the top next claims our attention. It is formed on the same principal, but by means of a steel cylinder, upon which the ends of the

Sketch of base to principal showing articulation at Grand. B.F.F. del

FIG. 7A.

trusses rest. To exemplify this, I give a scale drawing showing the jointing (from *L'Architecture*). A and B are the two webs of the trusses, running parallel to each other; C and D are the two cushions, which bind these webs together by the aid of bolts; E is the steel pivot, which is the only point of connection between these two trusses; F is a strong band in hammered iron, which clasps the two half-cushions, and prevents any liability to spread on the part of the two half-trusses. Two steel rings, G, one on each side of the truss, are held against the cushions by means of the bolt, as shown, which, passing through the steel pivot, binds the whole truss together. To these last, rings are attached by means of ears, which carry the tie-rods, which in the case of the two outer bays and the three central ones, run diagonally between the trusses from the ridge to the gutter. The thrust of the trusses on each articulation at the base is 115 tons (which includes the weight of the covering, as also the pressure of wind and snow. The weight of each truss is 196 tons. The weight of the pieces forming the vertical face (plate, gutter, and arch of a half-bay) is 23 tons. The weight of the trusses which support the gable ends of the brasswork is greater, each being 240 tons. The total weight of ironwork to the great roof is thus 7,400 tons. The point of support at each roller-plate at the base below the upper cushion is about 7 1/2 sq. ft.; therefore this weight of ironwork (7,400 tons) rests on a cast-iron surface of about 300 sq. ft. The lateral galleries covered also with iron roofing and framing form a series of natural buttresses which tend greatly to the stability of the hall. Considering the principals in detail we find that at the base the depth is 12 ft. 2 in., and it gradually tapers to the summit where it is reduced to 9 ft. 10 in. (this, necessitated, of course, by the construction, nevertheless has a great deal to do with the light and graceful effect of the roof as a whole). The trusses are composed of two parallel girders, running along their whole length, whose top and bottom webs are 17 1/2 in. by 35 in. These are separated by a distance of 1 ft. 9 in., and are jointed by four angle irons 4 in. by 4 in. by 1/4 in. and a top and bottom flange, the exterior one

FIG. 9.

being 30in. wide, and the interior one 35in. The thickness of these flanges of course varies with the weight put upon it, and it therefore is strengthened considerably towards the lower part below the fourth purlin. At the points where the greatest weight comes upon it, it has eight thicknesses of plate-iron, each one centimetre (.39in.) thick. The upper and lower portions of each of the girders forming the truss are joined by open lattice work of the form shown. The diameters of the rivets used are 22 millimètres (.86in.). The uprights of the lattice framing, it may be mentioned, are in double T-iron, and are drawn to centre of the arch. The cross-bracing is in T-iron. The lattice-work filling-in, designed by M. Dutert, is well deserving of notice. It is divided, as will be seen, into 12 large and 12 small squares to each half-truss. This spacing was to some extent necessitated to find spaces for the corbelling-out of the lattice-work purlins which are framed in the thickness of the principal. The two members of the extrados and intrados of the trusses are bound together by uprights at the points shown, made of double T-irons and close web (see section), in opposition to the open lattice-work, which is pierced at the lower part adjacent to the intrados by an opening which serves as a manhole, in which is a service ladder fixed to the connecting flange of the intrados. This ladder, running from top to bottom of the truss, allows of the inside of the truss being visited without any scaffoldings, and also gives access to the interior of the roof below the ridge.

The five purlins to each half-truss are corbelled out for every alternate small square (see No. 9), and are formed, like the trusses, with a top and bottom web, separated from each other and joined by angle-irons to their respective flanges, the top and bottom webs being joined by a species of N lattice framing, which serves to distinguish the purlins from the trusses, which trusses, as explained above, are in large and small lattice-work squares.

#### THE ORGANISATION OF AN AMERICAN ARCHITECT'S OFFICE.

A RECENT number of the *Engineering and Building Record* gives an interesting account of the office arrangements of a Philadelphian architect. Unlike many other offices, there are no individual heads of departments, the principal supervising all the work, thus being fully acquainted at all times with each particular portion. The original sketches of a proposed building are executed by the architect himself, at his own home, free from the interruptions unavoidable at his place of business. When these are approved, they are passed over to the drawing office to form a basis in preparing the working drawings. Every plan is laid out to  $\frac{1}{4}$ in. scale, so insuring greater accuracy in the estimates. Simultaneously with each set of plans the usual perspective view is commenced, and, in addition, a bird's-eye view is worked out.

The ironwork designs and the plumbing and heating arrangements are severally taken in hand by one man, who devotes his whole time to the

special work. Usually one room is set apart for the work of preparing the plans of any particular building, and a draughtsman at work on the basement plan nominally supervises the work of the draughtsman on other portions. Thus, any change made in his plan, likely to affect the other floor plans, may be taken into account at once in all the other drawings.

One of the features of the drawing office is the system adopted of using upright adjustable drawing-boards on easels. These were devised by the architect. They are arranged against the walls of the office, and allow easy inspection of the progress of the drawings, without disturbing the worker. Horizontal boards are used only for perspective work. Twenty draughtsmen are on an average constantly employed. There is a separate room for estimating: here tracings of the drawings are on view for the inspection of those desiring to hand in tenders. The tracings are not permitted to be taken away; but tracings may be taken from them by intending bidders. Blue prints taken from the tracings are furnished for the use of contractors; but this is not done in the office. The office staff likewise includes a number of building superintendents, whose duty it is to inspect the buildings in course of erection. They generally hand in their reports at noon. Office hours are from 8.30 a.m. to 5 p.m., with the exception of Saturdays, when the offices closes at 1 p.m. in summer, and 3 p.m. in winter.

The architect personally conducts all correspondence, and the system of his work enables him to get through work which would surprise many.

#### BRICKS AND BRICKMAKING MACHINERY.

By M. POWIS BALE, M.Inst.M.E.; A.M.Inst.C.E.

Author of "Woodworking Machinery," "A Handbook for Steam Users," &c.

#### BRICK-MOULDING MACHINES FOR THE SEMI-PLASTIC PROCESS.

THE method of moulding bricks for the semi-dry or semi-plastic process differs essentially from that of the plastic already described. In this latter case the ground clay is fed into dies and subjected to great pressure through the medium of pistons; the bricks on leaving the machines being ready to be taken to the kilns without further drying or preparation. To secure bricks of good quality, with freedom from cracks, it is necessary to carefully regulate the pressure applied, to the nature and dryness of the clay, to make the prepared clay of as even a sample both in firmness and dryness as possible, and to secure a constant and even feed of the clay to the moulds. Should these points be neglected, the bricks may either be pressed too little or too much: in the latter case, they may be made too thin, and the machine will at the same time run the risk of fracture. Another difficulty found in the production of bricks under the pressure system arises from the presence of air in the clay. To get rid of this as far as may be, in some machines of recent construction two distinct pressures are given to the clay, and the speed of production of the bricks is reduced to give time for the air to

escape. In some modern machines the pistons and dies are kept hot by means of steam circulating through them, which, acting on the moisture in the clay, keeps the dies thoroughly lubricated, and permits the pressed bricks to readily leave them with clean, sharp edges. Owing to the great pressure to which the clay is subjected in this process of manufacture, and the consequent great strain on the machines, to secure success in working and freedom from breakdowns, it is necessary that they should be of the most massive construction. This point has not, however, always been sufficiently borne in mind by manufacturers, and the failures arising therefrom has had a tendency to prejudice users against this process and form of machine. There is little doubt, however, as we have elsewhere remarked, that during recent years this process of brick manufacture has made great headway, especially in America, and many difficulties have been successfully overcome, so as to render it, when properly applied, a great commercial success; but at the same time it cannot be denied that, owing to the greater variety of the materials employed, it requires greater knowledge and skill in its application than the ordinary plastic process.

Our first illustration, Fig. 14, of a brickmaking machine for the semi-plastic process is from the designs of Messrs. Bradley and Craven, of Wakefield—a firm that has been for many years largely engaged in the manufacture of bricks as well as brickmaking machines. In this machine a mixer, pug-mill, circular rotary moulding-table, and press are combined. The plan of working is as follows:—The prepared material is fed by means of a spout from the grinding-mill into the mixer. The mixer consists of a horizontal trough, wherein rotates a shaft fitted with knives or stirrers, which mix the clay and propel it into the vertical pug-mill of the machine. The pug-mill kneads the clay and forces it into moulds, which are fitted on the rotating table shown in the sketch, and which rotate in succession under the bottom of the pug-mill to receive their charge of clay. The moulded bricks are ejected from the table moulds when they have rotated, to a position opposite the press of the machine, and they are mechanically transferred into the die of the press, in which they are subjected to great pressure by means of a plunger or piston. The bricks, on being ejected from the press, are ready for the kiln, except when the best quality of facing bricks are required. In this case the bricks are passed through a second press similar to the one forming part of the machine. This machine is of massive construction, and it is claimed by the makers that in its various arrangements, wear and tear and the chance of breakdown have been reduced to a minimum. We have seen these machines working in a most satisfactory manner, and the bricks turned out were of excellent quality. The makers also inform us that they have supplied machines to many collieries for working the shale as it is raised to the pit's mouth, and that they are working with great success.

Machinery is now in use (working the semi-dry process) for making slate *débris* into bricks, which are stated to be the strongest ever made

FIG. 14.

FIG. 15.

the crushing strain being equal to 1,056 tons per square inch. The waste slate is, in the first instance, reduced to a fine powder in a perforated-pan grinding-mill, it is then raised by an elevator to a stage above, and passed through a mixing trough, in which a little water is added. The material is then passed into the hopper of a Whittaker brick-moulding machine, and being subjected to great pressure, a sufficient quantity of the moisture is forced out of the bricks to enable them to be passed directly to the kiln without losing their shape. We have recently inspected some of these bricks, and found them of excellent shape, and very dense and compact in appearance. Should their durability be equally satisfactory, we venture to predict a considerable sale for them for various engineering purposes, foundations, &c.

Fig. 15 represents a Whittaker's patent semi-ry brickmaking machine, manufactured by Christopher Whittaker and Co., of Accrington.

It is especially designed for making bricks from ground shale, slate *débris*, fireclay, &c., prepared in a perforated-pan grinding-mill, with no more moisture than is found in the clay naturally. The prepared material is fed into machine and moulds by an elevator, where it is subjected to very great pressure, or, more correctly speaking, pressures, as it is claimed as a special feature of this machine that the clay is subjected to two separate and distinct pressures before the brick or piston leaves the mould, the object of this being to expel all air from the clay, and turn out a brick of a solid character. The pistons are heated by steam, which does away with the necessity of using oil for lubricating purposes. Expanding moulds are used, and by the insertion of linings of suitable shape and size almost any form of brick having parallel sides can be made. These machines are constructed to make either one or two bricks at a time, at a speed of from 12 to 16 bricks per

minute. They are strongly made, and stayed to resist the heavy strain put upon them. They appear also to have been well thought out, and must be pronounced very advanced machines of their class. We are informed they have met with great success in America.

#### HARDNESS OF CONCRETE.

THE intense hardness of concrete, its homogeneity, and the want of lines of cleavage in it, have rendered it exceedingly difficult to break up or remove in case of alteration. Probably for this cause, as suggested by one writer, concrete is very seldom employed in building, notwithstanding its many other advantages. As pointed out, all natural materials, such as stone and slate, possess lines of cleavage which make it easy to remove or divide portions, and following the analogy, he thinks that it would be feasible to leave artificial lines of cleavage in our street and road foundations, so as to permit of the concrete being broken up when occasion required. At present, certainly, the force required, the sledge-hammer blows that have to be given to the steel wedges used in breaking up street concrete, are considerable objections. In house or wall building, the "block" system has for this reason very decided advantages, as each block can be detached by ordinary means of dislocation, the wedge or lever being all that was necessary in removing or taking down.

#### CHIPS.

Mr. Owen Williams, for the past four years surveyor to the local board of Colwyn Bay, has been appointed to a similar position under the Aberdare local board.

The large projecting block of whinstone, known as the Bible Rock, on the south side of Edinburgh Castle, which for some time has been considered dangerous, was removed on Friday by blasting. The quantity of rock removed amounted to between ten and twelve tons.

Mr. John A. Bryson, assistant city engineer of Newcastle-on-Tyne, died on the 20th inst., in the 53rd year of his age. Mr. Bryson was the son of the late Mr. Thomas Bryson, borough surveyor, who met his death as the result of the nitroglycerine explosion which took place on the Town Moor on the 18th of December, 1867. While a young man, he entered the employment of the corporation as assistant to his father, and he has since occupied a similar position uninterruptedly under Mr. Fulton, Mr. Fowler, and latterly under Mr. Laws. Mr. Bryson was possessed of considerable architectural skill.

Mr. T. G. Murray, of Stenton, W.S., Edinburgh, has presented to Birmam Institute a copy of Slezer's rare print, entitled "The Prospect on the Town of Dunkeld, 1693." Dunkeld Cathedral is a prominent object in the picture, and shows the Gothic form of the windows as they were originally previous to 1762, when they were modernised during the repairing of the church. Bishop's Palace, long ago removed, is also seen. Craig-y-barns, now well wooded, appears a bare and barren height.

A new Wesleyan Chapel at Windmill Hill, Bristol, was opened on Friday. It is Early English in design, and provides sitting accommodation for 200 persons. It has been erected at a cost of £750, in Pennant stone, with Bath stone dressings, the windows and fittings being of varnished deal. All the glazing is executed in tinted cathedral glass in lead casements, the window heads being in geometrical design. The architect is Mr. Herbert J. Jones, M.S.A., Bridge-street, Bristol, and Mr. George Elmes, of Bedminster, was the contractor.

A new highway bridge has just been erected at Bishopstone, over the L. and S.W. Co.'s lines, by Messrs. Matthew T. Shaw and Co., of London and Wolverhampton, who have just removed the old structure. The new bridge is a road 25ft. wide. It is an iron bridge of four spans, the largest span of which is 96ft. long. The three other spans are 58ft. each. The end buttresses are of red brick, and the intermediate supports are 12 circular columns of about 3ft. diameter, with square base and top, and stand on a foundation of Staffordshire blue brick and cement on a concrete footing. The side girders are fitted on the expansion principle, and the bed of the bridge is of trough-pattern iron plates, the ballast being laid on a concrete floor.

The committee in charge of the movement for the erection of a statue of Burns in the city of Aberdeen, in an appeal for subscriptions, state that the estimated cost of a statue in bronze, including pedestal, is £1,000, and the subscriptions already received amount to £390. A model by Mr. Bain Smith, London, has been approved of.

## OUR LITHOGRAPHIC ILLUSTRATIONS.

NO. XXI. LENNOX-GARDENS, S.W.

THIS house, on the Cadogan Estate, is the town residence of Mr. W. M. Thorp, of Chippenham Park, Cambridgeshire. The walls are of red

## THE NORMAN GATEWAY, EVESHAM.

THIS is the most ancient relic of the Abbey of Evesham. The foundation of the abbey dates from 701; and this gateway, which dates from the 12th century, is the entrance from the south-east corner of the town market-place to the churchyard, where stand the two parish churches which have survived the great abbey church destroyed in the 16th century under the Acts of Henry VIII. for the dissolution of the great monasteries. The gateway was originally vaulted over, but all that now remains are the two sides, each of them having three semicircular arches supported by semi-columns, with indented capitals, and the bases of which are now below the level of the ground. The columns in front are also partially preserved, and from those sprang the circular vault already referred to. The accumulation of the soil during many ages has not only concealed the lower portions of this gateway, but has raised all the surrounding surface considerably above the floor of the church of All Saints, which is within a few yards of it. A wooden tenement erected above the remains of the gateway, bears in itself marks of antiquity, though lately restored and used as the parish room.

## CROPTHORNE CHURCH.

CROPTHORNE is a very picturesque village, delightfully situated on rising ground above the river Avon, and half-way between the abbey towns of Evesham and Pershore, being about three miles from either. It is an ancient parish, having been originally granted by Offa, King of Mercia, to the Bishop of Worcester in 780. The church is dedicated to St. Michael. It is one of the few parish churches in the neighbourhood which have not undergone recent restoration. The more ancient architectural features are of the

wall of the chancel, is a Greek cross elaborately carved with figures of animals and foliage. The sketches are by Mr. Edmund St. New.

## NEW MAIRIE, RUE DU FAUBOURG ST. MARTIN, PARIS.

THIS new building for the municipal authorities of Paris is being erected for the Tenth Arrondissement of that city, from the designs of M. M. E. Rouyer, the architect. The site is a very good one in the Rue du Faubourg Saint Martin and Rue du Château d'Eau. We give the principal façade in elevation herewith to-day, with the two chief plans and a longitudinal section showing the entrance, grand staircase, and central hall or cortile. Besides the usual accommodation and offices provided for the use of the chief official and his department, the building is intended to afford a series of apartments for the reception of societies and festive gatherings, for which purpose the rooms are contrived to be used together *en suite* or in part only, the whole arrangement being conceived on a commodious and sumptuous plan, as the drawings will show. A, on the ground plan is the grand vestibule, B is a smaller one, and C a covered doorway for persons arriving in carriages, with a robing place at G for the use of the mayor and other distinguished officials. The porters are placed at D, with small kitchen and conveniences; H is the grand staircase, I and J are secondary ones for use to the offices above. E and F are corridors round the cortile; Y, M, and N are the vestibule and court of the Justice of the Peace, and O is his private room; Q is his robing-room and water-closet, &c.; L and R are the relief offices; and K is the public assembly hall; V is the police office; and at T are cells for both sexes; and staircase to basement at S; X is a military-recruiting office. The first floor is chiefly devoted for grand ceremonies and muni-

SECTION OF NEW MAIRIE, RUE DU FAUBOURG ST. MARTIN, PARIS.

Fareham bricks with Portland-stone dressings, and the roofs of slate. The builder was Mr. T. Boyce, of Hart-street, Bloomsbury, and the architect, Mr. T. G. Finch Noyes, F.R.I.B.A., of No. 42, Half-Moon-street, W.

CONTEMPORARY BRITISH BUILDERS AND CONTRACTORS.

(See description on p. 464.)

Late Norman style; but the building is mainly Perpendicular: the lower part of the square tower at the west end is said to be Early Norman. The church contains two monuments of the Dineley family, one of which, dated 1646, is canopied and coloured, and is seen, in our illustration, at the east end of the nave. The old carved solid oak pews add to the picturesque character of the view. Outside the church, inserted in the south

central fêtes. E C are waiting-rooms in connection with the Salle des Mariages, D is the Mayor's room, and F F' are his assistants' rooms. M and N are connecting galleries leading to the banqueting-rooms at T, U, and V. G on this floor shows a committee-room, and H the secretary's office. K is the ante-chamber to the Mayor's department. O and P are the offices connected with the marriage register, and rooms P and Q

are occupied by the Registrar of Births. R is a secretary's bureau. Beyond are water-closets and urinals, arranged in a typical fashion at S.S. We are indebted for these particulars and details to the "Nouvelles Annales de la Construction."

#### PULPIT IN THE PARISH CHURCH OF GLOSSOP.

This pulpit has been executed in the workshops of Messrs. Cox, Sons, Buckley, and Co., of Southampton-street, London, and was designed by the Rev. E. Geldart. It is executed in oak, on a stone base, with marble colonnettes; the figures in niches are carved in box-wood, with walnut-wood backgrounds. The three groups represent the Patriarchs, Prophets, Apostles, and Evangelists. The four statues of the archangels at the corners of the pulpit are also in box-wood.

#### DECORATIVE ITALIAN METAL-WORK.

THE sketch of a Gondola Prow is taken from one of two specimens now in the Metal Work Gallery at South Kensington Museum. It is of pierced steel, and of Italian 17th-century design and execution. The dimensions are 4ft. 2in. high, 1ft. 7½in. from front to back, and the circular head is 13½in. in diameter. It is secured to the gondola by screws between each of the fleur-de-lis branches. The Brazier Stand is also from the South Kensington Museum. It is executed in wrought iron, and is of Italian workmanship, 16th century. The height is 3ft. 10½in., and the width across tripod at top is 8½in. The curious and clever Bronze Lamp is also of the 16th century, though probably copied from an ancient example. The opened mouth of the satyr's head forms the place for the wick, and foliage is skilfully substituted for hair on the head and face. Oil is poured in through an opening at the top, to which there is a hinged cover. The spirited stand of eagle's claw is of different workmanship. The height is 8½in. to the top of head.

#### AN INVERTED SIPHON ACROSS THE VALLEY OF A BURN.

IN laying down gravitating water-mains from the springs and sources of supply of a small town, it sometimes becomes necessary to convey the water across a ravine or valley of a burn by an inverted siphon of cast-iron pipes, in order to avoid a long detour. The details in our illustration show a simple and practical manner in which this may be accomplished. The object in keeping the pipes above the water of a burn, instead of laying them under its bed, is to insure that no undetected leakage may occur. The boulders in the burn can be utilised in forming the stone piers. It is very important to provide good ventilation at both limbs of the siphon. Our illustration shows the fittings, &c., and the arrangement adopted by Mr. Geoffrey Wilson, M.A.S.E., town surveyor, Alnwick, Northumberland.

#### WAYSIDE NOTES.

I MUST supplement my last week's remarks on the Registration question with a very earnest appeal to all Fellows and Associates of the Royal Institute of British Architects—to all members of that body, in fact, who have a lively interest in the future of the architectural profession. Last week I pointed out that at the next meeting of the Institute the subject of registration would be seriously dealt with, and endeavoured to show that there would be no possible reason for a single member regarding the matter in anything but an unbiased and unprejudiced manner. I now wish to point out the necessity for a very determined attempt on the part of all members who may be in favour of the Institute seeking statutory powers to establish, as in other professions, a system of compulsory examinations, to attend the special general meeting to be held on Monday next, the 31st inst., at 4 p.m.; and at the same time I would take the liberty of reminding members that Associates as well as Fellows have the right to vote.

Once again drawing the attention of members to the fact that the subject will be considered from a point of view independent of anything now being done or that has been done, I would urge the importance of a numerous and enthusiastic attendance of Registrationists. Let all who can make it convenient so to do attend

—few London members, with the exercise of a little self-denial, will be prevented from attending—and assist by vote the cause of Registration; and let those who can speak assist by voice. The day for action has arrived. We have had a plethora of writings at various times, and the subject has been forced upon the attention of all who, personally, have neglected it. The result of all this seed-sowing should be apparent in the result of any polling on Monday evening. If I am not mistaken, this result should be gratifying. Hitherto, unfortunately, other questions besides principle have influenced the opinion-testing of members with regard to the compulsory examining of all entering the architectural profession. But I trust that, on Monday, principle only will influence everyone present. To this end I would beg all to forget, for the moment, the existence even of the Registration Question, and think only of true compulsory examination, by the Institute, as advocated by you for thirty years, and brought within the range of "practical politics" by Mr. Hugh Roumieu Gough.

The importance of the present opportunity cannot be overrated. In the past the Institute Council, ill-advisedly as we may think, has neglected true compulsory examination—possibly pardonably in the belief that the majority of the members, in whose interest we should bear in mind it has been elected, have been unfavourable to any scheme of the kind. Now, it has long been the secret conviction of many, that the real opinion of the majority of Fellows and Associates of the Institute has never been obtained. The discussion that followed Mr. Graham Jackson's paper on the effect of making close the profession of an architect has been taken as an indication of a very antagonistic view on the part of the members of the Institute. All who know the circumstances attending the reading of that paper and the subsequent discussion know well enough that there was an unfriendly feeling towards the doings of the Registration Committee which warped the views of those present. Principle was thrown to the winds. Regrettable as this may seem, I maintain it is an indisputable fact. Being present on the evening in question, I could not fail to perceive the true nature of the feeling underlying the meeting. But now, I understand and believe, an opportunity occurs to really test the opinion of members. It may not be the most favourable, since London architects are not, as a rule, so wide awake to the desirability of the institution of true compulsory examination as are those in the provinces and provincial towns. Nevertheless, it being known that the subject comes under serious consideration on Monday evening, and the attendance being numerous, the result of any polling cannot be anything but a fairly correct indication of the private opinions of members.

My anxiety to ascertain the true feeling of Fellows and Associates of the Royal Institute of British Architects with regard to this question is born of an earnest desire to see the completion of any attempts to obtain statutory powers with regard to the closing of the profession in the hands of the Institute Council. Despite the fact that I have not hesitated to persist in giving what little assistance lies in my power to movements irrespective of, and directly opposed to, the opinions of the Council, I have yet all along cherished a wish that some day the Council would, under the influence of the expanding views of individual members, see fit to itself take charge of the arrangements for gaining the requisite statutory powers. This, I take it, is also the wish of nine-tenths of persons whom we call Registrationists. Earnestness and tolerance go hand in hand, and bigotry is as contemptible on the one side as on the other.

I really cannot understand the R.I.B.A. preferring to remain as at present, instead of attaining to the position of added dignity that it would assume if it had the power of compelling all entering upon the duties of an architectural practitioner to pass examinations of its own setting. It will perhaps be better to say *I shall not be able to understand* such a state of things at what time it happens, that a majority of its members are proven to desire true compulsory examination; for so far I prefer to consider that its Council has some grounds for neglect of the subject. If all passing the examination were

to become A.R.I.B.A.'s, one can imagine it would be decidedly distasteful to the whole body; but seeing that the Institute would remain as before, excepting that, as the holder of the statutory powers, it would be brought more before the public, and be regarded with more reverence by them, and seeing, moreover, that "A.R.I.B.A." and "F.R.I.B.A." would be designations of increased importance and value in the eyes of the world, if a second examination were instituted for admission to the Institute, of more intrinsic worth than at the present time when, if I may be some day forgiven for so declaring, the examiners are rushing candidates through with a vague and visionary idea, so I opine, of defeating the ends of those endeavouring independently to make the selfsame examinations truly compulsory (!) Seeing all this, and the futility of hoping to remedy crying evils by swelling out the bulk of the Institute, like the frog in the fable, I ask, Where is the just reason for the R.I.B.A.'s opposition to a scheme that will be all to its own gain?

The Institute may continue to absorb shoals of students and young architects; but even if it ultimately absorb all to be found in the length and breadth of the land, the evils will remain, because the examination is voluntary—voluntary, that is to say, as regards the independent architectural practitioner. It is a vanity to declare that the increased size of the Institute will constitute a safeguard to the public against incompetency, and to the member against charlatanism. Those who so affirm may deceive themselves; but it is difficult to understand how an unbiased person would be deceived. The evils would continue; the public would employ the grocer-and-architect class as heretofore; they would employ incompetency, and they would suffer; the young architect who has to fight the hard fight though which alone he passes to a measure of heart's ease, would be handicapped as heretofore; the doings of the incompetent would reflect upon the competent, and all would feel the effects of a condition of things where brag, bombast, and bounce are mistaken by the client class for depth of knowledge of professional duties. The bull would remain master of the situation, though the frog had inflated itself to bursting point.

True power will only come to the Royal Institute of British Architects when it is in a position to control by statute the portals of the architectural profession. At the present time it may be regarded as in much the condition of a ship without a rudder, a steam-engine without a supply of steam, or a watch without a mainspring. Something is required to make it really useful, to endow it with real power, and to bring it forward in the eyes of the world. The new Charter failed to give it power and added dignity, though it increased, in a measure, its usefulness. But dignity, usefulness, and true might would be wielded by the Institute if it gained to itself statutory powers with regard to compulsory examination. And it now remains to be seen whether it will maintain its old policy of "masterly inactivity" with regard to this question, or whether its members have awakened to the truth of the assertions that I have made, and are resolved no longer to let matters slide, but take immediate and energetic steps to make up for past remissness. To me, as I have said above, it seems passing strange how, in days gone by, this vital question has been so neglected; and if the future line of conduct is to be modelled on that of the past, I shall have to confess that the reason of such conduct will exceed my powers of comprehension.

GOTH.

The church of St. John the Evangelist at Rhyl was consecrated by the Bishop of St. Asaph on Tuesday week. Designed by Mr. Walker, of Liverpool, the church seats 600 persons, and cost £6,243.

The inhabitants of Richmond, Surrey, have decided by a large majority in favour of incorporation.

The Earl of Rosebery formally opened, on Monday, a new Fire Brigade station, erected at a cost of £13,878 upon a site of 12,000 superficial feet in East-street, a thoroughfare leading from Marylebone-road to Blandford-street. The building will be the chief headquarters of the A division of the brigade, which comprises Marylebone, Hampstead, Westminster, and Fulham. The building is surmounted by a tower 85ft. above the street level. The new station will be in communication by telegraph, telephone, or electric bells with thirteen minor stations.

## CONTEMPORARY BRITISH BUILDERS AND CONTRACTORS.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THE series of portraits which we commenced with the New Year giving photographs of Contemporary British Architects has been received with such general interest, that we have determined to give besides a similar and concurrent series of photographs of our leading Builders and Contractors. We publish the first sheet of these to-day. Shortly we intend to publish the photographs of some leading Contemporary Artists, Sculptors, Art Workers, and Manufacturers. Messrs. William Morris, Ford Madox Brown, Walter Crane, and others have already sent us their portraits. In the series of British Sculptors we shall give the President of the Royal Academy, Sir Frederic Leighton, Bart., R.A., Sir E. J. Boehm, R.A., Mr. G. F. Watts, R.A., Mr. Hamo Thornycroft, R.A., Mr. Alfred Gilbert, A.R.A., and others.

In the Builders and Contractors series, the senior partners representing the firms with which their names are herewith associated have been chosen in all instances. These commence with Mr. Benjamin Hannen, the head of the firm of Messrs. Wm. Cubitt and Co., of Gray's Inn-road. In the year 1858 he became a partner in the firm since known as Messrs. Holland and Hannen, of Duke-street, Bloomsbury. Previous to this he had worked in this same office for ten years. Mr. Hannen was a member of the Council of Builders in the first great strike, and chairman of the Builders' Committee in the second, which took place soon afterwards. Mr. Hannen is a brother of the Right Hon. Sir James Hannen, the celebrated judge, and President of the Royal Commission in the case of "Parnellism and Crime," lately concluded. In 1883, when most of the partners in the well-known firm of Wm. Cubitt and Co. retired, Messrs. Holland and Hannen acquired their business, and Mr. Benjamin Hannen and one of his partners migrated to Gray's Inn-road to conduct that establishment. Some of the more prominent of the works carried out by Messrs. Holland and Hannen, which we can recall at the present, are the Great Western Hotel (the first of the great terminus hotels), Montagu House, Whitehall, for the Duke of Buccleuch; the Wellington College; the Meat Market, Smithfield; and the Prudential Assurance Office. The photograph of Mr. Benjamin Hannen is by Messrs. Byrne and Co., of Richmond.

Mr. Robert L. Trollope, representing Messrs. George Trollope and Sons, comes next on our sheet. Their business was founded in Parliament-street in 1778, by Mr. Joseph Trollope, the great-grandfather of the present junior partners, and it has been conducted solely by his direct descendants up to the present time. It was simply a paperhanger's business, and the development of it is principally due to his younger son, Mr. George Trollope, who, having been some years a clerk in the War Office, and seeing no prospect of great advancement, joined his elder brother as partner. He soon began to undertake other trades connected with house decoration, alterations and repairs, employing, as was the practice in those days, separate tradesmen for each class of work, such as masonry, bricklaying, carpentering, &c. In 1851 one of his sons, having completed his articles with the then well-known firm of builders, Messrs. Haward and Nixon, the firm commenced executing their own building works, and from that time to the present their building trade has steadily progressed. Besides executing important works in London and the country, they have built largely on their own account on Crown land, and on the Duke of Westminster's estate, and are just completing their large undertaking in Cadogan-square, on Lord Cadogan's estate. Mr. Trollope's photograph is from the studio of Mr. Bassano, of Bond-street, W.

Mr. Wm. James Longmire, of Messrs. Longmire and Co., of Osnaburgh-street, Regent's Park, N.W., is the son of the founder of the firm for many years known as Messrs. Longmire and Burge. During more than half a century the work executed by them has been very considerable, and we subjoin a few as examples. The mansion, Brodsworth Hall, near Doncaster, and extensive works in farmhouses and buildings on the estate; Westfield House, Battle, Sussex; the French Hospital, Victoria Park; Parsonage, Onslow-gardens; Warehouses, 66, Mark-lane; Messrs. M. B. Foster's Beer Stores, Lisson-grove; Dame Alice Owen's Schools for the

Brewers' Co.; House at Ascot, for the late Mr. J. T. Delane (editor of the *Times*); New Weighing Offices, &c., to Ascot Racecourse; Mansion, "Tangewood," Hawkhurst, Kent; Wellingare Hall, near Grantham; Nostell Priory, Yorkshire; Lincoln's Inn Chapel; large blocks of Chambers in Stone-buildings, for the Honourable Society of Lincoln's Inn; Mansion, 39, Upper Grosvenor-street; Messrs. De la Rue's Factory, Bunhill-row; the Mansion, "Batchwood," St. Alban's; the Rectory, St. Alban's; Townsend Farmhouse, St. Alban's; the new Post-Office, St. Alban's; two Houses, Marden, Surrey, for Sir R. Garth; and two Interiors in Grosvenor-square, in fine Spanish mahogany. Their greatest work of late years has been the reconstruction of St. Alban's Abbey, for Lord Grimthorpe. They began to work there under Sir Gilbert Scott, R.A., in 1877, and are still engaged on the building. Mr. Longmire's photograph was specially taken by Mr. Thomas Fall, of 10, Baker-street, Portman-square, W.

Mr. Charles Lucas, of 37, Great George-street, Westminster, S.W., is the senior partner of the eminent firms of Messrs. Lucas Brothers and Messrs. Lucas and Aird, builders and contractors, whose works are well known both at home and abroad, and who are among the largest employers of labour in the kingdom.

Mr. Richard Thorn is the senior partner of Messrs. Woodward and Co., of Finsbury. This business was established 40 years ago by Mr. John Woodward, and carried on by him up to December, 1888, when he disposed of it to Mr. J. Hughes, Mr. R. Thorn, Mr. E. Beazley, and Mr. J. Woodward. The new firm have executed several very large jobs in London, and are now erecting business premises for Sir Reginald Hanson, Bart., Messrs. De la Rue, West End Hospital, Bishopsgate Ward Schools, Artisans' Dwellings, Wentworth-street, &c. Mr. R. Thorn's photograph was taken by Messrs. Gunn and Stuart, of Richmond.

The last portrait on our sheet to-day is of Mr. J. Howard Colls, who is a partner in conjunction with his brother, Mr. W. A. Colls, in the firm of Messrs. Colls and Sons, builders, of Moorgate-street and Camberwell. Their business was founded fifty years ago by the late Mr. Benj. Colls. The following notes furnish the names of some recent works and works in hand:—Offices of the Security Co., and the Meistersingers' Club in St. James-street; the Institute of Chartered Accountants, in Moorgate-street; Messrs. Ashurst and Co.'s offices, Throgmorton-avenue; the firm has also built the larger portion of the new buildings in Fenchurch-avenue, as well as buildings occupying several hundred feet of frontage in Queen Victoria-street; large works for the Stock Exchange, and others for several of the City companies. The new banking house of Lloyds, Barnett, and Bosanquet, in Lombard-street, was built by them, and the River Plate Bank in St. Swithin's-lane. The firm has a good connection among banks, insurance offices, &c., in the city, and the Union Bank of Scotland (London offices) is one of their works. Mr. J. Howard Colls is a Past President of the Builders' Institute, and is now President of the National Association of Builders, and of the London Central Association. He has served the office of president of the various charities in connection with the building trade with success. In addition to Messrs. Colls and Sons' London offices, they have a branch at Dorking, where they carry on extensive works. His portrait is from the studio of Mr. Thomas Fall, of 10, Baker-street, W.

## BOOKS RECEIVED.

*The Railways of Scotland: their Present Position, with a Glance at their Past and a Forecast of their Future*, by W. M. ACWORTH (London: John Murray), contains some useful information about the Scottish railways, which number five companies, though there is too clearly a desire on the part of its author to push a scheme. There is a little too much advocacy of one line to make us feel that we are reading a disinterested work on the Scottish railway system. An account is given of the Forth Bridge, and the cost of the approach lines borne by the North British is estimated at over a million—the total expenditure at four and a half millions. The author has some doubt as to the gain in distance. "From London to Perth, by West Coast, is said to be now 450 miles; it will also be by the bridge 450. By the Midland route it is 475½ miles; it will be 455

miles. By the East Coast the distance is 462 miles; will be 441½ miles—i.e., East Coast was 12 miles worse, and will be 8½ miles better than the West Coast." Such is what the North British and their allies will gain to compensate them for the great expenditure and the cost of maintenance of the bridge. The railways in Scotland form certainly a unique combination, and the complication of relationships between the various companies at Perth is far greater than any in England—even the railways at Manchester. Mr. Acworth's little book points out the future prospects of the Scottish system, and gives many interesting details of routes and specialities in modern railway travelling.—*Stone: How to Get it and How to Use it*, by Major-General C. E. LUARD, R.E., is the title of a thin book, the substance of which was written for the Surveyors' Institution. The author, as a Royal Engineer, has had some practical experience of his subject, and discusses the bibliography of stone, the resemblance of stones, the localities from which stone is procured, and qualities of certain limestones. The information conveyed is somewhat superficial, and the author refers largely to treatises on the subject, such as "Notes on Building Construction." The remarks on "How to Get Stone" are of more practical value, and the author refers to the necessary clauses in stone quarry leases, and gives several hints to those who become lessees of quarries. The estate agent who has had little experience in the letting of such estates will find some information in Major-Gen. Luard's little book. Those who are thinking of getting the stone themselves cannot do better than read the remarks on "Minimum Rent," "Rents Exact," "Causes of Dispute," and on the "Machinery Necessary in Working Stone."—*Ipswich, Past and Present* (Ipswich: W. Vick). Parts 15 and 16 of this monthly publication contain photographs of grotesque carved heads from the Market Cross, and a carved spandrel from the Shambles, two buildings which formerly stood on the Cornhill in that town; the bridge of "Seven Arches" carrying the London road over a branch of the Gipping; the Unitarian Chapel, a good specimen of a Queen Anne meeting-house erected in 1700; the Presbyterian Church, built from Mr. F. Barnes's designs twenty years ago; and views of 18th-century houses.

## MATERIALS FOR RELIEF DECORATION.

A NUMBER of new kinds of relief decoration has been brought into the market, the aim of which is to supersede the more expensive kinds of wall decoration, like stucco relief, wood carving, and marble veneers. Thus, we have several very beautiful kinds of reliefs for walls and ceilings, produced from paper pulp and other materials, such as Lincrusta, "Anaglypta," "Coriacene," which imitate the most delicate and sharply-cut low-relief surfaces. The old flat-printed papers are still in request for ordinary decorations to rooms; but the relief decoration admits of various kinds of effect, while, even without the aid of colour, it gives a richer effect than the most expensive kind of plain wall paper. An endless variety of colour effects can be produced; thus, by changing the tints only the painter can alter the entire effect of the room. The fabric itself need not be removed, it may remain as a permanent relief on the walls. Thus by the repainting of the "Anaglypta" in delicate shades of greens, pinks, and blues, the most varied effects can be produced on the same pattern. The fabric is obtainable in any thickness, and the parts in relief are not apt to get flat or to lose their sharpness. The designs are of the highest class, and are generally in strict keeping with the plastic material and the motive of wall or ceiling decoration. The expense is less than that of other similar materials. The walls so decorated can also be sponged over and cleaned. The "Coriacene" is another richly-modelled imitation of embossed leather, in which the raised parts are hardened. Various effective designs have been produced and brought out by Messrs. W. Woollams and Co. Many are lacquered a rich brown, well suited for dados. We now hear of new companies for decoration in America. The New York Stereo-Relief Decorative Co. have introduced a composition or chemical stone for interior and exterior decoration which is said to rival marble, granite, or sandstone. It can be moulded into any variety of forms in pure white or any other tint, or bronzed or gilded. As a wall decoration it is

DIOCESAN HOUSE OF THE EPISCOPAL CHURCH, NEW YORK.

said to be a success, and many of the historic styles of decoration have been produced, such as Moorish and Renaissance. These means of reproducing the relief of delicate modelling and embossed leathers, have certainly opened a new era in internal decoration, and if architects are careful to use these fabrics with discretion and taste, and manufacturers do not pander to a vulgar and indiscriminate public demand, there will be an encouragement to obtain the assistance of skilful designers, modellers, and engravers.

#### THE DIOCESAN HOUSE OF THE EPISCOPAL CHURCH, NEW YORK.

**T**HIS building presents so many good points of design, in spite of the incongruity of some of its parts, that we have chosen it for illustration to-day, from a sketch given in the *Engineering and Building Record*, whose drawings, printed in the "Illustrated Series," are quite among the best things published in America. The Diocesan House is situated in Lafayette-place, New York City, and the architects are Messrs. Renwick, Aspinwall, and Russell, of that town.

#### THE LATE MR. J. T. WOOD, OF EPHEBUS.

**W**E regret to announce the death of Mr. John Turtle Wood, F.S.A., Hon. F.R.I.B.A., the discoverer of the Great Temple of Diana at Ephesus, which occurred at Worthing on Tuesday last. Mr. Wood, who was 69 years of age, succumbed to heart-disease. Vast labour and research were expended by Mr. Wood during his Ephesian explorations between 1863 and 1874, and again in 1878-9, under the auspices of the

trustees of the British Museum. When these investigations were commenced twenty-seven years ago, nothing was known of the famous temple whose existence had passed into the region of doubt and of fable. Mr. Wood's labours were first rewarded by the discovery of the Odeum on the southern slopes of Mount Coressus, and soon afterwards by the ruins of the Great Theatre on the western slope of the same mountain. The disinterment of the foundations of these theatres occupied four years, but still nothing had been found which could be identified with the Temple. Numerous trial holes and trenches were dug, the clues given by Philostratus and Pausanias were followed up without result, and the funds being exhausted, Mr. Wood returned to England in failing health, having only added the Christian building known as St. Luke's Tomb to his list of finds. Accompanied by Mrs. Wood, he went back to Ephesus in 1868 and adopted a better plan—that of following up the roads from the Magnesian and Coressian Gates, already identified in the city wall, into the city, and on the last day of 1869 the first trace of the long-sought-for temple was discovered 20ft. below the surface. The walls of the cella and of the platform were traced back till the whole plan was revealed in 1874, and Mr. Wood established the fact that three temples were successively built on this site, while a Christian church was built into the last. Some drums of marble columns and other details brought home are now in the British Museum. Mr. Wood had many hair-breadth escapes, and was once stabbed by a madman within an inch of his heart, and undoubtedly injured his health by his painstaking exertions spread over many years in an unhealthy climate and uninhabited district. His labours are described in his monograph, "Discoveries at Ephesus," published in 1877.

## Building Intelligence.

**MANCHESTER.**—A Boys' Refuge in Great Ducie-street, Strangeways, is nearly ready for occupation, having been built from plans by Messrs. Maxwell and Tuke, of Princess-street, Manchester. Designed in the Queen Anne style, the structure occupies a site at the junction of two streets, in front of the present Boys' Refuge. The main frontage is faced with Ruabon terracotta and stone dressings, while terracotta ornamentation and moulding have been used freely. Three separate and distinct Homes are inclosed within the walls, in the largest of which it is intended to house lads rescued from the streets. A home will be provided here for 60 or 70 lads, each of whom will have a cubicle of his own. On the right of entrance is the reading room, and on the left the games and visitors' rooms, while overlooking the entrance is the superintendent's office. The dining-room, four classrooms, and the master's and matron's room are placed on the first floor. The second and third floors are divided into cubicles, and each floor is provided with bathrooms and lavatories. A large covered gymnasium is provided at the rear. In the centre of the block is the Caxton and the Shoeblack Brigades Boys' Home, where provision is made for between 40 and 50 boys. The basement of this division contains baths and lavatories, with disinfecting closets, and work and play rooms. On the ground-floor are the dining-room, the kitchen, the dayroom, and a shop. The dormitories are on the higher floors. The remaining division of the block will be used as a training home for intending emigrants to Canada, and accommodation is furnished for between 50 and 60 boys. The day and dining rooms, the kitchen, and the "father's and mother's" room are on the ground-floor, and dormitories, officers' rooms, and lavatories occupy the upper floors. At the rear of the buildings are additional workrooms. The interior is heated throughout with low-pressure hot-water pipes, constructed by Messrs. Elliott, Olney, and Co. Messrs. Robert Neill and Son are the contractors for the building, which has cost over £10,000.

**TORQUAY.**—To the church of St. John, built in 1865 from the designs of the late G. E. Street, has just been added a Chapel of Our Lady. It is divided from the chancel and south aisles by metal grills, and the approach to the altar is of polished Devonshire marble. The altar itself is of teak with polished marbles largely introduced into its frontal, and the reredos is of carved oak. The body of the chapel has just been seated with massive oak benches upon a raised floor of English oak. The seats have fleur-de-lis terminations, the fronts and backs of the seating are carved and traceried, and at the ends in panels are the various emblems of the Passion of Our Lord. The seating is of Early 13th-century character, in keeping with the general surroundings, and has been made and placed *in situ* by Mr. Harry Hems, of Exeter.

Last week there was completed in Barthomley Church a memorial, by Sir E. J. Boehm, R.A., to the late Lady Doughton.

Mr. Joseph Douglass Mathews, F.R.I.B.A., of Dowgate-hill, E.C., was returned unopposed to the Court of Common Council, on Thursday, in succession to the late Mr. Deputy White, who had represented Dowgate Ward in the Corporation for half a century. Mr. Mathews is district surveyor for Stoke Newington, and recently retired from the office of honorary treasurer of the Architectural Association (of which he has also been President), after more than 25 years' service.

Lord Burton has added to the suspension bridge over the river Trent at the old ferry, built at his expense, a footbridge or viaduct from the suspension bridge to Fleet-street, in order that the passage thereto should not be blocked in times of flood. On Monday week the extension was opened. The extension is nearly 1,700ft. long and 10ft. wide, and is carried on cast-iron columns and Belgian rolled iron joists. The columns are pinned on stone slabs laid on concrete foundations. The extension for the greater portion of the distance is 6ft. above the ground, and there is a gradual ascent to the bridge level, which is joined with a curve of 360ft. radius. The roadway is of St. Petersburg deals, 3in. thick, laid on T-irons; there is a hand-railing on each side. Lord Burton has borne the entire cost, which, with that of the bridge, has amounted to £10,000. Messrs. Thornehill and Warham were the builders, and Alderman Canning inspected the work as it proceeded.

## COMPETITIONS.

**BACUP.**—At a meeting held last Monday it was decided that the first premium for baths be awarded to Mr. Wilson, jun. (surveyor's assistant); second premium, Messrs. Magnall and Littlewoods, architects, Manchester; and the third to Mr. Wilson, borough surveyor.

**GRANT MONUMENT, NEW YORK.**—The competition for the erection of a memorial in New York to the late General Ulysses Grant has been decided. The jury, which consisted of Messrs. N. Le Brun, George B. Post, and James E. Ware, and Professors William R. Ware, of Columbia, and Solomon Woolf, of New York, have reported that the results of their examination show that the terms of competition "did not offer sufficient inducements to lead men of established reputation and experience to undertake the labour and expense of preparing drawings," and that, in consequence, "only a very few of the schemes submitted were worthy of serious consideration." Five designs were selected out of the sixty-five submitted. The first premium is awarded to one of two designs submitted by Cluss and Schulze, of Washington, who receive the very inadequate sum of fifteen hundred dollars, or about £300; the second place, with one thousand dollars, is assigned to Mr. J. Philip Rinn, of Boston, the designer of the Bennington monument; the third, with five hundred dollars, to Messrs. Haran and Werkelmann, of Leipsic, Germany; the fourth, with three hundred dollars, to Mr. J. A. Schweinfurth, of Boston; and the fifth, with two hundred dollars, to Mr. Herbert A. K. Gribble, A.R.I.B.A., of London. The report of the experts was favourably received, both by the Executive Committee and the Association, which declared the first competition closed, but voted that the payment of the premiums should not commit it to the adoption of any of the designs. It is probable that a second competition, on new conditions, will be invited later. Meanwhile, the monument fund has grown to nearly one hundred and forty-two thousand dollars, and an effort is to be made to obtain further contributions on the occasion of General Grant's birthday, which occurs on the 27th of April.

**HARROGATE.**—A meeting of the Harrogate Town Council was held on Friday at the Victoria Baths for the purpose of confirming a minute by the Wells and Baths Committee as to the Montpellier competition plans. The mayor presided. It was resolved that the council should go into committee and view the plans before coming to any decision on the matter. Mr. Geo. Corson, F.R.I.B.A., of Leeds, the assessor, was present, and said he had almost fixed on five of the plans sent in. Altogether 26 sets had been sent in for competition. Councillor Ward said that in connection with the plans submitted, he was sorry to say he received the previous day by post a miniature sketch of one of the plans, and some detailed instructions. He considered that such a course was altogether irregular, and, no doubt, it would be understood that no notice should be taken of such a communication. Councillor Hammond said he also had been favoured with one of these plans. Something of that sort always occurred in competitions; but, of course, no notice would be taken of it. Councillor Meyer and others concurred in that view, and thought they need take no further notice of the matter, only to make it known that they reprobated such a proceeding. Alderman Walker said the Council having appointed an assessor, the matter would rest with him.

**SELBY.**—In a limited competition, plans submitted by Mr. W. H. Thorp, of Leeds, have been accepted by the Selby Local Board for a new town-hall, to be erected on a corner site at the junction of Galthorpe-street and New-lane. The building will take the place of the existing inconvenient local board offices, which will be pulled down to make way for the new structure. The accommodation to be provided will comprise a large board-room, committee-room, clerk's and surveyor's offices, and a fire-engine station. The building is designed in the Tudor Gothic style. It will have gables to each street, mullioned windows, and an angle oriel, with a steep-pitched roof. Externally it will be faced with brickwork of a deep red colour, contrast being obtained by the use of cream-coloured Ancaster stone for the door and window dressings and other features.

The burgh of Kirkwall has adopted the provisions of the Public Libraries Acts.

## ARCHITECTURAL &amp; ARCHÆOLOGICAL SOCIETIES.

**EDINBURGH ARCHITECTURAL ASSOCIATION.**—At a meeting of this body held on the 20th inst., in Heriot-Watt College, Chambers-street, Professor F. Grant-Ogilvie, M.A., B.Sc., delivered a lecture on "Electric Lighting of Interiors." The President, Professor G. Baldwin Brown, occupied the chair. Mr. Grant-Ogilvie's lecture consisted of a practical demonstration of the principles of electric lighting, in the course of which he explained the construction and the cause of the incandescent and arc lamps. He hoped that from the elementary facts he had brought before the association they would take a greater interest in the coming Electrical Exhibition. A visit to an exhibition of that kind could be made far more interesting in the possession of even such elementary knowledge of the principles of electricity and electric lighting.

**SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.**—The usual monthly meeting of the above society was held in the School of Art on Friday night, Mr. F. Fowler, President, in the chair. Mr. C. F. Wike, C.E., the Borough Surveyor, read an interesting paper, entitled "Municipal and Sanitary Engineering." He presented statistics showing the relative sizes of Sheffield and other towns, and pointed out that Sheffield and Leeds have the largest areas of any English boroughs, each having an area of 20,000 acres. The next town in size is Bradford, with 10,776 acres. He also stated that Sheffield has an area equal to the areas of Manchester, Liverpool, Bristol, and Salford combined. He next dealt with the construction of roads, described the different kinds of granite, gritstone, and other materials used, gave particulars as to the manufacture of tar and concrete pavement, and as to the cost of maintenance. He also gave statistics as to the comparative cost of granite and gritstone paving, showing that at the end of 25 years the latter would have cost 50 per cent. more than the former. He then referred to the sections and gradients of roads, giving the formulas of the most experienced engineers for cross sections. The second part of the paper dealt with sewerage and house drainage. The most modern methods of sewer construction were described, and particulars given as to the different forms of sewers and the volume of sewage and amount of rainfall to be provided for. The question of sewer ventilation was extensively discussed, and various systems in work in other towns were described. Drawings were exhibited showing how engine chimney shafts can be utilised for ventilation purposes, and the results of numerous experiments made with different sewer ventilators were given. The question of house drainage was then thoroughly gone into, and different methods of drain disconnection and ventilation were explained. The use of rainwater pipes as sewer ventilators, and the use of soil-pipes as rainwater pipes were condemned. The Hon. Secretary announced that next month the well-known surveyor, Mr. T. M. Rickman, of London, would read a paper on "The Present State of Questions relating to Quantities."

**YORK ARCHITECTURAL ASSOCIATION.**—Under the auspices of this Association, Mr. A. Buckle, B.A., delivered a lecture on the "Manor House, York," on the 20th inst., in the Church Institute, Lendal. Mr. W. G. Penty presided. Mr. Buckle divided his remarks into three periods of one hundred years each. Originally the Manor House belonged to the Abbot of St. Mary's and was the Abbot's palace. The abbey was suppressed in 1538, and the Manor House became the residence of the Lord President of the North, and remained so until 1640. From then until about 1748 the Manor House ceased to be a palace and became an official residence for what might be called the Governor of the City. Then it was put in possession of one person, who let it out in lots, until in 1837 or 1838 it was leased by the Yorkshire School for the Blind. Nothing now remained of the palace except what they might call the dungeons or king's cellars. Under the Museum of the Philosophical Society were the remains of a fireplace. Mr. Buckle gave an interesting account of the residence of various Lord Presidents of the Northern Council at the Manor House, showing by means of a plan additions made to the house by several of the presidents up to 1640, when the Northern Council was abolished. He also dealt with the second and third periods, and remarked that no

one would consider that the Manor was losing any of its prestige in the work which was now being done within its walls. On the motion of the chairman, seconded by Mr. Hopper, a vote of thanks was accorded to Mr. Buckle.

## CHIPS.

A visit has been arranged by the Society of Architects to the works of Messrs. Starkie Gardner and Co., 29, Albert Embankment, S.E. (workers in iron, brass, and bronze), to take place to-morrow (Saturday), at 2.30 p.m.

A new Wesleyan school-chapel is being erected on the Palace Avenue Estate, Paignton. Four large classrooms and a commodious vestry are to be built in connection with the above. Messrs. W. G. Couldrey and G. S. Bridgman are the joint architects, and Messrs. C. and R. E. Drew are the contractors.

Messrs. Faraday and Son, of Berners-street, have recently laid down successful electric-light installations, including gas-engines, dynamos, &c., at Messrs. Agnew's Galleries and Messrs. Asprey's showrooms in Bond-street, Mr. Henry Irving's in Grafton-street, Mr. L. Solomon's in Bruton-street, and Messrs. W. Morley, Halstaff, and Hannaford's in Regent-street.

The Board of Works for the Plumstead district have appointed Mr. Wm. Gow, C.E., who at present is in Glasgow doing work for a London engineer, as their chief assistant engineer and surveyor.

Sir Edward Birkbeck's Bill, dealing with labourers' cottages, which was read a first time on Monday night, proposes to confer on the Rural Sanitary Authority power to compel the provision, in the erection of such cottages, of proper accommodation and adequate means of drainage, and also, where practicable, of a garden in connection with the cottage.

The Board of Guardians for Holborn have adopted plans prepared by Messrs. H. Saxon Snell and Sons for securing increased safety in case of fire at the Highgate Infirmary, the proposals comprising bridges from one block to another, and an outside gallery or verandah. The cost will be £2,300.

A pastoral staff is about to be presented to Bishop Temple, the design for which has been prepared by Sir Arthur W. Blomfield, son of a former Bishop of London.

A French Exhibition will be opened at West Brompton on the 3rd May next.

The Brighton Railway Company's Bill to obtain powers to widen and improve their line into Victoria was on Monday before a Select Committee of the House of Lords. Mr. Saunders, for the promoters, said the traffic to and from Victoria Station had enormously increased during the last twenty years, the number of passengers last year having been nearly four millions. On Tuesday the Committee declared the preamble proved.

A new police station has just been completed at New Brompton, near Chatham, from the designs of Mr. F. Ruck, county surveyor for Kent. Messrs. J. G. Naylor and Son, Rochester, were the contractors.

The body of the late Mr. J. R. Herbert, R.A., was on Saturday removed from his house, built by his friend, Mr. Pugin, at Kilburn, to the adjacent Roman Catholic chapel. Thence it was taken to Kensal Green Cemetery, and laid by the side of the deceased's wife, who only died five weeks ago.

The consecration of St. John's Church, Dunton-green, Sevenoaks, took place on Monday, the 24th inst. The church is built with local red bricks, slightly relieved with Bath stone dressings inside and outside, the roof being covered with local red tiles. The works have been executed from the designs of Mr. Thomas Potter, of Sevenoaks, by the Mid-Kent Building and Contracting Works (Limited), Beckenham.

An important addition is being made to the Royal Masonic Institution for Girls, which is so prominent a feature at the edge of Wandsworth Common on the top of Battersea Rise. The new works include a hall 10ft. by 40ft. for assemblies of the whole school, drill, and recreation; new kitchen offices, matron's room, &c.; three large class-rooms, and six large dormitories. At present there are 206 children. The new building will accommodate 240 in the dormitories.

The Blackwall Tunnel Scheme was further discussed at Tuesday's meeting of the London County Council, who adopted a proposal made by Sir J. Lubbock to proceed provisionally with the works under the advice of an engineer of experience in subaqueous tunnelling, and, after sinking shafts and ascertaining the difficulties of the soil, to report to the Council for further instructions. It was also resolved that the expenditure on experimental works shall not exceed £10,000.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 90c. gold). To France or Belgium, £1 6s. 0d. (or 3frs. 90c.). To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

## NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII, XLVI, XLIX, L, LI, LIII, LVI, and LVII may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

## GOOD FRIDAY.

THE BUILDING NEWS next week will be published on Thursday, and all advertisements for that issue must reach the office at the latest by 3 p.m. on Wednesday, April 2.

RECEIVED.—A. W. K. and Co.—J. P. and Son.—H. and G.—H. L. B.—H. and W.—E. K.—W. G. C.

## "BUILDING NEWS" DESIGNING CLUB.

## SIXTH LIST OF SUBJECTS.

Subject G.—A Village Bank on a street frontage of 25ft. wide, with a depth of 70ft. The adjoining buildings to be taken as three-story ordinary houses with shops. The Bank Entrance to be on one side, and a private entrance to the manager's residence on the other. The Bank to comprise public office, manager's room, small waiting-room, and strong room, with clerk's lavatory, w.c.'s, &c. The house to have two sitting-rooms, five bedrooms, kitchen, and offices, with bath-room, and also a store-room. Light only front and rear of the buildings. A good house yard to be reserved at the back; but there is no back way to the site. The coal cellar may be in the basement. Style: "Free Classic," in red brick and stone dressings. Scale: 8ft. to the inch. Elevation, section, plans, and sketch.

DRAWINGS RECEIVED.—"Attempt," "Glaucus," "Grafton," "King Bruce," "Nory B." (no name nor address, send name), "Van-Roke," "Cyclist," "Fiddler," "Skull and Crossbones," "Horse Shoe," "X. Y. Z.," in circle.

RED ROVER. (We regret your design for the Cabmen's Shelter was lost in the post.)—JACK PLANE. (Yes, the plainer the better, as a rule; this is an "old saw.")—ATTEMPT. (We can only say Try again.)

## Correspondence.

## LOW SIDE-WINDOWS IN CHURCHES.

To the Editor of the BUILDING NEWS.

SIR,—If anything further were needed to strengthen my faith in the "sanctus-bell" theory of the use of low side-windows advocated by me in the *Antiquary* for this month, the interesting example quoted by your correspondent, Mr. Dickson, and of which I had no previous knowledge, would remove all doubts, and I am greatly indebted to him for the mention of it.

I agree with Mr. Dickson that low side-windows in an upper-story chapel could not have been used for the purpose of confession or the Communion of the persons outside, nor for such

persons to witness the sacred rites being performed within, and the existence of such features in Prior Crauden's oratory is one of the strongest arguments I have met with against the acceptance of either of these theories.

But, so far from its "disposing at once" of the hand-bell theory, I submit that it goes to prove that it is the only one tenable under the circumstances. I see no reason why it should not be as desirable for the sanctus bell at the prior's private Mass (held, as it would be, at a time when public Mass in the cathedral was not being sung) to be heard outside, as in the case of that used at any other altar. The elevated position of the chapel, moreover, would cause the bell to be heard at greater distance, and promote the usefulness of the windows. It would be interesting to learn the location of the dwellings of the people, or even the prior's residence, in relation to the chapel as possibly explaining why there were two windows.

Mr. Dickson's own "very prosaic explanation of these two low windows" at Ely does not seem to receive support from the facts he states; he tells us that the chapel "is abundantly lighted by large eastern and western windows, as well as by two tall windows of two lights each on the north and south sides." Where, then, is the necessity for these small windows for the purpose of giving light? And if either of them was constructed on account of the "dim sight" of the "elderly prior," and against his stall, why was one put on the opposite side also? The low position of the windows, 2ft. 6in. from the floor, would seem to indicate that they were not for the purpose of giving light.—I am, &c.,

CHAS. E. PONTING, F.S.A.

Lockeridge, Marlborough, March 23.

## CHIPS.

A scheme is on foot for the building of a new town hall for Portobello, near Edinburgh. The present hall is seated for about 300 people, and it is proposed to provide a much larger one, with adequate accommodation for gatherings of Volunteers, Freemasons, and Foresters. A vacant piece of ground in High-street, close to the Municipal Buildings, has already been measured, and plans are being prepared. The front elevation will face Ramsay-place.

The Clifton Antiquarian Club are engaged in fixing commemorative tablets on interesting houses and places of Bristol and Clifton. Robert Southey, a native of Wine-street, has been already thus honoured, and it is proposed to inscribe houses similarly or in other ways related to Hannah More, Sir Thomas Lawrence, P.R.A., Chatterton, Bowdlen, the Ashantee traveller, T. L. Beddoes (author of "The Bride's Tragedy," &c.), Mary Carpenter, Thomas Eagles, S. T. Coleridge, and other eminent natives or residents of the past. Roman camps and roads of the neighbourhood are likewise to receive annotations on their respective sites.

At the quarterly meeting of the Yorkshire Association of Sanitary Inspectors, held on Saturday, under the presidency of Mr. T. Pridgin Teale, at Leeds, a paper was read by Mr. F. Rothera, surveyor to the Sowerby Bridge local board, on "Drainage and Ventilation in Dwelling Houses."

The City of London and Southwark Subway Bill came before a House of Commons' Committee on Friday, and their decision was that the preamble of the Bill was proved, but that the Committee expected a clause to be inserted protecting the Chatham and Dover Railway Company in the matter of the foundations of their bridge over the Clapham-road.

Messrs. Blaikie Brothers, Footdee Ironworks, Aberdeen, have completed the erection of a steel bridge across the river Urie at Inverurie. It consists of two main girders, the length of span being 52ft. 6in., and the breadth of roadway about 17ft.

A Select Committee of the House of Commons has rejected the Croydon and Crystal Palace Company's scheme, by which it was proposed to construct a line  $3\frac{1}{2}$  miles in length through a densely inhabited district in South London, at an estimated cost of £600,000.

The Prefect of the Seine has presented to the Municipal Council of Paris the new project of the French Government for the preservation of the Exhibition buildings. By this the city would become proprietors of them, but would be bound to lend the Champ de Mars and the buildings thereon to the State if they were ever required for the holding of another exhibition.

Messrs. Pilkington and Co., of Monument Chambers, E.C., are considerably extending the scope of their business, and are now undertaking contracts in slating and tiling, and supplying bricks, cements, and other building materials.

## Intercommunication.

## QUESTIONS.

[10251.]—Concrete Floor.—I shall be obliged if some of your readers will give me particulars for laying a concrete floor, composed of rolled iron joists and cement concrete, the depth of floor to be as small as possible. Size of building: 32ft. long by 9ft. 6in. wide.—SUBSCRIBER.

[10252.]—Old Mortar.—A portion of a recently-erected building (within the last three months) is to be pulled down and the bricks reused for an addition to the same building. Will some kind reader inform me if the old mortar, after having been screened, may be mixed with the new to advantage?—ECONOMY.

[10253.]—Cement Flat.—Will it be possible to make an external cement flat, containing an area of 460 sup. yards, laid on 6in. of cement and coke breeze concrete, carried by 4in. by 2in. rolled joists, which, in their turn, will be carried on plate girders, to be perfectly watertight?—BREWSTER.

[10254.]—Round or Octagonal Churches.—Could any of your correspondents kindly inform me how or where I could obtain ground plans of some of the best-known round and octagonal churches in England?—W. F. C. JORDAN.

[10255.]—Iron Bridge.—Will Mr. Henry Adams, or some other authority, be kind enough to say what rolling load per foot-run of bridge should be taken for an iron or steel girder bridge to carry, say, a 20ft. main road where the heaviest weights would be 20-ton traction engines? For spans up to 70ft., and how is it arrived at?—RIVET.

[10256.]—Shingle Spires.—I wish to fix an oak shingle spire. Would some reader kindly give me full particulars how to carry out same, the size of shingles, and how to protect laps and angles, &c.—E. W. D.

[10257.]—Sewage Disposal.—If any of your readers have had experience which will help me in the following case, I shall feel grateful for their advice. I am anxious to dispose of the sewage from a country house and stables of, say, 35 rooms and 12 horses, and propose carrying a pipe through a large kitchen garden about 400 yards from house, making use of a portion of the sewage there, and irrigating grass and ploughed land beyond with the remainder. The fall is satisfactory, the water-supply good, and the soil light and sandy. Would the result be a nuisance to the occupants of the house?—SANITATION.

[10258.]—Rain Driving through Stone.—Have any of your readers had the same experience that I have, of rain driving quite through Ham Hill stone mullions (9in. thick) of windows and perceptibly running down on the inside face of stone and lying in pools on the window seats, also coming through stone window heads and stone roofs of oriel windows properly weathered? If so, what is the best thing to prevent it without disfiguring the stone? Any practical advice will oblige.—E. T. S.

## REPLIES.

[10248.]—Warming Apparatus.—"Comfort" asks: "Is there any kind of apparatus that can be used in conjunction with low pressure where the latter system is not sufficient?" I should like to mention that my latest patent for generating pure warm air is specially constructed for the express purpose of easily connecting to an existing low pressure hot-water apparatus, without in the least disturbing any of the hot-water pipes, but to supplement the heat and to allay draughts. In cases where the boiler is worn out, this combined furnace is used to substitute the defective boiler, and to couple up to the present arrangement of hot-water pipes. Thus it will be readily seen that by this simple and inexpensive method an inefficient low pressure, hot-water apparatus may be made to thoroughly warm the building.—JOHN GRUNDY.

A bronze medallion portrait of the late Mr. William Hay, the architect who designed and carried out the St. Giles' Cathedral restoration, is now being erected in the north porch of St. Giles' Cathedral by a few friends who commissioned Mr. John Rhind, sculptor, to execute the work. The portrait is artistically modelled and a good likeness, and is the original of the plaster cast on view in the Royal Scottish Academy. The inscription is as follows:—"In memory of William Hay, architect, who designed and carried out the restoration of this church. Born 1818; died 1888."

Arthur John Robbins, who pleaded guilty on Monday to embezzling various sums belonging to the Cardiff Building Society, was, at the Glamorganshire Assizes at Cardiff on Tuesday, sentenced to five years' penal servitude. According to a statement written by the prisoner, he had appropriated £6,200, and his defalcations extended over a period of ten years. The deficiency was made good by the directors. Mr. Peter Price, secretary, an architect in Cardiff, contributed £3,500.

There is a new town-hall about to be erected at Cleckheaton, Yorkshire. The building is of imposing design, in the Renaissance style, and will, when completed, reflect credit upon the architects, who are Messrs. Mawson and Hudson, of Bradford, the builders being Messrs. Holdworth Bros., of Cleckheaton, and the stone-carving has been entrusted to Messrs. Howarth Bros., of Stretford-road, Manchester.

A new public hall has been erected at Maidstone, and special attention has been given to the ventilation, the extraction of the vitiated air being effected by the latest improved form of Messrs. Robert Boyle and Son's patent self-acting air-pump ventilator.

## LEGAL INTELLIGENCE.

**RE T. QUINN.**—The second meeting was held on Friday of the creditors of Mr. Thomas Quinn, M.P., Kilkenny, described as of the Estate Office, Popham-street, Islington, builder and contractor. The liabilities amounted to £75,743, of which, however, not more than £9,097 are unsecured, and assets estimated at £919. At the first meeting a composition of 5s. in the pound was accepted, payable in two instalments at 14 days and six months from approval by the Court, and the resolutions were now duly confirmed.

**NEW HOUSES AND OLD FOUNDATIONS.**—At Wandsworth Police-court on Friday, William Hole, a builder, of Lower Richmond-road, Putney, appeared to answer an adjourned summons at the instance of the London County Council for neglecting to comply with a notice to set back the external fence or boundary of the forecourt of certain houses in Quill-lane to a distance of 10ft. from the centre of the roadway. Mr. Alfred Millwood, the surveyor to the Council, explained that the fence inclosing the forecourts had been erected on the old boundary line, thus reducing the width of the way. There were posts on either end of the lane, which could not be used for vehicle traffic. He also stated, in answer to Mr. Todd, who represented the defendant, that there was a fence running right and left, and if the particular fence in question was removed it would leave a gap. Mr. Burton, on behalf of the Council, mentioned that they had refused an application made by the defendant for permission to allow the fence to stand. The defendant said two out of the three houses had been erected within the area of Quill-cottage, which was demolished to make room for new buildings. Mr. Todd contended that no order could be made in respect of two houses erected within the area of the old cottage, as the defendant was protected by the provision of the sixth section of the Act. With respect to the third house, he was bound to submit to an order. Mr. Denman, who took time to consider his decision, said he was of opinion if a man wished to be protected by the proviso he should confine his buildings within the limit of the external walls of the old house, and not within the area. He therefore made an order for the removal of the fence in 14 days.

**IN RE GREEN AND LEE.**—At the London Bankruptcy Court on the 20th inst., Lee, one of the partners in the firm of Green and Lee, applied for an order of discharge. The bankrupts were builders and contractors carrying on a somewhat extensive business at the Anton-street works, Amherst-road, Hackney. The failure occurred in November last, the joint liabilities expected to rank against the estate being returned at £10,985, with assets estimated at £4,545. The bankrupts entered into partnership in May, 1887, Green having traded for three years previously jointly with his nephew. The business showed a surplus of £3,554 at the time, and Lee paid Green £1,000 as premium on joining him, and he also brought £3,000 capital into the concern. In June on July, 1888, the bankrupts entered into a contract to erect a number of buildings in South Audley-street for the sum of £35,000, and in their balance-sheet of December 31, 1888, they assumed £2,328 as the amount of the profit on that contract at that date, the profits for the whole year being estimated at nearly £4,000. In consequence, however, of unexpected delay in completing the buildings, a loss of £3,000 was sustained. To this loss the bankrupts attributed their failure. The Official Receiver submitted that, inasmuch as the bankrupts tendered for the contract in question at 5 per cent. below the estimated cost of the buildings, and as they had sustained losses on other contracts from a similar cause, the failure was to some extent due to their having accepted contracts at too low a figure. There was no opposition, and Mr. Registrar Brougham granted an immediate order of discharge.

**Mr. Banister Fletcher, J.P., F.R.I.B.A., D.L.,** has been appointed to the Professorship of Building Construction and Architecture at King's College, London, in the place of Professor Kerr, F.R.I.B.A., who retires in July.

The following have been elected to five assistant surveyorships under the Staffordshire County Council:—J. Percy Gates, Worthing; J. Howarth, Liverpool; Alex. Kinnison, Eassie, Forfarshire, N.B.; Charles S. Morris, Bury St. Edmund's; James Wylie, Linlithgow, N.B. The salary in each case is £175, to include the keep of a horse and trap and all other expenses except stationery. There were in all 275 applicants.

The Leeds School Board have, by placing a large clock on the school buildings which are now nearing completion at Richmond-hill, conferred a great boon on the inhabitants in the eastern part of the borough. The clock has been made by Messrs. Wm. Potts and Sons, Leeds, and has four external dials, 6ft. each in diameter, and illuminated by gas at night. The clock strikes the hours upon a bell weighing over 5cw. The clock has gravity escapement, compensation pendulum, &c.

## Our Office Table.

**MR. EDWIN FRESHFIELD, F.S.A.,** writes that Mr. William Brindley, the well-known marble mason and sculptor of Westminster Bridge-road, has forwarded him a block of red porphyry, part of a large quantity just received from the quarries in Egypt, of which he is the lessee, which is very interesting, as it illustrates the ancient method of working hard stones in the Imperial porphyry quarries. On this piece is the wedge hole by which it was worked. The wedge hole, which Mr. Brindley has compared with those made in granite quarries in this country, shows that the tools used at the time this porphyry was worked were precisely the same as those which have been in use in granite quarries until recently in this country and throughout Europe. From the look of the hole, it seems probable that the tools were of steel, though this is not so certain as the method of their use.

The Guinness Trustees have received a letter from Lord Cadogan offering them as a gift a plot of freehold land, upwards of an acre in extent, in a central part of his estate in Chelsea, as a site for the erection of dwellings for the poorer classes in that district. The site, which has been accepted by the Trustees, forms part of the garden of Blackland's House, Marlborough-road, (now a private lunatic asylum), near St. Joseph's College and the Royal Military Asylum. In order to render it immediately available, Lord Cadogan has purchased from the lessee the unexpired term of his lease, which has still 14 years to run. It is understood that the value of the land thus given by Lord Cadogan is about £40,000. The trustees have lost no time in the matter, for they have already instructed Mr. M. E. Macartney, of 52, Berkeley-square, to prepare plans for the erection of dwellings on the site. The trustees have also acquired by purchase sites in Columbia-road, Bethnal-green, and Brandon-street, Walworth, and have instructed Mr. F. T. Pilkington, of 24, Russell-square, and Messrs. Joseph and Smithem, of 45, Finsbury-pavement, to prepare plans for these sites.

The collection of works belonging to the Italian schools at the National Gallery, already its strongest feature in point of numbers, has just been augmented by eight pictures, which are now hung. The most important of these is a large altar-piece, by Girolamo Giovenone, of the Piomonte school of Verelli. It represents the Virgin enthroned in the apse of a church of Romanesque type, holding the infant Saviour in her lap, and having on either side saints, who present two kneeling male donors in early 16th-century costume. At the back of the throne are two angels. The next work of interest is the right wing of an altar-piece by Antonio Vivarini, of Murano—with upright figures of St. Francis and St. Mark—of which the left wing had long been in the Gallery. There is also an Early 16th-Century landscape, showing a blue-green river flowing between high cleft rocks, sparsely adorned with herbage, the distance being furnished by the pale bluish peaks of an Alpine range abruptly springing into the air; it is, perhaps, the work of a 16th-century Lombard under Venetian influence. The other acquisitions are a "Pieta," from Lombardy; a "Madonna and Child," by Bernardino Luini; the "Portrait of a Youth," ascribed to Domenico Ghirlandajo; and two decorative landscapes by Giuseppe Zais, a Venetian painter of the 18th century. While these are interesting examples of the later schools of Italian art, it is to be regretted that the authorities should have purchased works of a class with which they are sufficiently stocked, and at a moment when they are hesitating to accept Mr. Tate's free gift of pictures by contemporary English artists.

The spring exhibition of the Royal Birmingham Society of Artists opens to-day (Friday), the main feature this year being a representative collection of 30 paintings in water-colour by Mr. Thomas Collier, including some of his finest works. The chief place in the large room is occupied by an important picture by Mr. Alma-Tadema, R.A., entitled "The Studio"; Mr. Walter Langley shows "Disaster," and other characteristic examples; Mr. T. Austen Brown sends "Sunday Morning" and "The Recruit"; Mr. J. Henry Henshall, "In Wonderland"; Mrs. Allingham, Mr. W. J. Muckley, Mr. John Parker, Mr. C. J. Lucas, Mrs. Stanhope Forbes,

Mr. George Weatherbee, Mr. Aumonier, and other water-colourists are well represented. In the oil rooms will be found "At Amalfi," by Mr. J. C. Hook, R.A.; "Dominicans," and "Feathers," by Mr. H. S. Marks, R.A.; "The Awakening of Eve," by Mr. Val Prinsep, A.R.A.; "Zephyrus Wooing Flora," by Mrs. Normand; "Husband, Children Home, All Lost," and "A Japanese," by Mr. Anderson. In the Black-and-White Room is a collection of studies by the President of the Society (Sir Frederic Leighton, P.R.A.), and 14 frames of studies by Mr. E. Burne Jones, A.R.A.

In order to aid in the revival of the art of book illustration, Mr. Felix Joseph has just presented to the Corporation of Nottingham, for the Castle Museum, a collection of Early English drawings of considerable interest and value. It consists of some 200 designs, principally in sepia, made about a century since, for such works as "Sir Charles Grandison," "The Invisible Spy," "Don Quixote," "The Vicar of Wakefield," "Paradise Lost" and "Paradise Regained," "Fatherless Fanny," &c. The drawings, which are in a perfect state of preservation, comprise the works of Mr. Stothard, R.A., Richard Westall, R.A., William Westall, A.R.A., W. M. Craig, W. Smirke, R.A., Richard Corbould, Thomas Uwins, R.A., S. Wale, R.A., Wright, J. P. Neale, and many others of that school of English painters. With this addition to the already existing works by Stothard and Smirke, also presented to the same place by Mr. Felix Joseph, the Nottingham Castle Museum now possesses the nucleus of what easily may be made, if it is followed up from time to time by judicious purchases of recent works, a pretty complete collection, elucidating the history and progress of English book illustration.

The new Glasgow Decorative Art Society, which has for its object the fostering of a public opinion favourable to decorative art, has appointed a provisional committee, consisting of the following ladies and gentlemen:—Francis Powell, R.W.S., P.R.S.W.; James Bell, chairman, Institute of Fine Arts; James Fleming, chairman, School of Art and Haldane Academy; William Jolly, H.M.I.S., president, Ruskin Society; James Paton, curator, Corporation Galleries; John Honeyman, F.R.I.B.A.; Wm. Leiper, F.R.I.B.A.; E. A. Walton, A.R.S.A.; William Kennedy, Duncan Mackellar, R.S.W.; D. S. Biddoch, James Mavor, Mrs. Cowan Lees, Mrs. Newbery, Mrs. Patterson Wingate, and Mrs. Reith. The honorary secretary is Miss Henderson, 17, Belhaven-terrace; honorary treasurer, Mr. J. A. Campbell (Burnet, Son, and Campbell), 167, St. Vincent-street; and convener, Mr. Francis H. Newbery.

The County Council of Northumberland received on Friday a report from a committee with reference to the superintending staff to be engaged on roads, bridges, and other county building works. The committee recommended that the staff consist of a county surveyor, to devote his whole time to the work, at £600 per annum; two assistant surveyors, at £150 each; and clerks, to cost in all £150, or less. The county contains, it was pointed out, 480 bridges and 475 miles of road, and the surveying expenditure would thus be £1,050 a year. The scheme was, however, thought by the councillors to be too expensive. Amendments were carried reducing the salaries of the surveyor to £400 a year, and of the assistants to £120 each, and the whole matter was then referred back to the committee.

MANY readers will learn with sincere regret of the death of Mr. John Ridley Hunter, who, until last July, was the senior partner in the well-known firm of Messrs. W. and J. R. Hunter, timber merchants, of 57, Moorgate-street, E.C., and 5 to 11, Bethnal Green-road, E. Mr. Hunter died almost suddenly (syncope of the heart) on the 11th inst. at his residence, Firtree House, Enfield, N., and was carried to his last resting-place at Cheshunt Cemetery on the 15th by workmen who had long been in his employ. He was in his 75th year at the time of his death, and was the second son of the late Mr. Alderman Hunter, Lord Mayor of London, 1851-2. The year afterwards (1852-3) the same civic chair was filled by Mr. Alderman Challis, father of the present Mrs. Hunter, who, with six children, now survives her husband. The deceased was on the Court of the Upholders' Company, a governor of St. Bartholomew's Hospital, one of the oldest members of the Board of

the Commercial Travellers' Schools, a trustee of the parish estate of St. Stephen Coleman, E.C., and was one of Her Majesty's Lieutenants of the City.

The Epping Forest Committee of the City Corporation report that they have received from Sir T. F. Buxton and Mr. E. N. Buxton, without payment, a piece of land situated at Oak Hill, Theydon Bois, containing about 12½ acres. This land forms a valuable addition to the Forest, not only on account of its beauty, but because there is now no break in the continuity of the Forest adjoining the main road from the Wake Arms to Theydon Bois. The area of the Forest, including Wanstead Park, is now 5,542 acres. The committee have given careful consideration to the question of thinning the densest portions of the Forest, about which certain complaints had been made. They found in every instance where the Forest had had time to recover itself that the underwood was springing up, and the trees had benefited by the admission of more light and air, and by having more room for growth. The committee had drawn up a few rules for the guidance of the superintendent, one of which provided that each annual thinning should be spread over an area of about 500 acres of thicket, which was to be gone over lightly, and that no blackthorn or undergrowth should be cut, except where it was dead or when it ought to be removed for the improvement of the growth of neighbouring trees, or for protection from fire or for the purpose of felling pollard trees. The amount expended on the Forest last year was £3,891, and the income was £1,061.

The object of the Technical Instruction Bill introduced by Sir Henry Roscoe, M.P., is stated to be to clear up any doubt as to the legality of the provision of technical and manual instruction in public elementary schools. At present it is questionable whether the managers of these schools may include such instruction in the time-tables, so that attendance at it may be counted as attendance at school. The Bill would remove all doubt on these points. It declares that the managers of any public elementary school may provide technical or manual instruction for the scholars either on the school premises or in any other place approved by the inspector; and attendance at such instruction is to be deemed to be attendance at the public elementary school. The conditions on which Parliamentary grants are to be made in aid of technical or manual instruction in public elementary schools are to be those contained in the minutes of the Education Department and of the Science and Art Department in force for the time being.

A few of Colonel King-Harman's friends are about to erect an elaborate memorial brass in the parish church, Margate, the design of which is decorated in character. Upon the left is the family coat-of-arms, surmounted by the Colonel's crest. Above the whole is a very rich gable ornamented by crockets, while the intervening ground is full of work, the detail of which is very minute. The whole of the ground in the body of the brass has been cut away and matted, leaving the inscription in bold relief. There is a wide border round the whole, consisting of elaborate work, very small in detail, to give greater effect to the appearance of the brass. It has been mounted upon a black marble slab. The execution has been intrusted to Messrs. Jones and Willis, London and Birmingham.

The honorary freedom and livery of the Turners' Company was conferred yesterday (Thursday), on Sir John Fowler, Bart., K.C.M.G., and Sir Benjamin Baker, K.C.M.G., "in recognition of their distinction and eminence as engineers, earned by many great works at home and abroad, especially the design and construction of the Forth Bridge, one of the greatest triumphs of British engineering in the Victorian age." The ceremony was held in the old council chamber at Guildhall, under the presidency of Mr. Burdett-Coutts, M.P., Master of the Turners' Company.

Mr. Newton Brooke, stone-merchant, of Northowram, near Halifax, was defendant in a breach of promise of marriage, in which a young woman, living at Halifax, sought to recover £2,000 damages. The case was, however, settled out of court, defendant consenting to pay £700 and all costs.

The waterworks committee of the Manchester Corporation have accepted the tender of Messrs. Monk and Newell, contractors, Bootle, for the construction of a large section of the Thirlmere aqueduct. Work will be immediately started between Windermere and Oxenholme.

#### MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Society of Architects. Visit to Starkie Gardner and Co.'s Works, Albert Embankment. 2.30 p.m.

MONDAY.—Builders' Clerks' Benevolent Institution. Annual Dinner at Holborn Restaurant. 6.30 p.m.

Royal Institute of British Architects. Business Meeting. 8 p.m.

TUESDAY.—Institution of Civil Engineers. "Barry Dock and Railways," by John Robinson. 8 p.m.

Glasgow Architectural Association. "The Development of Wood-Carving," by George Tudhope. 8 p.m.

WEDNESDAY.—Civil and Mechanical Engineers' Society. "Oceanic Vertical Circulation," by W. Lant Carpenter. 7 p.m.

#### CHIPS.

The parish church of Guestling, near Hastings, an edifice dating from the 12th century, was burnt down on Sunday.

The Senate of Bremen has approved a scheme for deepening the harbour. The cost is estimated at fifteen million five hundred thousand marks—about £775,000.

At the rising of his Court at the Birmingham Assizes, on Tuesday, Baron Huddleston paid a visit to the Victoria Courts, now in course of erection from the designs of Messrs. Aston Webb and Ingress Bell. He was shown over the building by Mr. Bowen (the builder) and Mr. Richards (the clerk of the works).

The parish church of Charles, near Barnstaple, is about to be restored from plans by Messrs. Gould and Webb, of Barnstaple.

Mr. Turner, head master of the York School of Art, delivered an illustrated lecture on "Art and Artists" before the Yorkshire Philosophical Society in that city, on the 20th inst.

Building operations are about to be commenced on the site procured by the Committee of the Junior Constitutional Club for the erection of the permanent club-house in Piccadilly. Col. R. W. Edis, F.S.A., is the architect.

A Select Committee of the House of Lords has passed, without opposition, the South London Polytechnic Institutes Bill, which authorises the purchase of a site in the Borough-road, Southwark, for the purposes of a Polytechnic Institute for that district.

At a general assembly of the Royal Society of British Artists, held on Friday evening, the following gentlemen were elected members:—Messrs. Alfred de Bréanski, J. W. Godward, Edwd. Holmes, Albert Kinsley, G. Sheridan Knowles, Chas. E. Marshall, Leopold Rivers, and Henry Zimmerman.

By the destructive fire which occurred on Friday last at Messrs. Wilson's saw-mills and timber-yard at Wearmouth Bridge-end, Sunderland, damage to the extent of £20,000 was occasioned.

The Strand district board of works decided, at their last meeting, to raise the salary of their surveyor, Mr. Ventris, from £500 to £550 per annum.

The charity trustees of Bath opened, on Friday, thirteen tenders, ranging from £14,000 to 19,000, for the erection of a hospital for idiots on Claverton Down.

"The Bridesmaid," by Millais, has been presented by Mr. Harding to the picture gallery of the Fitzwilliam Museum at Cambridge.

A new German Expedition in Eastern Africa is announced from Berlin. A German architect, Herr Hoffmann, and five other Germans, accompanied by a number of coloured men, have gone to Halule, on the Somali coast, for the purpose of founding a German station there.

Mr. Alfred G. Tucker, for the past two years surveyor to the highway board of West Powder, Cornwall, has been elected assistant district surveyor to the Sussex county council at a salary of £160 a year and expenses.

The county council of Shropshire elected on Saturday Mr. Frederick Brayshaw, at present in the employ of the Leeds corporation, as surveyor to the south-western division of the county, from among 29 candidates.

The Corporate Property Committee of Leeds have resolved to ask the corporation of that borough to grant the sum of £500 for the restoration of Kirkstall Abbey. It is proposed to lay new drains, in order to carry away the accumulated water on the land between the road and the abbey, and to clear away the debris from the base of the ruin.

The second annual meeting of the Bath Stone Firms, Limited, was held at the Grand Pump Room Hotel, Bath, on Friday, Mr. C. J. Pictor in the chair. In October a dividend at the rate of 5½ was declared, and at the meeting on Friday a dividend for the half-year at the rate of 7½ per cent. was declared, making £6 7s. 6d. for the year.

## Trade News.

### WAGES MOVEMENTS.

KENT AND ESSEX BRICKMAKERS' BARGEMEN.—On Monday a meeting of Sittingbourne and Milton bargemen was held, at which a proposal was submitted from the masters, to the effect that the bargemen should resume work upon the old freights until July, by which time a scale of new rates, the joint production of masters and men, might be prepared. To this proposal the men returned an emphatic refusal. Since the bargemen first came out, a month since, more than £7,000 has been lost to Sittingbourne and district through unpaid wages. About 1,100 of the brickmakers are in receipt of strike pay, amounting to 10s. a week, from the Kent and Sussex Labourers' Union, to which they belong. It has been suggested that, if the bargemen refuse to come to terms, the bricks can be sent to market by rail. The cost would be 8s. a thousand, at most, to London, and by short connecting lines the trucks could easily be loaded in the most convenient part of the fields.

KILMARNOCK.—The joiners resumed work on Tuesday, the masters having conceded the advance of a half-penny per hour, with a reduction of four in the working hours per week, as asked by the men. The strike lasted a fortnight.

NEWCASTLE AND GATESHEAD.—The upholsterers employed in Newcastle and Gateshead have obtained the demand made by them for an advance of 2s. per week—from 33s. to 35s.—from the majority of the masters in Newcastle and Gateshead. The men employed by those firms who have not made the concession struck work on Saturday. The cabinetmakers, who gave notice for a similar advance, have received the full amount from their employers, so that no stoppage whatever will take place in that trade.

THE POTTERIES.—Some time ago a dispute took place in the district in connection with the wages of carpenters and joiners, while the bricklayers also asked for higher wages and less hours. The arbitrators to whom the matters were referred were unable to agree, and it was mutually decided to leave the dispute to Mr. Cooper Whitwell, architect, Birmingham, who has given his decision. He gives the carpenters and joiners what they ask—namely, 7½d. per hour, to take effect from the 1st of May next. The bricklayers, who ask for 8d., are to have 7½d. an hour, without any alteration being made in the time they work.

#### CHIPS.

The net value of the personal estate of the late Mr. James Stewart, iron tube manufacturer, Glasgow and Coatbridge, has been returned at £153,487 9s. 8d.

An arcade is about to be made at Wrexham between Hope-street and the Market Hall, and will contain about a score lock-up shops. Mr. A. C. Baugh, of Wrexham, is the architect.

A free public library was opened at Middlewick on the 20th inst. The premises have been adapted and fitted up for their new purposes by Messrs. Clark and Son, Mr. Tarleton being the architect, and the indicators are on the Cotgreave system.

The contract for the demolition of Whitefield's Tabernacle, Tottenham Court-road, was signed on Monday morning, the work of destruction to begin forthwith. In a month the building will be razed to the ground, and the rebuilding will then be taken in hand.

A new warehouse, together with extensive stables, &c., are being erected in Stockport by Mr. D. Clifton, as an extension to his already large mineral water manufactory. When completed, there will be accommodation for 30 horses. The elevation (55ft. high) will be built of Darley Dale stone and Ruabon bricks, and there are fireproof floors throughout. Mr. A. M. Fowler, jun., is the architect.

The Hebrew Synagogue at Portsea was reopened on Sunday. A new porch has been erected to guard against panic, which must have ensued in the event of a hurried exit from the ladies' galleries, the original porch having been so inconveniently constructed. The whole of the interior has been re-seated in pitch pine, and a handsome new reading-desk erected. The ark, which was opened in the synagogue 175 years ago, has been carefully preserved and restored. This is surmounted by the first two letters in the Decalogue in Hebrew, symbolical of the two tables of stone delivered to Moses on Mount Sinai. The ark now stands on a tier of polished marble circular steps in place of the original worn wooden ones; a handsome brass pulpit rises from same. The floors have all been laid in mosaic. The total cost has been £1,100. The contractor was Mr. J. Dugan, of Portsea, and the architect Mr. Harry A. Smith, of Gosport.

**Holloway's Pills.**—The balsamic nature of Holloway's Pills commends them to the favour of debilitated and nervous constitutions, which they soon resuscitate. They dislodge all obstructions, both in the bowels and elsewhere, and are, on that account, much sought after for promoting regularity of action in young females and delicate persons.

## GEO. FARMILOE & SONS,

Lead, Glass, Oil, Colour, and Varnish Merchants.

ALL LETTERS TO OFFICES AND WAREHOUSES:—

**34, ST. JOHN STREET, WEST SMITHFIELD, LONDON, E.C.**

Lead Works: Island Lead Mills, E.  
Sanitary Appliances and Plumbers' Brass Work Factory: Eagle Court, Clerkenwell, E.C.  
Stained Glass Works: 109, St. Martin's-lane, W.C.  
Wharf: Queen's Wharf, Wapping Wall, E.

## DOULTING FREESTONE.

**THE CHELYNCH STONE.**—The Stone from these Quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

**THE BRAMBLEDITCH STONE** is of the same crystalline nature as the Chelynych Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

## HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material. Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—

**THE HAM HILL STONE COMPANY,**  
NORTON, STOKE-UNDER-HAM, SOMERSET.  
London Agent:—

Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

## BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

## Faraday & Son's ELECTRIC LIGHT FITTINGS

3 Berners Street London W.

## ELECTRIC LIGHTING.

## COMPLETE INSTALLATIONS OR WIRING ONLY} ESTIMATES GIVEN.

**STRODE & CO.** 42, Osnaburgh-st., N.W., and 67, St. Paul's Churchyard, E.C. LONDON.  
New Branch Showrooms:—188, PICCADILLY, W.  
Telephone No. 3958.

## WM. OLIVER & SONS, MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.  
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

## TENDERS.

\* Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

**BRISTOL.**—For works of street paving, for the city council:—

Districts 1 and 2:—Galbraith (accepted).  
District 3:—Yalland, T. K. (accepted).

**BEXHILL-ON-SEA.**—For completion of Marine Mansions Hotel. Mr. J. B. Wall, F.R.I.B.A., Walbrook, E.C., architect:—

Soper, R. ... ..	£3,138	4	8
Holloway, H. L. ... ..	2,714	0	0
Jenkins, P. ... ..	2,700	0	0
Eldridge and Cruttenden ... ..	2,682	0	0
King, J. ... ..	2,479	0	0
Webb, J. W. ... ..	2,369	16	0
Nicolls, J. G., Catford (accepted) ... ..	2,335	15	0

**CHARD.**—For the repair of all roads throughout the borough during the ensuing year, for the town council:—  
Hill, F. (accepted).

**CHELSEA.**—For the erection of new studios in Oakley-street, for Mr. W. Douglas. Mr. E. E. Hawkins, 19, York-buildings, Adelphi, W.C., architect. Quantities by Mr. C. G. Saunders, 5, Agar-street, Strand, W.C.:—

Bird, S. G. ... ..	£4,098	0	0
Green, T. L. ... ..	3,959	0	0
Smith, W. H. ... ..	3,953	0	0
Gregory, T., and Co. ... ..	3,867	0	0
Johnson, W. ... ..	3,630	0	0

**COVENTRY.**—For the construction of service reservoirs and works at Coundon in connection with the new water-works, for the city council:—  
Smith, G. F., and Sons, Milverton (accepted) ... £13,900

**DARVEL.**—For the erection of a house at Darvel, Ayrshire, for Mr. A. Jamieson. Mr. T. H. Smith, 17 and 18, Basinghall-street, E.C., architect:—  
Anderson ... .. £1,250 0 0

**DAWLISH.**—For laying a sewer from the Town Hall to Lawn-terrace, for the local board:—  
Matthews, W. T. (accepted).

**EALING.**—For additions to St. Mary's boys' school, Ealing, W. Mr. R. Willey, F.R.I.B.A., 66, Ludgate-hill, E.C., architect:—

Grover ... ..	£430	0	0
Down ... ..	424	9	0
Jobbins ... ..	410	0	0
Jones ... ..	405	0	0
Sills ... ..	399	15	0
Nye (accepted) ... ..	398	10	0

All of Ealing.

**GOSFORTH.**—For detached residence, Elmfield-road, for Mr. Lord. Mr. W. L. Newcombe, F.R.I.B.A., Newcastle-upon-Tyne, architect:—  
Reid, E. B., and Son (accepted).

**GOSFORTH.**—For detached residence, Elmfield-road, for Mr. Snowball. Mr. W. L. Newcombe, F.R.I.B.A., Newcastle-upon-Tyne, architect:—  
Haswell and Waugh, Gateshead (accepted).

# To Municipal Authorities, Engineers, and Surveyors. JENNINGS' PATENT URINALS

FOR PUBLIC THOROUGHFARES AND RAILWAY STATIONS,

Have been adopted in all the principal European Cities. They are particularly adapted for public use, being simple in construction, strong, and most economical as regards the water supply.

# JENNINGS' STONEWARE DRAIN-PIPES

Have been specially selected and adopted, after severe tests, by the South Australian Government for the drainage of Adelaide. The Sockets and Pipes are made in one piece under great pressure by Steam Machinery from the finest selected Poole Clay taken from Beds on the works, and, by hydraulic testing, have been proved superior to any other pipes in the market.

Prices and particulars can be obtained from

**GEORGE JENNINGS, STANGATE, LAMBETH, LONDON,**  
And the Manager, South-Western Pottery, Parkstone, Poole, Dorset.

## NOT NOW?

MONDAY night's meeting at the Institute was, on the whole, encouraging and hopeful. Mr. Wreghitt Cannon's speech was a statesmanlike and sagacious one. Professor Roger Smith, with amiable timidity, is afraid of Registration, and it is evident from the voting, that while all the reasons for Registration were adduced by its advocates, all the people who are insensible to reason still outnumber the wise. Five years ago Registration was scouted as ridiculous. In the face of facts more potent than arguments, everybody sees now it is a good thing; but "not just yet," plead the people who supported Professor Roger Smith's amendment on Monday. These gentlemen are acting with the best of faith, and from the most honourable motives; but they are—in many cases unconsciously—simply the puppets of the bitter and interested partisans who, for perfectly comprehensible reasons, want to keep the Institute in its present condition of feebleness—a respectable corporation enough, but one at which outsiders snap their fingers and the Judges of the land shake their heads and smile whenever its regulations are appealed to in support of professional custom. We do hope that the proposed poll of members of the Institute throughout the country will reveal a better and juster appreciation of the situation. The Royal Institute of British Architects is just now so powerful for good, if it can be brought to see it—though at the same time, fortunately, so powerless for evil—that it is impossible to over-estimate the responsibility which attaches to each of its members. We earnestly advise each member to read carefully our summarised report—all, unfortunately, we are able to give, and only that by the help of friendly Fellows. The old, bad, ostrich-like policy of the Institute survives in all its stupidity as far as excluding reporters from such meetings as that of Monday is concerned. On the vote each member gives depends, not whether Registration is coming—that is as certain as death and quarter day—but whether its attainment shall be effected in a dignified and statesmanlike fashion, at the instance and under the auspices of the Institute itself; or whether it shall be forced on the profession by the public, who are vitally interested and daily becoming more and more alive to the importance of Registration—quite possibly in an incomplete and in some respects ill-advised fashion.

## PROVISIONAL AMOUNTS.

A DIFFERENCE of opinion as to the meaning and intention of providing certain sums of money for certain goods supplied to a building in specifications and quantities is found to exist in the minds of architects and builders, and, as a correspondent has drawn attention to the subject in a letter we published on March 21st, p. 433, we refer to the matter. As "A Builder's Manager" says, much unpleasantness often arises in the adjustment of these amounts in contracts. There are, no doubt, two distinct views of the term "provisional amounts," and it is with the object of throwing some light on the question that we discuss those theories. The terms "prime cost" and "nett" as applied to these amounts are certainly liable to be confused—the architect intends one thing, and the builder another. The architect generally

implies by the term "prime cost," the "out-of-pocket cost" to the builder, and not the amount which the employer would have to expend, supposing he bought them. The amount is put in to be dealt with or not as the employer desires, the object of inserting the money value being for this purpose, and to insure the expenditure of a certain sum upon them, so as to prevent inferior goods being introduced into the building. Generally the client wishes to select his own grates, chimney-pieces, wall-papers, or other special fittings, and he can therefore deal with the sum provided as he pleases. If the sum included the profit of the builder, the object of its introduction as a sum of money would not be attained. Suppose, for example, £100 were provided in the contract for chimney-pieces, the general idea is that the builder would actually pay that amount to the manufacturer after they have been selected by the architect or the employer. The builder's idea is different; he assumes that the sum provided means the prime cost the client would have to pay if he went to the warehouse and purchased the goods. When we come to consider the *pros* and *cons* of the matter, there is a good deal to be said on each side. "A Builder's Manager" writes:—"Taking the illustration advanced by Mr. Gough, that if 500 locks were specified the builder would be bound to supply them, and that, therefore, if 500 sovereigns are specified he should be made to supply them also, the fallacy of this argument is in supposing sovereigns to be mere goods to be supplied, whereas they imply £500 worth of goods, a totally different thing, for the amount is put in to guide the builder—in fact to price it for him. In the case of the locks the builder puts his own value, but in the case of the other goods, which the builder has no means of knowing what is required, the architect puts the value at £500 in a lump sum for a quantity of them, and this value should be the same as the builder's—i.e., include his profit."

Our correspondent's remark appears reasonable—namely, that the £500 provided means that *worth* of goods, and includes builder's profit; but the architect has not looked upon the item in that light, but as a sum set apart to be actually expended by the builder if so desired, or, in case the £500 is not expended, to be deducted from the contract amount. Again, the employer, or his adviser, may say that if the builder's profit is to be deducted he has no assurance of the amount actually expended in the goods, and that, therefore, he is no better off than if they had been provided by the contractor in the usual way. Nor is he, if the amount of profit is not known. We think we are interpreting the opinion of many in the profession when we say the sum provided is looked upon as something intact, not to be touched except for a given purpose, and upon which no profit or commission is to be levied. It is, in short, a sum outside the contract which the builder is only asked to include. If the goods are to be fixed, of course the builder charges for the labour. At least, this is one view of the question; we do not say it is a satisfactory one altogether, but only that a large number of architects hold a "provisional sum" is to be considered in the sense of so much money, and not as "worth" of goods.

This theory can be supported if we consider the sums so provided to be something separate from the contract, yet inserted with the object of obtaining the goods at cost price, or at below the price they would be sold to the employer himself. He therefore hopes to obtain some advantage by the transaction. But the builder cannot see why he should do so—why, in fact, the employer should be benefited by the trade discount and builder's profit. Thus it is, our correspondent remarks, "the trade discount or builder's profit does not concern the client any more

than the manufacturer's profit." He further says, with some reason, if the principle is conceded that an architect has a right to know the exact prime cost to the builder of any article supplied, then he can claim the right to know the prime cost of the whole job. But this does not exactly follow if what we have said is the principle acted upon. Our correspondent very concisely states the builder's view of the reason why provisional amounts are provided—namely, the architect puts a value to certain goods like chimney-pieces or stoves "as a guide to the builder in making up his estimate," and this we know is the general view of the matter held by contractors, and we cannot think it unreasonable. The builder can argue, fairly enough, as he contracts to supply everything at certain values, allowing his profit, so at least he ought to be allowed to claim his profit on a large amount set apart for goods ordered for the work. There are, therefore, these two distinct opinions on the question: the employer and his architect regard the provisional sum as intact, exclusive of builder's profit, the builder regards it only as a sum including his profit. Both are to a certain extent reasonable, but in the interests of both builders and employers some agreed procedure should be adopted, as the present difference of opinion has an injurious influence. We even know of the "provisional amounts" being inserted not for the employer's benefit. The architect is intrusted with the order and selection of goods, and the trade discount is often handed to him. We cannot defend such a practice, though it is a common one. To avoid disagreements in adjusting contract accounts, it is highly desirable that builders and architects should arrange between themselves how these amounts are to be taken—it does not matter in what way so long as it is understood. We cannot, at least, find fault with one mode of dealing with them that is suggested—viz., that where the amount is expended, the builder should be allowed 10 to 15 per cent. profit upon the nett invoiced amount; if the amount is not expended, the nett sum to be deducted from the contract. The builder certainly is supposed to undertake some risk and trouble about goods, however they may be ordered, and, as every case would have to be determined on its own merits, the percentage of profit would naturally vary.

## PIECE AND DAY WORK IN THE BUILDING TRADES.

THE general disposition on the part of workmen to resist piecework is a constant source of disagreement between them and the masters. Several strikes from this cause among engineers have taken place of late. The carpenters and joiners every now and then, as in the notice for advance in the district of the Potteries, protest against this mode of payment. In the shipbuilding, boiler-making, and other engineering trades, and in many other industries, piecework is the practice, and has given satisfaction to such an extent that the employers are induced to extend the system. They find, in fact, the results more satisfactory, and as they have to prepare estimates, the system of working by the piece offers advantages over the "time work," as it facilitates the making of estimates; it lessens the trouble of superintendence, and the system has the tendency of reducing the cost of labour. The last result is the abiding offence in the eyes of the workman. Let us examine briefly the real position, whether he is not a gainer by a mode of working which transfers any credit there is in the work to the artisan; whether, in short, there are not compensating advantages that overbalance the simply pecuniary and near-sighted view. The societies which have

protested against piecework have laid down certain rules for the guidance of their members. These are that they are justified in resisting the system when introduced by a firm where it has not been generally followed, or where it is sought to be extended to certain branches that have not hitherto worked under it. Where the system has been in operation the resistance to it is discountenanced. These rules are somewhat arbitrary. They bind the employers to a certain mode of doing business, and leave them without the option, unless they decline to accept the terms, of competing with other firms in which piecework has been followed. They further impose terms on the masters, by not allowing them to avail themselves of markets open to them. Building and engineering firms who work under the rules of associations claim the right to adopt either system, and consequently they are in a more advantageous position for competing than the employers who are bound to adhere to one system. Is this fair? An employer of labour, like the buyer of goods or commodities, is his own master, and ought to be left to make his own bargains, provided he does so without infringing on the freedom and rights of the employed. Inasmuch as the men have it in their own hands to refuse work upon any system they decline to accept, it appears to us there is little justification in the rules of societies which try to impose them on masters. Equally hard to reconcile is the dictum of the societies as regards the men. There are hundreds of workmen ready and willing to give their services by the piece. Why should they be compelled to comply with rules framed in the interests of those who prefer the time system? These are questions which naturally occur to the mind of disinterested individuals when they hear of strikes. It may be not generally known that piecework is universal in many branches of trade; in France and on the Continent it is the rule rather than the exception. Thus the bricklayers in France, or rather the masons who lay bricks, earn their living by piecework, and the carpenters and joiners prefer it to daywork, as it gives more satisfaction to employers and workmen. It may be asserted that the repugnance to piecework by some artificers is owing to the distaste they have for any effort; they prefer to have regular working hours, to have no responsibility of any kind, no brain work, and to draw their wages at regular intervals. Other men are more enterprising, less inclined to plod on like machines, and if they can see their way to accomplish a work single-handed, to obtain the credit due to skill and exertion, they prefer to work by the piece, as it allows them more freedom of choice. To them the most cheerful kind of labour is that in which head and hand are both employed. The satisfaction that comes from a personal interest in the work is the incentive. We cannot, in short, shut our eyes to the fact that those who resist piecework for every class of work are generally the drones, while those who seek to obtain a larger share of the work in their own hands are the men who make our future builders and contractors. Of course, these conclusions must not be taken too rigidly. Sometimes it is not easy to determine the time required for doing a certain thing; one man cannot do the whole work himself, in which case a subdivision of labour is necessary.

The chief reason alleged by the trade unions against the principle of piecework is that it has the tendency to reduce day wages. It is asserted that piecework is used as a means of fixing the rate of pay by regulating the wages of day-workers by the amount of work done in a certain time by those who work by the piece. The argument has been made a plausible pretext by carpenters and joiners, and other building artificers. On the piece system the rates are often low, and

in order to earn a good wage the worker on this principle is apt to hasten his work. Those who work by the day are therefore expected to perform the same amount of work in a proportionate time. Again, it is alleged that the piece-worker, by having to hurry his task, is disposed to scamp the work. There is no doubt something in the allegation. The piece system is not always fairly conducted, and we hear of complaints by workmen. One master makes a change when he finds a man earn above his usual wage; the work is pretended to be wanted, and other hands are taken on at daywork. Another, who adopts the piece system, does not hesitate to cut down the second job, if he finds his men make more than daywork price. The effort is to under-rate the daywork wages. Now these kinds of tactics could not be carried on if the employers and employed both agreed to a standard price. Instead of running their heads against piecework as a system, let them endeavour to make it a condition that a certain price will be agreed to, and if a few can, by over-exertion and skill, make a little more than their fellows, let them do so, but without reducing the wages to others beyond a certain limit. It is a ridiculous fallacy to contend for equal wages in the building trades. The attempt to reduce wages to a uniform standard is about as absurd as to suppose that all men should be reduced to an equality in other things. It would simply be to bring down the skilful workman to the level of the most inferior. The best workman can always obtain an advantage over his less competent brother, if not in wages, supposing they are equal, but in expertness and skill. He will obtain the best work and must ultimately get ahead, however trade-unionism may endeavour to suppress all individuality by equalising the rate of wages.

In the building trades there is less opportunity for uniformity than in some others. In joinery, for example, there is every conceivable class of skill required, from that necessary in turning out high-class doors and windows and staircases to the commonest labours in laying floors, planing, and framing. In house painting and decoration the same remark applies. So in masonry and in brickwork and plastering. Only in mechanical labour of a uniform kind, as in riveting, jobbing, and repairs to building, can the day work system be applied with any success. Building artisans of any ability cannot see the justice of first, second, and third rate hands receiving the same remuneration. Those who object belong to the class of "laggards."

The dislike to the system of payment by results is becoming, however, less marked. The workmen are beginning to see the advantage of working independently of each other wherever practicable—and in all trades where there is much division of labour it is so—of using their own abilities on their own account instead of performing at fixed wages services which only enrich their employer and impoverish themselves. The unionist views are entirely based on the idea already mentioned, that employers regulate the piecework rates upon the standard of the quickest and strongest workmen, and that therefore the less expert have, in order to earn sufficient wages, to exert themselves to a very undesirable extent. But these views are not borne out by facts. Where the system is fairly applied and the work registered and regulated, the results are equal and often superior to the time-pay system. Each employé should be furnished with a return specifying nature of work, extent of it, and the rate at which undertaken. These returns being duly entered by him, with the number of hours spent, the difference between the two systems can be easily arrived at. Interruptions to piece working ought to be entered with equal regularity. From these

registers the rates can be tabulated, and the gain or loss to the employer or employé determined, from which fair piece-work rates could be found. What is wanted is to find out the equivalents in piece and time work, to prepare a price list of every quality of work per foot, and when this is done, as it is by some large firms, all difficulties and much of the ill-feeling between employers and employed would be removed.

#### THE ROYAL SOCIETY OF BRITISH ARTISTS.

THE Exhibition in Suffolk-street is rather weak in important works, and we find fewer pictures by artists whose canvases have of late years increased the repute of this old society. The large room contains several landscapes. In a poetic vein, H. T. Schafer's small "Eventide" view of a village may be noticed, with the charming grey-toned study of John Gray (291), the "Heathside," by T. Roberts, under an evening glow, J. L. Pickering's melodious "Devon Stream," Yeend King's "Changing Pasture" (362), full of light and shade; and in the same spirit are H. C. Fox's "Maple-durham Mill" (384), the works of R. W. A. Rouse, whose *penchant* is in giving the wilder aspect of dark, cloudy skies and grey rivers flickering in cold, grey light. "The Close of Day" (375), "Evening after a Shower" (454), "The Moated Farm" (491), and "A Gleam of Sunshine" (521) are of this character, thoroughly English in their sombre tones, and reminding one rather of Constable in a low key, but much more weirdlike. Sometimes, indeed, Mr. Rouse is rather hard and murky, yet in all there is a vigour and strength of treatment. "At the Calm of Eventide," Stuart Lloyd (337), we have the other extreme of tender pathos and melody, a calm riverscape in a warm, suffused light, and in 346 Jas. E. Grace has a delightfully delicate view of "A Backwater." W. S. Jay sends, as usual, a large, dexterously-painted study of forest glade, "Innocent Poachers," rich in autumnal tints and checkered lights. Giant trunks spread their roots over the leaf-strewn foreground, and a few children are gathering wood in the path-way. The picture is realistic to a perhaps wearisome degree, a fault which the peculiar *technique* of the painter has intensified. "Innocent Poachers" is more of a scenic background, its figures give it meaning and a name. Subject pictures, in which figures are introduced, are fairly represented by the hands of L. C. Henley, Adam E. Proctor, F. Brangwyn, W. H. Pike, and J. R. Reid. The finished and scholarly subjects of Mr. Henley, "Harmony" and "Discord" (258, 267), are full of expression. The refined grace and modesty of the young lady with her hand in her lover's hand, leaning on a piano, is more successful than the companion; both are admirable renderings of 18th-century dress and decoration. Simple in incident and treatment is "Scandal Mongers" (271); charming in its composition and colour is F. Brangwyn's group of seafaring men on a pier-head, the mist and spray and wet cleverly handled. In W. H. Pike's "In the Corridor of St. Mark's" (301), a group of well-dressed ladies are passing an old bearded man and his suppliant little daughter; there is much to commend in the animation and character of the faces; while J. R. Reid, in the strong little canvas, "When the Boats Come In" (314), sustains the sense of fresh, vigorous colour and grouping which we always admire in his work. The blue sea is perhaps a little too blue, the shaded figures too dark; but Mr. Reid always paints under intense suns, and we may object there is not enough atmosphere. Mr. Brangwyn's sea-sides are certainly a little more English. G. E. Hicks's

arge subject, "Adoration" (292), a little boy with clasped hands, smelling a flower, is rather unnatural; the child's eyes and expression do not suggest the adoring frame of mind, but rather that of fear. The colour in F. Hamilton Jackson's classic figure-subject "The Distant Sail" (297), is extremely harsh, the bright orange drapery wanting in harmony. We certainly cannot see much in the subject of Chas. E. Marshall's "The Heir Presumptive," except in the elegantly attired lady in figured gown, holding an infant before his grandfather seated by the fireplace; the painting is careful. One of the most prominent pictures in the gallery of this class of *genre* is R. J. Gordon's "Proposal," an effective painting, a little French in its method, representing an elegantly dressed young lady, reclining on a drawing-room settee, being wooed by a gentleman who leans over the couch; the figures are graceful in drawing, the light canary green silk dress, set off by a fine gauze skirt, the polished floor and white walls as a background, are in harmonious keeping with the scene. W. Strutt's, "A Primrose League" (394), Favonius the Centurion and a Maid of Kent, recounts an early observance of the League; the picture is painted with almost pre-Raphaelite care, but lacks solidity. The full-length seated portrait of a lady, "Ethel," by S. Sidley (406), at the corner of room, kills everything near it by the scarlet colour of the dress. As a portrait study, Davidson Knowles's "Reverie," a three-quarter portrait of a plump-figured dame, is far more pleasing, at least in the colouring. Seascapes and coast views abound. Arnold Priestman's small picture, "On Morecambe Bay," is charmingly painted in the mingling of silvery cloud and sea (259); the atmosphere in Gustave de Breanski's "Gorleston Harbour" (265) is also noteworthy; pearly and bright rippling seas are the qualities we admire in G. S. Walter's work—perhaps a little artificial. Julius Olsson's "Evening Sunlight," a sea wave coming in, its crest reflecting the red gleams of the sun, is a clever study of ocean effect. Haynes King's fisher-girls are natural; one of his best is "The Fisherman's Beacon" (311), a small study of a fisher-girl holding a lantern in a door of a cottage, poetically conceived and executed. Stuart Lloyd paints a restful riverside (337). Nelson Dawson's large impressionistic picture, "A Summer's Day, Cornwall" (400)—a stretch of brown sand and blue sea—is a note of colour, full of light, but too large. We like Fred Culver's charming bits of atmosphere and water, "Littlehampton Harbour" (340) and "A Bend in the River" (397). "Drifting" is luminous; the boat, gliding on the calm water, with its freightage of girls, is cleverly painted—a piece of restful, forcible sea-painting, the light and boat reflection admirable. F. Brangwyn, "January" (352), a large winter scene, is less happy than other works in his more accustomed sphere; J. F. Darley's "Cliefden Woods" (313) is a charming piece of woodland—a poem in its way. Among other pictures we must not omit notice of Horace H. Cauty's (the secretary) "Toilers of Pleasure," a dancing girl in a circus before a number of spectators, and her dog, Toby-like, on the drum by her side—the bright dress of the girl, the accessories, and the character of the faces of the spectators are painted with considerable effect; nor should we pass over J. S. Noble's study of a tiger or leopard (324). We have left to the last the President's grand interior, "Monza Cathedral—the Duomo of the Iron Crown" (264). The subtle pencil of Mr. Wyke Bayliss does not lose its cunning; the pearly and jewel-like effect of the flickering light on vault and pillar, on spiral stair and fretted shrine entrances the eye; the gloomy spaces of shadow throw a spell of mystery over the

interior. There is over-richness and dottiness sometimes, but we also feel the repose and grandeur of the perspective.

In the other rooms we see that Claude Hayes is still a rapturous student of the poetical in landscape. "Milford-on-Sea" is a fine study of dark gleaming clouds. Richness of autumnal colour is the charm of H. C. Fox's "Edge of a Wood" (426). Again R. W. A. Rouse shows us two other landscapes (454), and W. H. Y. Titcomb's "A Cliff Pasture" is a charming little coast bit. H. Cauchois has a nice flower study (412). A large picture by Jas. Hayllar of a country wedding (429) in humble life is not without interest, though somewhat hackneyed; the characters of the bride and her smocked father, the bashful bridegroom and his "best man," and the onlookers in the small whitewashed church are well painted. Jas. E. Grace has a pleasant "Surrey Common" (430). Flora M. Reid's pretty little subject, "Dolly's Spring Cleaning" (430), is childlike in its simplicity and tenderness. A nice figure study is by E. Ethelston (462); and F. Cayley Robinson has painted very deftly and gracefully a fisher-girl seated on one of the mooring structures on the look-out. "Waiting for the Boats" (485) is a clever handling of rough sea at Boulogne pier-head. J. S. Noble's "Drove of Oxen" (500), coming along a rough road on a moor, is full of strong colour and clever drawing, worthy of this painter's talent. A pleasing view of craft on the Tay (501) is by A. S. Edwards. The snow-clad landscape of V. P. Yglesias (509) is full of poetic charm and pearly hues. The undulating country of Tunbridge Wells has afforded the required elements to the painter. Arnold Helcké, Annie Baker, and Leopold Rivers contribute clever studies. The Hon. Stephen Coleridge paints a pleasant reminiscence of "Venice from the Lagoon" (523); E. J. Cobbett is, as usual, clever in his rural studies, as in "Sheep in a Stubble Field" (528); Jas. Peel paints "On Holmwood Common" (532), a delightful Surrey landscape, and a "Surrey Lane" (572). H. C. Fox is equally happy in his autumnal effect, "Just Before the Sun Goes Down" (535), a strong piece of colour. "Poppy," by Constance E. Plimpton, is a clever sketch of a girl's head, full of expression and character; "Maidenhood" (550), by G. Sheridan Knowles, a three-quarter figure of a young lady on a grey ground, is dignified and pleasing. A. W. Strutt's head of an ox, "Young Scotland" (568), is clever; but its boldness and size suggest the signboard. W. A. Howgate paints with feeling his grey-lighted landscape (566), and for sympathetic painting we may notice Albert Kinsley's "December Morning" (564).

It would be neglecting an important part of the exhibition not to notice the water-colour drawings. The north-west room, as customary, is full of good work. J. Fraser is a master of coast life and small craft. His "Trawling in the North Sea" (3) is exceptionally good, and we like it quite as well as we do his oil pictures. The atmosphere in J. Jackson Curnock's "On the Lledr," is well rendered. Pure colour, freshness, and fidelity to nature characterise A. W. Weedon's work. His "Romney Marsh" (7), "Folding Sheep" (100), and "Winchelsea" are healthy and feeling studies. J. M. Bromley, in "Summer Shallows," is naturalistic—the pebbly bed of river and green landscape under strong sunlight; the foliage is perhaps too vivid for the conventional eye. Leopold Rivers's "Showery Weather on Sussex Downs" (24) is a successful effort; clouds and gleams of sunlight checker the landscape. We must speak approvingly of the studies of "Little Ruth" (10), by A. M. Rossi; of W. J. Morgan's "Old Man with Pipe" (20); of W. Harding Smith's "View of St. Bartholomew's the Great" (22); of W. Follen Bishop's "Part-

ing Day" (33). Albert Stevens has two clever sketches in which atmosphere and effect are broadly handled (76 and 145), one a view in Suffolk. Ernest George's sketch of Hamburg (48), and Wyke Bayliss's "Interior of St. Wulfon, Abbeville" (46), are both masterly drawings, and we need not say that Chas. Cattermole's historical study, "Treachery," is equal to his dramatic skill as a delineator of Mediæval incidents. The afterglow effect in Stuart Lloyd's "Dartmouth Castle" (61) is full of breadth and sweet repose. W. Harding Smith's drawing of cloisters of St. Antonio, Padua (79), as an architectural piece of grouping and colour; T. B. Hardy's "Thames Tunnel Pier" (84); the tenderness and delicate handling in A. E. Brockbank's "Hillside" (92), the strong coast view of J. Macmaster (99), and the subtle technique and colour in A. Kinsley's autumnal landscape, "When Summer Flowers are Flown," are worthy of praise. Some picturesque grouping of colour is to be found in the view of "Dort Harbour," by Arch. Webb (142), and in the sketches and studies of J. Hayllar (153), Nelson Dawson, A. Ludovici (168), J. M. Bromley, T. B. Hardy, C. Duassant, W. Follen Bishop, W. H. Weatherhead, we recognise well-known hands. The sketch of Bristol Harbour (222) in simple washes of transparent colour is delightfully clean work; the "Peat Bog," by J. M. Bromley (215), and the masterly drawing, "Town and Temple," a view up Ludgate Hill, by C. J. Lauder (218), F. Coleman's figure, "Repairing Armour" (209), clever and spirited, and a drawing of Bolton Abbey, by W. H. J. Boat, are other works worth notice. G. Tinworth sends a terracotta panel representing Alexander the Great drinking the medicine prepared for him by Philip, in which there are, though in a less degree than in some of his works, simplicity of composition and character. The work is in low relief.

#### ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Association was held on Friday evening, the President, Mr. Leonard Stokes, in the chair. Mr. F. C. Bristowe and F. W. Rogers were elected members.

#### A TRAVELLING STUDENT'S TOUR IN THE LOIRE VALLEY.

MR. A. E. BARTLETT, of Wimbledon, who won the Travelling Studentship of the Architectural Association for 1889, read his "Notes" made during that tour, illustrated by a number of delicately-executed pencil perspective sketches, together with many details, and a few plans. The lecturer selected as the district in which to expend the time and money placed at his disposal the Valley of the Loire, his aim being to examine and sketch the great chateaux and other buildings of the period of François Premier. He began work at Chartres on the 2nd July last, making perspectives of portions of the cathedral, and taking a few details of that great edifice. The most striking point in a first view of the cathedral to his mind was the effect of colour given by the bright green copper roof which tops the rich brown-grey walls. This roof is skilfully constructed of iron, and is a comparatively new addition, to replace the lead-covered wooden one destroyed by fire in 1836. The interior of the present roof is worth a visit, if only to see how little the vaulting has to do with the construction, the tie-roofs coming several feet lower than the cement finishing of the vaulting. It seemed a wasteful method of construction, though undoubtedly effective. Chartres has suffered much from fire; five times the cathedral has been burnt to the ground, and on each occasion the greater part of the town was involved in the catastrophe. The graceful tower, which stands at the north-west angle, was designed by Jean Jesuier in 1606, to replace another which had been burnt down, and though of so late a date, it shows little Renaissance feeling, except in some of the panels near the top. The cathedral as it now stands was begun in 1194, and consecrated in 1260. Mr. Bartlett referred to the rose windows, the stained

glass, the excellent sculptures, the marvellous Renaissance screen running round the choir, and compared by Fergusson to point-lace in stone, to the intricate labyrinth marked out in black marble on the floor of the nave, and the Black Virgin, the most precious treasure in the building. Except one small house in the Rue de Grand Cerf, there is not much good Domestic work in Chartres. There is, however, a curious little clock-tower on the north side of the cathedral, the cornice of which is almost exactly the same as the cornice on the main entrance front of the Chateau of Chenonceaux. Another excellent detail worth mentioning is the little cast-iron fountain in the Market Place. At Le Mans, the next town visited, he noted the extreme care with which the Mediæval builders chose their sites, taking the best for the church and other noble buildings, and grouping the rest of the town round these. The great choir towers high above the surrounding town, with a broad flight of steps leading up to the level of the floor of the church. If the builders of the choir had pulled down and rebuilt the nave in accord with it, the cathedral at Le Mans would be one of the largest in France. As it stands the nave of the cathedral is an interesting archaeological study, the capitals of the columns in this portion showing their Classic origin in a very marked manner. Mr. Bartlett's next stopping-place was Tours, in the very centre of all the great works of the François Premier age, and whence he visited Azay-le-Rideau, Loches and Beaulieu, Chenonceaux, Amboise, and Blois, and got his first impressions of the French Renaissance. The early builders of the French Renaissance used their own brains in devising their houses, and employed the skilful hands of Italian workmen to complete them, even as their predecessors, the Romans, used the cunning handiwork of the Grecian craftsmen to dress their own designs. These Early Renaissance builders thus produced a series of works which seemed to belong to a distinct class of their own, for in spite of their Gothic feeling and Classic detail, there is no appearance of the two styles clashing, and the François I. style is as distinct from the Flamboyant which preceded it, and the heavy Classicity of the Henri Quatre which came after it, as two adjacent styles can well be. As the requirements and occupations of the people who lived in those chateaux cannot have been very different from those of the ordinary country gentleman of our own day, we may learn a good deal in studying the planning and general arrangement. Perhaps they were none the worse for being Gothic in feeling. Their roofs were high pitched to throw off the snow and rain—so high sometimes as to be almost an affectation. Nearly everyone has each its little chapel or oratory, often apparently too small for the needs of the household. Their reception-rooms were stately and well-proportioned, often decorated with carved panels, into which the craftsmen must have put months of labour, and the windows arranged to give some fair view. The main staircase was treated as an important feature in the house. Thus at Azay-le-Rideau the beautiful little staircase is more lavishly decorated than any other part of the house, and the well-known external staircase allows the chateau to be divided up into a series of flats, while in the great double staircase at Chambord there is an ingenious device by which two persons might pass one another on their way from floor to floor without either being aware of the other's existence. The treatment of the balconies of these chateaux and the way in which they are screened from sun and rain is worthy attention. Every detail, in fact, points to an age almost as luxurious as our own. One detail, the lead finial, reached at this period its highest excellence. The Renaissance detail which made the strongest impression on his mind during the tour was the monument of the two children of Charles VIII. and Anne of Brittany in the chapel by the south transept of Tours Cathedral. The two children, watched over by four angels, all carved in white marble, lie on a black marble slab, underneath which is a white marble sarcophagus decorated with the arms of France and somewhat weak cherubs, and the angles of the tomb are marked by dolphins and eagles' wings. Along the upper part of the sarcophagus are carved scenes from Biblical history, most of them being conventionalised illustrations of the exploits of Samson. Another monument of great beauty is that of Agnes Sorrel, the favourite of Charles VII., which

stands in the tiny chapel of the castle at Loches. In Tours are some interesting domestic buildings, including a charming 15th-century house in the Rue Briçonnet, known as the house of Tristan l'Hermit, the famous prime minister of Louis XI. The angle staircase in the song-school, on the north side of the cathedral, is an excellent piece of work. There are many churches in Tours, some of which are desecrated, which are well worth a visit, and also a large white marble fountain in the Market-place by the brothers Juste, who designed the monument to the children of Charles VIII., already described. The Chateau of Azay-le-Rideau, next visited, contains a rather good collection of pictures. The chateau is picturesquely situated on a tributary of the Loire, a moat running round the house. Here, as in most of the buildings erected at the same time, when an angle turret is built out from the wall, the angle underneath is thickened out into an angle buttress for the moulding to work out into, giving the appearance of strength where it is most needed. The church here has a curious doorway covered with a three-centred arch. The Castle of Loches, next visited, is more famous for its terrible dungeons than the modern group of buildings standing a little way off, which form the chateau proper. There is a great deal to be seen near Loches, including the far-famed church of St. Ours, a Late 12th-century building, having four cone-shaped roofs; a 16th-century bell-tower in the lower part of the town, that of St. Antoine, now undergoing restoration; and a picturesque little François I. Hotel de Ville. Most of the author's time was spent in the little village of Beaulieu close by, where there was much to be seen and learned, the dilapidated Romanesque church of St. Laurent being well worthy of study as an impressively-planned building of three grand aisles, and without a clerestory. Mr. Bartlett's next stopping-place was Chenonceaux, where the famous little chateau is built on a bridge spanning the river. It was bought last year by the Credit de Paris, and looked at the time of his visit very desolate—stripped of its old armour and furniture, except that in the long gallery built across the river. At Amboise, the lecturer continued, I found one of the most charming of little Gothic chapels, standing in the castle garden, built on a solid rock towering high above the river. It is dedicated to St. Hubert, of Liège, and over the two little western doorways under an arch is a large representation of his miraculous meeting while hunting in Holy Week with a fine white stag, bearing a crucifix between its antlers. The chapel is a cruciform structure, measuring 40ft. by 30ft. inside. The tiny nave is practically the same size as the choir; but the eastern angles are arched over, so as to form a half-octagonal apse just below the window-sills. This arrangement works perhaps just a trifle awkwardly on the outside, but as the apse stands away from the castle garden, high up above the road leading up to the castle, this defect is not much noticed. There are no western windows in the nave or transepts, so that all the light comes from the front and sides, none from the back. One small point may be noted about the doors of the chapel—the upper panels are covered with tracery, but the panels themselves are hinged into the stiles of the door, so that the panels may be opened. The doors shut, and a very pretty peep-show effect is gained from outside by looking through the wooden tracery. The details of the chapel are very florid, and somewhat over-done. It was restored by Louis Philippe early in this century, and I was inclined to suspect that in several cases plaster had taken the place of the original stone. The little flèche at the top is decorated with stags' horns in memory of its patron saint. The chateau itself is an interesting building of red brick and stone dressings, built about the end of the 15th century, and containing a good deal of useful detail. Two great towers spring from the base of the rock on which the castle stands; they are 42ft. in diameter, and 92ft. in height, each containing, instead of a staircase, a great inclined plane, broad enough, I should think, to allow a coach and four to drive up. The present owner of the chateau is the Comte de Paris, who, though an exile from France, is patriotic enough to restore it and leave it, and the gardens in which it stands, for the benefit of the French people. The Romanesque church of St. Denis is well worth a visit, containing some good 12th-century detail and a handsome north door. There is very little good old domestic work about Amboise. The

best-known features about the Chateau of Blois is the great open staircase standing in the courtyard of the castle. There is also a very excellent 15th-century staircase of red brick and stone dressings, of which there is a good illustration in Norman Shaw's sketches of Mediæval architecture. The greater part of the Chateau has been restored by the Government, and though it has been undoubtedly well done, it struck me that it had been somewhat overpainted, as inside at least it was impossible to tell what was old and what new, and I often found myself wondering whether some paint-laden detail was stone or wood. The work here is of various dates, from the 13th-century *Salle des États* down to the western side of the quadrangle, which was erected by one of the Mansards, who, it is said, hoped to be able at some future time to model the three remaining sides of the quadrangle to suit the one he had already put up. Happily, this idea was never accomplished. The *Salle des États* is a big hall 97ft. long by 59 broad, with a row of cylindrical columns running down the middle supporting pointed 13th-century arches, with a broad, flat soffit. It has been so much restored that it savours now rather much of modern 13th-century Gothic. At first sight it seems a somewhat undesirable arrangement in a *Salle des États* to have a row of columns running right down the middle of the room; but of course it depends entirely on the arrangement of the seats. There are some excellent François Premier fireplaces to be noted here, which, however, like everything else, suffer from being overpainted. The designers of the François Premier part of Blois seem to have been careful to get in Francis I.'s salamander crest wherever they could. There are several good churches in Blois. The principal one is St. Nicholas, a large, cruciform, 12th-century church, with the crossing covered by a Gothic dome, which is covered outside with a wooden flèche. Then there is the cathedral and the Renaissance church of St. Vincent de Paul, close to the chateau. There are a few good domestic details about the place, mostly in unexpected corners; but most of the streets are comparatively modern and uninteresting. The most striking, the largest, and certainly the one which left the most vivid impression on my mind, was the Chateau de Chambord. And yet here, where there is a great house empty and stripped of its furniture, skilfully planned, boldly executed, and carefully finished—a lesson to architectural students of all ages and countries—by the order of the owner's agent, no one, unless he be a student of the Ecole des Beaux Arts, is allowed to make any drawings, inside the house or on the terraces at the top, or in the open galleries. I made every effort to obtain leave, both by letter and by applying personally, but practically without success, and I was by no means singular in my experience here. Since the destruction of the Chateau of Madrid, the Chateau of Chambord is, *par excellence*, the representative chateau of its period in France, possessing most of the excellences and a good many of the faults of its time. From its great size (it has a frontage of over 500ft.), it can hardly fail to be impressive, and, in spite of a few vagaries and extravagances, of which I think the double staircase I mentioned before is the most remarkable, it tells its story so well that it is impossible for it to be uninteresting. No one seeing it for the first time could possibly take it for anything but what it was built for, the country seat of some gay and wealthy owner. The central lantern, the conical roofs, the tall chimneys, with the little squares of black slates hung on them to fill in some of the panels of the stone-work, and which give them the appearance of being inlaid with marbles, and the fantastic dormers, all produce a most effective and interesting skyline, while the varied treatment of the building itself, its division into open arcades and groups of windows, relieved by a piece of comparatively plain wall-space, teaches some fresh lesson at every turn. Many of the caps of the pilasters are beautifully carved, and are well worthy of notice; they do not, however, do any work, and are merely used as an opportunity for allowing the carver to display his skill in his craft. Excellent leadwork is in this building chiefly conspicuous by its absence; but I am inclined to think that that is not the fault of its builder, as I feel sure that men who designed the gay and fanciful details of the lower part would never have put up with such commonplace cupolas as at present crown the tall conical towers. The Cathedral of Orleans, next seen,

is a Gothic erection of the 17th century, and on the whole is singularly uninteresting. Leaving Orleans, I travelled on to a place little known to English architects, though a good deal visited by Americans, the town of Chateaudun. It contains a most interesting chateau of Late Gothic or Early Renaissance, which is absolutely untouched by the hand of the restorer, and over which one is allowed to roam at will, unaccompanied by any chattering guide or romancing cicerone, and in which the sketcher can work undisturbed by visitors from morning till night. The chief feature about this chateau is a glorious staircase, which is illustrated in Viollet le Duc's "Dictionnaire," and of which I made a drawing. Then there is a good Gothic chapel in a very fair state of preservation, another staircase of much the same plan, but on a smaller scale than the grand one. On the first floor there is a big hall (with a fine fireplace at each end), where one has to walk gingerly for fear of rotten joists. There are also some good fireplaces in two rooms on the ground floor, which are used as general rubbish shoots. The staircase is oblong in plan, with a landing on each floor open to the air. It was, I think, on the whole, the most satisfactory staircase I saw on my tour. In the angles were little stone traceried screens, supported on corbels, in which to set a light. The chateau itself has a splendid position, standing on a lofty rock on the outskirts of the town, overlooking the river. There are two or three good bits of domestic architecture in Chateaudun, one of the best of which is the Maison des Petits Bonhommes, a house with a stone ground-floor and a half-timbered first floor, supported on 16 wood brackets, each of which is carved (so it is said) into the likeness of some local celebrity of the 16th century. I spent my last fortnight at Rouen, chiefly in measuring up the sacristy of St. Ouen. The old sacristan there gave me a very animated and interesting description of a visit of John Ruskin's to the church; his most salient criticism, done into English, seems to have been that the church was too light for a religious building. St. Ouen is so essentially French, that it was some time before I got to appreciate it thoroughly. The great height of the nave in proportion to its breadth, gives rather a bulging effect to the columns; but if all the niches on the piers were properly filled with statues, this effect would be a good deal lessened. The glazed triforium, with its sheet of unglazed tracery inside, has a very pleasant effect. I noticed in this church, and in most of the other French ones I visited, how very little the hood mould is used compared with English work. I do not remember seeing a single window in St. Ouen with one, and they were only used over the doors as vehicles for crockets and statue bases. The towers at the west end, originally planned to meet the nave diagonally, are much praised by Fergusson, who says that this arrangement solved the difficulty of giving breadth to the western façade without placing the towers beyond the aisles, as is done in the cathedral at Rouen. Externally, at least, every trace of this diagonal arrangement has now disappeared. Probably the two most famous churches which I visited on my tour were the Cathedral of Chartres and the Church of St. Ouen at Rouen, but, though both raised by the same nation, and for people of the same creed, how different are the two buildings. Chartres gives us an idea of grandeur, of simplicity of detail, of massiveness, and everlasting strength. In the great nave, which is low for a French church, even on the brightest days the light, which comes through the stained-glass windows, is subdued, and the church is in a perpetual twilight. St. Ouen, on the other hand, is lightness written in stone. Inside, the church is as light as a conservatory, and every line seems soaring upwards. The nave is so narrow in proportion to its height that, standing in the middle of it, one gets little more than a suggestion of the clerestory windows. Outside St. Ouen the multitude of flying buttresses, the conical chapel roofs coming up in front of the clerestory windows, the tall, narrow-mullioned windows, and the crocket-crowned pinnacles, all tend to heighten its light-aspiring character. At Chartres the buttresses are heavy, the windows are filled with broad plate tracery; the aisle roofs are not noticeable, and except on Jean Texier's tower, there is hardly a crocket to be seen. It is more than a difference in the style of building: it is a difference in the style of thinking. Chartres is

grand, self-restrained, and almost gloomy; St. Ouen is fanciful, light, and in parts almost frivolous. Such, at least, was the estimate I formed of these two great buildings. Besides St. Ouen there is the Cathedral of Rouen, which alone is worth some weeks of study. The first point to be noticed is the great beauty of the towers of the north and south transepts, and the north tower of the western façade. The central tower has begun but never finished, and its place has been filled in comparatively recent years by a cast-iron open-work spire, which, though not altogether an unpleasing design in itself, seems a little out of place there, springing as it does right off the massive stonework. Internally the bays of the nave are, perhaps, a trifle too small; but the choir is very fine. This was a favourite building of Street's, and I could not help fancying that in the transept towers I saw the suggestion of some of his details. In the north transept is a fine staircase leading up to the library, of which I made a drawing. There are also some good tombs in the choir, first among which comes the tomb of the Cardinals of Amboise, which was erected in 1525, and is crowded with the rich and fanciful Classical detail of that period. One of the two brothers to whom this tomb was erected carved the greater part of the west end in the feeble and frivolous Flamboyant Gothic of his period. In the middle of his work a sharp contrast is produced by some of the buttresses having been left in the block, and never finished. The third church of Rouen is St. Maclou. The central spire, which has been very well restored, is much the same in detail as the spire of the church at Caudebec, of which a photograph was published in a journal some little time back. The detail here is very gay and fanciful; but being a small church, it does not strike one as being overdone. The western doors themselves are splendid pieces of workmanship, attributed to Jean Goujon, the great carver of the François Premier period, and the brasswork on them is well worth making a note of. The choir has been spoiled by Late Classical upholstery. There is some good 15th-century painted glass in the church, and a most charming little newel staircase leading up to the organ-loft, which I made a sketch of alongside of the staircase in the cathedral. The church of St. Patrice has a large number of windows filled with 16th-century stained glass, which is very good for that date; but the most remarkable point about this church was the plan, which struck me as simple and useful. The aisles run the whole length of the church; but by the choir there are double aisles on each side, which arrangement gives a very good effect, and, I should think, gave a larger number of people an opportunity of seeing and hearing than would be possible with an ordinary plan for a church of that size. Besides those already mentioned, there are a good many other churches in Rouen, several of which are well worth a visit. I must just mention the tall, graceful tower of St. Laurent, whose church, like many others in Rouen, is now desecrated, and this particular one is used as a lodging-house. Chief among the civil buildings comes the Palais de Justice, an interesting example of Flamboyant Gothic. It is somewhat overloaded with the exuberant detail of that period; but there are several details, notably the big bay window, rising boldly out of the ground, and crowned with an octagonal roof, which are well worth remembering. Then there is the great 16th-century Grosse Horloge, spanning the narrow street, a most charming piece of Early Renaissance work, which everyone who has been to Rouen must remember, and which nearly everyone seems to have sketched. There is a rather nice Henri Quatre house just above the Grosse Horloge in the same street; but the chief bit of domestic work in the place is the Hotel du Bourgtheroude, which is an Early Renaissance house, built round a courtyard. It is not a particularly large house, and after the splendid chateaux of Loire Valley it struck me as a trifle tame; but there were one or two hints to be got from it. In a garden in the Rue Jean d'Arc stands the façade of a house, skilfully constructed entirely of oak, which formerly stood in the Rue de la Grosse Horloge; but on the demolition of the house which it fronted it was moved to its present position. There are still a good many pieces of good old domestic work in Rouen which one runs against at odd corners, though not so many as formerly, and I suppose what are left are gradually dis-

appearing. In wrought-iron work there is to be seen the great screen surrounding the choir at St. Ouen, as rich and elaborate as the great screen from Hampton Court in South Kensington Museum; then in the old museum is a good collection of ironwork of various sorts, especially excellent in the matter of keys and locks. The modern church of Notre Dame (De Bon Secours) stands on a hill a mile or two from the town. It is cold and uninteresting enough outside, but the inside has been most skilfully decorated, and the general effect is extremely good. The vaulting and the whole of the wall-space inside, with the exception of a small strip running round the church, which is used for setting forth the names of the benefactors of the church, each on a separate marble slab, is richly painted in four colours—green, red, blue, and gold. Every window is filled with very tolerably good stained glass, and it is to this, and the fact that there is practically no part of the interior stonework of the church left unpainted, that although the general effect is extremely rich, it is neither gaudy nor spotty. The music at the church is unusually good, and I could not help wondering whether the paint which covered up all the stone had anything to do with the entire absence of echo and the distinctness with which every sound could be heard. The other little modern matter of detail let me mention. I noticed in a good many new buildings, the architects' and builders' names on an inoffensive little tablet on either side of the door. This is surely no more advertising than a painter signing his picture, and if the building were a good one, it would probably save a good many discussions among the architectural students of the future as to the probable authorship of it.

Mr. F. R. FARROW, in proposing a vote of thanks to Mr. Bartlett, congratulated the lecturer on the catholicity of taste displayed in his choice of subjects, as shown by the beautiful sketches on the walls and on the many fresh details of François Premier buildings he had drawn. He thought the extremely high pitch of the roofs of chateaux in the Early Renaissance periods was due to the fact that the proprietors wished to make as ostentatious a show as possible without adding the number of rooms to their mansions that such lofty buildings would seem to involve. The little church near Loches was a remarkable instance of the planning on the church-hall system, so common in Germany. In the little village of Boos, near Rouen, was one of the finest columbaria of the French Renaissance period he had seen, and one which had so far as he knew never been illustrated in English publications.

Mr. B. DICKSEE, in seconding the vote of thanks, said he considered the high roofs of the Early Renaissance period in France arose not from ostentation on the part of the nobles, but were copied, or, rather, adapted from the high-pitched roofs of Late Gothic churches.

The PRESIDENT remarked that Mr. Bartlett had the promise of being early in the field with a style, that of François I., which bid fair to be very fashionable. They were specially indebted to him in preparing his paper at short notice, as Mr. Keith D. Young, who was to have lectured on "Hospitals," had met with an accident to his hand, and was unable to write or fulfil his engagement. The members would like to know the cost of such a seven weeks' tour as Mr. Bartlett had described.

Mr. BARTLETT, in responding to the vote of thanks, said the expenses had but little exceeded the amount granted for the studentship. The expenses were about 6fr. or 7fr. a day, exclusive of travelling, and as the district selected was comparatively close at hand, the fares were not high. He avoided English hotels, as he found French hotels were more economical.

A portrait of the Bishop of St. Alban's, by Mr. W. W. Oules, R.A., which has been subscribed for by the clergy and laity of the diocese, was presented to the Bishop, to be ultimately preserved as an heirloom of the See, on Wednesday week in the library of Danbury Palace.

The memorial to the late Lord Napier of Magdala will take the form of an equestrian statue, and the committee will endeavour to obtain as a site the centre of the roadway between the Athenæum and United Service Clubs in Waterloo-place. Sir Edgar Boehm is to be communicated with as to the sum he would require to execute a replica of his statue of the late field-marshal now at Calcutta. The fund in hand exceeds £3,700.

CONTEMPORARY BRITISH BUILDERS.—PLUSCARDYN PRIORY, ELGIN.—R.A.A.S. DESIGN FOR COVERED BRIDGE.—PROPOSED POLICE STATION, LEMAN-STREET.—NEW HOUSE, ASHTON-ON-MERSEY.

## OUR LITHOGRAPHIC ILLUSTRATIONS.

CONTEMPORARY BRITISH BUILDERS AND CONTRACTORS.

(SEE description on p. 498.)

PLUSCARDYN PRIORY, ELGINSHIRE.

TO-DAY we commence to illustrate the Institute Silver Medal Drawings by Mr. Alex. Macintosh, who has sent us the following particulars:—This fine piece of Scotch architecture was founded in the year 1230; it was dedicated to St. Andrew. The monks were of the French order of Vallis Caulium, a reform of the Cistercians. The foundation of the parent institution of Val des Choux, in Burgundy, dates from the end of the 12th century. There are three houses of this order in Scotland, all erected in the same year (1230) by King Alexander II.—viz., Ardchattan, in Argyshire; Beaulieu, in Ross; and Pluscardyn, in Moray. These are the only priories ever erected in Britain under Val des Choux. In 1460 the priory came under the Benedictine rule; the Black Monks of the neighbouring priory of Orchard taking possession of Pluscardyn by mutual agreement. This change in the order may help to explain some of the numerous alterations made on the building in the 15th century. From documents which have come to light there appear to have been eleven priors of the Order of Vallis Caulium, and eight Benedictine Priors. The priory continued under monastic rule till 1560, the year of the Reformation in Scotland. Since then it has passed through the hands of several of the leading families in Scotland; among others having been successively held by the Morton family, the Seaton family, the Earl of Dunfermline, the Lords of Kintail and Seaforth, the Earl of Cromarty, the Earl of Caithness, the Seafeld family, and at present is the property of the Duke of Fife. The building is said to have been twice burnt, and the condition of the lower part of walls, the gables, and side of tower, show unmistakable marks of fire. In 1390, Elgin Cathedral and some neighbouring monasteries were burnt by the "Wolf of Badenoch"—it is probable he also burnt Pluscardyn at the same time, for the priory records of that time state that the building was then in a very ruinous condition. The fire appears to have created greater damage than the means at the monks' disposal could make good, for instead of restoring the beautifully traceried windows in choir and transept gables, they built them up with the fragments of original tracery and mullions, leaving only small lancet windows and four-light traceried windows of the simplest design. The plan of the building is very similar to that usually adopted by Cistercian monks, with the exception of the choir, which is longer than usual; the part locally known as the "Lady-chapel" probably derives its name from one of the changes introduced by the

Benedictine monks, the squint and the foundation of altar being work of the 15th century. There are no records of the date of erection of the various parts of the building; but there is little difficulty in following the progress of the work and deciding the approximate dates. The oldest part is that locally known as the "Lady-chapel," built about the date of foundation, 1230. The building of the south transept was carried on about the same time. The north transept, the gable of south transept, the tower, and most of the domestic buildings are late 13th and early 14th-century work. The choir is work of about the middle of the 14th century, and the vestry adjoining was built by Alex. Dunbar, the last prior; he ruled the house from about 1533 to 1560. The building up of the tower-arches and windows in choir and transept gables was done after the fire in 1390. Like other buildings following Cistercian or similar rules, the characteristics of Pluscardyn are its absence of ornament, refinement of detail, the simplicity—almost amounting to severity—of its parts, and its fine proportions. One of the most noticeable features is the number of circular-headed doors. This retention of early forms in later work is characteristic of Scotch Mediaeval buildings. We see the same thing in the group of four lancet windows at the east end of choir—work of the 15th century. The refectory door—also work of the 15th century—is a facsimile (even the moulding is a clumsy copy) of the door to the north transept, built fully a century earlier. It is interesting to notice the similarity that exists between Pluscardyn and other buildings of the same period. The transepts of Hexham Abbey, for example, are very similar in design to the south transept of Pluscardyn. Mr. Hodges, of Hexham, who has recently published measured drawings of that building, has compared my drawings of the mouldings and the masons' marks of Pluscardyn with those of Hexham, and considers them to be the work of the same masons. There is a remarkable similarity in the plan, general design, and proportions of Sweetheart Abbey, near Dumfries, to Pluscardyn. Portions also of Elgin Cathedral and Fortrose Cathedral, Ross-shire, are almost identically similar in their details and design to the 14th-century work of the choir of Pluscardyn. The building suffered considerably by Lord Fife's alterations in 1821. It was his intention to convert the building into a large mansion house, though fortunately he never finished the carrying out of his scheme. He "restored" and altered some of the most interesting features of the building, and almost entirely demolished the dormitory, leaving no trace of what the original design had been. Previous to Lord Fife's alterations, large portions were pulled down by neighbouring farmers, and many of the stones removed can still be seen in the walls of the surrounding farmhouses. At present the buildings are in a very ruinous condition and fast falling to decay. There is an accumulation of soil all over the area of the building, varying in depth from 6in. to 18in; when excavating in this soil to find the levels of original pavement in church, I found numerous fragments of stained glass, leadwork, a holy-water stoup, and many beautifully-moulded pieces of tracery, caps, &c. The walls are covered by a dense coating of ivy of the wildest and most luxurious growth. The numerous rents in the walls, and the loose state of the stonework show that, unless prompt measures are taken, we shall soon lose one of the finest and most interesting examples of monastic architecture in Scotland.—ALEX. MACINTOSH.

## R.A.A.S. DESIGN FOR A COVERED BRIDGE.

This drawing, by Mr. Thomas Davison, obtained the Royal Academy Architectural School Prize last year.

## LEMAN-STREET NEW POLICE STATION.

This building, of which an elevation and block-plan is given, is now in course of erection on the site of the old police-station and the old Garrick Theatre. Ample accommodation has been provided for the public service, and for quarters for married and single constables. The building will be faced with red gault bricks, red Mansfield stone being used for the entrances and dressings. The roof will be formed of steel troughing and concrete covered with asphalt, to be available for a drying ground in connection with the laundry. Mr. John Butler, F.R.I.B.A., surveyor to the Metropolitan Police, is the archi-

tect; and the work is being carried out by Messrs. Garlick and Horton, who are under contract to complete the work in twelve months.

## HOUSE AT ASHTON-ON-MERSEY.

THIS house is now being erected in Oakfield, Ashton-on-Mersey, for Miss Stavert, by Messrs. Torrance Brothers, of Chorlton-on-Medlock, from the designs and under the superintendence of Mr. Robert C. Whitelegg, architect, of 29, Brazen-nose-street, Manchester. The house will be faced on all sides with Ruabon bricks, the roofs covered with brindled tiles, and the half-timber work filled in with adamant cement. The whole of the interior fittings will be of the best description, the entertaining-rooms and hall being finished in American walnut, with ornamental plaster ceilings, and wood mantels. All the hearths throughout will be tiled, and all the sanitary fittings of the best and latest improved type. On the side not shown in the perspective will be a large bay window to the drawing-room, and an angle bay to the breakfast-room, the latter being carried up to the roof, and finished as a half-timber gable.

## ARCHITECTURAL &amp; ARCHÆOLOGICAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—On Saturday afternoon the members of this association visited Prestonpans, under the leadership of Mr. Hippolyte J. Blanc, who first introduced to them the interesting feudal tower of Preston, which was described as a work of Early 15th century, comprising, in an area of about 34ft. by 28ft., a tall keep about 50ft. to the parapet, with a 17th-century addition, increasing the height by 17ft. more. The original structure had been divided into four floors, with the usual appropriation of lord's hall, private apartments, and accommodation for retainers and stores. In a wing projected from the west side of the keep a unique construction of dungeons was examined, as also the special features of construction for the defence of the main entrance exhibited on the outside elevation. Originally a possession of the Hamiltons, the tower has remained, with but short intervals from the period of its erection, with the family; and although much of the property originally attached to it has been disposed of, the tower itself, with the inclosure in which it stands, is now owned by General Sir William Hamilton. The tower seems to have been occupied up to 1663, when a fire, the third from which it had suffered, rendered it no longer habitable. It possesses a good deal of interesting detail, sufficient to have elicited the interest of antiquaries, by whom a few years ago a considerable sum was expended, under the direction of Mr. Blanc, in replacing a great deal of the carved stonework found among the ruins, and generally repairing the structure. The party next proceeded to Preston Cross, which is one of a type of market-crosses erected in various towns in Scotland at the beginning of the 17th century. After visiting the ruins of Preston House—the mansion of the Hamiltons after their occupancy of the Tower—and the old parish church at Preston, the party returned by Northfield House, the apartments of which the party had an opportunity of examining.

A new Wesleyan chapel, built from plans, selected in competition, by Messrs. Potts, Pudcup, and Dixon, of Oldham, was opened at Pickering on Friday. It has cost £3,000, replaced an older one on the same site, and is Renaissance in style. The body of the chapel will seat 470 persons; and in addition there are an assembly-room, a couple of class-rooms, and lecture-room, besides caretakers' houses, and extensive kitchen and cellar provision. Messrs. Martendale and Barnes, of Pickering, were the contractors.

On Tuesday, March 25, the foremen and workmen engaged on the London contracts now being carried out by Messrs. Foster and Dicksee, of Rugby and Manresa-road, S.W., had their annual dinner at Clout's Restaurant, Victoria-street, S.W., when upwards of 100 were present. Mr. Dicksee was in the chair, and was supported by Mr. Goddard, the head of the London staff.

Five thousand bricklayers and masons in Vienna have struck work, demanding that their working hours should be reduced to eight, and their minimum wages be fixed at two florins per day. Twenty thousand of their fellow-workmen are threatening to follow their example; but the employers state that their trade is suffering from unusual depression.

## WAYSIDE NOTES.

AT the meeting of the Institute on Monday evening the subject of the memorial recently presented to the Council was discussed; but further discussion is adjourned until the 21st inst. The most remarkable feature of the meeting was an admirable speech, in favour of the Institute's seeking statutory powers, by Mr. John Wreghitt Connon, of Leeds. Mr. Connon spoke with the earnestness of conviction, and the weight and deliberation of his remarks evidently impressed his audience. For not only were those who earnestly desire the Institute Council to take steps necessary to make close the profession of an architect, enthusiastic over Mr. Connon's speech, but all, of every shade of opinion, pronounced it to be excellent.

Whatever may be thought of the significance of Professor Roger Smith's amendment, as affecting the future action of the Institute Council, it is regarded by those in favour of the compulsory examination scheme as an admission of the righteousness of their principles. It matters little that this amendment urged more inaction and procrastination on the part of the Council. It admitted the principle—and that is the great point. The significant thing will be the result of the poll, which is to be taken. I regard the issue hopefully, because country members, who could not attend Monday's meeting, are the class to whom the need for prompt action is most apparent. Anyhow, be the result what it may, I see no reason so far to complain of the way things have gone. The consideration shown to the compulsory examination question by members whom one would have expected to have obstinately opposed any idea of closing the profession, was an encouraging feature. So long as tolerance and kindly feeling are shown, one can put up with defeat if necessary. But it is my earnest hope that the poll may be a clear index of a growth of the principles among members of the Royal Institute of British Architects which are undoubtedly in the ascendant outside that body.

Order is Heaven's first law, it is said, and accordingly the 20-draughtsman-power architect of Philadelphia, whose habits the *Engineering and Building Record* made public, is to be commended for his methodical system of office-working. Otherwise, there is nothing very remarkable or novel about this gentleman's manners and customs.

Quarter-scale drawings are all very well in their way, and when a job is small we all acknowledge that they are necessary; but unless one happens to be blessed—or the other thing—with a thick-headed client who cannot be convinced that it is less easy to grasp the arrangement of a plan when to this measure than when prepared to an eighth scale, the 4ft.-to-the-inch is to be regarded as good in theory, but bad in practice. When those halcyon days arrive, in the which an architect will be a more-sought-for and better-paid individual, we shall perhaps be able to follow the example of our Philadelphian confrère and allow one draughtsman to spend the extra time necessary to bestow that two-fold labour which ½ in. scale as against ¼ in. entails. That the larger scale involves exactly double the labour is not only a self-evident fact, but one appreciated by all draughtsmen who have to do with it. Here and there we find offices where the principal has a hankering after the ½ in. scale system, or where, as occurs at times, clients insist upon their plans being drawn out to this measure. But by general consent the scale of ¼ in. to the foot has been adopted as the best for plans of buildings of any importance, and, in spite of individual fads, will continue to remain the most popular among architects.

Our Philadelphian friend finds it better to scheme plans, &c., "at his own home, free from the interruptions unavoidable at his place of business." Many wielders of the T-square on this side of the Atlantic also find that designing and general office cares do not harmonise. Plan-scheming may be said to resemble, in a sense, playing the game of chess—one has to think out moves ahead. Having been racking one's brains for an hour or so, it is not true economy to be obliged to divert one's attention to matters alien to the subject either by persons in, or callers at, the office. Threads are dropped that may never be picked up again, and details that were getting

clear become again obscure. Order once more becomes a chaos, and developing form returns to its original nebulous state.

But it is said that he who best can suffer best can do, and the wisest people are those who constantly endeavour to adapt themselves to circumstances, howsoever adverse. Once begin to flee difficulty and trouble, and will and determination are undermined. I should like to know what would become of the practice of many of our London architects, if they could not work serenely in the midst of distraction of all kind? High-pressure and competition would soon divert the business into other channels if Mr. Irresolute and Mr. Nervous stayed away from their offices to do their work. Those who feel, too keenly, the distracting nature of working between interruptions of one kind and another, may depend upon it that giving way will make matters worse in the end, and that severe self-schooling is the only remedy. I can sympathise with any who feel that office duties and design clash inharmoniously, and after, when designing under the combined influence of distractions of every kind, think fondly of days when I have raised my eyes from my work, and looked out through the open window across summer seas or peaceful countryside. How different from the surroundings and attributes of an office in London! Mr. Ruskin has said that an architect should not live in a great city, and we feel, as the great writer says, that there is something about town life that walls up the imagination; but as we cannot all, if we would, work amidst rural peacefulness, we must remain content to adapt ourselves to circumstances and do the work that lies nearest, in spite of the distraction of bustle, noise, and haste, and of social and business intercourse.

The nature of the designs submitted by the four successful architects in the Harrogate Baths competition is not yet generally known, and probably will not be for a couple of months or so; but I have reason to believe that they must be something extraordinary, and that the architectural profession may flatter itself that it knows a thing or two about the design of public baths. The planners of the *thermae* of the palmist days of the Roman Empire, will, I fear, have to retire into the background and take the traditional back-seat. This is decidedly encouraging; for hitherto public baths have been remarkable chiefly for unscientific planning, and as monuments to the gross neglect of the study of the therapeutic attributes of various baths. But, if I mistake not, we should shortly see that the days have grown less evil. And I hope that we shall not be mistaken, for the Harrogate Corporation, in offering liberal premium-money, deserve to have gained the best possible ideas for the *Kurbad* they contemplate building in the town.

Enthusiasm, and an evident desire to see fair-play characterised the doings of the Harrogate Corporation in connection with this competition; the gentleman (?) therefore, who did the three-card trick, or whatever other kind of trick would best describe the operation you reported last week, doubtless did himself brown, even if he had any chance. And as it is difficult to conceive of anyone judging the work of a proposed bath-house with reference to anything but compactness and suitability of plan and arrangement—unless the elevations are actual abortions—there seems no reason for any complaint as to the awards made. Should events prove otherwise, the Harrogate Corporation will feel like the man who bought an expensive watch because it had a pretty face, and found it was useless as a timekeeper.

The gentlemen to whom the Guinness Trustees have intrusted the design of blocks of dwellings for the poor are all, I believe, skilled in the class of work required. But why no competition? I understand the object of the funds given by Sir Edward Guinness to be to get new ideas on the subject of providing dwellings for the poorest of the poor, and if there had been a competition, with good premiums—which could here have been afforded—it would seem to me to have been more in accordance with the idea of Sir Edward.

I am not fond of discussions of the "Bill Stumps, his mark" description, and don't see that the world will be visibly affected when the sweet uses of the "low side-window" are dis-

covered; still, this archaeological *bête noir* must have a certain interest to all architects. As some contribution to the discussion on this subject, I would refer to some very pertinent remarks made by Mr. Gough in the course of a lecture delivered some years ago to the St. Paul's Ecclesiastical Society. The subject of this lecture was old Rainham Church, Essex. Mr. Gough favours the theory that the low side-window was opened when the sanctus bell was rung—the "hand-bell theory" as your correspondent Mr. C. E. Ponting calls it. I throw in my weight with the sanctus bell. Mr. J. J. Cole, whom Mr. Gough largely quoted in his lecture, favours this theory. Mr. Cole says that "prior to the introduction of the sanctus bell-cots, and commonly when these were not erected, then at the 'low side-window'—the only real opening in the church except the doors, and this unglazed but provided with a shutter—the sacristan stood, and on the elevation of the Host, opened the shutter and rang the sanctus as directed, I think, in the liturgy: 'In elevatione vero ipsius corporis Domini pulsetur campana in uno latere, ut populares, quibus celebratione missarum non vacat quotidie interesse, ubicunque fuerint, seu in agris, seu in domibus, flectant genua.'—Const. Joh. Peckham, A.D. 1281." If this is not a "clencher," what is it? It is, at any rate, my trump card for the sanctus-bell theory.

But I have another of nearly equal value. In the course of the lecture referred to above, Mr. Gough stated that he was indebted to Mr. Edward M. Dewing, late hon. sec. to the Suffolk Institute of Archaeology, for the following extract from Nichol's "Narrative of the Days of the Reformation," which appears to refer to the custom for which Mr. Cole contends:—"John Craddock, hys man be Clarke to ring the bell, and to keep the priest too mass, untill he was threatened that yf he dyd use to putt hys hand owt of the window to ring the bell, that hand soon should make him to smart." GOTH.

## WATER SUPPLY AND SANITARY MATTERS.

DEWSBURY.—Mr. Arnold Taylor recently held an inquiry at the Board Room, Soothill Nether, near Dewsbury, with respect to taking four acres of land otherwise than by agreement, for the purpose of dealing with the sewage of the district. Mr. Malcolm Paterson, M.I.C.E., of Bradford, explained the scheme. The estimated cost is £11,500, inclusive of the main drainage, sewage tanks for lime treatment, and land for intermittent filtration. A special feature of the scheme is the provision for taking trade refuse into the sewers, in accordance with the Rivers Pollution Act, 1875, thus striking at the root of rivers pollution in the manufacturing districts. Soothill Nether is one of the districts proposed to be incorporated by Dewsbury, whose extension scheme was rejected in its entirety by the Local Government Board.

## STAINED GLASS.

BRISTOL.—The last window on the south side of St. Stephen's Church has now been filled with stained glass as a memorial to the late organist, Mr. Samuel Cook. The subject is that of the Ascension, which occupies the three lights. In the centre is Our Lord, in the act of ascending; beneath him on the hill are St. John and another apostle kneeling, gazing upwards. On the right and left are groups of the other disciples, St. Peter being on Our Lord's right hand. Above these figures are the two angels descending, and in the background are seen portions of Jerusalem. The ascending Saviour is surrounded by a multitude of cherubim. The whole is surmounted by canopies of 16th-century ornaments. In the tracery are angels playing various musical instruments, the organ being conspicuous among them, and these also are surrounded by ornament of the Perpendicular period. The window is by Mr. Alfred O. Hemming, of 47, Margaret-street, Cavendish-square, London.

At a recent meeting of the Harrogate town council to consider the competitive plans for the Montpelier baths, Mr. George Corson, of Leeds, the assessor, reported that he had selected the four drawings whose authors will be asked to take part in the final competition.

Queen-street Wesleyan Chapel, Huddersfield, was reopened on Friday. The alterations are mainly internal, and have cost about £2,500. The work has been carried out under the supervision of the architects, Messrs. William Cocking and E. W. Lockwood.

## CONTEMPORARY BRITISH BUILDERS AND CONTRACTORS.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

WE give the second sheet of British builders to-day. The series of British architects will, of course, be continued, and we have already several sheets in hand, so that the anxiety expressed by some correspondents in reference thereto is somewhat premature, as might have been understood from our opening remarks last week.

Mr. Joseph Hill, whose portrait is the first on our plate, represents Messrs. Higgs and Hill, of Lambeth. The firm is composed of two members, William Higgs, son of William Higgs, formerly of Stangate, and, since 1867, of Crown Works, and Joseph Hill, son of William Matthew Hill, of the firm of Hill and Sons, of Charlton Works, Islington, both businesses being amalgamated on the retirement of the late William Higgs, and being carried on at the Crown Works premises, covering about four acres of ground. The following is a list of some of the principal works carried out by the firm:—Royal Marine Infirmary, Woolwich; Chelsea Barracks; Caterham Barracks for Brigade depot; Bedford Barracks for Brigade depot; Barracks at Windsor; Barracks at Newport, Mon.; Hospital at Albany Barracks, Regent's Park; Powder Magazines at Plumstead Marshes; Government and Admiralty contracts in London, Woolwich, Greenwich, Portsmouth, and Waltham Abbey; additions to Marlborough House; bridge connecting Royal Mausoleums at Frogmore; Assize Courts, Winchester; Law Courts, Usk, Mon.; Sessions House, Clerkenwell; County Court Offices, Gravesend; Offices for Lewisham Board of Works; Post-Office, Bedford-street, Strand; additions to Post-Offices, N. district, in Packington-street, Essex-road, and, S.W. district, in Buckingham Palace-road; extensions of Lunatic Asylums at Wandsworth, Hanwell, Colney Hatch, and Hoxton; Sanatorium at Reedham and another at Earlswood Asylums; London Orphan Asylum, Watford; St. Paul's Choir Schools, Carter-lane; City of London Schools, Hanwell; Roman Catholic Schools at Brentwood and North Hyde; Master's residence, &c., Highgate Schools; St. Joseph's College, Tooting; additions to Wellington College, Berks, Royal Cambridge Asylum, Kingston, Orphan Asylum, Beddington, and University College, Gower-street; Police-stations at Snow-hill, Rochester-row, Paddington Green, Kensington, Kingsland, Brentford, Richmond, Shepherd's Bush, Streatham, Wood Green, and Sunbury; Hospital for Consumption, Brompton; Chelsea Hospital for Women, Fulham-road; Cheyne Hospital for Children, Cheyne Walk, Chelsea; North London Hospital for Consumption, Hampstead; Temperance Hospital, Hampstead-road; Hospital for Women, Euston-road; additions to St. Mary's Hospital, Middlesex Hospital, Charing-cross Hospital, Westminster Hospital, St. Bartholomew's Hospital, King's College Hospital, St. George's Hospital; Medical Schools at Westminster and Charing-cross Hospitals; Examination Hall for Royal Colleges of Physicians and Surgeons, Savoy-place; additions to Royal College of Surgeons, Lincoln's Inn-fields; offices of London School Board, Victoria Embankment; Hand-in-Hand Insurance Offices, New Bridge-street; British Equitable Assurance Offices, Queen-street-place; blocks of offices in Throgmorton Avenue and Great St. Helen's; St. George's Dwellings, North-row, W.; Mortimer Mansions, W.; new buildings for Peter Robinson, Oxford-street; "Harcourt House," Cavendish-square, for the late Duke of Portland; "Frognaal," Faringdon, Berks; "Foxbury," Chislehurst, Kent; mansions at Stanhope Gardens and Queen's Gate, Kensington, St. George's-place, Knightsbridge, Esher, Surrey; additions to "Montague House," and new stables for Lord Portman; additions to Stoke Park, Guildford; Union Bank of London, (head offices), corner of Princes-street, E.C.; and branch Bank in Sloane-street, Chelsea; Commercial Bank of Scotland, 62, Lombard-street; London Joint Stock Bank, Great Tower-street; City Bank, Great Eastern-street; Central Bank of London, Tooley-street, S.E.; London and County Bank (branch banks), at Aldersgate-street, Upper-street, Islington, Caledonian-road, Newington, Shoreditch, Brixton, Deptford, Greenwich, Woolwich, Hastings, Horsham, and Sittingbourne; Crown Swimming Baths, Kensington Oval; Victoria Swimming Baths, Peck-

ham; St. Luke's Church, Redcliffe-square; All Saints' Church, Surrey-square; Church, Woolwich Dockyard; Holy Trinity Church, Sloane-street; Spurgeon's Tabernacle; East London Tabernacle; Maze Pond Chapel, Old Kent-road; Wesleyan Chapel, Ealing; Wesleyan Chapel, Lewisham; Union Chapel, Brixton-hill; Kenyon Baptist Chapel, Solon-road, Brixton (a memorial of the late William Higgs); Presbyterian Church, Notting-hill; and several other churches and chapels; cases and fittings in the Natural History Museum, South Kensington, and British Museum. Mr. Hill's photograph was produced by Mr. George Glanville, of Tunbridge Wells.

Mr. Thomas Boyce was apprenticed to and taught his business by Mr. Edward Conder, of Baltic Wharf, Kingsland-road Bridge. He commenced business in 1872 at Eagle Works, Hackney, but subsequently, in 1883, moved his offices to No. 8, Hart-street, Bloomsbury. He has built a number of noblemen and gentlemen's mansions in different parts of the country. Amongst the works carried out by him in London are the Metal Exchange and buildings attached in Whittington Avenue, Leadenhall-street; the Legal and General Insurance Offices, in Fleet-street; the Constitutional Club, in Northumberland Avenue; the Badminton Club, in Piccadilly; and the Green Park Chambers, in Piccadilly.

Mr. John Mowlem Burt is the present senior partner of the firm of John Mowlem and Co., building and engineering contractors, who, amongst other vast works, are now building the Imperial Institute at South Kensington. He is a great-nephew of the late Mr. John Mowlem, the founder of the firm, and son of Mr. E. Sheriff Burt, who was, in conjunction with Mr. Joseph Freeman, for many years at its head. The other partners of the present firm are his cousin, Mr. William Robert Freeman, and his brother, Mr. George Burt, jun. Mr. J. M. Burt was born in the year 1845. The first work in which he was actually engaged with the firm was in connection with the Exhibition of 1862, and he has from that time been actively engaged in the management of the business. He became a partner fifteen years since. He is a Freemason, is on the Courts of the Glass-sellers' and Loriners' Companies, has served the office of Chief Burgess of Westminster, and is a Deputy Lieutenant for the City of London. The portrait of Mr. Mowlem Burt is from the studio of Messrs. West and Son, of Southsea.

Mr. James William Hobbs, J.P., is managing director of the well-known firm of contractors, Messrs. J. W. Hobbs and Co., Limited, which business he was the founder of. The following are amongst some of the notable buildings erected in recent years by Mr. Hobbs:—The Hotel Victoria, Whitehall Court, Albert Gate Mansions, Carlisle Mansions, Westminster, and he is now engaged upon the development of the Salisbury Estate on the site of Cecil- and Salisbury-streets, Strand. Mr. Hobbs is President of the Builders' Benevolent Institution for the current year. His portrait is by Mr. S. Philips, of Croydon, and was taken during his Mayoralty of Croydon, which office he held for two years in succession.

Mr. F. J. Dove is senior partner of Messrs. Dove Brothers, of Islington. This firm have made a special feature of ecclesiastical building-work, and in that respect are thought to be somewhat unique as being the largest builders of churches in this country. They have also executed many other important works; amongst others being Huntsham Court, Devonshire; Slaughman Hall, Sussex; Doldowid Hall, Brecon; additions to Riby Hall, Lincolnshire; Gogmagog Hills, for the Duke of Leeds; Bridehead House, Dorset; Littleborough, Lancashire; Patteson Court; additions to Beaulieu, Hants, for Baron Montague; Temple Bar Branch of the Bank of England; large offices and printing warehouses in Bream's-buildings for the proprietors of the *Field* and *Queen* newspapers; foundations to the Law Courts; buildings in Northumberland-avenue, &c., &c. The firm was founded about 70 years ago by Mr. W. A. Dove, and has been carried on in the name of Dove Brothers for nearly 40 years. Mr. F. J. Dove, now the senior partner of the firm, is in his 60th year; he was educated at a private school in Islington, and trained for the business by spending some time in his father's workshops, and afterwards studying architecture for some years in the office of Messrs. Gough and Roumieu. Prior to becoming partner he acted as superintendent

and foreman upon some of the firm's contracts. Mr. F. J. Dove occupied the position of President of the Builders' Benevolent Institution in 1880, with which institution he had been identified for many years. He was also President of the Central Association of Master Builders of London for three consecutive years, and is also the Vice-President of the Builders' Accident Insurance. The firm was amongst the first of London builders to carry out works in forming insulated chambers for the storage of frozen meat, and they have done this very successfully at Smithfield, the Foreign Cattle Market, Deptford, and below Cannon-street Station. A large proportion of work done in restoring City churches has also fallen to their share. There is nearly always work being carried out at one or the other of these buildings, such as St. Sepulchre's, Holborn, St. Vedast, Foster-lane, St. Mary's, Aldermanbury, All Hallows, Lombard-street, St. Magnus, Thames-street, St. Olave's, Hart-street, St. Mary-at-Hill, St. Bartholomew's, Smithfield, St. Giles's, Cripplegate, and lately St. Andrew's-by-the-Wardrobe. As to their church work generally, we have a list before us of nearly three hundred instances, too numerous to mention, including several works under Sir Arthur Blomfield, A.R.A., and the late Mr. Geo. Edmund Street, R.A. The photograph of Mr. Dove was taken at Islington by Mr. F. C. Turner, of Upper-street.

Mr. John Thompson, of Peterborough, is famous in connection with works of restoration. It is sixty years ago since Edward Blore—afterwards the master of William Burges—entrusted the contracts for the restoration of Peterborough Cathedral to John Thompson (the father of the present head of the business) and Francis Ruddle. They were not partners, although they co-operated by dividing the works of a building between themselves. Mr. Thompson took the stonework in the cathedral contract, and Mr. Ruddle the carved woodwork. Among other contracts of theirs was one for a large part of the work in the choir of Westminster. After the death of Mr. Thompson, senior, the present Mr. Thompson assumed all the responsibilities of the two establishments. Mr. Ruddle continued to take an active interest in the new arrangements. The restoration of a large part of no less than six English cathedrals was undertaken by Mr. Thompson—viz., Hereford, Ripon, Chester, Lichfield, Bangor, and Peterborough, the works at one sometimes extending over several years. Among the numerous churches in which his work can be found we may mention the following:—Milton Mowbray, Oakham, Holy Trinity, Coventry; St. Michael's, Coventry; Higham Ferrers, Ashley, Rhyl, Holyhead, Bridlington Priory, Halifax, Fife, Cromer, Warmington, Mirfield, Abingdon, Wolferton (for H.R.H. the Prince of Wales). Mr. Thompson also erected the new chapel of Balliol College, Oxford, and the new church at Hanbridge, Chester, for the Duke of Westminster. Two of the most important of his secular works are the Glasgow University Buildings, which were commenced in 1866, and the Royal Holloway College, and we may also mention the Grocers' Schools, schools, mansions, &c. Some of the employés may claim to be as long connected with the business as Mr. Thompson himself, and can point to forty or fifty years of loyal service. Mr. Thompson has been twice Mayor of Peterborough, and at present he is one of the aldermen of the city. The following are some of the works in hand or just completed:—St. Michael's Church, Coventry; Bedworth Church, near Nuneaton; Bennington Church, Herts; Terrington Church, Norfolk; Cromer Church, Norfolk; Gedling Church, Notts; Long Crendon Church, Thame; choir fittings, Leamington Church; St. Andrew's Chapel, Northampton; St. Mary's Chapel, Dalkeith, Scotland; Peterborough Cathedral, and choir stalls for same; Eton College, Windsor; Chapter House, Lincoln Cathedral; Croyland Abbey; works at Llandaff Cathedral; Flixton Hall, Suffolk; interior fittings, Denton Hall; tower of Ludlow Church; west front, Rochester Cathedral; Sandy Lodge (the Right Honourable the Speaker); Irnham Hall, Lincolnshire; Rivulet House, Runtun, Norfolk. Mr. Thompson's portrait is the work of Mr. T. T. Groves, of Peterborough.

[When referring to the firm of Messrs. Woodward and Co., in our last week's issue, it should have been stated that Mr. James Hughes and Mr. Richard Thorn are senior partners.]

# "REGISTRATION" AT THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE crowded meeting held under the chairmanship of the President, Mr. Alfred Waterhouse, R.A., on Monday evening last at the R.I.B.A., if not unanimous, was undoubtedly good-tempered, enthusiastic, and very much in earnest. This Special General meeting was convened to consider the desirability of statutory examination, which shall be compulsory on all seeking to practise the profession of an architect, and the motion "That at as early a date as possible, statutory powers should be sought to establish, as in other professions, a system of compulsory examination to be held by the Institute, and to be extended to all architects hereafter entering the profession, whether as members of the Institute or not." The President remarked at the outset upon the vital importance of the question of Registration, and urged upon the meeting the desirability of discussing it without personal feelings or biased considerations, so that the subject might receive their careful judgment in an impartial spirit. The notices calling the meeting, and the requisition which occasioned it, having been read, some communications received from the Bristol Society of Architects, the Liverpool Architectural Society, and the Northern Architectural Association, on the question of Registration, were likewise read by the secretary. The Bristol Society and the Northern Architectural Association urged the necessity of some such measure conferring statutory powers, but the Liverpool Society considered that the time had not yet arrived for a successful plan of compulsory examination. The debate was opened by Mr. John Wreghitt Connon, F.R.I.B.A., of Leeds, who in a very telling and moderate speech, well-reasoned, effective, and at times eloquent, forcibly advocated the adoption of the first resolution before the meeting. He desired to deal only with the general principle of the question of Registration, and he claimed for it the support of the Institute. All he asked was an admission as to the necessity and urgent need of the adoption of the abstract proposition, leaving the details for the careful consideration of that body who alone could and ought to deal with the question. The present state of the profession was eminently unsatisfactory, only about one-seventh to one-tenth of the whole body of practising architects being members of the Institute. He said that the power of their great central Society was growing weaker and weaker—a remark which called forth much dissent from those present; but to this the speaker remarked that it was only a question of statistics. It was not the fault, but the misfortune, of the Institute that it was at present unequal to the task of the proper exercise of that wholesome influence in controlling the conduct of persons acting as architects which was so much to be desired, not only in their own interests, but for the benefit of the public. The medical and legal professions were successfully working under Registration, and about a dozen other societies had in some form or other adopted the measure with advantage. Indeed, he would ask which one of them would give up Registration now that they had obtained its benefits? And further, this being so, why should not this success, obtained by others, be equally secured by architects? In the interests of the Institute itself he urged the question. In Leeds, out of seventy architects at work there, only seven were members of that body, and they by no means the leading practitioners in the town. The Institute was now viewed by outsiders as a selfish corporation, and the public looked upon it often with suspicion. The public had given them no powers, and therefore considered their society unable to work with effect in the public interest. Once obtain statutory powers, and this opinion would be rectified. Expulsion from the Institute never injured any man yet in his practice, much as that fact would, no doubt, damage such a one in the esteem of his fellows. With other professions Registration made all the difference. Men would contest expulsion from their societies at every cost, and spend their last shilling to avoid so great a catastrophe. That Institute had the highest sense of honour, and its aims were of the noblest character; but its misfortune was its weakness—its powerlessness—its want of widespread utility. It was also, Mr. Connon thought, unfortunate that the initiative step in this matter should have been taken by another society; but, for his own part, he never

swerved from entire loyalty to the Institute, which, he was sure, would never permit prejudice to sway its judgment, or allow the question to receive only a partial hearing. He only contended for principles, and left details for time to work out in their committees and council. Difficulties there were, undoubtedly, in the way; but no measures of reform were without objections; and, if the council of the Institute would only exercise as much energy in removing these difficulties as they had displayed ingenuity in inventing them, he was sure of the progress to be speedily obtained. The heads of the profession might see in the change no advantage to themselves, but for the sake of their poorer brethren, the measure should be carried. Mr. Hugh Roumieu Gough, F.R.I.B.A., seconded the resolution, and said that the Institute undoubtedly was the best body to carry out such a scheme as this which was no longer Utopian. He denied that the question was brought forward in antagonism to the Institute; on the contrary, its promoters would gladly hand over the result of their labours to that central body, who would give the proposal a fair consideration. In France, Canada, and Australia, measures of Registration, were being formulated and attempted among architects. The present was the time, and if compulsory examinations were good for the Institute members, they were good for the whole body of the profession. Professor Roger Smith, F.R.I.B.A., before proposing an amendment, paid a deserved tribute to Mr. Connon's speech, with which he almost entirely agreed—in fact, he had long felt the importance and force of the question of Registration, the abstract principle of which he certainly, for one, adopted; but the difficulties before them were so serious and important, that in his judgment it would be better to postpone dealing with the matter, at any rate, for a few years. This, in fact, was the burden of his amendment: that, while not opposed to the desirability of Registration and compulsory examination, the difficulties were so insuperable that time should be allowed for their consideration, and in order that the more limited plan now in force at the Institute of compulsory examinations should have an opportunity of strengthening their hands before bringing the greater scheme before the public. If it were practicable to exclude all unworthy architects, and provide for all competent men being employed, no one would reasonably oppose the measure. Parliament could easily say, no doubt, that only competent architects should be employed, and the House of Commons could pass such a measure; but he thought it would be disadvantageous for architects to ask Parliament to take up this question just now. The exigencies of the work carried out by the profession were so involved, and while it was not difficult to prevent persons doing the work of doctors, it was essentially so in the matter of building work, which was so vast and varied in character and scope. The Society of Engineers was not registered, and they opposed the Bills brought forward in that direction. If such an Act passed, all, however unworthy, would have a status given them, and a certain class of perfectly unqualified persons would be certified as capable of acting as architects. The Institute had made a new departure. By all means give that time to work, and allow the scope of their new Charter time to develop their powers and influence, after which, take up Registration, which must come in a few years, and no doubt will be passed with éclat. Mr. Paul Waterhouse, M.A., A.R.I.B.A., seconded the amendment, and said that those who most loudly abused the Institute had the least knowledge of its working, as well as of the very thorough work which it carried on in an honest endeavour to keep pace with the progressive movement of the age. It was often urged that the public were clamouring for this measure of Registration; but as far as he could judge, this was very much of a bogus cry, unwarranted by facts. As an Associate, he said that the amendment entirely coincided with his views on the matter. Mr. G. A. T. Middleton, A.R.I.B.A., spoke in favour of the resolution, pointing out that Professor Smith had agreed to the abstract question embodied in the proposition before the meeting. Once let the Institute adopt that proposal, and the movement out of doors would be gladly dropped in the favour of the Institute, which was undeniably the only body who could efficiently advocate its adoption by Parliament. If not, then they would, outside, again and again urge it

forward, and till life was taken from them they would strain every effort to make an Act of Registration the law of the land. Mr. William White, F.S.A., supported the amendment, though if the movement was desirable, it seemed to him the sooner the better, only "do not marry in haste and repent at leisure." He had advocated Registration for years, though, for his own part, he thought the present was not precisely the time to bring the matter forward. Guarantees would be necessary, and no means should be afforded for unqualified architects and would-be architects for obtaining a status by a side wind, as it were. Mr. Alex. Payne, F.R.I.B.A., though fully in accord with Mr. Connon, supported the amendment because of the immense difficulties he foresaw in adopting the resolution. No one has defined what an architect is, and he thought it essentially to the point that some exact definition should be made between engineers and architects on the one hand, and between architects and builders on the other. The public would never consent to a measure which would prevent engineers from collecting fees for doing architectural work. Mr. Wm. Woodward, A.R.I.B.A., in a vigorous speech, pointed out that the pith of the amendment was not that alteration in existing matters was unnecessary, but that now was not the time to bring improvement to the front. But he (Mr. Woodward) denied that any substantial or tangible reason for delay had been advanced by Professor Smith or his followers. He challenged them to point out clearly what was likely to occur at the end of, say, five years to advance this question which did not exist to-day. What Professor Smith might deem to be rapidly, he (Mr. Woodward) might consider as the essence of slowness. He remarked that there was not any analogy between engineers and architects. The former were intrusted with works nearly always large and important, and only well-tried men were employed to carry them out; whereas, with building matters, which were necessarily of less magnitude, hundreds of men operated as architects who had no right whatever, either from education or skill, to carry on the practice, which resulted in injury alike to the public health and well-being and to the profession of architecture. He insisted that now was the time to move—that no good could come by delay, and expressed the hope that the resolution of Mr. Connon would be voted upon and carried that evening. Mr. Robert Walker, F.R.I.B.A., St. Martin's-place, very warmly supported the motion, and said registration must come—"nay," said he, "it is already upon us." The Bill now before Parliament he unreservedly condemned as a mischievous measure, ill-digested and unworthy of their support; but he was sure the public were not indifferent, while his many years' experience as a metropolitan district surveyor forced the opinion upon him that Registration was inevitable, and, moreover, desirable. Mr. Maurice B. Adams, F.R.I.B.A., thought it most necessary that the Institute's position should be strengthened by a measure of Registration or some statutory powers, which would give a reality to its position and prevent so eminent a body from being made ridiculous before the public, as only recently was the case in one of the law courts when the Institute's scale of charges was treated, if not with contempt by the judge, at any rate, with by no means the consideration it deserved. Often architects were led to accept fees quite inadequate and out of proportion to their just claims rather than risk a trial at Queen's Bench, where no reliable help could be obtained through the Institute as to the justice of their charges. The "Custom of Trade" came in, men were engaged on both sides, the one swearing against the other with the glorious uncertainty of anything like a fair result to the claimant, whose charges were not infrequently divided by two on the average principle so popular with juries when they know nothing about the merits of the case they are called upon to try. The dignity of the Institute demanded some such measure, and if the leaders of the Institute failed to realise its need, it was certain the rank and file of the profession, particularly in the provinces, felt its necessity. Let the Institute adopt the principle, and so prevent it from being spoiled by partial and inefficient advocacy outside. Mr. Douglass Mathews, F.R.I.B.A., supported the amendment, and urged a middle course, which he thought would be found in establishing a register to enrol all

qualified architects, and then on this register base an application for general registration in a few years' time. Mr. Lacy Ridge, F.R.I.B.A., contended that no one defined the duties of an architect in a way clear enough to present to the House of Commons, and so make it evident as to who alone should act as an architect. The burden of this definition rests with the proposers of the resolution and not with the movers of the amendment. He saw great difficulties accruing from any scheme of taking in all sorts and conditions of men who would claim to be architects, and, he said, "Wait till the Institute has well established itself as an examining body." Mr. C. H. Brodie, A.R.I.B.A., said that if the general body adopted the resolution, the Council should resign. They had opposed the Bill before Parliament, and if the general assembly voted in favour of this proposition, the resignation of the Council must follow. This statement was received with much laughter. Mr. Francis Hooper, A.R.I.B.A., advocated the passing of the resolution, and referred to the case brought forward by Mr. Maurice Adams as one evidence of the wisdom of its adoption. Mr. Ralph Nevill, F.S.A., spoke against the measure, and said why in country places incompetent men were employed as architects was, that till now there had been so few good ones there to employ. The public did not want highly-gifted architects to build farms and cottages. He himself had been thus engaged to design such buildings; but it was soon found out how to get on without him, so that he was not employed again, and they sent for a "practical" man in the neighbourhood. (Laughter.) Passing examinations did not necessarily make good architects, and it was a monstrous proposition to suppose that no architects could be competent unless they passed examinations. Many ex-builders became excellent architects, and better than many who were turned out of swell offices. Mr. Phené Spiers, F.S.A., urged the utility and permanent value of examinations, and spoke in favour of Registration, instancing the Registered Plumbers and Professors of Sanitary Science. He advocated time to be given for the Institute's plan of examination, which was growing rapidly, to develop, and then go to Parliament. The President (Mr. Waterhouse) said that the Institute had doubled its numbers within the past ten years, because of the educational facilities afforded. These had been taken full advantage of, in so far as they had had time and opportunity, and while he considered the issue before them of the most vital importance, he would urge that it would be wise not to press the subject forward just now. They would not wait many years; but time is necessary to consider the exact lines of Registration to be adopted. While country members of the profession, no doubt, advocated Registration, the two leading provincial societies (Manchester and Liverpool) voted dead against it. Most of them agreed, and were in accord, as to its importance and necessity, but how best to do it was still an open question. The amendment was put and subsequently carried. The voting was 106 for it and 37 against it. The second resolution was withdrawn, and the third was not put. These were as follows:—2. That when such compulsory examination comes into force, the position of all existing architects shall be completely respected. 3. That, whether these (Nos. 1 and 2) be carried or not, a poll be taken by voting-papers, in order that under any circumstances the opinion of the entire body of professional members may be ascertained. It was ultimately, however, resolved, on the suggestion of Mr. Arthur Cates, vice-president, that a poll should be taken of the entire body of professional members of the Institute on Professor Smith's amendment, as adopted by the meeting, and it was agreed that a full report of the discussion—of which we have given a summary above—should be circulated to the members with the voting-papers. The meeting adjourned, shortly before eleven, to the 21st instant.

#### A NEW SYSTEM OF SEWER VENTILATION.

AN experiment in sewer ventilation is being made by the Portsmouth Corporation on one of the main sewers of that borough, under Mr. Murch, the borough engineer. The drainage committee ordered the experiment to be made some months ago, upon the advice of Mr. Percy Boulnois, the late borough engineer of Portsmouth; but, owing to his appointment as city

engineer of Liverpool, he has left the investigation and reports upon the system, as far as Portsmouth is concerned, to be made by his successor. The section of main sewer chosen for the experiment, and which borders on the Canoe Lake at Southsea, was selected by Mr. Boulnois as being in need of ventilation, and therefore as imposing a severe test upon the invention, the object of which is, not only to ventilate the sewers, but, at the same time, to obviate the nuisance and danger to the public health which arises from the foul emanations escaping from the sewer gratings in the roads. Although all sewer towns suffer alike, the importance of the question as affecting the prosperity of a watering place like Southsea cannot be over-estimated, especially as the low-level main sewer of this borough passes all along the sea-front from Portsmouth to Eastney. The results of the experiments are pronounced by the inventors to be satisfactory, records taken during the last three months proving that volumes of fresh air are regularly forced into the sewer through the gratings, instead of foul air coming out of the gratings, thus preventing smell, and also changing the air of the sewer about once in an hour. The inventors of the system appear to have surmounted the difficulties incidental to sewer ventilation by the expedient of separating the "air way" from the "sewage way," by putting a tube within the sewer, the tube for air being disjointed at intervals and otherwise specially arranged, so that although it collects the foul gases and carries along the fresh air current to dilute them, it is expected to be free from the disturbing influences occasioned by variations in flow of sewage and of temperature. Mr. Archibald Ford, C.E., architect, and Mr. E. W. Wright, ventilating engineer, both of Portsmouth, are the joint inventors. They have had a special form of sewer and drain-pipe made for them to meet the arrangements of the double tube, so that their system is not only applicable to existing and new large main sewers, in which tubes can be fitted, but also to new sewers and drains of smaller size. Water is used at Southsea to introduce fresh air into the sewers; each cubic foot of water being expected to force in as much as 1,200c.ft. of air. At Cosham the water will be afterwards utilised again for automatically flushing the sewers. The system with the patent sewer pipes is now being adopted on a new building estate on Portsdown Hill, Cosham, Hants, belonging to Mr. G. Coffin.

#### PRACTICAL ARCHITECTURE WITH DETAILED ESTIMATES.—LXIII.

By HENRY LOVEGROVE, F.S.I., Surveyor.

##### ESTIMATE FOR A VILLAGE ELEMENTARY SCHOOL.

###### FOUNDER AND SMITH.—CAST-IRON STANCHEONS.

	4 0	4 0 Labour rounded edge to 1 1/2 in. slate.
2	5 0	10 0 Labour to rebate for 1 1/2 in. slate and red lead joint.
	5 0	5 0 Labour to groove for do. and do.
	4 0	4 0 6 by 4 slate cir. sunk channel set in cement.
		1 Hole through do. for brass grating 3 in. diameter.
		1 3 in. brass grating and fixing in slate.
	4 0	8 0 1 1/2 in. slate planed one side paying, bedded and jointed in cement.
	2 0	45 0 3 in. lead service in girls' lavatory, &c.
18 0	18 0	4 Add.
		1 Soldered joint.
		4 Basins as before.
		4 3 in. B. piston-valves as before.
	0	1 1/2 in. slate planed one side, lavatory top as before, including joints.
1 9	19 3	4 Perforations as before, including basins.
		11 Labour rounded edge to 1 1/2 in. slate.
14 6	14 6	14 6 Labour scribing 1 1/2 in. slate to brick-work.
2	11	23 0 3 in. by 2 in. fir wrought-framed bearers.
		4 Ends cut and pinned.
3		0 Add legs.
2	1	4 C.
3	2 0	5 0 1 1/2 in. lead waste.
	14 0	3 9 Add.
3	1 3	3 Soldered joints.
		1 End made good.
		1 Attend plumber to lavatory, with 4 basins.
4	4 0	16 0 1 1/2 in. lead supply to water waste preventer.
		4 Soldered joints.
		4 Units w.c. apparatus as before.
4	7 0	23 0 Water waste preventers as before.
		4 1 1/2 in. lead flushing-pipe.
		4 Planed clean deal seat as before.
		4 Attend plumber to w.c.

## Building Intelligence.

**ALLOWAY, NEAR AYR.**—Alloway Church, which has been since last autumn undergoing extensive alterations and enlargement, was reopened on Sunday. The new church of Alloway was erected and endowed in 1858, and consisted of the nave and a north transept. In 1876 the south transept was added, but the seating accommodation again became insufficient for the increasing population. The main features of the present enlargement are the lengthening of the nave of the church to the west by 13 ft., and the addition of a chancel at the east end. The chancel floor is raised 2 ft. above the nave. On the south side is a new organ chamber. The seats for the choir are fitted up in the north and south sides of chancel. On the north side of chancel a new session-room and vestry have been built. The enlargement has provided 114 additional sittings. Gas has been introduced into the church, and ornamental hammered iron pendants erected. The slating on the whole church has been renewed, and the ventilation and heating arrangements improved. The new pulpit is of oak, and is erected on a stone base at the north corner of the chancel arch. The Communion table and minister's and elders' chairs are also of oak, and these, as well as the pulpit, were made by Messrs. John Reid and Son, cabinetmakers, Ayr. Messrs. J. and D. Meikle, of Ayr, were

the principal contractors for the work. The improvements have been carried out from the designs of Mr. J. Macvicar Anderson, V.P.R.I.B.A., London, assisted by Mr. John Eaglesham, of Ayr. The cost will be about £2,000.

**BLOOMSBURY.**—The foundation-stone of the Jubilee Wing of the Great Ormond-street Hospital for Sick Children, which will complete this building, was laid on Wednesday week. The addition to the hospital, which is to be finished within about 18 months, has been designed by Mr. Charles Barry, and Mr. W. J. Mitchell, of Dulwich, is the contractor. The design externally has necessarily been varied from that of the present building, as the levels of the floors—save the basement—are different. The wards are more lofty and the windows larger. Eighty-nine additional beds are provided by the new wing, raising the entire accommodation of the hospital to 214 beds. The committee have in hand £21,000, which will suffice to construct the mere structure itself, but £9,000 additional is needed for the purposes of lighting, heating, fitting, and furnishing.

**CARDIFF.**—The Exchange at Cardiff, which was only opened four years since, is now being enlarged for the second time, the total expenditure on the building up to the present having been £66,000. The work now in hand consists of a club, having provided on the ground floor a dining-room 50 ft. by 20 ft., with a smoking-room of similar dimensions in the basement. Over the dining-room will be suites of offices, and in the topmost story a kitchen, having service lifts traversing the whole height of building. The wing will cost £4,000, and is being carried out under the supervision of the architects for the original scheme, Messrs. Seward and Thomas, by Mr. Clerke Burton, also of Cardiff. In the near future the directors intend to rebuild the floor of the Exchange, the original outlay on which was restricted in anticipation of more costly structural features, and which will allow of vaulted apartments and corridors, giving in the basement stores, fireproof strong-rooms, and cellars. A hydraulic lift is to be placed in the building close to the north entrance.

**SELBY.**—The Selby Board of Guardians adopted at their last meeting a scheme and plans prepared by Mr. H. L. Tacon, of Westgate, Rotherham, for the reconstruction of the workhouse at an estimated cost of £4,870. The works will include new isolation hospital, to be built on the site of the present infirmary, the new infirmary to be built on the north side of the garden and porter's lodge; new male and female wards, to be erected on the site of the present male vagrant ward and stone-yard, the board-room, clerk's office, waiting-room, and relieving officer's pay-room. New inmates' workshops to be built on the men's yard, the new laundry and wash-house to be erected next to the kitchen; new larder and mortuary to be built on the north wall of girls' yard. The drainage is also to be entirely reconstructed.

**SPAIN.**—The Roman Catholic Church of St. John the Evangelist was consecrated on Dec. 27, 1889, by Canon Alimaty, delegate of the Bishop of Palma. The whole of the exterior is of black marble carried out in Early Gothic style, the marble being obtained from the estate known as La Albufera de Decudia, the property of Mr. Lee La Trobe Bateman, by whom the church was designed and carried out. The interior fittings are of a very elaborate and costly character, consisting of silver and silver-gilt altar vessels and furniture, processional crosses, sanctuary and other lamps, candlesticks, vases, &c. There is also a fine altar and tabernacle in carved oak, with figure of the patron saint in centre panel, carved oak screens for the Confessional, and various other oak work. The embroidery has all been specially designed, and consists of complete sets of vestments, frontals, bookmarker, worked in gold and silk. The whole of this interior work has been entrusted to and carried out by Messrs. Jones and Willis, of London and Birmingham.

At a meeting of the Cardiff Literary Society on Tuesday evening a lecture was given on "Early Printing and Book Embellishments," by Mr. Edwin Seward, F.R.I.B.A., who exhibited a valuable collection of books and engravings, which the lecturer showed as illustrations.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

## NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII., XLVI., XLIX., L., LI., LIII., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—C. G. R.—J. D. and Son.—M. S.—R. W.—B. and Son.—H. H.—L. and W.—B. T. S.—J. A. W.

## "BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Toby," "Niger," "Coombe," "Skip Jack," "Wallaby," "Country Bumpkin," "Sea Foam," "The Red Rover," "Cawder," "North Star," "Menelaus," "Dot," "Koko," "Streona," "Y" in a circle, "West Anglian," "Waverley," "Anvers," "Syak," "Tyne," "So-and-So."

## Correspondence.

### R.I.B.A. EXAM.

To the Editor of the BUILDING NEWS.

SIR,—In "Wayside Notes," on page 445 of your last week's issue, "Goth" accuses the Board of Examiners of "rushing candidates through." As one who has passed the examination, I think a protest should be lodged against such a statement, as tending to lower the qualification.

My opinion, and the opinion of those candidates with whom I had conversations after the exam., was that the examiners were by no means too easy; and I can only feel a certain conviction that the number that are not passed is a proof that there is no attempt at the "rushing" of which "Goth" writes.—I am, &c.,

EDMUND J. BENNETT.

Gravesend, March 30.

### COMPETITION DEGRADED.

SIR,—We have not yet got to the bottom of the scale of competitive degradation. We thought we had, considering some of the conditions attached to competitions; but there is a still lower depth. The R.S. Authority at Leighton Buzzard want a scheme of drainage and water supply, and have invited engineers to respond to their wishes.

1. The Authority ask for report, with plans and detailed estimates.
2. They do not bind themselves to accept any plan.

3. They offer no premium.  
4. They do not say whether they will claim the plans, &c., as their property—perhaps they will.

In short, the matter is reduced to this:—Engineers are permitted to work for nothing and without any assurance of getting a penny for their labour. What a chance is here! Permit me to put a parallel case. I want to have the skill and experience of half-a-score professional men on a difficult matter. I do not bind myself to accept their skill and their work when I have got it. I guard myself against paying a single penny. If I should get some excellent opinions and valuable documents, I do not undertake, even if I act upon them, to give anything to their authors. In short, I am a cautious, calculating humbug, and I want other people's brain and work for nothing. Shall I find any fools big enough in folly to give it me? I trow not; so also I do trust the Leighton Buzzard R.S. Authority will advertise in vain until they amend their shabby proposals. It is said there is a flat born every minute. I begin to think it must really be so.—I am, &c.,

CIVIL ENGINEER.

#### "WHOSE END IS TO BE BURNED."

Sir,—I have to record yet another church of historic interest burnt.

Surely there is disaster hanging over every church that has been, or will be, built, if the future generation is not more cautious than the present.

The following is an extract from the local paper, March, 29 1890:

"Guestling Church was totally destroyed by fire early on Sunday morning last."

The Norman tower, the Early English chancel, the nave and roof were gone entirely—nothing remained but the aisle walls and the pillars. The church was quite restored five years ago at a cost of £1,700.

The fire originated through the overheating of a flue. This flue is a common pipe connected with a tortoise stove. It runs in an oblique manner through the roof, and at the corner of the roof, where the pipe passed through into the open, "the fire first began." Heroic efforts were made to save the ancient building, but with no avail. Guestling is five miles from Hastings.—I am, &c.,

CONSTANT READER.

#### LOW SIDE-WINDOWS AT ELY.

Sir,—Allow me the privilege of thanking Mr. Ponting for his interesting letter in your last number, and of assuring him that I should have much pleasure in showing him the chapel. My conjecture in reference to these low windows is perhaps more prosaic than plausible, yet the tinkling of the hand-bell does not commend itself to my judgment as an acceptable substitute; for, in the first place, the chapel has a bell-cot forming the termination of a newel staircase at the north-west angle of the building. I can discover no trace of friction or grooving by a bell-rope, and I fancy that the bell was struck at the proper moment by a person standing at the head of the stairs. The niche or recess in which he possibly stood is closed by a small wooden door, recently renewed. In the second place, the position of the chapel in relation to the dwellings of the citizens is such as to preclude the idea that the sound of this sanctus-bell, still less that of a hand-bell, could reach any ears save those of the prior's own servants or guests. The abodes composing the town or city of Ely were clustered together, as they still are for the most part, to the north and west of the monastic buildings and the palace of the bishop. The chapel of the prior was shut off from the street by the whole of the vast pile of the abbey church or cathedral, by the guest-hall—a huge and lofty edifice, now the Deanery; by a row of buildings, which included a hall adorned by a magnificent fireplace and chimney-piece, still preserved. The northern low window looked into a little court, hemmed in on three sides by the domestic offices of the prior's residence. The southern side of the chapel overlooked the gardens and pleasure-grounds, now called the Park, and which have never been encumbered by buildings of any kind.

From all this, it will be seen that the ringing of the sanctus-bell could have had little concern for the inhabitants of the town of Ely, and it seems to me well-nigh incredible that a beautiful and costly window on each side should have been introduced for the purpose of ringing it. To

my own mind, the notion of a freak or fancy on the part of the wealthy and powerful churchman who built the chapel, and who had at his elbow a true artist—*flos operatorum* in his generation—to carry out his wishes, is a far more attractive solution of the mystery.—I am, &c.,  
Ely, March 30. W. E. DICKSON.

#### THE RAILWAYS OF SCOTLAND.

Sir,—In a notice by the BUILDING NEWS of a book which I have just published under the above title, I find the following passage given in inverted commas: "From London to Perth, by West coast, is said to be now 450 miles; it will also be by the bridge 450." May I be permitted to explain that the words are not mine. That the distance from London to Perth by a road that has been open more than forty years is 450 miles, is matter not of assertion but of simple and easily ascertainable fact, and has no more to do with the completion of the Forth Bridge than with that of the Channel Tunnel.

One point more. You say, "there is too clearly a desire on the part of the author to push a scheme." What the scheme may be you do not say, and I cannot guess; for I can hardly think you would characterise as pushing a scheme an expression of opinion that the maintenance of the *status quo* in Scotland is for the interest of the public. If to desire to see, in lieu of monopolies or quasi-monopolies, the maintenance of free competition between fairly well matched rivals is to push a scheme, then the two Houses of Parliament have been pushing schemes for half a century past.—I am, &c.,

W. M. ACWORTH.

St. Margaret's, West Dulwich, April 1.

#### CHIPS.

Mr. J. P. St. Aubyn has prepared plans for the restoration of the reredos in the parish church of St. Austell, Cornwall. The work will be carried out by Mrs. Arthur Coode, in memory of her brother.

The Ratcliffe local board having applied to the Local Government Board for power to borrow £25,000 for works of sewerage and sewage disposal, Mr. J. T. Harrison, E.C., held an inquiry at the Local Board Offices on Friday. There was no opposition.

Mr. R. Herbert Carpenter, F.S.A., gave a lecture on "St. Patrick's Cathedral, Dublin," before the members of St. Paul's Ecclesiological Society at St. Paul's Chapter House, E.C., on Thursday evening, the 27th March.

At the end of two years' service as town surveyor and water engineer of Weston-super-Mare, Mr. Arthur E. Collins, Assoc.M.Inst.C.E., has had his salary increased from £300 to £350 per annum by a unanimous vote of the Weston-super-Mare Improvement Commissioners.

A new police-court has been erected at Bromsgrove, and especial attention has been paid to the ventilation, the extraction of the vitiated air being effected by Messrs. Robert Boyle and Son's latest improved patent self-acting air-pump ventilator, and fresh air admitted by their air inlets.

It is proposed to raise £1,000 for the purpose of endowing technical scholarships in connection with the new engineering laboratories at University College, Liverpool, so that about forty workmen and apprentices can attend the evening classes in the college. In order to raise the money and secure the interest of the workers, an industrial exhibition will be held in the college during the ensuing month of July, and the entire machinery of the place will be set in motion in connection with the exhibition.

At St. John's Roman Catholic Church, Burwash, a new high altar and reredos was consecrated last week. The work is carried out in Caen stone, and has a lofty crocketed canopy, the lower part of which contains the tabernacle, which is of oak, carved and gilded. Mr. Bernard Whelan was the architect, and Mr. E. Thurbon the builder.

A central public library for Battersea was opened by the Rt. Hon. A. J. Mundella, M.P., on Wednesday. A branch library was opened in October, 1888, in Lammas Hall, Old Battersea; another branch is in course of erection in Lurline-gardens, near the Albert Palace, and will be opened in the autumn of this year. The central library, which stands in the exact centre of the parish on Lavender-hill, and near to Clapham Junction, is to be the chief of these. It is of red brick with Portland stone designs, erected from the designs of Mr. E. W. Mountford. On the ground floor are reading rooms and the lending-library department; above is a reference library. The total cost has been less than £10,000. The library opens with £16,650 books at its disposal.

## Intercommunication.

### QUESTIONS.

[10259].—**Rustless Iron.**—Can malleable iron castings be treated, by Barff's or other process, to render them non-rusting, if coated, as paint would do? There are half-a-dozen castings in a small machine I am making—all out of sight, except a small piece in. by in. by in. —would dull heating and dipping in oil be any good? What is cost of apparatus, as several thousand castings have to be done?—MODEL-MAKER.

[10260].—**Sulphur and Iron Filings.**—Will some one please say in what proportions these should be melted for fixing wrought-iron railings with?—C. F. M.

[10261].—**Sound-Proof Plastering.**—Can any of your readers tell me if non-conducting composition for plastering walls and ceilings is any good?—C. F. M.

[10262].—**Change in the Colour of Paint.**—Some seats facing the sea which were painted drab colour have, by the action of the salt spray, become a deep blue. An explanation of this change by some correspondent will greatly oblige.—WESTON.

[10263].—**Tall Chimney Construction.**—Why do some architects put cast-iron caps on the top of tall chimneys? Is it better than stone or brickwork to finish off with? Should I derive any benefit by building a tall shaft with brickwork in cement—would not good mortar do as well? Which will stand the greater heat—brickwork in cement or brickwork in mortar?—INQUIRER.

[10264].—**Prime Cost.**—Is prime cost the amount of the article specified, as taken from the trade list; or is it subject to the usual discount therefrom? If the latter, can the contractor lay claim to it, or should it be allowed to the employer?—FAIRPLAY.

### REPLIES.

[10249].—**Beam.**—By removing the two columns, the bending moment of the beam will be three times greater than before, supposing a distributed load on the beam, and therefore its size may be increased, say to 12in. by 9in.—G. H. G.

[10250].—**Seasoned Timber.**—Inspection will seldom discover if the wood has been properly seasoned. One of the principal tests is weight. In properly-seasoned timber the weight is less than when unseasoned. Tredgold says the reduction in weight should be about one-fifth to one-third. The surface of good timber should not be woolly or dull in appearance. Rivington's "Notes on Building Materials" describe the characteristics of good timber, and will be found useful to an architect. See also Laslett's work on "Timber and Timber Trees."—G. H. G.

[10251].—**Concrete Floor.**—With so small span  $4\frac{1}{2}$  to 5in. thickness of well-made concrete, with good cement and aggregates, on good joists not over 30in. centre to centre, will do flat. If good abutments, the same will do without iron joists, if it rise  $\frac{1}{4}$  to 1in. to the foot of span, and if well executed, in opinion of—J. P.

[10252].—**Old Mortar** should not be used as an aggregate, with lime or cement, for fresh mortar; it's no better than road scrapings, though too often used where sand or other grit is too expensive.—J. P.

[10253].—**Cement Flat.**—No such flat can be made perfectly water-tight by concrete on iron girders; unless quite free from deflection and expansion of the iron joists or girders. Good asphalt, owing to its elasticity, is best.—J. P.

[10258].—**Rain Driving through Stone.**—Before "E. T. S." made the assertion that rain had driven through a 9in. thickness of Ham Hill stone he should have made a more careful examination of the work he refers to. The fact he mentions, that water "was lying in pools on the window seats" is quite enough of itself to prove that he has made a great mistake or a great misstatement. The "pools" of wet could only have come through the beds of the walling above the stone. In parts of Somerset and Dorset, and in very exposed places, Ham Hill stone has been more largely used than any other for many centuries past. I am in a position to say that no rain has ever driven through a 6in. thickness of solid Ham stone, much less a 9in. thickness. There is perhaps hardly any freestone to be found which receives less moisture than Ham stone of good quality. "E. T. S." should get the assistance of a good practical mason to examine the walling, and he will, I have no doubt, find out where the wet comes in.—EXPERIENCE.

[10258].—**Rain Driving through Stone.**—If "E. T. S." will write me, I will furnish a certain preventative against water passing through the stone.—JAS. PULHAM.

Ward's City of London School for Girls, which is about to be removed from Bishopsgate on account of extensions, will be rebuilt on a site on the Thames Embankment, at the rear of the Guildhall School of Music. The school will be rebuilt to accommodate 556 girls, and is expected to cost about £15,000.

Works of water supply have just been carried out by the Water Commissioners of Dundee in the district of the Monifieth local authority, and this week the main pipes have been charged. The cost has been, for the six miles of new mains, £2,327 1s. 6d., being £23 2s. 6d. over the outlay as estimated by Mr. Watson, engineer to the Commissioners.

As a memorial of the late Mr. J. F. B. Firth, a marble bust and pedestal are proposed to be placed, by subscription, in the meeting-room of the London County Council at Spring-gardens.

Mr. Thomas, C.E., county surveyor of Carnarvon, has been elected county surveyor of Buckinghamshire at a salary of £500.

## LEGAL INTELLIGENCE.

**DISTRICT SURVEYORS' FEES FOR BLOCKS OF TENEMENTS.**—Messrs. Sutton and Dudley, builders, were summoned by adjournment to the Lambeth Police-court last week by Mr. George Lansdown, district surveyor, for the non-payment of fees claimed by him with regard to a block of model dwellings in Lion street, Kent-road. Mr. Partridge now gave his decision. He said the defendants were summoned, under the Metropolitan Building Act, for certain fees alleged to be due on the ground that the buildings were separate. There were ten blocks under separate roofs, with one common entrance from without, and one common staircase leading to separate chambers or tenements within each, the area of each block being less than 3,600sq.ft. The dispute was whether the fees were to be charged upon each set of tenements or upon each block only. For the defendants it was contended that the fees could not be assessed upon each tenement, but only upon each block. The sub-section of the Act (Section 27) recited, "If any building in one occupation is divided into two or more tenements, each having a separate entrance and staircase, or a separate entrance from without, every such tenement shall be deemed a separate building." The sub-section dealt with buildings being separate sets of chambers or tenements, and was not applicable to the present case. He held, therefore, that the surveyor was entitled to claim only for each block contained under one and the same roof, but not for each tenement contained under such roof as a separate building. He therefore decided for the defendants, leaving the parties to arrange upon that basis the amount of fees, upon which there was no dispute.

**TRESPASS ON A PARTY-WALL.**—MESSENGER V. LOADER, AND GROOM V. LOADER.—These actions have been tried together in the Court of Chancery before Mr. Justice Ford North. The plaintiffs are respectively lessor and lessee of the Highlander beerhouse, High-road, Lee, and the defendant is a builder, who, after serving the usual party-wall notice, proceeded to build a separate external wall to his premises adjoining the party-wall. The plaintiffs, for whom Mr. Cozens-Hardy and Mr. Moyes appeared, claimed damages of trespass, and for damage to the wall, calling the manager of the house, and Messrs. Pountney and Roberts, surveyors. The defendant called Mr. Charles Bell, F.R.I.B.A., and Mr. H. Lovegrove, F.S.I., to prove that the old wall was a party-wall, and that the alleged damage could be made good for a few pounds. The judge decided to dismiss the action by the freeholder (Messenger), each party to pay his own costs, and in the other action he awarded £25 damages for the trespass with costs on that part of the action only, as he dismissed that part relating to ancient lights.

## CHIPS.

A lecture under the auspices of the Dundee Institute of Architecture, Science, and Art, was delivered in the Y.M.C.A. Hall in that city on Thursday, the 27th ult., on the subject of "Ventilation." There was a good attendance, and Mr. Charles Ower, architect, of Dundee, presided.

The Union Workhouse at Tunbridge Wells is about to be extended at an estimated cost of between £5,000 and £6,000, from plans by Mr. William Oakley, surveyor to their rural sanitary authority.

The County Council of Flintshire have decided to appoint a county surveyor to look after the roads, to inspect every road at least once a fortnight. They further agreed to offer the very inadequate salary of £160 a year only, and give his assistant or inspector £130.

Messrs. Luxton and Co.'s cabinet works at Col-lumpton, Devon, were destroyed by fire on Tuesday week, when damage to the extent of £2,600 was done, and the workmen lost tools valued at £300.

The city council of Manchester decided on Wednesday to advance the salaries of Mr. H. Chenery and Mr. T. A. Lomas, the surveyors of paving respectively for the northern and southern districts of the city, from £215 to £240 a year each.

A bronze bust of the late Colonel F. Duncan, C.B., M.P., was unveiled in the main entrance to Holborn Town Hall on Wednesday week. The sculptor is Mr. Conrad Dressler.

Messrs. Jones and Willis recently made for the parish church, Carmarthen, an angel lectern in brass. This appropriate and very uncommon idea represents an angel, almost life-size, standing upon a richly-chased globe, supported by cusped and crocketed buttresses. The figure is modelled in a spirited manner, giving due effect to the sacred character of the work, the facial expression and the hair being particularly good. A copy of this lectern, cast from the original model, can now be seen at the showrooms, 43, Great Russell-street, near the British Museum.

## Our Office Table.

WE regret to announce the sudden death of Mr. Ernest Claude Ayton-Lee, F.R.I.B.A., till recently of James-street, Bedford-row, W.C., which occurred at his residence at Ramsgate on Saturday last. Mr. Lee, who was only 43 years of age, had been suffering for some years from hæmorrhage of the lungs, and spent the winter of 1887-8 in Australia. On his return he resumed practice, but removed from Teddington to Ramsgate. The cause of death was aneurism of the heart. The younger son of a clergyman, trained in the office of the late William Burges, A.R.A., Mr. Lee became an accomplished draughtsman, and when in his 24th year he carried off in the same session of the R.I.B.A., that of 1870, the Soane Medallion and the Pugin Travelling Studentship, he joined the Institute as an Associate in 1869, and became a Fellow in 1880. The possession of private means undoubtedly prevented him from undertaking so much work as his originality and his powers of draughtsmanship and design warranted, and his practice largely consisted of churches and mansions. In his earlier years Mr. Lee took an active part in the working of the Architectural Association, which he joined in 1864, and he ascribed much of his dexterity with the pencil to the training received in the Class of Design. In the session of 1880-1, having served the Association in subordinate capacities, he occupied the Presidential chair. This year of office was marked by the inauguration of the A.A. Travelling Studentship, and by the augmentation of the value of the prizes given in the classes, in both which directions the President offered substantial pecuniary aid. He was, as is mentioned in the A.A. Notes for April, "a constant and greatly valued contributor to the Sketchbook," and also took part for many years in the annual excursions of the Association, and was a genial member of the party. Among his works we may mention the rebuilding of the parish church of St. Mary, Whitechapel, carried out at a cost of £20,000, borne by Mr. Lee's uncle, the late Mr. O. E. Coope, M.P., a church illustrated in the BUILDING NEWS for September 8, 1878, and again, as reconstructed after the destructive fire of August, 1880, in our issue of May 12, 1882. He also rebuilt the parish church of Brentwood, likewise at Mr. Coope's expense, and this building was illustrated by us on July 25, 1879; June 23, 1883; and July 11, 1884; and Berechurch Hall, Colchester, the residence of Mr. Coope, a drawing of which we published in our issue of June 16, 1882. Among other buildings may be mentioned a bank at Colchester, illustrated by us April 11, 1879; Holy Trinity Schools at Westminster, also given in our pages; churches at Woodford and Collier-row, Essex; the Grange and cottages at South Weald and Midhurst. He won, in 1883, one of the premiums in the Art Museum competition, Dublin. He was an occasional exhibitor at the Royal Academy, and besides many architectural drawings, we recall on the walls of Burlington House a water-colour sketch of old house at Mont St. Michel, hung in 1877, and another drawing in the same medium of the Hôtel Bourgtheroude at Rouen, exhibited in 1887. Mr. Lee married, ten years since, the sister of his friend and fellow-pupil, Mr. H. W. Lonsdale, and is survived by her and by their only daughter. The funeral takes place on Saturday next, at Teddington Cemetery.

It will be recollected by some of our readers that about two months since the Newcastle Society of Antiquaries were exercised in mind by the receipt of a demand from the vicar of St. John's Church in that city, for the restitution of the piscina formerly belonging to that church, and which has for many years been exhibited by the Society in their museum at the Castle. Several members, led by Canons Franklin and Hicks, considered the piscina was virtually stolen property, and urged that it should be returned; but Mr. C. C. Hodges and others suggested that a more prudent course would be to inquire into the circumstances under which the Society obtained possession of the piscina, especially as a by-law of the Society forbids its council from giving away any of its property unless it is duplicated. The result of an adjournment has been to confirm the opinion that the Society is legally in possession of the piscina, for it was

presented by the contractors for the restoration of St. John's Church so far back as July, 1844. It will, therefore, continue to be shown in the Castle Museum at Newcastle.

Mr. CHARLES SWINSTEAD, who died on March 22nd, was in his 75th year. He was appointed one of the masters of the National Art Training School when the Department of Science and Art initiated the system of sending its students, as part of their training, to teach in the parochial schools of London, his office being the inspection of the work done by the students, and teaching them how to teach others. In this way the whole of the masters in training for many years came into contact with him, and it may safely be said that all found him a true and kind friend, many of these friendships only terminating with his life. He subsequently founded the North London and Hornsey Schools of Art, where many students have profited by his exceptional teaching powers, and have been drawn to him by his geniality and love of art.

On Saturday a meeting was held at Gloucester to consider the formation of a scheme to improve the approach to Gloucester Cathedral. Plans have been prepared by Messrs. Waller and Son, the cathedral architects, for the improvement. Nothing worthy of preservation on antiquarian or other grounds will be destroyed, and the interesting remains of King Edward's Gateway will be brought into prominence. The cost of the improvements, after allowing for aid given by the corporation in constructing the new roadway and pavements, is estimated at £14,000. Towards this sum upwards of £4,000 has already been subscribed.

At the last meeting of the London School Board, the Works Committee brought up a report stating that, having regard to the great pressure of work in the architect's office, and to the large number of schools still to be erected, the planning of which has not yet been begun, the committee were of opinion that the assistance of outside architects, who had had special experience in the planning of schools, might be obtained to design some of the schools which were to be erected on sites at present in the possession of the Board. The committee accordingly recommended that five new schools should be planned by, and built under the superintendence of, five outside architects. A long discussion ensued, and on a division the report was, by 24 votes to 11, referred back to the committee for recommendation.

THE Bill introduced by Mr. James Stuart, to provide for the better housing of the working classes in the metropolis, embodies the principal provisions of the Bill of last session, and empowers the County Council to buy, sell, hold, let, or hire land; to build and manage buildings, and let rooms; and to lay out land for providing suitable dwellings inside or outside of the metropolitan area for use by the population engaged in the industry of such area; lodgings, baths, wash-houses, halls, open spaces, lands, kitchens, nurseries, dining-halls, or other rooms for joint use. The funds of the County Council to be used for these purposes will include any accumulations of any such moneys and any sums received by way of compensation, payment, repayment, sale of materials, chattels, or effects. The Bill provides for the rating of ground values to the extent of one-sixth part of the gross ratable value of the premises erected thereon, and for the levying of a rate for houses of the working classes not exceeding 6d. in the pound on the annual ground value, the tenant paying the rate and deducting it from the rent. Vacant land is also to be rated on an annual ground value equal to 5 per cent. of the amount which the land would sell for.

## MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Liverpool Architectural Association. "Orms-kirk Parish Church," by W. E. Hill.  
THURSDAY.—Edinburgh Architectural Association. "Accessories of Architecture," by John Keppie, Pres. G.A.A., Glasgow. 8 p.m.  
FRIDAY.—Bradford Historical and Antiquarian Society. "Some Bradford Charities," by William Claridge, M.A.

New offices are about to be added to Messrs. Warwick's brewery in North-gate, Newark-on-Trent, at a cost of about £3,400. Mr. Charles Baines, of Newark, is the builder.

At a meeting held at the County Hall, Paisley, on Friday, it was decided to erect in that town a bronze statue of the late Sir Peter Coats, of Auchendrane.

**Holloway's Pills** act so kindly yet so energetically on the functions of digestion and assimilation, that the whole body is revived, the blood is rendered richer and purer, and the nervous and absorbent systems are invigorated. They soon rectify whatever is in fault, restore strength to the body, and confidence to the mind.

**W. H. LASCELLES and CO.,**  
121, Bunhill Row, London, E.C.

TELEPHONE No. 270.

**HIGH-CLASS JOINERY,  
LASCELLES' CONCRETE.  
Conservatories & Greenhouses.  
WOODEN BUILDINGS.**

**BANK, OFFICE, & SHOP FITTINGS.  
CHURCH BENCHES AND PULPITS.**

ESTIMATES GIVEN ON APPLICATION.

**DOULTING FREESTONE.**  
**THE CHELYNCH STONE.**—The Stone from these Quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

**THE BRAMBLE DITCH STONE** is of the same crystalline nature as the Chelynych Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to **CHARLES TRASK and SONS**, Doultong, Shepton Mallet, Somerset. London Agent:—**Mr. E. A. WILLIAMS**, 16, Craven-street, Strand, W.

**HAM HILL STONE.**

The attention of Architects is specially invited to the Durability and beautiful Colour of this material. Quarries Well Opened; Quick Despatch. Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—

**THE HAM HILL STONE COMPANY,**

NORTON, STONE-UNDER-HAM, SOMERSET.

London Agent:—**Mr. E. A. WILLIAMS**, 16, Craven-street, Strand, W.C.

## BILLS OF QUANTITIES & PLANS.

**T. PETTITT and CO.** Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Buildings, Estates and General Plan Work at very reduced prices.—**T. PETTITT and CO.**, Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

**Faraday & Son's**  
**ELECTRIC LIGHT FITTINGS**

3 Berners Street London W.

**ELECTRIC LIGHTING.**

**COMPLETE INSTALLATIONS  
OR WIRING ONLY}** ESTIMATES GIVEN.

**STRODE & CO.** 48, Osnaburgh-st., N.W., and 67, St. Paul's Churchyard, E.C. LONDON.  
New Branch Showrooms:—188, PICCADILLY, W.  
Telephone No. 3956.

**WM. OLIVER & SONS,**  
**MAHOGANY, WAINSCOT, WALNUT,  
TEAK, VENEER, and FANCYWOOD  
MERCHANTS,**

120, BUNHILL ROW, LONDON, E.C.  
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

## TENDERS.

\* \* \* Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

**BROMLEY.**—For repairs at the Red Cross, Keston, Greyhound, Bromley, and Plough, Bromley Common, for Messrs. H. and V. Nicholl, Ltd. Mr. A. L. Guy, A.R.I.B.A., 78, High-street, Lewisham, architect and surveyor:—

Pritchard	...	...	...	£244	0	0

## WHAT ARCHITECTS WANT.

LIKE other professional men, an architect wants many things that are attainable, others that are not. He looks for a good practice and the means of keeping it. He wants clients who prefer rather to build than to buy; others that have no crotchets of their own, and are willing to take the advice of their professional advisers. Certain obstacles to practice he requires removed—as, for example, those amongst his own class who undersell their services and act in an unprofessional manner; builders and agents who undertake to prepare plans. He would like to see uniformity in professional practice, in matters of contract, in charges for services, so that he may be spared the unpleasantness of others amongst his craft appearing as witnesses against him. When we look at the present condition of architectural practice it would seem to be hopeless to expect these wants all satisfied at once, or all the restrictions to prevent those from practising who are not qualified to do so. In the present indefinite and “nebulous” condition of the profession, we cannot circumscribe the duties of the architect; certainly we cannot expect that they who have not the credentials of their office will come forward and do anything to improve the position of affairs. A large number of men in practice indeed prefer the latitude which prevails: they thrive and grow fat in the present vague and undisciplined state of the public mind; they make the most of the freedom they enjoy.

To take a few instances. There are a very few people who are not satisfied with what the builder can give them. A building to them, whether a house or a church, is a commonplace thing—at least, they think so; any art, or science, or good design that may be displayed in it is a question to which they have not had their attention specially directed, because there is no standard to judge by. All kinds of good, bad, and indifferent buildings pass muster; the builder's house is often freer from faults of a structural nature than that on which an architect has been engaged, and as there is no apparent difference between the perfect and the just good enough, so it is difficult to persuade the public why they should employ an architect. Persuasion must come from an absolute conviction that the architect can give a better result, and to do so he must be able to give his employer a guarantee of his qualifications, and prove that architecture is good building and something more. A very large proportion of the buildings erected are designed by men who have either only practical knowledge of some one trade, or by men who are not architects in any sense of the term; who have a very partial knowledge, and who undertake to supply plans and carry out buildings. The provincial architect is the sufferer, for he finds it hard to convince any one that his services are worth paying for. This prevailing impression weighs heavily on him; it is the one obstacle he naturally desires to see removed, for he finds among his friends and clients a very vague and wrong idea of what an architect is, and can do. They tell him plainly that his services are superfluous. They employ builders to do their work, they buy houses ready built, and they act as if they could do without an architect. There is only one means of convincing the public of the value of professional services, namely, to place restrictions on building; for example, to compel every one who builds to observe

certain laws and regulations and to submit plans and sections to an authority. The by-laws of the urban and rural authorities and the regulations of the Metropolitan Building Act have done a good deal to make the public respect the architect, and to compel them to seek his aid. Still more would legislation, by requiring a statutory test of proficiency from every professor, induce every one who contemplated building to employ an architect or take the consequences of his own rashness. If, then, an individual bought a house from a speculator or employed an incompetent person to build one, he would have to take the consequences if it turned out inferior; but more than this, a statutory diploma or guarantee would in time remove the obstacle which now the professional man has to contend against—viz., that of every one setting up as an architect.

Another of the drawbacks to success is the want of authority which characterises the profession. Other professional men can appeal to infallible standards within their professions—solicitors can, for instance, appeal to legal precedents and the authority of the Courts; but the architect has no such tribunal that is of legal authority. Thus, for instance, in questions affecting his practice he can only adduce the custom of his profession or call witnesses, and these are often conflicting. In his endeavours to get justice to obtain the settlement of his accounts—to defend actions brought by employers for negligence and want of skill—he is at the mercy of judges and juries who know little or nothing of the real merits of the case. How to obtain redress for his wrongs, or to prove to his employers he is in the right, is a difficulty under which he smarts. A lawyer has only to refer to statutes or decisions; a medical man can appeal to the leading hospital practice; a clergyman to the canons and formularies of the Church to which he belongs; but the architect can only give his own opinion, and in questions of taste he is often hopelessly at variance with members of his own craft. We are quite aware that in questions of art it will always be so; but the younger men naturally desire, in matters of practice, to substantiate their opinion and action before their clients. The latter may be crotchety individuals, and fond of questioning or cavilling at the course taken by their adviser in some point of business, or in a matter of construction. Who can be appealed to? An arbitrator in every case that arises would be costly and unnecessary, but if the architect knew he was acting rightly, and could substantiate it, he would be contented. It is because he has not the means of doing so, and does not know how his brother professional may answer or act towards him, that he feels discontented. The remedy for this grievance also is to bind together the profession by a legal recognition. Every one in practice now feels that clients are too apt to hear with indifference the advice they receive. A tribunal for professional questions would, to a large extent, remove the grievance—a court composed of professional men ready and willing to give their opinion to their brethren, a kind of architects' “exchange.” The *Prud'homme*, or Council of Experts in Paris, is an institution having a similar mission in determining causes of dispute between employers and workmen. The magistrates are elected for a certain period, and a small number are sufficient to form a court. As most architectural questions involve technical knowledge, they should be settled by experts. The law court is expensive—more, it weakens the authority of the architect on questions of a technical kind.

The expediency of formulating and tabulating data for architects would be of great service. Schedules might be prepared of many requirements. Those for the planning and design of public buildings, such as areas

of accommodation, dimensions of fittings, lists of materials used in construction, formulæ for the strength of various structures would supply the architect with information of which he is at present deficient. For the want of specific data of this kind, much that he does is uncertain. The incompetent are the gainers. An extended study and examination of particular buildings and their requirements, such as few architects can ever hope to obtain, are necessary for a satisfactory solution. How far a speaker's voice can be heard in a public lecture hall or church in any direction; what are the best methods to prevent or remedy echo; rules for the planning of an auditorium; the best kinds of apparatus for warming and ventilating buildings, are points which can only be settled by experiments conducted in buildings of varied size and construction. The repeated failures in these matters are hindrances to the pretensions of architects. With respect to sanitary details, the public are still disinclined to trust to them. The numerous inventions and appliances before the public have only patentee claims; what is wanted is that the profession should give their sanction to those principles which have been proved to be correct. At present one architect specifies one maker's goods, another architect someone else's; and so the public are given to understand that favouritism is at the bottom of the business. The same remark applies to building materials of all kinds; to methods of heating, lighting, and ventilation, and specialities for decoration. When and how are all these questions to receive the attention they ought to have? Will it be when the profession awakes to a sense of their duty to the public after further failures have made people begin to think there can be no science in building as the doctors disagree so much, and that builders can do equally well without them? We can only look to some measure of legislation to remove these disabilities, whatever it may be called—registration or statutory examination, or something equal to it. The provincial architect looks for some authority which will enable him to hold his own, to remove the obstacles which at present impede his path, and to make his qualifications known. He does not desire to deprive the rights of others outside his own class to practise—he cannot do that if he would, even after the most rigid statutory Act has been established—but he simply desires that these individuals should not so easily interpose themselves between his clients and himself, that the public should at least acknowledge him as a competent practitioner.

## CHARGES FOR TIME.

THE action tried before Lord Justice Fry the other day, brought by a London architect, Mr. Haward, against a gentleman at Darlington to recover a sum in respect of railway fares and time, adds another to the list of cases in which the Courts have decided adversely to the architect's claims for time. The dispute was as to the plaintiff's right to charge for time in superintending buildings at Darlington in addition to his commission, which was at the rate of 5 per cent. There was no special contract between the plaintiff and defendant as to charging for time, and this was the weakness of the plaintiff's claim. It seems difficult to convince the architect that unless there is a special agreement entered into between himself and client, the plea of the custom of the profession will prove of very little use in Courts of law, where the architect's business is regarded with not much higher respect than that of an ordinary tradesman. We have before now shown the uselessness of these sort of claims, as when an architect defends an action brought by his client for the giving up of the plans on the

ground that it is a custom in the profession to retain them. A special contract is in all such cases necessary, as it is unavailing to allege custom in the present unsettled and unrecognised position of the architect. Still, we find a hard fight made for principles and customary practices, despite repeated defeats; architects cannot see the justice of being dealt with differently to other professional men—lawyers, for example—who can charge a fee for the smallest service. They cannot see the fairness of their time being accounted of no value, simply because they have not combined years ago in establishing the right, or of their advice being taken without remuneration, though it be quite as well worth paying for as a design. Why should it be so? Why, for example, should a client come to an architect day after day and waste his time in answering professional questions, detaining him from other work, to obtain information and advice without paying for it? Yet this happens every day. An architect cannot claim a fee unless he has been instructed to do something. He can only charge for a report or a written opinion, or for any services rendered in a business form; but not for conversations and answering questions of a professional kind, however protracted they may be, or however valuable to the individual and worth paying for. It is useless to inquire why this should be. Custom has not established any rule, and the Courts of law have set their face against any claims for services that cannot be shown to be matters of contract.

The claim made for time engaged in travelling to Darlington was proved to be a customary one. The rules of the Institute of British Architects were put in evidence to show that if an architect was required to go a long distance the percentage did not cover the charge for time. The schedule of the Institute says, besides all travelling and incidental expenses incurred, the architect "may charge for time occupied in travelling if the work be executed at a considerable or inconvenient distance, or if more than ordinary personal attendance is required." Another clause states that the charge per day depends upon the architect's professional position, "the minimum charge being three guineas per day." Upon these clauses the plaintiff rested his claim. He had been engaged in carrying out alterations to Bransome Hall, and for designs for stabling; he had gone down to Darlington seventeen times, and stayed there a few days on each occasion, for which he charged only £1 11s. 6d. per day for his time. The evidence given by the secretary of the Institute and Mr. Charles Barry both affirmed the custom of architects, which was to the effect that an architect could charge three guineas a day for time occupied in travelling to and fro, but not for time in superintending the work, this duty being part of that covered by the commission. The defendant, on his part, said that the plaintiff worked for him as a builder, and not as an architect, and two architects—witnesses—stated that it was not their practice to charge anything for time in respect of work executed at a distance, except by special agreement. We cannot wonder at the ruling of the Judge when such a difference of opinion was found to exist among members of the same profession. He thought the defendant had paid enough into Court, and gave judgment for defendant, the plaintiff to have costs down to, and the defendant costs subsequent to, the payment into Court. The defendant paid into Court £72 2s. on account of the claim of £160 19s. for railway fares and charges for time.

The decision establishes the ruling that has before prevailed: that the architect can charge for time only under exceptional circumstances, and, further, that

no rules accepted by the members of the profession, although generally followed by them, are binding on employers. It should be generally known that the schedule of any institute or incorporated society is not admissible as evidence except under special agreement by the parties that the schedule should be evidence. The members of the Institute or any body of the profession might agree to be bound by rules of their own making, but they would not be binding on a layman who had not agreed to the stipulations. It is extraordinary with what pertinacity members of a profession cling to rules and adduce them as evidence, when, as a matter of fact, the Courts of law regard all such evidence as only one-sided, and as merely establishing a custom which has no power in law except when it is thought reasonable. The question of charges, whether for time or for services, or that of the custody and ownership of plans, will therefore always be subjected to the independent ruling of a Judge or a jury, whatever evidence of custom may be brought; hence the importance of a special agreement between parties in which the question of charging for time, as for long journeys, is arranged. The profession are at present ruled out of court by circumstances; they have no legal authority to substantiate their customary charges, their own profession include many men who take commissions below the regular percentage, who are willing to work for 4, 3, and even 2 per cent., and who never think of charging for time. So long as these irregularities remain it is perfectly useless to expect a Court of law to follow any other rule than that which it generally adopts. If an architect has to take long journeys which consume his time, he ought certainly to be paid for it; but this decision shows him he must not expect the law to give him more than his client expected to pay, or what is regarded as a reasonable sum by the Court; therefore, his only alternative is in agreeing to a certain charge per day with his client. It is impossible to make one rate for long and short journeys, and for this reason a special charge for superintending works beyond a certain distance ought to be stipulated for.

#### ARCHITECTURAL BRICKWORK.— XXXII.

##### ORNAMENTAL ARCHES.

**G**AUGED and rubbed brick arches are employed now in a great variety of ways, both for construction and ornament. For plain buildings in which strength is the main consideration, the arch is generally built in separate rings of two or more concentric half-brick arches. Each of these is, as we have said, an independent arch, though sometimes, to secure bond, lacing-courses are introduced at intervals. Col. Pasley says this arrangement has been used in the fortifications at Chatham; but it does not strike him that any very great advantage can result from it. The result of the lacing-courses is to prevent the entire weight being carried by any one of the rings—the former, in fact, tend to distribute the pressure and to bind the arch together.

##### SMALL ARCHES.

For arches of small span the necessity of building in separate rings is obviously to prevent the great divergence of the joints that would arise if the bricks were carried from the intrados to the extrados. To quote the above authority: "If we suppose the span of a semi-circular arch to be only 3ft., and that it is built in four concentric portions of 4in. arches, the radius at the intrados of the lowest of those small arches will therefore be 18in., whilst the radius of the extrados of the same small arch will be 22in., and the lengths of the two curves will, of course, be in the

same proportion; and those numbers being to each other as one to one-and-a-quarter nearly, there will be open spaces at the upper part of the curve of one-quarter of a brick in width between the several arch bricks, which will touch each other at bottom. Hence no joint between two bricks will anywhere exceed about  $\frac{1}{4}$ in., this being the one-fourth part of the width of a brick. In the upper portions the joints between the bricks will evidently diminish as each successive course is added." If the same span of arch were built "with bricks laid as headers, which would form a couple of 9in. arches, and if the radiating joints were continued from the intrados outwards, then as the radius at the intrados is 18in. and at the extrados 36in., which numbers are in the proportion of one to two, there will, of course, be open spaces at the upper part of curve equal in width to the bricks themselves." The mortar joints would thus form a source of weakness. In gauged arches the joints could be reduced, though not sufficiently, in a small-spanned arch to make up for this divergence. It will be seen, therefore, that for arches over windows of small radius it is desirable to employ half-brick rings. A brick tapered too much is unsatisfactory in appearance, and this is why for arches of small span it is sometimes desirable to increase the radius to make the arch—in fact, a segment instead of a semi-circle.

##### BOND IN ARCHES.

In large plain arches, where an ornamental effect is desired, and there are no mouldings, the joints are generally made to radiate throughout the whole thickness, but are broken by transverse joints. Thus, for an arch of two bricks in thickness, every other course would show two headers, one at the extrados and one at the intrados, and a whole brick between. The effect is that of English bond in the section of a wall of two bricks. Sometimes two closers are introduced in every other course as being more ornamental, but it is not so strong as the former arrangement. In gauged and rubbed work the transverse joints are often imitated, especially when the arches are flat; but the plan is objectionable, as the real joints show through. Fareham rubbers make the best red gauged arches, as they are of good texture, and take a fine arris.

##### GOTHIC WORK.

In sketch 1 we show a three-light window under an inclosing arch for a gable. The face of the lights is set back half a brick or 9in. The side piers are 9in., and have a header and closer at the reveal, as in the angle of recess. The main inclosing arch joints radiate to one centre, to avoid the wedge-shaped key; the plan is suitable for a relieving arch of this description, though it is not so strong as radiating the joints to the true centres. The same plan is shown in the pointed arches over the windows. The tympanum of arch may be filled with ornamental bricks or squares, though the pattern shown is probably as effective as any other for a gable window. The arches could be executed either in "gauged" or "axed" work. To avoid the straight joint over mullions at the springing of the smaller arches, a stone or terracotta skewback block may be introduced. Many examples of windows of this description are to be seen, but of very different degrees of excellence. The grouped window of this kind offers a good opportunity for the bricksetter.

In sketch 2 we give an example of an archivolt for a church arcade. Some very effective combinations of moulded bricks can be employed for arches of this description, though often the simplest are the best, such as those with two re-entering angles over the impost, the centre member being simply moulded or notched. We will show a few

other examples of executed work. The chief object to be kept in view in designing brick arches of this kind is to make them at the impost level agree as far as possible with the plan of the abacus of capital. Sometimes a springing block of stone or terracotta is placed directly over the capital, cut to the required radiation to start the arches from, and we think this plan is desirable.

#### THE AMALGAMATED SOCIETY OF CARPENTERS AND JOINERS.

THE thirtieth annual report of this society has just been issued from the general offices at Manchester. In his opening address, Mr. F. Chandler, the general secretary, remarks on the substantial progress made by the society during 1889, adding:—

"Our members have begun to experience the beneficial effect of improved trade, whilst the signs of activity prevailing, both in house and ship building, encourages the belief that the great depression which we have had to contend with for several years has for a time happily disappeared; and, conjointly with this, the non-unionists in our trade have displayed a greater desire to avail themselves of the advantages offered by our organisation, enabling us to record that our society is numerically stronger than it has been in any previous year."

During the year 15 new branches have been opened and four were closed, leaving a gain of 11 branches, and a total of 471, situated as follows:—In England, 348; Ireland, 20; Scotland, 21; United States, 33; Canada, 8; New Zealand, 6; Australia, 32; and 3 in South Africa. 3,902 candidates have been admitted into the society, which, after allowing for deaths and exclusions, leaves a net gain of 1,422; this increase being greater than in any previous year since 1884, the total number of members in December, 1889, being 26,472. The income for the year amounted to £75,068 17s. 0½d., which, compared with 1888, shows a decrease of £1,399 17s. 5d., owing to the fact that in 1888 special levies amounting to 13s. 6d. per member were required, against 7s. in 1889. All other sources of income having improved, £15,244 7s. 8d. has been added to the cash balance, this also being the largest amount ever accumulated in one year, leaving a balance, including the offices and other property of the society, of £58,922 14s. 7d., or £2 4s. 6d. per member. In assistance to members temporarily thrown out of employment, there was expended £18,805 12s. 7d., or 14s. 2½d. per member, a reduction of £21,947, or 18s. 5½d. per member less than 1886, from which period the liabilities under this heading have steadily decreased. Sick benefit absorbed £15,822 17s. 2d., or 11s. 11½d. per member, £1,073 less than the previous year; and funerals cost £2,901 6s.,

or 2s. 2½d. per member, the loss of members through death being 48 less than the previous year, and the lowest record since 1884. In replacing tools lost by fire, water, and theft there was expended £1,466 4s. 9½d., or 1s. 1½d. per member, and in accident benefit to members partially or totally disabled, £1,320, or 11½d. per member, was spent, and in superannuation payments £5,026 14s. 9d. This branch of expenditure continues to increase, and is not subject to the fluctuation which other items undergo. In trade privileges was expended £2,999 10s. 10d., in trade management expenses £602 1s. 6d., making a total of £3,601 12s. 4d., or 2s. 8½d. per member; while in grants to other organised bodies, and for the relief of distressed members, and the widows and children of deceased members, they expended £894 10s., or 8d. per member. At the triennial meeting of the general council, held in June, numerous suggestions for alterations in the rules, with the object of minimising the necessity for general levies, were considered; but the proposals agreed to by the general council have been submitted to the votes of the members, with the result that the four proposals, making changes in the benefits of the society and the modes of distribution, were rejected. Among those adopted by the members, the formation of a trade section was one of the most important, as it aimed at perfecting the organisation for trade purposes. As the contributions are small, and the maximum age of candidates for admission fixed at 55 years, the general secretary believes it will draw into the ranks a vast number of competent joiners whom they have hitherto been unable to reach. To insure against the possibility of the expenditure on this section affecting in any way the financial stability of the society, it has been determined that it shall be entirely self-supporting. Members are advised to be more active in municipal affairs, helping, so far as they can, to swell the number of those towns which have elected to their school boards and other corporate bodies working-class representatives pledged to see that every contractor who undertakes to execute public work shall guarantee that he pays to his employés the acknowledged standard wages of the district. In the case of contracts accepted from the Government, much good might be accomplished if the co-operation of local M.P.'s were secured, who should be asked to support the labour members in urging upon Ministers of State the necessity of observing these conditions. Managing committees throughout the country can testify to the great scandal that in innumerable instances, in what is known as Government work, members cannot accept employment because of the low remuneration offered. Mr. Chandler says he cannot advise the establishment of a recognised working-day of eight hours upon those trades who believe it would endanger their particular industry. Time should be allowed to enable them to adjust these adverse circumstances with which they are surrounded. In the colonies of Australia the eight-hour working-day has by general consent been established; and in order to prevent the possibility of reverting to longer hours, Bills to legalise the same have been introduced into the Parliaments of South Australia, Tasmania, and New South Wales; in the latter case it was rejected by the small majority of six, whilst in America the agitation for the eight-hour day bids fair to be attended with success. Mr. Chandler adds: As a general advance of wages has taken place on all hands, members engaged in the house-building trade very naturally consider themselves entitled to some consideration; but this branch of industry is always the last to feel the good effects of improved trade. We may look forward to numerous movements in this direction during the ensuing year, and if the demands are reasonable, and negotiations persisted in and conducted in a friendly manner, the employers cannot resist the just claim of members for increased remuneration.

#### UNDERPINNING BUILDINGS.

THE difficulty often attending the underpinning of buildings by the ordinary means has frequently prevented any remedial measures being applied to structures that have partially settled. Many unsightly cracks and fissures are still visible in buildings which could have been stopped if proper means had been taken at the outset. A special branch of engineering practice has of late years been developed in this direction,

and engineers are now found who undertake to underpin buildings which have bad foundations, and if necessary to raise the walls to their original position. The restoration of not a few of the great central towers of our cathedrals has been entrusted in this way to the ingenuity and skill of the engineer; the failure of the tower and spire of Chichester Cathedral necessitated the adoption of methods for rebuilding and strengthening the structure, and the late Sir Gilbert Scott undertook the work with the aid of a skilled engineer. Mr. H. P. Seddon successfully carried out a restoration of a tower and spire at Grosmont church, the piers and arches of which were seriously crushed and twisted. St. Mary's Church, Stafford, was another edifice where the tower was bound together with iron ties by the aid of screws, the arches were blocked or supported by centres and the piers shored up, and a bed of concrete inserted round the tower, upon which new foundations were made to rest. Under Sir G. G. Scott Mr. Chapple carried out an important work in connection with the tower of St. Alban's Abbey in 1871, to check the gradual subsidence of the tower towards the north-east angle. One of the most interesting operations of the kind has recently been undertaken at Great Yarmouth. As some of our readers may know, indications of the subsidence of the west front and other portions of the new town hall occurred soon after the completion of the building, and steps were taken to underpin the foundations, and insert concrete blocks. This was abandoned because it was thought probable that in removing the water from the trenches cut for the purpose, further subsidence might take place. Wrought iron needling was proposed to widen the foundations, but was also abandoned. A scheme was ultimately adopted by the town council, prepared by Mr. Frederick Eliot Duckham, M.Inst.C.E., and Mr. James E. Teasdel, Assoc.M.Inst.C.E., which has happily been successful. The plans submitted proposed a new foundation for the western or river front of the building, and the raising of the settled portions which had sunk over 12in. at the ends. The cast-iron screw piles, 23ft. long, and 2ft. 6in. diameter to 3ft., were driven at intervals of 9ft. along the inside and outside of the main walls. They were 1½in. thick, and filled with concrete after being cleared of clay and ooze. Upon these, double lines of rolled girders were placed parallel to the walls. Suspended from these by 2in. bolts, wrought iron needles, 16in. by 6in., were passed through under the old concrete foundations at intervals of about 3ft. On to these needles and screw piles the entire weight of the building was transferred. By tightening the bolts suspending the needles from the longitudinal girders resting on the piles, the sunken portions of walls were raised, and a good foundation obtained. Thus the tower weighing 700 tons, 20ft. square, and the whole of the sunken walls are carried on a kind of grid of wrought iron joists, suspended from girders resting on piles. The gradual screwing up of the suspending bolts has restored the level lines, and the verticality of the tower, for which five special cylinders, two in front and three behind, were sunk to the gravel. The east and west walls of tower rest on four lattice girders, one on each side, upon which needles are suspended by similar bolts—four 2in. bolts at each end, the needles piercing these walls. After screwing up, the ground under the old foundation was excavated to a depth of 2ft., and the space filled with cement concrete covering the tops of piles, girders, and bolts. To show the accuracy of the operation and its success, we may mention that the ornamental ceiling of the assembly room was not injured. The total cost is said to be within £8,250. The details of the operation are given in the *Proceedings* of the Institute of Civil Engineers. Sufficient has been said to show that the plan is applicable to any building the foundations and walls of which have partially settled.

#### CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—III.

By BANISTER FLETCHER, JUN., A.R.I.B.A.

THE arches to the façades of the hall are formed of a plate girder cut to the form and connected by two angle-irons 3½in. by 3½in. by 36in., and a plate 11½ by 3. The top and bottom plates are connected by uprights on which rest the zinc crowning member of the façade held

— Base des contreforts des pignons. — No 10

in position by plate corbels and angle-irons. In this arch it may be mentioned that where a purlin is fixed to an upright, the upright is formed of four angle-irons, inclosing the web of the purlin, which has two angle-irons on its outer face. In the vertical glazed surfaces to the building throughout, the vertical and horizontal bars are T-iron, and the lattice-work is flat iron. (See No. 10, from *Le Génie Civil*). Each side of the great trusses is divided into five divisions by the purlins; the four uppermost parts are glazed; the fifth division, near the gutter, is covered with zinc, and it is only in these unglazed parts that wood has been used.

Bois des Machines

No 11

Sketch showing rafters, purlins & boarding to Main Roof

B 77 del

The figure (No. 11) shows one of the three rafters A, which come between the main trusses, and are framed into the purlins, and indeed help to bind them together. On this rafter in the lower bay of the roof, and in the whole of the end bays, where no glass is used and it is all covered with zinc, rest in each bay five small purlins B, on the lower flange of which are bolted the wood plates on which the wooden rafters rest (13in. from centre to centre). These rafters are boarded underneath, as shown in the sketch, with grooved and tongued boarding 1in. thick, and on these are glued and nailed the painted canvases and "staff" decorations, with which this lower part of the roof is appropriately ornamented. The rafters are boarded above, and have rolls fixed over every alternate rafter (or 2ft. 2in.

apart), on which the zinc is laid. This zinc roofing, 52.6 wide, and about 1,300ft. long, not counting the two end bays, and having to be framed at a minimum height from the ground of 80ft., a movable scaffold was designed, consisting of a framework in two parts, the lower part of which was moved along on wheels parallel to

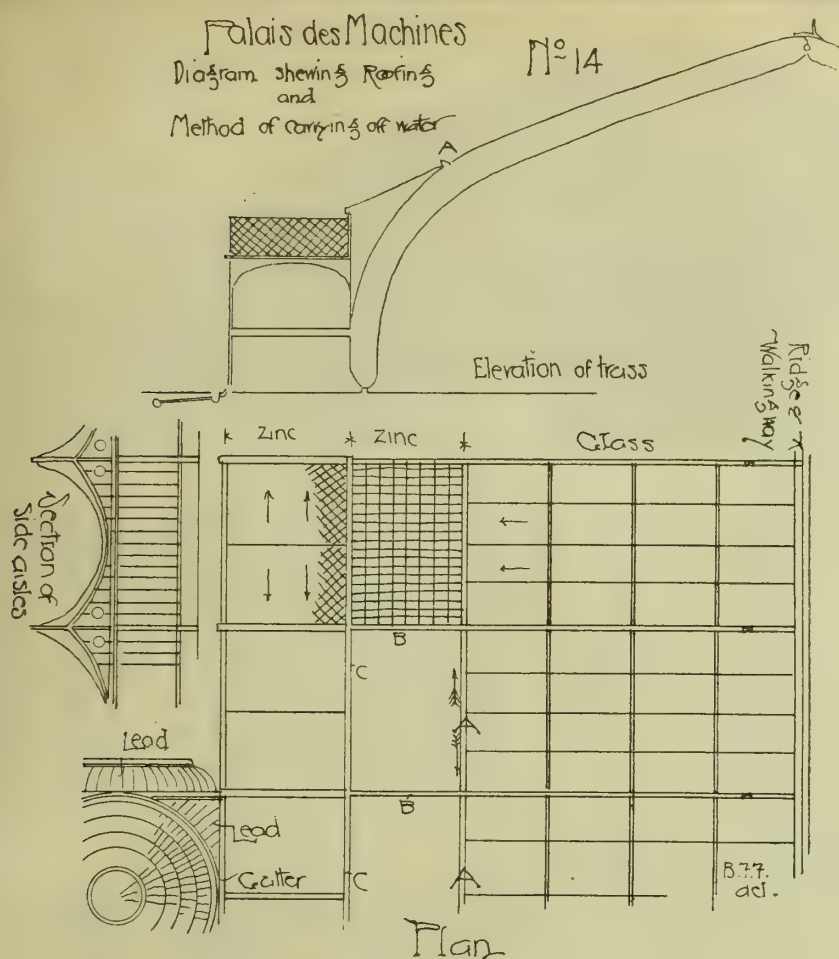

Diagram showing scaffolding to main roof

No 12

the main axis of the hall; on this lower framework, but running transversely to the main axis of the building, was placed the second framework, which enabled it to be moved towards the centre of the building to clear the trusses when the scaffolding was being moved to a fresh bay, when one bay had been finished. Ladders were fixed to both of these for the service. There were two of these scaffolds, one for each side of the nave. The method adopted was the following:—The scaffolding started from the centre and worked towards the gables, the workmen fixing the rafters, the boarding, and the zinc as they went along; when the gable was reached,

the scaffolding returned on the same rails, and the workmen nailed to the underside of the rafters the soffit boarding, on which the painted canvas was then placed before removing to the next bay. When the scaffolding had returned to its starting point, the central bay, it was broken up. I give an outline sketch

the great purlins, and held up in the centre by cords fixed to the iron rafters; upon these was placed a staging upon which the men worked.

*The Roofing to the Aisles.*—The roofing to the aisles is segmental in form (No. 13), and runs into the semicircular arches which flank the nave, separating the great trusses. It consists of

(No. 12) of the scaffolding, which is very ingenious. The width of the scaffolding enabled the workmen to complete one bay at a time. The end bays, which are completely covered with zinc up to the ridge, necessitated the scaffolding to be raised to this height; this was accomplished by long deals passing between the trellis-work of

grooved and tongued boarding nailed to a wooden plate which is fixed to the top flange of the segmental iron rafter by means of square-headed screws. Above this boarding are placed the small curved rafters which are nailed through to the plate, the intermediate rafters resting on a flat iron bar; to these are nailed the outer

boarding and the zinc covering. No. 14 is a sketch diagram showing two bays of the hall and half the central bay, and the method of carrying off the water down the side aisles. I propose to commence with the method of carrying the glass-work throughout, commencing with the covering and then proceeding to vertical planes. The sheets of glass for the covering are about  $\frac{1}{2}$  in., or 5 millimètres, thick, about 1ft. 8in. wide, and 6ft. 6in. long. The test employed on these sheets is interesting, and was as follows: Samples 1ft. 8in. by 1ft. 8in., inclosed between indiarubber sheets, were subjected to the falling of leaden balls from different heights. It was found that all the sheets of glass sustained without breaking

a leaden ball 77 grains Troy falling from a height of 22ft. About half broke with a weight of 108 grains Troy falling from the same height. These sheets are painted inside, as no blinds are used, with a mixture of milk and Meudon white; it is said that this mixture does not become yellow, like ordinary white paint, on exposure to the sun. The painting was performed on scaffoldings fixed between the purlins, and of the length between two purlins, and was moved along by means of pulleys. I give below a drawing (No. 15) made from *L'Architecture*, of the method adopted for fixing these glass sheets, from which it will be seen that they rest on T-irons on a bed of putty, and are held in position by the same material. These T-irons, 1ft. 7in., rest in their turn on U-iron purlins, the lower part of which are bolted to the back of the iron rafters. The T-irons carrying the glass at their upper extremity rest on an angle iron, bolted to the back of the U-iron, as shown; it will be seen, therefore, that each sheet is perfectly independent of the ones immediately above and below it. Above the U-iron and the under side of the glass there is a space formed by the thickness of the bottom flange of the T-iron and the thickness of the putty on which the glass rests; this is used for ventilation to the hall, and also allows the condensation on the inner side to pass off freely.

This is marked by an arrow on the drawing. This ventilation opening, which is at the lower ends of all the sheets of glass, along the whole length of the building represents a total aperture of 1,720sq.ft., and with the window opening below forms a perfect ventilation. The ends of every alternate row of T-irons (see sketch) supporting the glass is, by the aid of a piece of sheet-iron, fitted with an angle iron (marked A) running the whole length of the roof, which forms a rail on which ladders can be placed when repairing the roof. The fixing of all this glass in position gave rise to a very ingenious method of scaffolding. Stirrups (No. 16) were formed, which rested on the upper part of the U-irons. On these stirrups rested the planks, which had a piece of wood fixed on their under side at each side to prevent them slipping; it was on this platform that the workman was placed. There was also an exterior

platform on the rails, fixed on the ends of the T-irons supporting the glass, following the outline of the roof and giving access to its different parts. These platforms had rolls fixed on them to prevent slipping. As additional safety, nets were placed underneath the bays where the men were working to catch them if they fell. The glass was raised to this platform by means of a hand-crane. The superficial amount of glass to this covering is about 373,521sq ft., or 34,700 square metres.

**The Vertical Glazing.**—The glazing to the gable of the Avenue de Luffren is composed of stained glass belonging to an exhibitor, M. Champigneulle, and represents a military subject, "The Battle of Bovines." The stained-glass window representing "Le Char du Soleil," executed by M. Lorin, is fixed in the great central bay facing the "Ecole Militaire." But it is the entrance facing the Avenue de la Bourdonnais on which M. Dutert bestowed most of his care, as he informed me that he intended this to be the main entrance when the exhibition was closed. The main disposition of the façade is seen in the woodcut given (from *Engineering*). It is entirely in stained glass, resting on an iron framework. The principal feature is a great circular-headed doorway, with a stained-glass band round it containing the shields of the principal countries exhibiting, composed of a light yellow ground with circular bands of a deeper yellow. The crescents and shafts are in light blue, and the circular and lozenge-shaped pieces at the end of these are in deep red. The escutcheons, executed by M. Neret, are in stained glass. Having examined the method of fixing the glass work and the distribution, we will now glance at the zinc covering, and at the method of forming gutters, &c. Zinc is the covering which has been used where glass is not used, and considering the size even of the parts of the roof covered with zinc, it is interesting to note that zinc is the material adopted. The gauges in which it is used we shall come to presently. Commencing at the top, we find that the roadway used for examination is covered with 14-gauge zinc, with drips and rolls, and one side is a handrail in galvanised iron. This is reached by 6 galvanised iron ladders on the extrados of the large trusses fixed above the gutter described later on. The zinc covering to the grand nave, which includes the whole of the two end bays and the lower part of all the rest of the roof is of 12-gauge zinc in sheets 2ft. 7in. by 6ft. 6in. Each sheet is held at its upper extremity by two zinc clasps, and upon each of the turn-ups at the side by two clasps passing under the rolls and turned back over the turn-up of the zinc sheet. The lap joints are fixed by zinc clips, allowing free play to the sheets, which have a good lap. There are 18 service hooks to each bay for ladders, &c., in galvanised iron. The covering to the side angles is in zinc squares, No. 10 gauge. They are 24 x 24, with the top and side clips.

#### THE HOME ARTS AND INDUSTRIES ASSOCIATION.

**THIS** useful society, whose yearly exhibitions are always very interesting and furnish practical illustrations of really honest, good work, has this week published its annual report. From this we learn that a steady increase in the work and success of the association has been

made during the past year, and until the time when every village has its workshop and guild of hand-workers, there remains a wide sphere of usefulness open to all who are willing to help this society. One great point to be notified is this: that the council, instead of exercising their powers in producing stirring appeals for money help, have continued steadfast in their faithful endeavours to do the practical work in hand, acting on the principle that it is a truer policy to use every effort to make the actual work a reality. However, more money is evidently needed, seeing that the average expenditure in excess of the annual receipts for the years 1887, 1888, and 1889 has been £170 10s. Experience has proved that the classes which succeed best in the end are those started by voluntary teachers, who are willing to give time and patience to the working out of methods for themselves. "Classes which begin with professional teaching are apt to depend on it completely, and never to stand on a firm and self-reliant basis." The great increase in the number of the classes during the past year has greatly taxed the resources of the available stock of designs and models. "There is a great need of designs and working drawings of domestic furniture, such as village lads could not only carve, but also construct and find a use for in their own homes." During the past year, besides the Kensington Exhibition, which we noted at the time, there have been local ones at Sydenham, Macclesfield, Mansfield, and several other places. This year the annual exhibition is to be held at Birmingham, in response to an invitation given by the Kyrle Society in that town. Mr. Walter Crane lectured on "Design," and Mr. Bliss Sanders gave a paper on "Wood Carving," illustrated by limelight photographic slides, last April. The classes in London do not increase in number with the same rapidity as they do in the country. Town boys are more volatile than their provincial cousins, and, besides, the counter-attractions in London are so numerous. The reports from Ireland are encouraging, and show a decided improvement in the work. In Scotland there is also evidence on a corresponding scale of vigorous life. In the Isle of Harris, for example, about 1,000 women and girls work at home daily in spinning, dyeing, weaving, and knitting. There are four paid teachers here working under the manager's instructions, besides one voluntary instructor. Most of the branches have contributed reports of their work, and these come from all parts, often the most outlandish districts of the United Kingdom; but some 35 classes have not furnished any account of their proceedings. The specimens printed are so numerous and so good as to furnish ample evidence of the solid work which has been undertaken, and which so heartily deserves aid in view of further development.

#### THE ROYAL ACADEMY SCHOOLS.

THE NEW RULES FOR THE ADMISSION OF ARCHITECTURAL STUDENTS.

1. **N**O one is eligible for admission to the schools of the Royal Academy who is more than twenty-three years of age on the date fixed for the delivery at the academy of works for probationership (see Rule 3).
2. All instruction in the academy is gratuitous, the students providing their own materials.

3. Applicants for admission must obtain from the registrar, through the written request of any member of the academy, or other artist or person of known respectability, a printed form, to be filled up and delivered at the Royal Academy, together with a certificate of birth and the required specimens of ability, on or before January 1st or July 1st. Architects must also send a certificate from an architect member of the Royal Academy, of the Royal Institute of British Architects, or any other public institution for teaching art and science, certifying that the applicant has followed up the study of architecture and architectural drawing, and has acquired a fair degree of proficiency in the same.

4. The specimens required are:—

**Architects:** (1) A geometric elevation of some part of an existing building (which may be copied from published drawings or prints), in which some part of the ornament or other features shall be drawn in freehand; (2) geometric elevations of the Doric, Ionic, and Corinthian orders, with their entablatures complete, to  $\frac{1}{2}$  in. scale, the columns to be 2ft. high; (3) an original perspective sketch in pencil of an existing building, or part of a building, on a quarter-sheet of imperial paper; (4) and a drawing of a piece of architectural ornament from a cast, shaded in pencil or chalk, or tinted, and of the size of the original.

All the drawings required must be on paper, and unmounted.

5. The above required specimens of the applicant's ability will be submitted, within two weeks of the date of their being sent in, to the Council, who will select a certain number as probationers to compete for the vacant studentships.

6. Notice of their admission as probationers will be sent to the successful applicants, and they will be summoned to attend on a fixed day at the academy and there execute the following works:—

**Architects:** (1) A geometric drawing from memory only of one of the Orders, to  $\frac{1}{2}$  in. scale, the order and height of the order to be fixed by the Council, and no book or other aid allowed, to be done in one evening of two hours, 6 p.m. to 8 p.m.; (2) a drawing from a cast, the size of the original, to be done in seven evenings of two hours each, 6 p.m. to 8 p.m.; (3) a geometric elevation (with or without a plan) of a building, or some part of a building, in London, to be done from the probationer's own notes and measurements, taken from the building itself, in two evenings of two hours each, 6 p.m. to 8 p.m., the notes and measurements to be submitted to the Council; (4) and two studies in outline, each on a quarter imperial sheet of paper, of two of the principal casts (to be selected by the master of the school) in the architectural school, to be done in two evenings of two hours each, 6 p.m. to 8 p.m.

7. All the above works will be submitted to the Council, and the successful competitors will be admitted students of the Royal Academy for three years. At the end of the three years, subject to the fulfilment of certain conditions and the passing an examination, students will be admitted for a further period of two years.

8. The period of studentship is limited to five years, and cannot be renewed.

9. All the drawings and models submitted by

applicants for admission as probationers must be removed by them personally, or through an agent, within one month from the date of sending in. Any works not removed at the end of the month will be destroyed. The academy cannot undertake to pack and forward any works.

10. Applicants who have been unsuccessful in their first endeavours to gain admission as probationers, can renew their application at any subsequent period, by again going through the prescribed forms; but the works submitted must be different from those sent in on any previous occasion.

#### BROAD MEAD, BRISTOL.

THE small sketch of two old Bristol houses will interest some of your readers. They are fairly representative specimens of a certain

class of old Bristol domestic work, though by no means the most elaborate remaining; yet they have a peculiar character of their own, with the bay windows cutting through the pent roof *quoiqua* across the front.

WALTER F. CAVE.

#### CHIPS.

The annual soirée of the members of the Architectural Association will take place at the Westminster Town Hall, on Friday in next week, the 18th instant, commencing at 8 o'clock. There will be a vocal and instrumental concert, in two parts, and the second part will, we hear, be as usual of a light nature.

A fatal fire occurred on the premises of Mr. T. M. Brightling, builder, of Welling, near Eltham, on Friday. The house and workshops were destroyed, and Mr. Brightling's daughter lost her life.

A fine bronze cross and pair of candlesticks have been placed upon the altar of St. Paul's, Bedford. Upon the shaft of each candlestick stands an angel bearing symbolic words corresponding with others upon the cross, the latter being surrounded with small crystals, and having for a centre between four lapis lazuli, a head of Our Lord carved in ivory. The design is by Messrs. Carpenter and Ingelow, carried out by Mr. Gawthorp, of Long Acre.

An effigy of the late Duke of Albany was unveiled on Sunday, in St. George's Church, Cannes, by the Prince of Wales. The Duke is represented in a recumbent position, and the sculpture of the head is expressive and refined. He is in Highland dress, his right hand folded over his heart, and the other pointing to a passage in the book which the Prince was reading the night before he died. The feet rest on a helmet. The body is resting on a Gothic sarcophagus supported by six red marble columns, with carved capitals of white stone. The sculptor was Signor Pellegrini.

## OUR LITHOGRAPHIC ILLUSTRATIONS.

CONTEMPORARY MANUFACTURERS AND ART-WORKERS.

(SEE description on p. 533.)

CHURCH OF SANTA MARIA DELLA SPINA, PISA.

THIS exquisite gem of a church was erected in 1230, and enlarged in 1323. It grew out of the intense religious fervour of that period, which, as much as its warlike spirit, was the mark of the age. The building was at first a mere oratory on the quay on the left bank of the Arno. This sailors' church was erected by the Senate and the noble families Gualandi and Gattosi for the use of mariners who were wont to implore the aid of Our Lady of the Sea, as the Blessed Virgin was called, before embarking on a voyage. In 1333 a merchant brought from the Holy Land a precious relic, a thorn from the Saviour's crown, and placed it in this shrine, which Giovanni Pisano had some years before begun to beautify. His filial love led him to place a portrait of his father as one of the statues on the east front, which is rich in Gothic canopies and tabernacles of white marble. Some other niches were filled by later Pisan artists. Nino Pisano placed a Madonna on the façade, and the altar is adorned by his best work, a charming Madonna offering a flower to the infant Saviour. He, too, sculptured his father Andrea's likeness in St. Peter, a very characteristic statue on the altar. The church exhibits traces of the influence of German Gothic, which at this time began to penetrate into Italy. Vasari speaks of several Germans known as "Tedeschi" who were seeking employment in that country. Some of these worked at Orvieto, and others were engaged at Siena and Assisi. Giovanni is mentioned as having special sympathy with them. The key of the Church of the Sacred Thorn is kept at the house facing the building. Our illustration is taken from a splendid photograph procured at Florence, and it will be valued by our readers.

R.I.B.A. EXTRA MEDAL DESIGN FOR A TIMBER SPIRE.

THE Grissell Gold Medal of the Royal Institute of British Architects is a prize founded by the late Mr. Thomas Grissell for "the encouragement of the study of construction," and is open to all architects who have not been in practice for a longer period than ten years. The subject—varied each year—was: "A timber octagonal spire, covered with lead or other suitable material, the external dimensions of which are 120ft. high, rising from a stone tower 36ft. square. The spire to have angle turrets of timber at, or near,

the base, and dormers at two stages." The author's views—treating for the first time with an "Institute" competition, and guided solely by the conditions—were: That the competitor was evidently expected to meet whatever difficulty there might be in an octagonal spire springing from a square tower in the timber construction, and not by building up the corners in solid masonry to produce an octagonal base for the spire; that an elaborate exterior would receive little consideration in view of the object of the prize, and that a simple outline would be more appropriate for the covering suggested; that the timber we should be most likely to use in practice should be employed, and that the tower walls, the thickness of which was not given, should be considered from the same point of view, for it was manifest that by making the tower walls very thick the difficulties with the roof could be much reduced. The resolution (time being precious) to limit the work to one sheet of paper has resulted in a "multum in parvo." For the same reason, the result of the calculations of wind pressure was merely given in a report, from which the following is an extract:—Surface exposed to pressure of wind, 2,160sq.ft.; force of wind, 55lb. on the square foot; the centre of pressure is 36ft. above the wall plate; total force exerted by the wind to overthrow the spire = 4,276,800lb. Power of resistance—weight of timber, 121,170lb.; weight of lead, 91,280lb.; weight of iron (approximately), 4,480lb.; total weight, 216,930lb. Resistance to the force of wind in the weight of the roof alone = 3,904,740lb. As this 3,904,740lb. is but 9 tons 4½cwt. short of the weight required to counteract the force exerted by the wind, and as there is upwards of 200 tons of masonry above the cast-iron corbels to which the spire is bolted down, it is unnecessary to carry the calculations further to show that stability is amply secured.—T. FREDK. PENNINGTON.

[We shall at an early day publish the Prize Medal design for this same subject.—Ed.]

LLANDAFF YARD CHURCH.

THIS church is to hold 300. The style is 15th century, and consists of nave, organ-chamber, and vestries, with a small tower and spire at south-west angle. The upper part of the tower is of teak, and the spire of cleft oak shingles. Nave, 59ft. long by 25ft. wide—33ft. to the ridge. The choir is separated from the nave by a large arch in centre and a small arch at each side. There is also an arch between choir and sanctuary. By this plan (a broad nave) all the congregation, with the exception of about half-a-dozen, will be enabled to see the altar. The church is to be built of Newbridge stone, and dressings of Bath stone, and the roof of green Welsh slates. The interior will be wagon-boarded all over in red deal, with ribs of pitch pine forming the panels. The choir will be 15ft. in length, and the sanctuary 15ft. by 12ft. 6in. Llandaff Yard is a pretty little village within one mile of Llandaff; there is no church there at present. The architects are Messrs. Kempson and Fowler, of Llandaff.

FOUR HOUSES IN BOTANIC AVENUE, BELFAST.

THESE houses have recently been completed for Sir James Haslett in a fashionable part of this city. As may be seen by the plan, the ground is of an irregular shape, having very little depth, and also the street has a curve of some 6ft. in the length of the principal front and a fall of 3ft. The first floors have been kept on a level throughout, the difference of height being given to the ceilings of the ground-floor rooms. The walls are built of local red bricks, and the sills and heads of windows are of red stone from the Dumfries quarries. The half-timber work is filled in with cream-coloured cement, the roofs are covered with Bangor slates, except that of angle bay window, which is tiled. The houses are fitted up throughout with electric bells and all the most modern appliances. The sanitary arrangements are of the most improved type. The staircase windows are filled with leaded lights. The works have been carried out by Mr. William Gabbey, of Hope-street, from the designs and under the superintendence of Mr. Vincent Craig, architect, 5, Lombard-street, Belfast.

St. Saviour's Home for Children at Shrewsbury was opened last week by the Bishop of Lichfield. It has been built by Mr. Farmer, from plans by Mr. A. E. Lloyd Oswell, both of Shrewsbury.

## NEW BOATING PREMISES, EAST MOLESEY.

THIS building, now in the course of erection, is intended to be an addition to the extensive premises of Messrs. Tom Tagg and Son, boat and steam launch builders, and is to be finished for the forthcoming season. It is situated above Molesey Lock, close to the new Hurst Park Club racecourse, and opposite Tagg's Island. The ground floor contains a large storage for boats, the centre portion having a clear space of over 30ft., by 80ft. long, so that the longest boat can be easily moved. The floor is of asphalt, with railway metal bedded in to run the boats on. Lavatories and dressing-rooms are provided on this floor, and the grounds laid out for lawn tennis, gardens, and stables. The upper floors are arranged for club premises, ladies' dressing-room, &c., and show-rooms. Electric light will be used throughout, and when completed it will, no doubt, be the best arranged boating-house of its class upon the river Thames. The walls are formed of New Heather Co.'s bricks and rough cast, the roof tiled. The constructional ironwork was supplied by Measures Brothers, the contractor for the whole being Mr. Edward Potterton, of East Molesey, and the architect, Mr. Burnell-Burnell, of New Stone Buildings, Chancery-lane, W.C.

## HOTEL DE VILLE, CALAIS.

THIS well-known example has been seldom illustrated, but its elevation is a florid and typical piece of French Gothic of late date. The view given in Mr. Fred Oliphant's spirited sketch, reproduced to-day, is seen on entering through the town gate near the railway station, and the Hotel de Ville overlooks the Market Place. In front of the façade are busts of St. Pierre, of Francis II. (Duc de Guise), and of Cardinal de Richelieu, who built the citadel on the west of the town; above it rises a belfry containing the chimes. The high tower behind the Hotel de Ville, called La Tour du Guet, dates from 1214; it was used as a lighthouse until 1848, and now does duty as a watch-tower for fires.

## CHIPS.

Alterations have been made to the Town Hall, Cromer, embracing the ventilation, which is now carried out on the Boyle system, the extraction of the vitiated air being effected by the latest improved form of the self-acting air-pump ventilator.

The Marquis of Ripon will unveil the statue of the late Right Hon. W. E. Forster, on Wednesday, the 30th inst. The statue will occupy a prominent position in the centre of the square at Bradford named after the late statesman. It was designed by Mr. Harvard Thomas, of Chelsea, and has been cast in bronze by Messrs. H. Young and Co., Pimlico. The figure is 9ft. 3in. in height. Mr. Forster, who is attired in a frock coat, is represented in a speaking attitude. His head is slightly raised, and his right hand uplifted and outstretched almost to a level with his head.

Whilst making alterations underneath a fish-monger's shop in Grantham, an apartment, 15ft. by 12ft., of the 13th century, and intended for an oratory, has been revealed. There is a slab of stone for the altar, 24in. by 18in., with a recess for the crucifix. The place is approached by steps, which are much worn. The column and arches are of native stone, apparently from Great Ponton quarries, a mile or two from the town.

Mr. W. H. Radford, civil engineer, Nottingham, has been appointed representative and consulting engineer in England for the corporation of Durban, in South Africa. He will act conjointly with the London agents in ordering and testing the materials required for the waterworks extension. The cost of the new works when finally completed will be about £120,000.

New Wesleyan Sunday-schools are in course of erection at Baddock, near Huddersfield, and will accommodate 200 scholars at a cost £1,600. Mr. J. E. Tate, of Milsbridge, is the architect. The memorial-stones were laid last week.

The quaint little mausoleum at Kilbirnie, near Dumbarton, erected in 1603 by Captain Thomas Crawford, of Jordanhill, is being restored at the cost of his descendant, Mrs. Fergusson Pollock. The contractor is Mr. William Finlayson, of Leith, and the work is superintended by Mr. Charles S. Johnston, architect, of Edinburgh, whose object is to reconstruct the sadly shaken stonework, render the roof water-tight, and slightly relieve the almost obliterated lettering of the motto, with the least possible disturbance of their weatherworn aspect.

## WAYSIDE NOTES.

THE R.I.B.A. *Journal of Proceedings* for April 3 is now before us, and all those who have access to this publication may peruse at leisure the report of the remarks made by Fellows and Associates present at Conduit-street on March 31. From its pages it may be gathered how great has been the progress made in the conversion of members of the Institute to Registrative principles. Time was, and not so very far back, when many of those who spoke favourably of the proposal to make close the profession of an architect, would have spoken in very different terms. In effect, as I said last week, and as all acknowledge, the result of the meeting on the 31st ult. was an admission on all sides of the desirability of the proposed reform. For this we should be infinitely thankful, since it is more than half the battle, and active measures will result, as a matter of course, sooner or later—sooner, if the polling of members is in favour of immediate action, and later if the “not yet” policy is to be supported, and procrastination becomes the order of the day.

While urging immediate action, even if only preparatory and prospective, it would yet be idle to pretend that the remarks of those Fellows and Associates who, though advocating delay, are yet with us on principle, are to be blindly ignored, and that we should drive ahead, looking neither to the right nor left. Such a policy may be very well where party spirit prompts; but those desirous of seeing a scheme of Registration at once complete, self-contained, and generally pleasing to all, must endeavour to benefit by hints thrown out and suggestions made, whatever may be the quarter from which they emanate. Now, out of the mass of criticism for criticism's sake, and from the array of bogies conjured up in the minds of gentlemen gifted with a wonderful fertility of imagination, who spoke at the recent meeting of the Institute, I would select two objections to Registration on lines already proposed, which, on the face of things, have some degree of weight. These are (1) the inclusion of the lowest class of “architect”—the architect-and-undertaker class; and (2) the carrying out of architectural work by engineers, and builders, and others. It will serve no honest purpose if one affects to think lightly of these matters, and to deny that they are deserving of reconsideration. At the same time their presence in past attempts at Registration is not to be made a pretext for casting ridicule at the whole question, and scorn upon the promoters of the Architects' Registration Bill. If those who discover these objections are seriously in earnest in their desire to remedy existing evils—the outcome of the present happy-go-lucky condition of the profession—they will set themselves a-thinking as to the best methods of overcoming the difficulties, and will look about for any possible loop-holes of escape through seemingly insurmountable obstacles.

This, I take it, will be the duty of the Institute Council, should the polling be found favourable to the suggestion that it should seek statutory powers. To sit down, like Mr. Micawber, and wait for something to turn up, is, to say the least, not a dignified policy; while, on the other hand, no better work could occupy a committee appointed by the Council than an endeavour to solve problems that have been attacked by others with success, which, if measured, is at least honourable. It is, after all, an easy thing to find fault and criticise; the difficulty is to improve and make perfect. But on the labours of others the Institute, with vastly greater means, could advance by strides and perfect ideas which, if immature, are not to be regarded as reflecting upon the credit of pioneers who have had enough to do to promulgate principles, without refining details.

It ill becomes any one to talk of “insuperable difficulties.” I really think I should be afraid to complain of such in full public view—fearful of bringing upon myself contempt and scorn as lacking manliness and manly courage. And apart from this, it is surely conceivable that the difficulties will be as great in, say, five years' time as now, and we all know the value of present time and the danger of delay. Are there no members of the Royal Institute of British Architects who blush to think of the faint-heartedness exhibited at the “insuperable difficulties”? Are British pluck and perseverance

denied to the architect? If so, then let us faint by the wayside; but if any spark of manliness is left, let us at least make a show of attacking these “insuperable difficulties,” and redeem days that are evil because of our own past neglect.

In the matter of the Institute examination, having regard to the moderate tone of your correspondent Mr. Edmund J. Bennett's letter, and the fact that it is difficult, if not impossible, and certainly unpleasant, to prove what after all can be only a personal impression, gained by reflections on events and facts that come under one's notice, I am by no means inclined to nail my colours to the mast on the precise wording of the sentence in “*Wayside Notes*,” to which your correspondent objects. Like Mr. Gladstone, I will, while holding my present view, leave my mind open to conviction either way. It would be very displeasing to me to say anything calculated to leave an impression on the general reader that I would write in a derogatory manner of the qualifications and ability of those who have passed the exam.; for in what I consider I have above well called the “happy-go-lucky” state of the architectural profession, “A.R.I.B.A. by examination” means more to me than anything. At the same time, be it remembered, the opinion I gave as to the Institute's desire to hastily increase its members is frequently expressed by many others who write on examination matters. It so happens that putting down last week's *Building News*, containing Mr. Bennett's letter, I picked up *A.A. Notes* for April, and chanced upon the leading article by Mr. Fred. M. Simpson, on “The A.A. and Architectural Education.” Among other things, that may well be read by those interested in this matter, the writer says, “If the Institute desires only to increase its members, and, consequently, examines only to see if men are ‘fit and proper’ persons to be admitted into its ranks, it can, of course, do as it pleases, and fix its own standard. But if, as I imagine, it aims at representing the profession, and really has the welfare of architecture at heart, and honestly desires so to frame its examinations as to pass only those who are likely to do credit to and advance our art; then I think its standard is altogether too low, and that it has been guilty of stamping with its official stamp, as thoroughly competent, candidates who may, of course, be competent, but whom it has never tested except in elementary knowledge.”

Here, an independent writer gives precisely the same opinion as myself. I quote Mr. Simpson's words as fitting to the present occasion, while at the same time I shall be heartily glad if any one can prove that he, and I, and others are labouring under a delusion.

In travelling for the purposes of the study of architecture, it is a great thing to know when and how to lay out funds. There is such a thing as false economy, and we arrive home with money in our pockets that would have been better expended in seeing this or that and giving here and there, or, at the worst, purchasing plenty of photographs. Nevertheless, one cannot but admire the tact of the economical, who go about accomplishing much and incurring little expense. I think that all will admit that Mr. Bartlett, the A.A. travelling student, managed wonderfully well, and discharged the duties he owed to the founders of the Studentship in reducing expenses to six francs or seven francs per day. Expenditure in these matters is, after all, a matter of genius. Some, it seems, cannot manage cheaply; others do as much work, and more, doubtless, on a third less money. For an architectural student, it is a great gift, I take it, to be able to economise without necessarily incurring discomfort, and thus have money to spare for incidental expenses, fees for sight-seeing, and what-not. Unless one be desperately in earnest, it may be a mistake so to cut down daily expenditure when making holiday tours; but matters take a different aspect in regard to travelling studentships, where the traveller should consider the tour a serious business affair. In so doing he will certainly best serve his own interests, and most creditably discharge obligations which, if unwritten, are, nevertheless, morally placed upon those accepting studentships of this nature.

Returning from the country, after the Easter holidays, I took up the *Times* of Tuesday, and

was interested, if not amused, by a letter on Tintern Abbey, from Mr. R. C. Poulter. The subject of the writer's communication, however, is rather beyond a joke. Mr. Poulter says he was at Tintern Abbey a few days before Easter, and found some labourers “tidying up,” in anticipation of holiday visitors. Thinking that they were only mowing the grass, sweeping the paths, &c., he took no heed of their operations, till, startled by a shout of “Look out, below!” followed by a series of dull thuds, he found that the labourers, mark, were removing loose stones and architectural fragments that might be a source of danger with the aid of long punting poles! The *Times* correspondent well says that he should have thought that every fragment of so beautiful a building ought to be carefully reset in its place. So it ought! The incident strikes me as most disgraceful sacrilege, and the sooner means of preserving the old abbey from further treatment of a like nature are adopted the better for all, as repeating the punting-pole operation every successive holiday time will soon make visible havoc at Tintern.

GOTH.

## CHIPS.

The Earl of Camperdown unveiled, in the Mowbray Park, Sunderland, a statue in memory of Jack Crawford, seaman, who nailed Admiral Duncan's colours to the mast of the *Venerable* after they had been shot away at the battle of Camperdown, October, 1797. Crawford was a native of Sunderland, and died in 1831. The statue is the work of Mr. Percy Wood, sculptor, London, and the height of the group is 20ft. 7in. Jack is supposed to have ascended the mast of the *Venerable* as far as the cap, which rests on the summit of the pedestal. The colours are thrown over his left shoulder, and in his right hand he holds a pistol, with the butt end of which he drives in the nails.

The parish church of Winsford, near Dulverton, is about to be restored. The committee have signed a contract with Mr. J. Steer, a local builder, for the carrying out of the work from the plans of Mr. J. D. Sedding, of London, diocesan architect, for £670. The work includes reseating the church with oak seats, a new roof over the north aisle, reglazing all the windows, and new tracery for those which at present have stone mullions, relaying the pavement in the central portions with Hopton stone on concrete, a new heating apparatus, resetting the present Jacobean oak pulpit, and repairs to the tower and fabric.

It is proposed to effect improvements in Glasgow Cathedral at a cost of between £800 and £900.

Judgment was given at the Hants Quarter Session on Tuesday in the case of the Southampton Corporation, v. the Assessment Committee of the Hursley Union. The corporation have recently erected new waterworks at Otterbourne, and these have been assessed on the basis of the value of the land, machinery, and buildings. Against this the corporation appealed, and the case was argued for two days. The corporation claimed that the waterworks were erected, not for profit, but to supply the people of Southampton with pure water, and that they should not be assessed like a company trading for profit. The Court decided that the rate was a good one, and found for the respondents, with costs, but granted a stay of execution in view of an appeal.

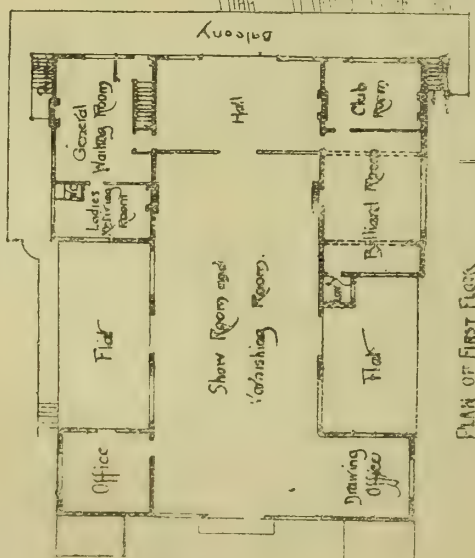

Several improvements have just been completed, at St. Matthew's Church, Stonehouse, Devonport, including the decoration of the interior of the church, carried out by Messrs. Fouracre and Watson, of Plymouth, and the addition of a lectern of carved wainscot oak, 6ft. 8in. in height, and having the desk carried by the figure of an angel. Mr. Trevenner, of Stonehouse, was the carver.

The Manchester Corporation Art Gallery will open on Monday next with a collection of water-colour drawings of the English Lake District, by Harry Goodwin, illustrating the poetry of Wordsworth.

A new council chamber has been erected for the London County Council on the site of the old Metropolitan Board of Works' offices in Spring-gardens. It was constructed under the superintendence and from designs by Mr. Thomas Blashill, architect to the Council, Messrs. John Allen and Sons being the builders, at a cost of about £8,000, exclusive of furnishing.

Mr. Ford Madox Brown has completed the tenth of his twelve historical paintings for the Town Hall at Manchester. The material represents John Kay, the inventor of the flying shuttle, rescued from the mob by his wife and workmen. These concealed him in a sheet of wool, and carried him out of his house by a back way while the rioters were forcing an entrance in the front of the building. The scene is represented as taking place in Kay's workshop.

HOTEL DE VILLE. CALAIS.

CONTEMPORARY MANUFACTURERS  
AND ART-WORKERS.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THE following portraits are eminently representative, and commence a short series of leading manufacturers and art-workers associated with some of the most important building operations of the age.

Mr. William Brindley, whose portrait we give first on our sheet, is proprietor of the establishment of Farmer and Brindley, London. The various important architectural works carried out by this firm, under different architects (especially the late Sir Gilbert Scott), embrace the restoration of nearly all the cathedrals in England and Wales, as concerns sculpture and carvings of the fabrics, reredoses, pulpits, stalls, and marble pavements; the carvings of the National Prince Consort Memorial, Hyde-park; also sculpture, &c., of St. John's College Chapel, Cambridge; transept portals of Westminster Abbey; St. Nicholas, Hamburg; Wellington College Chapel, and various extension works to many of the Colleges of both Oxford and Cambridge. The sculpture and carvings to the Government House and Colonial Offices, the Town-halls of Preston, Manchester, and Bradford; also Glasgow University, Albert Institute, Dundee; and the hotel and station, St. Pancras. Some of their most important works in marble are the reredos, St. Paul's Cathedral; Eaton Hall, for the Duke of Westminster; Mount Stuart, for the Marquis of Bute; and at mansions for Lords Wemyss, Windsor, and Eldon; the National Gallery extension; National Liberal Club; Oxford Examination Schools; Greek Church, Bayswater; Stock Exchange; Northumberland Avenue and Hat-chett's Hotels; also the new pedestals for the Elgin marbles, British Museum. Amongst the numerous monuments may be mentioned those of the Bishops Tait, Wilberforce, Wordsworth, Lonsdale, and Woodford, the late Dean of York, and Lord and Lady Halifax. Mr. Brindley is an authority on coloured marbles, and has himself rediscovered several important ancient Roman ones in Greece, Egypt, and Tunis, and is the concessionaire of the old Egyptian Porphyry ones. His papers on marbles, read before the R.I.B.A. and British Association, are well known. He is joint author, with Mr. W. S. Weatherley, of "Ancient Sepulchral Monuments," which is a textbook on the subject, consisting of 212 plates quarto; also "Marble Pavements from Old Examples." He has formed a unique museum of polished stones and marbles applicable to colour decoration, open free for study to artists. He is a F.G.S. and F.R.M.S.; is on the Court and one of the judges of the Turners' Company, and Treasurer of the Royal South London Ophthalmic Hospital. Mr. Brindley is assisted in his large art establishment by a very able staff, with whom he has always worked most harmoniously. His photograph was produced by Messrs. Debenham and Gould, of Bournemouth.

Mr. Robert Dennett is the head of the firm of Messrs. Dennett and Ingle, whose places of business are 5, Whitehall, London, and Station-street, Nottingham. Mr. Dennett is the only surviving brother of Messrs. Dennett, an old-established building firm in Nottingham. He still resides there, while the London business is managed by Mr. Fredk. Ingle, the only other member of the existing firm. Mr. Dennett, who is at present on a voyage to the Cape for the benefit of his health, is an Alderman of his native borough, and has recently filled the office of Sheriff of Nottingham. The London branch of the business consists of the fireproof flooring, and all kinds of special concrete work, and the designing, supplying, and erecting of constructive ironwork. This branch was established in 1866, and the first important work carried out by the firm was the fireproof floor construction of St. Thomas's Hospital, followed up during subsequent years by the Government buildings at Westminster, Her Majesty's Theatre, the National Gallery Additions, the New Royal Courts of Justice, and numerous other buildings of the first class in all parts of London and the provinces. The firm throughout its career has enjoyed the highest reputation for good and sound work, and faithful discharge of its obligations. Amongst the more important works upon which the firm are at present engaged may be named the floors, &c., of the large new Middlesex Fourth Asylum at Claybury, the New Royal Courts of Justice at Birmingham (floors, roofs, and constructive iron-

work), and the New Winter Garden in connection with the People's Palace, &c. The portrait given is from the studio of Messrs. Blanc and Son, of Paris.

Sir Henry Doulton, the head of the firm of Messrs. Doulton and Co., is the second son of the late Mr. John Doulton, who in 1815 established, in conjunction with Mr. J. Watts, a small pottery in Vauxhall. From here they removed in 1834 to High-street, Lambeth, which is still the head-quarters of the gigantic firm which then numbered some twelve persons, but now employs in Lambeth alone over 1,500, and altogether, in town, country, and abroad, over 3,200. At an early age Mr. Henry Doulton entered the factory in order to acquire a thorough knowledge of the technical processes, and was not content until he had succeeded in fashioning upon the wheel the largest vessel which had hitherto been made. This devotion to the practical side of the work has borne excellent fruit, and enables Sir Henry Doulton to always exercise the minutest supervision over the details of the constantly widening field of ceramic productions. In 1846 he commenced the manufacture of stoneware pipes and apparatus for sanitary purposes. This has developed into an enormous industry, monopolising several factories in different parts of the country, with depots in important foreign centres. About 1855 a terracotta department was added, from which have proceeded many important works of sculpture and architectural ornament. Conspicuous among the artists engaged is Mr. George Tinworth, who, since his first tentative efforts in 1866, has worked entirely for Doultons'. For the 1867 (Paris) and 1871 (South Kensington) Exhibitions a few vases and jugs of good form, but no decoration to speak of, were brought forward as an attempt to bring art into the common domestic stoneware of the day. These met with immediate encouragement and patronage, and "Doulton ware" forthwith ranked as an interesting and valuable art manufacture. Within a year or two, ladies and young girls were employed, and it was thus found possible to organise an entirely new field for female labour. Faience-painting, pâte-sur-pâte, impasto, silicon, chiné, carrara, and many other styles of decoration were subsequently introduced, until now it may be said that the range and variety of Messrs. Doulton's productions are quite unequalled by those of any other pottery in the world. The honours awarded to the firm have been numerous and noteworthy; a Grand Prix, at Paris, in 1878, and a similar distinction in 1889, being, perhaps, the foremost. The total list comprises 91 gold medals and first-class awards, with no less than 101 medals of minor importance. Valued most highly by the head of the firm (if only on account of its gracious presentation at the Lambeth Works by H.R.H. the Prince of Wales) is the "Albert Medal" of the Society of Arts, awarded in 1885 to Mr. Henry Doulton "in recognition of the impulse given by him to the production of artistic pottery in this country." Two years later Sir Henry Doulton received the honour of knighthood. He is a member of the Council of the Society of Arts, one of the Lieutenancy of the City of London, an Almoner of St. Thomas's Hospital, and a member of the Cordwainers' and Turners' Companies. He was also appointed in 1878 a Chevalier of the Legion of Honour. His photograph is by Mr. Downey, of Ebury-street, S.W.

Mr. Metford Warner, representing Messrs. Jeffrey and Co., of Islington, whose art wall-papers are so famous, forms the next subject among our portraits to-day. The firm of Messrs. Jeffrey and Co. has been located at 64, Essex-road, Islington, for twenty-six years. It had previously been established for many years at Kent-and-Essex yard, Whitechapel. When removed to Islington, the business was amalgamated with that of Messrs. Holmes and Aubert, paper-stainers, who had long sustained a reputation for making the highest class of wall-papers. It was at this time that Mr. Metford Warner joined them, and in a few years after, owing to the death of his partners, the entire control of the business came under his care, and has remained so up to the present time. He has always made it a chief object to have English art of the present day introduced into his manufactures, and we therefore find that almost all eminent artists, who have been willing to design for wallpapers are on his roll of designers, including the late William Burges, A.R.A., E. W. Godwin, Bruce Talbot, and Owen Jones; Miss Kate Faulkner,

Messrs. C. L. Eastlake, J. D. Sedding, W. J. Muckley, Walter Crane, and Lewis F. Day. With such assistance it is not surprising that English papers should more than hold their own against those of French manufacture, which were at one time so much more in vogue. An ample proof of this was given at the Paris Exhibition, where Messrs. Jeffrey and Co. made such a grand display of all classes of their productions.

The firm of Messrs. Geo. Jackson and Sons was founded by the great-grandfather of the present partners, who, originally a builder in Bedford, left that town and became clerk of works to one of the Brothers Adam, the celebrated architects, who were at that time building houses in Portland-place. Some Italians employed there ornamenting the ceilings and woodwork used a composition hitherto unknown in this country, the secret of which they jealously guarded. By close observation and experimenting Mr. Jackson was enabled to discover this, and began the manufacture of chimney-pieces, which for some years had a large sale. The demand for these falling off, his son began to copy picture-frames in the same composition. The father of the present generation very much enlarged the manufacture, adapting it to interior decorations, and, amongst other works, put up the decorations in Westminster Abbey for the Coronation of Queen Victoria, decorated the great gallery at Apsley House and Stafford House. This firm also introduced into England from France the manufacture of Carton Pierre, the material so much used in Paris for internal work. The present partners purchased of the late Mr. Owen Jones the patent for fibrous plaster, and have developed it to so large an extent that it has caused almost a revolution in the mode of carrying out plain and ornamental plaster work. The firm were one of the original guarantors for the 1851 Exhibition, and one of the firm was a juror there, and also in that of 1862. In these exhibitions they were awarded first-class medals. They also obtained a silver medal in Paris in 1855 and a gold medal in 1878, while last year the only gold medal given for plaster decorations to any nation was awarded to them. These last honours are particularly gratifying as a success in a special department of art in which the French are supposed to be *facile princeps*. Mr. Jackson's portrait is the work of Mr. J. Thomson, of Grosvenor-street.

Mr. J. C. Edwards is the proprietor of extensive brick, tile, and terracotta works at Ruabon, N. Wales. He was the first to open up the valuable clays of the district and turn them to account. He may be looked upon as one of the pioneers of the terracotta trade, and it is due to his energy and enterprise that a flourishing trade has sprung up in a hitherto distressed neighbourhood. When 20 years ago he acquired the now well-known bed of red clay at Pen-y-bont the works consisted of one small shed only, in which half-a-dozen men were employed making bricks for local purposes. They now cover many acres, and a large manufactory has sprung up there, employing from 400 to 600 men, according to the state of trade, and sending goods to all parts of the United Kingdom, and, indeed, all over the world. In addition to these works, Mr. Edwards has made sanitary goods for some 40 years at the Trefynant Works, and some few years ago started a new manufactory at Rhos for glazed and enamelled bricks, and others for tessellated, encaustic, and artistic tiles. He finds employment altogether for about 1,000 hands. Some of our best-known terracotta buildings are products of his works, such as the Constitutional Club, Northumberland-avenue; the Royal Infirmary, Liverpool; the new Royal Law Courts, Birmingham; new pavilion at Lord's Cricket Ground; new wing at Cliefden and other works for the Duke of Westminster; Hove Town Hall, Brighton; Clerkenwell Free Library; houses in Pont-street, Chelsea; Peabody Buildings, Pimlico; Kensington Baths, Notting Hill. Mr. Edwards is a County Magistrate, and a member of the County Council of Denbighshire. The photograph is by Mr. Mayall, of Brighton.

The Fleetwood Industrial Co-operative Society have just erected a clock in their new building, which strikes the hours and quarters, and shows the time upon one illuminated dial. It has been erected by Messrs. J. B. Joyce and Co., of Whitchurch.

## BOOKS RECEIVED.

*School Hygiene*, by W. JENKINSON ABEL, B.A., &c., Clerk to the Nottingham School Board (London: Longmans, Green, and Co.), is a useful manual for teachers and school authorities, and will be found to contain practical notes on the hygiene of schools. Thus the remarks on ventilation and temperature are concise, and embody the results of authorities. Tobin's tubes or wall ventilators are recommended; these should be kept open and not closed as we often find them. The remarks on disinfection and the best disinfectants are of service, not only in schools but in houses. An excellent antiseptic family ointment is vaseline mixed with about 2 per cent. or 3 per cent. of pure carbolic acid. Suggestions for the preservation of eyesight; the symptoms attending infectious diseases, such as smallpox, scarlet fever, measles, diphtheria, whooping cough, ringworm, &c.; hints and directions to facilitate first aid in accidents are to be found. The book may be usefully placed in the hands of parents, teachers, and, in short, anybody who has the care of children.—*Electrical Influence Machines*, by JOHN GRAY, B.Sc., Assoc. of the Royal School of Mines, &c. (London: Whitaker and Co., White Hart-street, Paternoster-square; George Bell and Sons, Covent Garden.)—This is an elementary little book giving, in a condensed form, all that a general student would require to know about static electricity and influence machines. In the earlier chapters the phenomena and principles of static electricity are given, illustrated by diagrams. The hypothesis of the electric field is clearly explained, after which the principles of the electrometer in its various forms are discussed. Of influence machines, a brief sketch of their history prepares the reader for a description of various types of machine, including Varley's, Toepler's Holtz machine, and the powerful machines invented by Wimshurst, which give off sparks of 14 in. in length. Sir William Thomson's inventions are also described, and details are given of other leading forms of apparatus. The work is full of well-executed wood engravings, and the instructions for making machines of this description add to the value of the book to the amateur.

## DRILL-HALL, SOUTHAMPTON.

THIS building, the foundation stone of which was laid last August, was opened on March 21 by the Secretary for War. The cost has been nearly £4,000. It has a frontage of 85ft. 6in. by a depth of 200ft., and, with the exception of 24ft. in the rear, will be entirely built over. The building may be divided into two portions—the administrative block and the drill-hall. The latter is 150ft. long by 82ft. 4in. wide, and will, when erected, be the largest hall in the town. The floor will be perfectly free and unobstructed by any columns. The walls will be of brick, and the roof-trusses, standards, and lattice girders originally formed part of the Liverpool Exhibition buildings. The interior will be faced with fair red brickwork relieved with bands and devices of black bricks. The administrative block occupies the entire frontage, and is subdivided in elevation into three parts, the central being a three-story building finished as a tower, and standing slightly in advance of the two-story wing on either side. The main entrance, which is in the centre of the building, leads into the vestibule or hall, giving access, 12ft. 6in. wide, by four easy steps to the various rooms, &c. These consist of sergeants' room, 20ft. by 17ft.; armoury, 20ft. by 17ft.; men's room, 20ft. by 14ft.; and quartermaster's room, 20ft. by 14ft. On the ground floor each of these rooms has direct communication with the drill-hall. A staircase on the right of the entrance leads to the first floor, containing commanding officer's room, 15ft. by 13ft.; officers' mess-room, 28ft. by 20ft.; officers' class-room, 20ft. by 17ft.; and band-practice room, 20ft. by 17ft., the latter having a separate staircase for independent access from the hall. A projecting balcony at the level of this floor gives separate communication to the several rooms, and also to the officers' lavatory. On the upper floor, and partly in the roof, living-rooms, two bedrooms, and offices have been provided for the caretaker; also mess kitchen and store. The front, which is of red brick, with Doulting-stone dressings, is designed in the Tudor style. The name of the corps and the Royal arms will surmount the entrance, and at the south-west corner of the tower there will be a small octagonal stair-

case turret to give access to flat and support the flag-pole. The contract for the work was taken by Mr. Jonas Nichols. Mr. W. H. Mitchell, of 9, Portland-street, Southampton, is the architect.

## BRICKS AND BRICKMAKING MACHINERY.

By M. POWIS BALE, M.Inst.M.E.; A.M.Inst.C.E. Author of "Woodworking Machinery," "A Handbook for Steam Users," &c.

BRICK-MOULDING MACHINES FOR THE SEMI-PLASTIC PROCESS.—(Continued.)

VERY considerable progress appears to have been effected of late in making bricks from weak, inferior clay, containing in many cases a large percentage of lime, which is, under ordinary treatment, extremely detrimental to the production of sound bricks. Mr. Johnson, of Leeds, has published the results of some of his experiments in this connection, part of which we reproduce. "The character of the clay is invariably of a soft and plastic nature, and in some cases contains from 20 to 30 per cent. of lime. This clay cannot be worked successfully by the ordinary plastic process; but, if it be crushed very fine, mixed with water, thoroughly tempered, and the bricks subjected to great heat, the lime becomes silicated, and forms a flux, making a hard, strong brick of a vitrified character. It was found, however, that this process was too costly to be a commercial success. In carrying out his improved process, Mr. Johnson dries the clay before reducing it to powder. For this purpose a revolving cylinder 20ft. long by 5ft. in diameter is used. This is filled with an intense heat of from 1,000° to 2,000° by means of a Thwaite Twin Gas Producer. The clay is brought up from the clay-hole in the ordinary way by hoisting, tipped into a hopper, in which rotates a winged valve, forming a series of pockets, which, as they come into position, are filled with clay, and each in turn discharges its load into the revolving cylinder, and the clay thus begins its traverse through the whole length of the cylinder, taking about 30 minutes to accomplish the journey. During this time the clay is being subjected to the intense heat therein, and the

FIG. 16.

moisture is expelled from it. The thoroughly dry clay is then delivered from the lower end of the cylinder by a shoot into a perforated edge-runner grinding mill, from which it is elevated into a revolving sieve. The fine powder drops through the sieve into a hopper, and the coarse is returned again to the grinding mill to be re-crushed. The powdered clay then runs in a constant stream into a double-shafted and differential mixer, where the necessary water is added, then into a brickmaking machine, and afterwards the brick is finally finished in a power lever press. The bricks are taken direct to the kiln without any intermediate drying. The traverse of the clay towards the mould is continuous, and as soon as the latter is sufficiently charged, and while another mould is coming into position, the stream of surplus clay is discharged back into the hopper of the machine, thus avoiding overstraining.

We conclude our notices of semi-dry brick-making machines by illustrating one from the designs of Mr. Wm. Johnson, Castleton Foundry, Leeds. This machine possesses several fresh features in its arrangement, and it is claimed for it that the ground clay can be fed to it in a damper state than in other machines for the same process. Its method of working is as follows:—The ground clay or material to be formed into bricks is fed into a hopper at the base of which, working in a slide on the face of the table, is a bottomless box or charger which receives the clay from the hopper, and sliding over the face of the moulds formed in the table fills them. To insure a certain and dense feed a pressing head drops with its own weight upon the material while the charger is still over the moulds; the pressing head is then raised to allow the charger to return again under the hopper to be re-filled, and in its passage it strikes off the loose material level with the face of the moulds. The pressing head drops a second time upon the material in the moulds, and during the time it remains there two additional distinct and powerful pressures are given. The presser then leaves the moulds, and the bricks are raised for delivery, which is performed by the charger returning again to fill the empty moulds, and to deliver the finished bricks at the same time. Each brick receives four distinct pressures, whereby the air contained

in it is thoroughly expelled. As will be seen from the sketch, the machine is powerfully geared, and of massive construction generally, to overcome, as far as may be, the great working strain put upon it. It is claimed by the maker that it is particularly adapted for working difficult and refractory materials, such as marl, shale, slate, *débris*, fireclay, nickel oxide, purple ore, &c.

#### NEW SANITARY SPECIALITIES.

**B**OROUGH engineers, surveyors, and architects, will do well to consult Messrs. Adams and Co.'s new catalogue of sanitary improvements. The catalogue recently published by this firm, whose London offices are 10, Little Queen-street, Westminster, in addition to their York, Manchester, and Glasgow branches, comprise various arrangements of Mr. Adams' patent automatic flush latrine. Each closet is distinct, an advantage over the open-trough form for public buildings, factories, &c. The lavatories are especially worthy of attention. We particularly call the notice of architects to Adams's lavatory range (McMath's and Adams's patent) where there is no tap, no waste-plug to get lost, and always filled with clean water for immediate use. This lavatory can be fixed singly or in rows. The action is simply a continuous supply of water from bottom of basin striking the front, which is directed upwards, flowing over an outlet weir at the back of basin; thus the dirty water is continually escaping, giving place to clean. A tap below regulates the supply. The basins are of various shapes, with fronts either semicircular or flat, made of brown glazed ware or cream colour and white ware. The decorated basins are quite ornamental adjuncts to the wall. They can be built into wall, having a cast-iron standard, or can be built on glazed brick piers. Adams's Special Disconnecting Chamber is an improved make of this very necessary provision for house-drainage. The stock size made is 2ft. 8in. by 1ft. 8in., with 6in. centre invert, and 4in. branches; but any other size can be made. There is an outlet siphon trap, glazed inside, the chamber and invert being of glazed ware, and fitted with an airtight cover with hinge or sand joint. The price complete, with outlet-trap, is £5 10s. for

the brown glazed ware. The parts are readily jointed and fixed. All well-drained houses and buildings should have a disconnecting chamber of this description; it would then be impossible for sewer-gas to pass through the house-drains, and the junction of the branches could be always under inspection. Many good types of closets are shown with Adams's flushing cisterns. The Adams hopper pattern is a very useful kind for servants and general use, and has the Adams patent flushing arm.

A new patent urinal, suitable for railway stations, &c., is one of this firm's specialities. Each urinal has a curved back of glazed ware—brown, cream, or white—connected by galvanized cast-iron piers, with glazed ware, marble, slate, or iron tops and screens. Flushing pipes scour the backs from an automatic tank. The dishes at the bottom of each stall are of glazed ware, and the patent floor tile, made of opaque glass and ribbed with channels, is a marked improvement upon the dirty and offensive-looking floors sometimes seen. These tiles always afford a clean, dry standing-place, and can be used for any other kind of stall.

Among other improvements particularly calling for the attention of engineers and borough surveyors is Adams's patent "Revolving Disc Penstock," where the action is simple and direct. The faces of the penstock are turned ground water-tight, and the revolving door, or valve, is raised or lowered by a chain passing round its grooved edge. The lift is easy, and the door can be held up at any height by grip attached to penstock frame. We think this plan of shutting off sewage in towns subjected to tidal waters in the sewers a decided improvement. The penstock, if reversed, can be used for drawing off top waters from tanks or reservoirs. The "automatic flushing door" is also an improved arrangement, having a ball and lever, by which it opens and closes automatically—a very important contrivance for sewers which have to be flushed at intervals. The flushing door is made oval, circular, or square, and from 12in. upwards. Many other sanitary specialities are to be found in Adams and Co.'s new list, including their well-known Automatic Sewer Flushing Siphon in cast-iron. Adams's was the first siphon made to start with the drop-by-drop supply, and is the original

"Deep-trap" siphon; there are now upwards of one thousand in use, and the whole of these are in as perfect working order as when supplied, each one sold being guaranteed in actual work. The manhole covers the tide flaps; the back-pressure valves are improved forms. We recommend Adams and Co.'s catalogue to all sanitary engineers and officials.

#### ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

**SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.**—The monthly meeting of this society was held at the Montgomery Hall on Tuesday evening. Mr. Thomas M. Rickman, architect and surveyor, of London, read an exhaustive paper on "The Present State of Questions relating to Quantities." The object of the paper, he remarked, was to enable the society to discuss the position which the quantities now take in estimates and contracts. Precise definition was desirable to avoid misunderstandings as to materials, designs, and mode of measurement. The variety of terms in use throughout the country, and their derivations, the changes in design and style of architecture, and in the present purposes of buildings, had all complicated the subject. The custom for architects to prepare quantities for their own works implied that the preparation of quantities was part of an architect's education. The position of the Royal Institute of British Architects as regards this practice had somewhat changed of late. The lecturer described the different duties required of an architect, and enlarged on the value of a surveyor's services as regarding the more important class of work. The appointment of the measuring surveyor, once usually made by the builder, was now commonly made by the architect for his client. The appointment of a surveyor who, from his position could insist on justice for both parties, which in some instances the architect was unable to obtain, was of great importance. The growing practice of making the quantities part of the contract was considered, and the arguments on both sides of the question. The present position of the builders' institutions and of those of architects and surveyors with reference to the appointment of quantity takers were explained, and the extent of responsibility resting with the supplier of quantities considered. The report of the committee appointed by the Conference of Architects held in London in 1871 was given in detail. The position of architects supplying quantities for their own works was gone into by the lecturer, who pointed out the special difficulties which they must encounter in the settlement of accounts, which had led the committee before mentioned to recommend that quantities so supplied should form part of the contract. The complications arising from a course occasionally taken of throwing on the builder the onus of testing the quantities so furnished, and the consequences to the employer from the insertion of such a clause, were obvious. In conclusion, Mr. Rickman recommended a uniform system of measurement, and the diffusion amongst employers and their solicitors of a larger amount of knowledge as to the bearings of all these questions upon their own interests.

We are informed by a relative that Mr. E. C. Ayton-Lee was article to Mr. R. W. Edis, and did not work in the office of Mr. W. Burges, as we stated last week.

The twelfth annual dinner in connection with the Builders' Clerks' Benevolent Institution took place on Monday week at the Holborn Restaurant, under the chairmanship of Mr. H. H. Bartlett, president. During the evening subscriptions and donations were announced to the amount of nearly £300, including the president's gift of twenty guineas.

The Town Council of Birkenhead have elected Mr. J. D. Lewis, from the offices of Messrs. John Whalley and Sons, surveyors, Chester and Birkenhead, to the post of assistant road surveyor at a salary of £150 per annum. The applications were very numerous, and the following gentlemen were selected to appear before the Road and Improvement Committee: Mr. C. Watkins, surveyor's office, Widnes; Mr. J. T. Briscoe, engineer's office, L. and N.W. and G.W. Joint Railways, Birkenhead; Mr. J. G. Anderson, road surveyor, Wallasey; Mr. F. H. Taylor, borough surveyor's office, Southport; Mr. J. D. Lewis, Birkenhead; and G. H. Newton, surveyor's office, Ashton-under-Lyne.

#### Building Intelligence.

**JOHANNESBURG.**—The Werdmuller Buildings, having a frontage of 150ft., are about to be erected facing the Market Square, adjoining the Bank of Natal. The edifice will be three stories high, and the expenditure will be about £15,500. On the ground floor are six shops and a corner bar. The upper floors consist of offices, and on the first floor are a large billiard room, two show-rooms, and ten offices. On the second floor will be seventeen offices, averaging in size about 14 by 14. The staircases to the offices will be of iron. A large cupola will be constructed on the roof for ventilation, and to light the staircase and landings. The building will be of brick, with moulded brick cornices, strings, &c., and terracotta finishings. The entrances to the shops and the entrance corridor to the offices will be tiled with tessellated tiles from the Campbell Tile Company, Stoke-on-Trent. The tender of Messrs. Lawrie and Sibthorp has been accepted. Mr. Harry Taylor is the architect.

**PERTH.**—St. Ninian's Episcopal Cathedral, which has for many months past been undergoing extension in accordance with the original designs, was reopened for worship on Friday. Founded in 1849, only the choir, transepts, and one bay of the nave were then built, and thus it has remained until some time ago the work of extending the edifice was taken in hand by the present provost. Subscriptions amounting to about £7,000 were secured, and plans having been obtained from Mr. William Butterfield, the original architect, work went on apace until the choir, transepts, five bays of nave, and baptistery with minor transepts had been finished off in due cathedral form. The building is now 200ft. long and 70ft. high, but the external aspect suffers from the want of relief and ornamentation, the more so as the excessive plainness of the structure is emphasised by the character of the stone used, and aggravated by the further fact that, owing to want of money, the tower has had to be left in a stunted condition. The east window is filled with stained glass, in memory of the late preceptor of the cathedral; the west window and the south transept window are also to be similarly treated.

**PETERBOROUGH.**—A meeting of the executive of the Cathedral Restoration Committee was held in the Knights' Chamber on March 25th. Mr. John Thompson's offer to remove the stonework of the old organ screen and to have the stone for the cost of removing was accepted. Mr. J. L. Pearson, R.A., architect to the committee, was instructed to prepare a plan for making use of the woodwork of the choir in providing vestries at the west end of the cathedral; for flooring the canons' vestries; and for placing the nave pulpit. The sub-committee was directed to confer with Mr. Pearson and arrange for a better exit at the south-west door. Mr. Pearson was asked to provide a plan for placing the Communion-table in its ancient position in the chancel of the apse.

#### CHIPS.

The workhouse infirmary at Rotherhithe, belonging to the St. Olave's board of guardians, is to be enlarged by 270 beds. Messrs. Newman and Newman, of Tooley-street, S.E., are the architects, and the tender of Mr. J. O. Richardson, of Peckham, has been accepted at £30,857 for the execution of the work.

Jacob Coat, a stonemason, was committed for trial at the Highgate Police-court, London, on Tuesday, on the charge of causing grievous bodily harm to Charles Strong, builder, of Hornsey, his employer, by knocking him down and kicking one of his eyes out during a dispute about money matters.

At St. Michael's church, Bristol, on Easter Sunday, a new altar-table was placed in position. It is of oak, richly carved, and was designed by Mr. Vincent W. Voisey, and carved by Mr. George Houghton, both of Bristol.

An Industrial and Art Exhibition was opened at Bournemouth on Monday, and will remain on view for a fortnight. The judges in the arts and crafts were Mr. Harry Furniss, the artist of *Punch*; Mr. Harry Hems, of Exeter; and Mr. J. Gerrard, of Lyndhurst.

The Corporation of Oldham are making a collection of the works of the late Thomas Oldham Barlow, R.A., the engraver (who was a native of the town), for their Art Gallery.

#### Engineering Notes.

**THE CLIFF RAILWAY AT LYNTON.**—The steep-gradient railway from the Esplanade at Lyntonmouth to the town of Lynton, nearly 450ft. above, was inaugurated on Monday. The incline, formed partly by blasting and partly building up in masonry, is claimed to be the steepest yet worked, having a uniform angle of 29°30'; the length is 900ft., and the width 13ft., a broader passing place being provided halfway up the railway. The line has two cars fixed equi-distant from each other to an endless wire rope, which passes round large grooved wheels laid at the bottom and top of the track, and the top car is loaded with water from a neighbouring stream. The work has been carried out by the patentee, Mr. B. Jones, Mr. G. Croydon Marks being the consulting engineer.

**PORTKNOCKIE.**—The Portknockie harbour works, on the Banffshire coast, are on the eve of completion, and have cost between £9,000 and £10,000. They are built on a deep, natural basin, and at the lowest state of the tide there will be about 10ft. of water in the harbour, while at high water there is a depth of 22ft., a depth which no neighbouring harbour approaches. The area of water is 3½ acres. The engineers were Messrs. D. and J. Stevenson, Edinburgh, and the contractors, Messrs. Morrison and Son, of the same city. The natural bow-shaped creek which served as a shelter to the local fleet of boats was formerly inclosed on three sides by a high rocky ledge, but a substantial roadway has been cleft through the high rocks as an access, a north breakwater, 400ft. in length 25ft. broad, built out, and a turn of 90ft. to the south put on at its extremity. On the seaward side of the breakwater a parapet, 10ft. high, has been constructed. The whole is built of solid concrete, and on the outside a large number of 25 ton blocks of solid concrete have been laid, and these will most effectually break up the rollers and minimise their force. £1,000 is being spent in running out a south jetty, in a northerly direction, for a distance of some 230ft., with 25ft. of quay way. The engineers of the undertaking have been represented by Mr. John Ross, and the contractors by Mr. Kinnear.

#### COMPETITIONS.

**SOUTH SHIELDS.**—For the proposed new police buildings the town council have received 35 sets of competitive plans, which have been arranged for exhibition in the examination-room at the Mercantile Marine Offices. Mr. G. Gordon Hoskins, F.R.I.B.A., of Darlington, President of the Northern Architectural Association, has been appointed the assessor.

**WEST BROMWICH.**—The first premium in the competition for County Court and Police Offices has been awarded to Messrs. Wood and Kendrick, who have been appointed architects for the buildings. The premises will be erected in Lombard-street. On the ground floor will be the pay and plaint offices; the registrar's office will be placed in the front of the buildings, and the high and under bailiffs' offices will be situated together. The front part of the first floor will be occupied by the county court and judge's room, and the latter will be used for magisterial business. The registrar's court will abut on the county court, with a communicating doorway which will afford ready access for the public to either court. Accommodation will be provided for solicitors and witnesses, and the cells are planned on the ground floor. The estimated cost is about £4,500.

The first section of the restoration of the parish church of West Teignmouth having been completed, the edifice was reopened yesterday (Thursday), when the Bishop of Exeter preached. The work now done included the reseating and heating of the building; and Mr. W. Elsworth, of Teignmouth, was the contractor.

Receiving orders in bankruptcy have been issued in the cases of John Joseph Woodman, of Chorlton-cum-Hardy, late of Manchester, architect; of George James Baker, Robertson-street, Battersea, Maryland-road, and Ashmore-road, Paddington, and Chesterton-road, North Kensington, and some time of Northcote-road, Walthamstow, and at Enfield, builder; and of William Bulcock, Tuebrook, near Liverpool, builder.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 35fr. 30c.). To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

## NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII., XLVI., XLIX., L., LI., LIII., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—C. S. and P.—J. E. and Son.—F. W. G.—B. of N.

GEO. C. MASON, JUN., Phila.—(Not open to foreigners. You can buy the Transactions. The secretary may reply to you if you address him at 9, Conduit-street, W.)

## "BUILDING NEWS" DESIGNING CLUB.

"PIPPIT."—(Your drawing comes a week after date, and since our award was made. It would not have been placed either first, second, or third. Rules, in fairness to others, must be observed.)

## Correspondence.

## REGISTRATION OF ARCHITECTS.

To the Editor of the BUILDING NEWS.

SIR,—The objection to Registration on the ground that it would give to incompetent men a standing which they do not now possess, might perhaps be removed in this way:

Suppose a board of examiners provided. Let it be enacted that the architectural members and associates of the Royal Academy, the members of the Institute, and possibly of some other societies, should at once be entitled to Registration; let those also be entitled to it who should pass the Institute examination; and those, too, who, having been in independent practice for three years or more, should be able to satisfy the examiners of their competence by a reference to their executed buildings. At this point let the right of being registered terminate; but let it also be enacted that no one should be liable to prosecution under the provisions of the Act provided he had been in *bond fide* practice as an architect for three years before the passing of it. In this way a definite line might, perhaps, be drawn at the outset between the fairly competent and the grossly incompetent, and yet the latter would escape the hardship of being shut out from a profession on which their living might depend.—I am, &c., C.

## THE R.I.B.A. AND REGISTRATION.

SIR,—As a provincial member of the R.I.B.A., I have carefully read the account of the special

meeting held last week at the Institute to consider the desirability of the compulsory registration of architects, and also the Institute's objections, which are issued to all members in the *Journal of Proceedings*. It is evident that London architects do not feel the pressing need of such a measure so acutely as provincial architects, owing, no doubt, to the fact that unqualified and illiterate men have not the same opportunities to practise architecture in London as they have in the provinces; hence, the name of architect in London is not so defiled, or of so mixed a character, as elsewhere.

The Institute's two main objections are—1st, the inclusion of present unqualified men in the first starting of the Registration. This is a very superficial objection, as, although it would be a necessary evil, yet it is only an evil which already exists, and would in a very short time improve.

The second and main objection is that the proposed Act of Registration would not prevent surveyors, builders, agents, and others from practising architecture as before. That is so; but it would tend to lessen that existing evil by inspiring the confidence of the public in a class of men who had given proof of their training, and who would be better qualified to serve their purposes than formerly.

But, however, I think that, with the strenuous aid of the Institute and the profession at large, a measure might be carried in which it should be necessary that all buildings were to be erected under qualified supervision other than that provided by the Building Acts, and especially if such a measure were put before the public as a means to prevent unsanitary and jerry-built houses.

Auctioneers have an immense exclusive privilege in their annual license of £10, so preventing the public from selling their own goods—but for which hundreds of farmers and others would preside at their own auctions. I mean this not as a parallel of position or character of work, but as regards the contraction of public liberty.

Unless the Institute are moved from outside and from provincial members, it will probably take them twenty years to mature activeness in this measure. The Institute has been in the past, and is now to a large extent, merely a Metropolitan society, and who, of course, do not suffer so much from the present loose system. Indeed, many of the town members have long ago obtained a comfortable position, whereby they are blinded to the general condition of affairs.—I am, &c.,

Exeter, April 8. P. S. A., A.R.I.B.A.

## Intercommunication.

## QUESTIONS.

[10265.]—**Sound-proof Fire-proof Floor.**—Will some of your readers kindly inform me of some efficient means to prevent sound through a concrete and iron fire-proof floor. I propose to cover with deal floor on deal joists, and batten down under for lath-and-plaster ceiling. Would it be effectual to fill in under wood floor with sawdust, or lime and hair pugging, and should space under floor be filled in also? It is known that fire-proof floor of description given is very noisy when much traffic is carried on upon same.—H. R.

[10266.]—**Workhouses.**—Where may recently-built workhouses be seen, accommodating 200 to 300 paupers?—CAW.

[10267.]—**Movable Partitions.**—In dividing a village reading-room into two parts, what kind of movable partition would be most effectual in preventing penetration of sound, and the neatest in appearance when open?—EMBRYONIC.

## REPLIES.

[10249.]—**Beam.**—"G. H. G." is quite in error in stating that "by removing the two columns" from a continuous beam "the bending moment will be three times greater than before." In point of fact it would be nine times greater when the columns were removed. The bending moment for distributed load on any one of the three openings is approximately  $\frac{wl^2}{8}$ . When the columns are removed, the span and amount of load are each trebled, and the moment becomes  $\frac{3w \times 3l^2}{8} = \frac{9wl^2}{8}$ —i.e., nine times greater than before.—G. H. WARD.

A Bill has been introduced by Sir Edward Birkbeck to confer further powers on rural sanitary authorities with respect to labourers' cottages. The objects of the Bill are to secure sufficient bedroom accommodation and proper drainage and ventilation in all new cottages for the labouring classes, and to enable rural sanitary authorities to take care that such cottages have adequate gardens.

## LEGAL INTELLIGENCE.

A BUILDING BY-LAWS APPEAL CASE.—At Birmingham Assizes, before Mr. Baron Huddleston, on Saturday week, was heard the case of "Shaw v. the Solihull Rural Sanitary Authority." It was an action of trespass brought against the sanitary authority for the demolition of buildings erected by the plaintiff, and the question involved was whether the defendants had exercised duly the powers given to them by the Public Health Act and their own by-laws. By one of these last it was provided that the board surveyor might call upon the builder of any new structure to make good defective work. The aggrieved party might within 14 days appeal to the authority, who should then invite him by a seven days' notice to appear before them and show good grounds against the order. The authority, if they dismissed the appeal, were to communicate the result in writing to the appellant, and then, if he did not comply with the surveyor's requirements, the authority might carry out the work themselves. The plaintiff was engaged in building some cottages, and in the opinion of the surveyor to the rural authority used mortar of an improper kind. He was served with notice to pull them down. In answer he said he was prepared to defend his buildings before the authority, and accordingly attended two days later. His version of the proceedings was that he produced some specimens of the mortar used by him, but that the members present declined to look at them, saying that they were not practical men, and must be guided by the opinion of their surveyor. An adjournment in order to produce evidence was refused, and he subsequently received a notice in writing that his appeal was dismissed. According to the evidence on the other side, his specimens of mortar were passed round and examined; plaintiff was allowed to say what he liked; the surveyor was also heard; and, after deliberation, the authority supported the decision of the surveyor. The plaintiff not having complied with what was required of him, the buildings were pulled down by the direction of the authority. This was the trespass complained of. For the plaintiff two points were made. It was said, in the first place, that he had no notice in writing seven days before the meeting in accordance with the by-laws, and in the second that there had been no genuine hearing of the appeal or independent exercise of the judgment of the authority. As to the first point, Mr. Baron Huddleston held that it was competent to the plaintiff to waive the notice, and that he had done so. As to the second, if the plaintiff's story was true there had been no hearing of the appeal in the proper sense of the term. On this point, however, he believed the evidence of the defendants, and thought that there had been an honest exercise of the discretion intrusted to them. Whether they were right or wrong was immaterial, provided they had heard and determined the appeal. He therefore decided in favour of the defendants.

## CHIPS.

The Edinburgh Town Council, at their meeting on Monday, discussed on the minutes the question of petitioning against the granting of a supplementary charter to the Royal Scottish Academy, and on a division reversed their decision of three weeks ago by 18 votes to 17. The petition against the charter will therefore be adhered to.

On Easter Sunday four two-light windows in the north and south transepts of St. John's Church, Blackpool, were unveiled. They have been filled with stained glass by Messrs. Giddings and Dacre, of Manchester.

On Saturday the Duke of Westminster unveiled a new west window in the ancient Church of St. John the Baptist, Chester. The new window, which has cost over £1,000, contains 12 illustrations of the history of the church and of the city of Chester.

The carpenters at Chicago, to the number of 5,000, have struck for an eight hours' working day and payment at the rate of 40 cents per hour. Stimulated by the example of the Chicago carpenters, 4,500 men employed in that trade in 37 towns of Massachusetts made on Monday a united demand for reduced hours, and have announced their intention to strike on the 1st May should the employers not accede thereto.

The foundation-stone of a new Roman Catholic school-chapel for Seaforth and Litherland was laid last week by Bishop O'Reilly, of Liverpool. The new building will be of two stories, holding 250 persons each, and the cost, exclusive of furnishing, will be nearly £2,200. The upper portion will be used as a chapel, and the lower portion as a day-school. The building is from designs by Messrs. Sinnott and Powell, and the contractor is Mr. George Mulholland, Great Crosby.

The local board of West Broxton, Cheshire, has elected Mr. John Pigott as their surveyor, from among 24 candidates.

## WATER SUPPLY AND SANITARY MATTERS.

**MANCHESTER MAIN DRAINAGE SCHEME.**—The Rivers Committee of the Manchester Corporation have now made a start with their sewage scheme, and have let the first four contracts. Nos. 1 and 2 have been let to Messrs. Davies Brothers and Knight, of Wrexham. Their contract commences at Davyhulme, near to the site of the outfall works, which is about 700 yards west of Croft's Bank-road. The sewer at this point is 10ft. internal diameter, and is continued of the same size to the westerly side of the Bridgewater Canal, near to the Water Meetings at Stretford, where it joins the storm overflow chamber. At this point a storm overflow sewer will be constructed through Trafford Park for the purpose of discharging the flood water below the Mode Wheel locks. Messrs. Davies's contract embraces about 4,200 yards of 10ft. sewer, and about 1,500 yards of 9ft. sewer, about half of which will be in tunnel. This sewer will cross under two canals by means of cast-iron tubes. Contracts Nos. 3 and 4 have been let to Mr. James Nuttall, contractor, Manchester, and this section of the work commences where the last contract terminates, and passes under the Cheshire Lines Railway, Stretford, and also passing under the Midland and the Manchester South Junction and Altrincham Railways, along Stretford-road, to the city boundary at Erskine-street, the entire length being about 3,000 yards. The size of the sewer, 14ft. by 10ft. 6in., nearly the whole of which will be in tunnel, averages from 25ft. to 43ft. in depth. On the four contracts nearly 400 men are employed, and the work will be pushed forward as rapidly as possible. The four contracts let amount to over £120,000. The Rivers Committee have also received tenders for the extension of the Stretford-road sewer, a section of the work intended to intercept the sewage at present passing into the river Medlock. The quantities for the next contract are also being prepared. This section of the work will commence at Erskine-street, passing along Deansgate and Collyhurst-road, and terminating at the city boundary at Harpurhey. The works are being carried out by Mr. Allison, the city surveyor, and Mr. W. T. Olive is the resident engineer.

**THE WATER SUPPLY OF SOUTH-WEST DURHAM.**—At the last monthly meeting of the Teesdale Sanitary Board Mr. Robinson, C.E., of Darlington, was appointed engineer to survey for the new works, in the room of Mr. W. Waistell, deceased. It is understood that the reservoirs and the whole line of pipes in connection with the proposed water supply will be confined to the property of the Duke of Cleveland, and arrangements are forthwith to be made for carrying out the undertaking, a parochial committee having been appointed.

**THE THIRLMERE WATER SUPPLY FOR MANCHESTER.**—A union has been effected between the north and south workings of the tunnel which has had to be made through Moor How, a hill about two miles east of Windermere village, in connection with the Thirlmere waterworks. The length of the tunnel is 3,040 yards, with a length of "cut and cover" of between 600 and 700 yards more. The tunnel at the north end pierces the Troutbeck hillside near Thickholme, and terminates southwards at a point near Broadgate Farm, in Ings parish. Most of the length has had to be cut through solid rock, and will therefore need no facing, being as nearly watertight as possible; in parts, however, a lining of concrete will be necessary. The work has been proceeding between three and four years, and the weekly progress has varied from 12 to 18 yards.

## STATUES, MEMORIALS, &c.

**MEMORIAL TO THE LATE ARCHBISHOP ULLATHORNE AT BIRMINGHAM.**—At St. Chad's Cathedral last week the Archbishop's memorial was unveiled. The effigy is in the form of a recumbent figure vested in alb, stole, cope, pectoral cross, and mitre, resting on a moulded slab, supported by three massive stone brackets. The inscription is carved on the three sides of the slab. The sculpture was designed by Mr. John Powell, and executed by Mr. Boulton, of Cheltenham.

It was stated at the last meeting of the Staffordshire County Council yesterday, that the salary of the chief surveyor has been fixed at £800 a year, and five assistant surveyors will each receive £175. The expenditure necessary on the main roads of the county is estimated at £50,000.

The work of enlarging and improving Holy Trinity Church schoolrooms in Wetmore-road, Burton-on-Trent, has now been completed. The chief addition has been the erection of an infants' classroom, 25ft. by 16ft., with a gallery for 50 children. New outbuildings and lavatories have also been erected. The cost has been about £500, and the work has been carried out by Mr. G. Hodges, under the supervision of the architect, Mr. R. E. Carpenter.

## Our Office Table.

By a curious coincidence the councils and committee of the three Metropolitan architectural bodies this year recommend the re-election of their respective presidents, Mr. Alfred Waterhouse, R.A., being nominated again to occupy the chair at the R.I.B.A., Mr. Robert Walker, of Cork, at the Society of Architects, and Mr. Leonard Stokes at the Architectural Association. In each case the honours are well deserved, and the members are to be heartily congratulated on the prospect of further service from these gentlemen.

IN our brief and rapid review of the pictures at the Royal Institute of Painters in Water-Colours in Piccadilly, we omitted to mention the grand landscape by H. G. Hine, the vice-president, "Fittleworth Common, Sussex," in the Central Gallery. The undulating pastures under a hazy sunset sky are rendered with all the masterly power of this veteran artist, and as a landscape it may be regarded as one of the few masterpieces in the gallery. Another of the pictures for which we had no space to refer was Arthur Severn's "Breaking Waves," one of the most successful of his drawings. "La Salute, Venice," in the same gallery, is one other of his works deserving notice.

The value of line in engraving was the subject of an interesting lecture by Mr. W. J. Linton at the Society of Arts the other day. Mr. Linton, who is a master in the art of engraving, pointed to the contrast between the old and new styles of the art. In the old engraving the line was chosen to express the form, light, and shadow; in the new style the line shows an indifference to values and form. Referring to the engravings in *Harper's* and the *Century*, Mr. Linton said that there was little art in them, though they were pleasing and well-designed pictures. The cleverness in them is mechanical; there is no art in them—no taste or judgment in the use of lines. Colours may be kept, but form is lost. The distinctions of linear treatment are neglected: sky may be wall, and water, folds of drapery, and the lines are laid with disregard to the objects represented. Thus, horizontal lines of the sky are crossed; foreground and distance are cut with the same unvarying fineness. In good art the line ought to convey the meaning, form, texture, and atmosphere.

ACTING on the urgent representations of Captain Shaw as to the necessity of providing better for the protection of the Metropolis against fire, the London County Council have sanctioned some important changes in connection with the Metropolitan Fire Brigade. The number of districts into which the Metropolis is divided for fire-brigade purposes has been increased from four to five, the D division, which included the entire area south of the Thames, having been subdivided, with a new district head-quarters to be provided at New Cross. It has also been decided to create a new class of officers in the Brigade, to be stationed at superintendents' stations, and to be termed foremen. The additions which have been made to the strength of the brigade comprise, besides these new officers, three stations, 50 fire-escapes, 25 hose carts, 200 fire-alarm points, and 117 men. The additions have created one superintendent (Mr. Philcox, previously of Kennington district head-quarters), six foremen, nine engineers, 30 first-class firemen, and 50 second-class firemen. Captain Shaw remains in charge of the Brigade, and is assisted by Mr. Sexton Simonds as second officer. The places selected for the new stations are Temple Bar, New Cross, and East Dulwich. In the case of the two latter the sites are already selected, and building will be immediately commenced. In the case of Temple Bar there is a difficulty in finding a site. The addition of 200 fire-alarm points will raise the number from 364 to 564. Of the 50 fire-escapes, 17 are being placed at stations which were not previously supplied with one; and of the remaining 33, one has been allotted to head-quarters, and the others have been distributed in the various districts.

FROM the replies received by the Horse Accident Prevention Society from nearly 2,000 London omnibus drivers and cabmen, it appears that among these men 750 declare wood the best for driving over, 219 macadam, 197 granite cubes, and 51 asphalt. As to the "worst paving," 122 drivers say it is wood, and 1,046

pronounce asphalt to be the worst and most dangerous paving material used. The society are now sending circulars to the various local authorities in the Metropolis, saying that whenever asphalt needs renewal it should be replaced by some less dangerous paving material. It is curious to note the division of opinion as to wood, but with this exception the weight of testimony agrees with our own experience, and bears out indeed the views we have repeatedly advocated in our leading columns.

A CASE which it would have been interesting to see tested in the law courts, has just been settled in Hartford, Conn., by a compromise. It involved the question whether the promoters of a competition, having rejected all the designs sent in as unsuitable, can be made to pay compensation to the author of a plan from which the architect eventually employed has cribbed suggestions. In the case in question, Mr. George Keller, architect, of Hartford, recently sued the New York, New Haven, and Hartford Railroad Company for £500 as compensation for plans furnished in competition for the new station in Hartford. The competition for the station resulted in the rejection of all the designs as unsuitable; but Messrs. Shepley, Rutan, and Coolidge were subsequently commissioned to carry out the work. According to Mr. Keller, the plan as executed is substantially the same as his competitive design, and he thought he ought to be paid for it. It would have been curious to see what a jury would have said on the case, which would have rested mainly on the internal evidence furnished by the plans themselves, and also to have a judge's opinion on the point; but the case was compromised by the payment to Mr. Keller of 500 dollars, the railroad officials claiming that they were in the right, but that it was cheaper to pay that amount than to contest the action.

PRELIMINARY excavations on the site of the old Priory Church are being made at Kenilworth, under the supervision of Mr. W. C. Fretton, of Coventry, and already the results have amply justified the expectations of the promoters of the scheme. A start was made at the foot of the block of masonry standing in the newly-acquired portion of the graveyard, and in a few hours the western entrance door of the Priory Church was laid bare, revealing a splendid tiled floor. Test borings in the immediate vicinity show similar results. The floor at all the openings is in good preservation, the tiles are unbroken, and the patterns are easily traced, the colours being as bright and the glazing as perfect as though only buried yesterday. Following the line round the entrance the cloisters were soon found, showing a flight of steps leading from the church. Already about forty yards of walling have been bared. The stones removed in the progress of the work are as sharp in the arrises as when they left the hands of the workman. The columns which supported the arches of the cloisters are richly moulded, and one of the stones found evidently formed the base for a statue.

THE death is announced, in his 65th year, of Mr. Ebenezer L. Roberts, a well-known New York architect. Mr. Roberts was born in Connecticut, and was apprenticed to a carpenter; but, when twenty-five years old, he went to New York, and soon established himself as an architect, gaining an excellent reputation. He designed the Standard Oil Company's Building on Broadway, the Ninth National Bank, the Baptist Church of the Epiphany, on Madison Avenue, St. Paul's Methodist Church, on Fourth Avenue, the Phoenix Insurance Company's Building in Brooklyn, and many other important structures in the sister cities.

AN architect of Munich, Herr H. Rosenbusch, has written a pamphlet, in which he proposes the construction of streets in two stories, so that the two kinds of traffic may be kept distinct. The idea is at least ingeniously introduced, as in the form of propositions the author asks the questions: "Why should the roadway of a street lie at a higher level than the basement of the houses? Is it not more reasonable, seeing that the basement is generally used for the storage of goods, to make the access thereto as nearly as possible on a level with the roadway, so as to avoid steps and lifts in order to load and unload goods?" Hence the writer deduces the following as results of a more rational arrangement. The footwalks are proposed to be on a higher level, the carriage-way, cellars, stores on a level one story lower.

By a threefold longitudinal division of street the lighter carriage traffic may be divided from heavy goods traffic, while wheel traffic generally is separated from foot traffic. The two foot-walks are connected by bridges, and communicate with the roadways by staircases. Such an arrangement of streets is affirmed to admit of the most manifold development of architectural construction. The idea, though not original, is deserving of attention in the planning of new streets.

MANY readers desirous of preserving our own loose numbers till the time of binding, or a selection of the thousand and one circulars and catalogues that are rained remorselessly down on architects and builders, cannot do better than get one of the "Marlborough Pamphlet Cases," made by Messrs. Marlborough and Co., of 52, Old Bailey. They supply a size specially made for THE BUILDING NEWS for 2s. 9d. There are no springs or other contrivances to injure the pamphlets or loose numbers by pressure. A blank list for "contents" is attached to the inner case, together with a list showing the numerous sizes in which the cases are prepared under this patent. Upon the bookshelf these cases are in appearance similar to ordinary volumes, being rounded and cloth backed.

#### MEETINGS FOR THE ENSUING WEEK.

**MONDAY.**—Surveyors' Institution. Adjourned discussion on "Betterments," 8 p.m.  
Liverpool Architectural Society. "Ormskirk Parish Church," by W. E. Hill. 7 p.m.  
**TUESDAY.**—Society of Architects. 7.30 p.m.  
Society of Arts. "Modern Indian Art," by Caspar Purdon Clarke, C.I.E. 8 p.m.  
Institution of Civil Engineers. "Application of Electricity to Welding and Stamping," by Sir F. Bramwell. 8 p.m.  
**WEDNESDAY.**—Society of Arts. "Old and New Fashions in Typography," by Talbot B. Reed. 8 p.m.  
Civil and Mechanical Engineers' Society. "Recent Improvements in Dredging Machinery," by Ambrose A. Myall. 7 p.m.  
**FRIDAY.**—Architectural Association. Members' Soirée, Westminster Town Hall. 8 p.m.

#### CHIPS.

The Rev. Prebendary Scarth, the rector of Wrington, Somerset, the well-known ecclesiologist and antiquary, died on Easter Eve in his 76th year.

The corporation of Ashton-under-Lyne have received from the trustees of the late George Heginbottom a gift of £10,000, for building technical schools and a free library in the town.

A brass tablet, inclosed in a border of grey marble, has been placed in the north aisle of the choir in York Minster, to the memory of the late Canon Trevor.

Mr. Chamberlain will preside at the annual dinner of the Artists' Benevolent Institution, to be held at the Hôtel Métropole on May 10.

Mr. James Holroyd, manager of the Burmantoffs Faience Works, now incorporated as a branch of the Leeds Fire Clay Co., Limited, died at his residence, Holly Bank, Headingley, near Leeds, on Tuesday last, aged 51 years, as the result of a chill taken in attending his brother's funeral.

At Tuesday's meeting of the Somerset County Council it was decided to raise the salaries of the two county surveyors by £100 a year each, making Mr. Wilcox's remuneration £320, and that of Mr. Norman £300 per annum.

At a cost of £3,000 the Marchioness of Bute has just erected a chapel to the memory of her father, the late Lord Howard of Glossop, on a remote island of the Hebrides, called Canna. The chapel is for the accommodation of the natives, who number about ninety, and are all adherents of the Roman Catholic faith.

New cricket and recreation grounds, some 18 acres in extent, have been laid out on a portion of the Cardigan Estate, at Headingley, Leeds. The pavilion and other buildings have been carried out from the designs of Messrs. Smith and Tweedale, of Leeds.

Mr. John A. Patterson MacBride, sculptor, late of Liverpool, died on Friday, at Southend-on-Sea, aged 71 years.

The extensive saw-mills belonging to Messrs. Watson and Stabler, at West Hartlepool, were partially destroyed by fire on Friday. The damage amounts to about £4,000.

The Leeds town council have finally adopted notified plans by Mr. W. H. Thorp, of that town, or the alteration of the Mayor's rooms at the Town Hall.

## Trade News.

### WAGES MOVEMENTS.

**ABERDEEN JOINERS.**—The employers have granted an advance of ½d. per hour. The present rate of pay is 6d.

**ALLOA.**—All the operative joiners in Alloa came out on strike on Monday in consequence of the masters having refused to give time-and-a-half after five o'clock.

**BELFAST.**—Four hundred men, belonging to the Bricklayers' Society at Belfast, went out on strike on Saturday for an increase of 4s. a week in wages. Altogether, about 2,000 men are affected by the dispute.

**BIRMINGHAM.**—The conciliation board of members of the Birmingham Master Builders' Association and operative bricklayers have settled the matters in dispute between them, and the rate of wages is fixed for twelve months, from 1st inst., at 8½d. per hour.

**BIGGAR, N.B.**—At a meeting of operative masons held on Saturday evening, it was agreed, after considerable discussion, that unless the masters conceded the request of the men for an additional ½d. per hour, they would come out in a body on Monday. The latter step was accordingly taken.

**DUNDEE.**—The masons have made a demand for an increase of wages of ½d. per hour. The rate at present is 7½d. to builders and 7d. per hour to hewers. The men state that they will be content with the present rate if the masters bind themselves to maintain it for a year.

**MANCHESTER.**—The Builders' Labourers' Society of Manchester and Salford and District have resolved that notice be given to the master builders for an advance of wage to 6d. per hour, to commence on May 3 next.

**NORTHWICH.**—The carpenters and joiners of Northwich and district have asked for an advance of ½d. per hour, as well as a small reduction of hours. The employers have expressed the opinion that the present state of the building trade in the locality does not justify them in acceding to the request. At the same time they promise to consider any fair readjustment of the rules when circumstances permit.

**SOUTHPORT.**—The joiners of this town, at a full meeting held on Saturday (Mr. D. Richards presiding), resolved to accept an advance of wages from 7½d. to 7¾d. per hour on May 1, and to 8d. on Nov. 1.

**SOUTH SHIELDS.**—The strike of the operative bricklayers and labourers at South Shields for an advance of wages continues, and the men are determined to stand out until their demands are conceded—namely, bricklayers to 9½d. per hour, and labourers to 6½d. per hour. In the mean time, building operations at South Shields are at a standstill. On Saturday the men received their first strike money—namely, 2s. per day. Non-union men also received strike allowance.

The important works of restoration at the collegiate church of St. Michael, Coventry, have now been completed, after an expenditure of £40,000, and the reopening services will take place on Tuesday week, the 22nd inst., when the Archbishop of Canterbury will preach. The works have been carried out from plans of Mr. J. Oldrid Scott, Mr. G. R. Webster acting as clerk of works, and Mr. John Thompson, of Peterborough, being the contractor. The famous spire and tower, the highest among those of our parish churches (303ft. from ground to vane), which has been underpinned and restored, was illustrated by us from measured drawings by Mr. J. Drayton Wyatt in our issues of Oct. 31, and Nov. 14, 1884.

At the church of St. Thomas, Stockport, the new chancel and pulpit were used for the first time on Sunday. The alterations, which have been carried out from the designs of Mr. Medland Taylor, of Manchester, at a cost of £3,200, include the formation of a chancel within the church, by marking off a raised platform inclosed by a low wall and open balustrade. There are nine steps in all leading up to the Lord's Table, while a new reredos of alabaster and marble greatly enhances the effect of the pre-existing fine picture of the Ascension. Triple oaken sedilia with stone canopies north and south of the chancel, and a credence on the east wall, have been provided. The new pulpit projects from the west wall of the chancel, the projecting part being carried by two carved stone pillars, while its oak rail is supported upon wrought-iron standards. There are three rows of choristers' seats in carved oak on each side. The organ has been taken down from the west gallery, and put up in the gallery north of the chancel, after having been altered by Messrs. Young at a cost of about £300. The old three-decker has been converted into a screen, which partitions off the east end of the south aisle, making it into a choristers' vestry.

Holloway's Pills are the most efficient restoratives when the spirits droop and the frame feels fatigued. They preside so effectively over the digestive organs, and regulate so nicely the secretory and excretory functions, that they generate elasticity of mind, with strength and health of body, and improve the constitutional vigour.

### DOULTING FREESTONE.

**THE CHELYNCH STONE.**—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

**THE BRAMBLE DITCH STONE** is of the same crystalline nature as the Chelynych Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRANK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

### HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material. Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—

**THE HAM HILL STONE COMPANY,**  
NORTON, STOKE-UNDER-HAM, SOMERSET.  
London Agent:—  
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

### BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

**Faraday & Son's**  
**ELECTRIC LIGHT FITTINGS**  
3 Berners Street London W.

**ELECTRIC LIGHTING.**  
**COMPLETE INSTALLATIONS**  
**OR WIRING ONLY** ESTIMATES GIVEN.  
**STRODE & CO.** 48, Oldbath-st., N.W., and 67, St. Paul's Churchyard, E.C.  
New Branch Showrooms:—188, PICCADILLY, W.  
Telephone No. 3958.

**GEO. FARMILOE & SONS,**  
Lead, Glass, Oil, Colour, and Varnish Merchants.  
ALL LETTERS TO OFFICES AND WAREHOUSES:—  
**34, ST. JOHN STREET, WEST SMITHFIELD, LONDON, E.C.**  
Lead Works: Island Lead Mills, E.  
Sanitary Appliances and Plumbers' Brass Work Factory: Eagle Court, Clerkenwell, E.C.  
Stained Glass Works: 109, St. Martin's-lane, W.C.  
Wharf: Queen's Wharf, Wapping Wall, E.

**WM. OLIVER & SONS,**  
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,  
120, BUNHILL ROW, LONDON, E.C.  
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

#### TENDERS.

Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

**ABERDEEN.**—For the erection of a public library on Rosemount-viaduct, for the town council:—

Masonry:—  
Gall and Walker (accepted)... £4,509 0 0  
Carpentry:—  
Leslie and Hay (accepted)... 1,371 0 0

**BANSTEAD, SURREY.**—For extension of tailor's shop at the Cottage Homes, for the Managers of the Kensington and Chelsea School District. Messrs. A. and C. Harston, 15, Leadenhall-street, E.C., architects. Quantities not supplied:—

Small, W. F. and W., and Co. ... £489 12 0  
Potter, J. B. ... 387 0 0  
Taylor, W. ... 369 0 0  
Barton and Son, Croydon (accepted) 336 0 0

**BLISLAND, BODMIN.**—For the erection of a new dwelling-house at Trewint, for Mrs. E. C. E. Collins, Trewintale. Mr. F. W. McCoskrie, Grampound-road, architect:—  
Tinney (Foxpark), and Buntand Son (Cardinham)... £335  
(Jointly accepted.)

**BATHEASTON.**—For extensions to the old brewery, for the English Lager Beer Brewery Co. Mr. C. Johnson, Bath-street, Bristol, architect:—

Hayes, C. A., Bristol (accepted).  
**BRISTOL.**—For the completion of St. Francis Church, exclusive of upper part of tower. Mr. J. Bevan, architect:—

Beaven, A. J. (accepted) about ... £2,600 0 0  
 (No competition.)

**BURSLAM.**—For the conversion of one of the aisles of the Shambles into a fish-market, for the town council:—

Bott, W. (accepted) ... £360 0 0

**CAMDEN TOWN.**—For new lecture, theatre, museum, &c., for the Royal Veterinary College, Camden Town. Mr. A. Vernon, 26, Great George-street, Westminster, architect:—

Holland and Hannen ... £5,653 0 0  
 Aldin Bros. and Davis ... 5,300 0 0  
 Dove Bros. ... 4,875 0 0  
 Bywaters ... 4,848 0 0

**CLACTON, NEAR COLCHESTER, ESSEX.**—For detached house on site adjoining the Valley Farm, for Dr. J. C. Burnett. Mr. A. Broad, 27, Dingwall-road, Croydon, architect. Quantities by the architect:—

Chambers ... £932 0 0  
 Smith and Bulled, Croydon ... 913 0 0  
 Diss ... 885 0 0  
 Dobson ... 879 0 0  
 Orfeur ... 815 0 0  
 Everett and Son (accepted) ... 810 0 0  
 Allen, Clacton ... 807 0 0  
 Ambrose and Co. ... 794 0 0  
 Sargeant, Clacton ... 761 0 0  
 Architect's estimate, £850.  
 Rest of Colchester.

**CLACTON, NEAR COLCHESTER, ESSEX.**—For detached cottage, Foot's Farm, for Dr. J. C. Burnett. Mr. A. Broad, 27, Dingwall-road, Croydon, architect. Quantities by the architect:—

Chambers ... £553 0 0  
 Smith and Bulled, Croydon ... 504 0 0  
 Dobson ... 475 0 0  
 Allen, Clacton ... 447 0 0  
 Diss ... 441 0 0  
 Everett and Son (accepted) ... 436 0 0  
 Orfeur ... 420 0 0  
 Ambrose and Co. ... 409 0 0  
 Sargeant, Clacton ... 366 0 0  
 Rest of Colchester.

**CROYDON.**—For detached cottage, Warrington-road. Mr. A. Broad, 27, Dingwall-road, Croydon, architect. Quantities by the architect:—

Waller ... £480 0 0  
 Goulder and Glasscock ... 449 0 0  
 Knight ... 425 0 0  
 Docking ... 425 0 0  
 Page ... 415 0 0  
 Smith and Bulled ... 414 0 0  
 Saunders, E. J.\* ... 410 0 0  
 \* Accepted subject to revision.  
 All of Croydon.

**COATHAM.**—For additions to Grammar Schools. Mr. H. Weatherill, Stockton-on-Tees, architect:—

Bradley, T., Coatham (accepted).

**DENFORD.**—For Wesleyan chapel, Denford, Northamptonshire. Mr. J. Wills, F.S.S., Derby, architect:—

Coates, W., and Son, Thrapston ... £500 0 0  
 Smith and Son, Raunds ... 455 0 0  
 Freeman & Son, Denford (accepted) ... 439 15 0

**DERBY.**—For new bakery, for the Co-operative Society, Ltd., Mark-street, Derby, with stores over, for four ovens by J. Baker and Sons, City-road, London. Messrs. Coulthurst and Booty, Derby, architects:—

Sharp ... £637 12 0  
 Vernon ... 550 0 0  
 Dickinson ... 458 0 0  
 Chattell ... 447 0 0  
 Brown, A. ... 419 0 0  
 Morley, E. ... 345 10 0  
 Wagg, G. (accepted) ... 344 13 0  
 All of Derby.

**DERBY.**—For three shops, with provision and curing rooms, Princes-street, for the Derby Co-operative Society, Ltd. Messrs. Coulthurst and Booty, Derby, architects. Quantities supplied:—

Wood, E. ... £4,641 0 0  
 Walker and Slater ... 4,570 0 0  
 Walkerdine ... 4,570 0 0  
 Durant ... 4,340 0 0  
 Pemberton ... 4,240 0 0  
 Brown (accepted) ... 4,213 0 0  
 All of Derby.

**DULWICH.**—For Congregational Church, Barry-road, East Dulwich. Mr. W. D. Church, 12, South-place, Finsbury, E.C., architect. Quantities by Messrs. C. Stanger and Son, 21, Finsbury-pavement:—

Everitt and Son, H. ... £12,298 0 0  
 Shurmer, W. ... 12,099 0 0  
 Woodward and Co. ... 11,770 0 0  
 Perry and Co. ... 11,767 0 0  
 Staines and Son ... 11,626 0 0  
 Dove Bros. ... 11,215 0 0  
 Hart Bros. ... 11,038 0 0  
 Colls and Sons ... 11,031 0 0  
 Higgs, F., and H. F. ... 10,649 0 0  
 Kilby and Gayford ... 10,500 0 0  
 Higgs and Hill ... 10,436 0 0  
 Bowyer, J., and C. ... 10,155 0 0  
 Holloway Bros. (accepted) ... 9,649 0 0

**EAST MOLESEY.**—For new boating premises, for Messrs. T. Tagg and Sons (main building only). Mr. Burnell, New Stone-buildings, Chancery-lane, architect. Quantities by Mr. Chidgley:—

Croaker, W. and T. ... £4,230 0 0  
 Nightingale, B. E. ... 3,990 0 0  
 Collinson, Teddington ... 3,920 0 0  
 Wheatley, East Molesey ... 3,840 0 0  
 Potterton, East Molesey\* ... 3,655 0 0  
 Hiscock, F., Hounslow† ... 3,499 0 0  
 \* Accepted. † Withdrawn.

**EXETER.**—For alterations and additions to Devonshire Arms, Exeter. Mr. A. H. Wills, 2, Higher Belmont-road, Exeter, architect and surveyor:—

Mitchell, G. ... £55 0 0  
 Tree and Bolley ... 49 0 0  
 Moass and Sons (accepted) ... 38 0 0  
 All of Exeter.

**EXETER.**—For painting and decorating part of Royal Public Rooms, Exeter. Mr. A. H. Wills, 2, Higher Belmont-road, Exeter, architect and surveyor:—

Kingwell and Sons, Exeter (accepted) £80 10 0

**FAIRFIELD.**—For the erection of one pair of semi-detached houses, for Mr. J. Swindells. Mr. J. H. Burton, Warrington-street, Ashton-under-Lyne, architect:—

Robinson and Co., Hyde ... £2,201 0 0  
 Fielding, H., Droylsden ... 2,121 0 0  
 Gardner, H., and Co., Ashton-under-Lyne ... 1,990 0 0  
 Williamson, J. W., Ashton-under-Lyne ... 1,920 0 0

Hurst, W., Droylsden ... 1,903 6 0  
 Gibson, J., Dukinfield ... 1,890 0 0  
 Whitell, R., Manchester ... 1,800 0 0  
 Robinson, J., Ashton-under-Lyne ... 1,786 0 0  
 Booth, R. H., Stalybridge ... 1,784 10

Holmes, A., Ashton-under-Lyne ... 1,779 14  
 Shaw, T. G., Stalybridge ... 1,770 13 0  
 Underwood Bros., Dukinfield ... 1,751 12 0  
 Jackson, E. and C., Openshaw ... 1,746 0 0  
 Wallworth, C., Gorton (accepted) ... 1,710 0 0  
 Dean, T., Ashton-under-Lyne ... 1,677 0 0

**FIGHTING COCKS.**—For caretaker's cottage, for the Middlesborough and Stockton Water Board. Mr. H. Weatherill, Stockton-on-Tees, architect:—

Craggs and Benson, Stockton-on-Tees (accepted).

**HEAVITREE.**—For alterations and additions to the Heavitree Brewery, for the Heavitree Brewery, Ltd. Mr. A. H. Wills, 2, Higher Belmont-road, architect and surveyor. Quantities by the architect:—

Facey, Taunton ... £900 0 0  
 Kensole, Heavitree ... 875 0 0  
 Setter Bros. ... 827 0 0  
 Gooding ... 765 0 0  
 Tree and Bolley ... 749 0 0  
 Westcott ... 719 0 0  
 Ham and Passmore ... 717 0 0  
 Pratt, Mary's Cyst ... 673 0 0  
 Phillips (accepted) ... 673 0 0  
 Rest of Exeter.

**HEXHAM.**—For carrying out works of sewerage in Alendale-road and Cockshaw-road, for the local board:—

Carr, W., Hexham (accepted) ... £246 6 8

**LISKEARD.**—For the erection of new public buildings:—

Trehane, S., Liskeard (accepted).

**LISKEARD.**—For repairs to the old Independent chapel in Dean-street, for the Baptist community:—

Ugaldi, Liskeard (accepted).

*To Municipal Authorities, Engineers, and Surveyors.*

# JENNINGS' PATENT URINALS

FOR PUBLIC THOROUGHFARES AND RAILWAY STATIONS,

Have been adopted in all the principal European Cities. They are particularly adapted for public use, being simple in construction, strong, and most economical as regards the water supply.

## JENNINGS' STONEWARE DRAIN-PIPES

Have been specially selected and adopted, after severe tests, by the South Australian Government for the drainage of Adelaide. The Sockets and Pipes are made in one piece under great pressure by Steam Machinery from the finest selected Poole Clay taken from Beds on the works, and, by hydraulic testing, have been proved superior to any other pipes in the market.

*Prices and particulars can be obtained from*

**GEORGE JENNINGS, STANGATE, LAMBETH, LONDON,**  
 And the Manager, South-Western Pottery, Parkstone, Poole, Dorset.

## ARCHITECTS AND MANUFACTURERS —DESIGNS AND PRODUCTS.

THE want of interest taken in the manufacturer's work by those whose business it is to employ materials and the industries connected with them, is one of the most disheartening and unsatisfactory conditions of the present age. Thus it is that hundreds of things in daily use, or which are employed in the structure and decoration of our houses, are looked upon with perfect indifference, simply as products purchased for so much money. The average householder does not interest himself in the production of his carpets or floor-cloths, his wall-papers, chimney-pieces, grates, or furniture, so long as they answer their purpose fairly well, or are cheap. Cost or fashion seems to be the chief question which concerns the well-to-do householder: everything else is disregarded. Well does Emerson in one of his beautiful essays speak of the ends of labour. "Cheapest," he says, "is the dearest labour. What we buy in a broom, a mat, a waggon, a knife, is some *application of good sense to a common want*." "The absolute balance of Give and Take; the doctrine that everything has its price, and if that price is not paid, not that thing, but something else, is obtained," is a doctrine that does not enter the minds of such users and consumers of our industries. Very few people trouble themselves about the application of common sense to their houses or furniture, or whether it is possible to obtain what they want at a certain price. The signs of wealth and fashion are taken for the real things, and so long as people are satisfied with the imitation and counterfeit signs of knowledge and good sense, the "stern ethics which sparkle on the chisel-edge, which are measured out by the plumb and foot-rule," will cease to have any meaning for the operative himself.

The trade circular affords us an illustration of the utter ignorance and want of appreciation of the work of the manufacturer shown by the public. The very "get-up" is intended to draw attention away from the essentials of good construction or correct taste. To take, for example, some of the catalogues or trade lists supplied by furniture dealers and ironmongers. Very little construction underlies the form and ornamentation; the latter is over-wrought and badly designed for the purpose, the idea of the designer of the patterns being to imitate the styles—to give the appearance of costliness at the least sacrifice of labour. The material is counterfeited as much as possible. Showy grates, overlaid with bad cast ornament, appear to be the main object which the ironmonger has in view, for anything like consistent treatment of material is not attempted. Unfortunately, in these manufactures the architectural designer has no direct influence: the designs are prepared by trade pattern-makers, who receive orders to render them attractive and in keeping with the taste of the day. We may see what truthful purpose and good sense can do in designs of this class if we look at the sketches prepared by the late Alfred Stevens for some of our leading manufacturers. The mistake of repeating designs made for special purposes or situations is the great evil. Many most felicitous designs by our leading architects for furniture and metal-work, including some by the late Mr. E. W. Godwin, Mr. Norman Shaw, Col. Edis, and Mr. J. D. Sedding, have been spoiled by being copied

as stock patterns by wholesale manufacturers. In the original the design was scrupulously carried out by one hand under the eye of the author, in certain materials and for a particular position; the artistic mind is seen in every joint and moulding; but the later copies show a great falling off, inasmuch as the details and meaning of the whole design have been so changed that, but for the general outline, it would be impossible to say from what source it came. The close connection between designer and workman can be seen in the earlier work, as if one mind and hand had conceived and executed; not so in the goods turned out by wholesale copyists. The connection between designer and executant is completely severed—in fact, what seemed to follow as a natural result of design is lost, and what is a source of beauty in the first is one of deformity in the copy. Thus in the original a simple mode of framing suggested an equally simple treatment of material; but in the imitation elaborate moulding or ornament has been added, which destroys the intention of the designer completely.

Ordinary building materials and manufactures reveal the same want of agreement between architects and makers. In that large class of clay manufactures in which the architect is more immediately concerned, terracotta and tilework for example, we find very little of that co-operation that would be of advantage to both the architect and manufacturer. The latter employs his own design, or is satisfied if he can turn out goods that will suit the larger number of his customers, so that if the architect requires anything of a special character, or something to be modelled after his own design, he has to pay dearly for it. Only when many replicas of the same pattern are required can he avail himself of the opportunity of securing what he wants. By a better understanding between architect and manufacturer, a higher standard of design could be maintained, and we have evidence of this in the products of leading terracotta and moulded brick firms. The stock designs of the trade are generally devoid of architectural character because of the ignorance of those engaged as modellers. Look, for instance, at the designs for balustrades, cornices, trusses, and terminals. The ornament is clumsy, the profiles inelegant or fussy; but this kind of design is appreciated by the "middleman" dealer, whose idea is to have replicas of a showy character. That a superior kind of manufacture can be turned out with a fair margin of profit can be proved by an inspection of many of Messrs. Doulton and Co.'s patterns, or those of Mr. J. C. Edwards, Ruabon. We should like to see the special-made design the rule amongst the profession, for if this kind of trade could be established, the manufacturers would soon cease multiplying their stock patterns, and would pay more attention to architect's work. These remarks refer chiefly to ornamental accessories and details. There are other goods, like moulded bricks, sanitary ware, tiles, &c., in which freshness of design is not material or necessary. In moulded work, for example, the architect can produce his own combinations for jambs, arches, and the like, as he is forced to use the same elements; to make a new model or mould would be unnecessary. But for window and door-heads, gable ornaments, balustrades, the character of the design should be adhered to, and the selection of any stock pattern is objectionable. The present weakness in the patterns turned out for work of this kind is largely to be attributed to the neglect of the architect in not making himself master of the knowledge of the class of clays adapted for terracotta, the shrinkage in burning, the sizes and thickness of blocks that ought to be used to avoid twisting, and unevenness of line in fixing. The Natural History Museum and the Constitutional Club are notable in-

stances of careful design and pattern-making. Many of the failures in the use of this material have been owing to the mistake of designing details in this material as if it was stone, and of making considerable projecting members, thereby increasing the thickness of some parts which are sure to twist when they are dried and burned.

In other departments of workmanship—joinery, for example—there is a similar want of co-operation between the architect and workman. General drawings, often to a small scale, are furnished for important fittings and details; but the execution is left entirely to the builder or his foreman. We cannot expect an improved or a very high class of joinery under these conditions. The best illustration of this is the large importation of foreign-made joinery, showing that architects and their patrons are contented with ordinary regulation work and with inferior qualities. Under the fostering care and guidance of institutions like the Carpenters' Company, the education and efficiency of the craft is improving, but these efforts do not reach the rank and file of the trade; architects, by delivering practical lectures before apprentices and craftsmen, bring the needs of the profession before the joiner; they put before him the ideas of architects, explain theories of construction, and recommend courses of instruction and examples to follow; the classes and prizes of the Company promote the skill and handicraft of the apprentice. The technical schools and courses are doing a great educational work; but they stop short of one necessary thing, that of encouraging the power of design and of putting old and good examples before the pupil. It is the seeing of good work, the best Mediæval and Renaissance joinery, that will alone give the workman ideas, which he cannot derive from following the lessons in technical joinery. Unfortunately, there is a large class of machine labour expended which gives finish and appearance of good work, but which is really not so. Doors, for example, are turned out very clean and perfect in appearance, but the quality is indifferent. We have a number of wood-block floors; some good, such as the systems of Lowe, Geary, "Acme," and the keyed plan of the Westminster Flooring Company; others imitations, the external surface, and not the foundation or mode of laying, being considered. If architects were to select their workmen as they do in France, or provide sums for special work in their contracts, we might again see artistic joinery rivalling the old.

In ironmongers' and smiths' work the temptation to make what will sell, instead of that which is substantial and artistic in design, is even more evident. Architects are willing to select their patterns from the trade catalogue, and to save themselves the time and trouble of making special designs though we are quite ready to acknowledge the increasing superiority of the patterns made and kept in stock by firms of established reputation. Comparing, for example, the patterns of ecclesiastical metal-work prepared 20 years ago with those of to-day, we can perceive a remarkable difference. The design for lecterns, standards, coronæ, pendants, and brackets were profuse in their scrolls, leafage, and other ornaments—fussy to a degree; but now they are quieter. The treatment of metal has been observed, and we have better, because more natural, designs. It is the same in builders' ironmongery and brass-work. The old Brummagem patterns have died out: in such things as stove-fenders, cast-iron rain-water fitting-verandahs, spiral stairs, and ornamental castings, improvement is evident; but more would be done were architects to design their own fittings or select them. In the important branch of metal-work applied to gas and electric-lighting there is an opening for the designer; already some manufacturers

those fittings have judiciously studied the requirements of architects and their patrons by opening furnished showrooms, in which electroliers and other fittings are fixed in position with surroundings that admit of a more critical and appreciative selection. The same conditions of judging are observed by leading firms of decorative artists. Marble mosaic work, stained glass, wall decoration, are so intimately connected with architecture, that they should be no longer considered as distinct and independent arts. The warehouse, rather than the studio or atelier, has been the accepted idea, and to the contractor has too often been committed the task of selecting artistic products. Modern architecture has at last rebelled against this isolated and commercial view, and it is for the disciples of the art to identify themselves with allied crafts and manufactures.

#### LOCAL AUTHORITIES AND BUILDERS.

URBAN and rural sanitary authorities have, in the trusts reposed in them, to steer clear between an appearance of arbitrary power and self-interested motives. The election of members to serve on the committees has been a source of weakness. They are often taunted with having private interests to serve, as being property holders, or as exercising their powers in a manner to give offence to builders who are opposed to them in politics, or who are not favourites with the board. We are constantly hearing of the arbitrary conduct of these authorities towards builders, and the reasons adduced for their action are often of an unsatisfactory character. The interpretation of the by-laws under the Public Health Act is a continual grievance, and if we are to credit all we hear, the authorities and their officers have been a long time in coming to an agreement about the meaning and intention of certain by-laws. The complainants often allege that they can show in the same district houses built in violation of those very rules, even after they have become law, which are enforced against them. Of course, such an assertion is awkward if it can be substantiated, for it shows that the officials of the board have either not comprehended the meaning of the by-laws they have put into force, or have been remiss or partial in enforcing them. The surveyor is, of course, the person upon whom the responsibility of correctly interpreting the statute falls. His opinion is, or ought to be, the ruling one. On the other hand, it is no excuse to make that his remissness or oversight in one case should be repeated, or that because buildings have been erected without proper foundations, or with walls not in compliance with the schedules, that other builders should be allowed to infringe the intention of the Act. Nevertheless, there are many builders, and architects too, who argue that what has been done should be allowed to be repeated; that errors of judgment should be a standing precedent. To attempt to put any clause into force that has been leniently dealt with in other cases is, they argue, unfair and unjust towards them. The members of the committee are blamed for their partiality. Often, indeed, some colour may be given to the accusation which makes matters ten times worse—as, for example, when it is clearly proved that the house property of certain members of the local authority is in a very defective sanitary condition, that the surveyor has not enforced the by-laws in their case. These are the sort of complaints which are made from time to time, and seriously impugn the honesty and conduct of local authorities, and builders have a strong ground for the opposition they raise in such instances. On the other hand, instances occur of builders neglecting to read by-laws. The other day the Solihull Sanitary Authority decided that the mortar used in some cottages

was of an improper kind, and dismissed the appeal of the builder. Specimens of the mortar were examined, the plaintiff and surveyor were both heard, and the authority supported the latter's decision. The question raised by the builder was as to the authority of the board in pulling down his cottages; he alleged that there had been no genuine hearing of the appeal or independent exercise of judgment of the authority, who acted in accordance with their surveyor's opinion. The action was brought in a superior court for trespass for the demolition of the buildings, the question being whether the defendants had exercised duly the powers conferred on them. The judge thought there had been an honest exercise of discretion, and decided in favour of the defendants. This case appears to have been clear enough. Other examples of the infringement of by-laws refer to party-wall thicknesses and structural defects. The builder too often assumes he is the best judge; he does not comply with the provisions because he thinks they are unnecessary, or because the by-laws have not been uniformly enforced. The by-laws themselves are obscure to practical builders; they are not studied as they should be, and local authorities have not sufficient practical knowledge to deal with them. These are the hindrances to a perfect carrying out of the statutory regulations. The only remedy for this condition of affairs is to make the by-laws so clear that no doubt can possibly arise in the minds of builders. Many of the clauses are certainly open to misapprehension; but if they could be supplemented by diagrams or sections, a considerable obstacle to their observance might be removed.

#### DUDLEY GALLERY ART SOCIETY.

ONE would have thought that the multiplication of water-colour societies would have left very little of any merit for the unostentatious but well-established gallery in the Egyptian Hall. The fact, however, is that competition spurs the artist to do his best, and we have here, amongst the 344 pictures, a few that would worthily adorn any gallery in the season, which is not, perhaps, saying very much after all, except that in the smaller galleries there is less room for inferior work, and more discrimination is exercised. For breadth of handling, in which the local washes are made to do an important part, we must acknowledge the excellent work which John Fullwood has contributed. His freshly-drawn subject, "A Beacon," has in it all the power and true feeling of landscape; the broad brush-work in "A Landmark"—a hill with its lonely cluster of trees; "By the River" (122), subtle in its softness of tone and its suggestion of atmosphere and light, and other studies of open country, are worthy of praise. Kate Macaulay (7), "A Good Catch," still displays her power of giving ripple and sunlight, and cleverly-drawn craft; others are "Herring Trawlers" (160), "Waiting for Buyers." Albert Stevens has several landscapes and studies of mountain scenery. His "Menaggio, Lake Como" (208), is a clever study of mountain and cloud. "St. Oswald's, Durham" (259), "After Rain, Derwentwater" (70), are also marked by clever handling. However expert as a painter of still life in all its minuteness, as in 215, L. Block has not impressed us with his architectural drawing of the "Interior of St. Stephen's Church, Walbrook" (40). The perspective is a little faulty, and the colouring hard. In landscape studies we must notice the feeling and breadth in Wilfrid Ball's work, "Mending the Old Boat" (43), is a delightful bit of drawing and colour. Two or three noticeable studies of "impressionism" meet us in William Estall's "Winter Afternoon" (48), in "Cow Pastures" (137), and "A Spring Morning"

(159). Discarding conventional methods, Mr. Estall notes in colour what he sees. The red opalesque hues of a winter afternoon, the fresh green and hazy light of pasture land with sheep and lambs under a spring sky, are the themes given us in these subtle and delicate studies, full of poetry and feeling. The drawing of the sheep is admirable. Lexden L. Pocock's figure-subject "The Pet," a girl feeding a lamb, is prettily conceived and well drawn; and we come to J. Bedloe Goddard's "Branksome Cliff, Bournemouth," a sunny blue sea and sandy beach; and Alfred Powell's "Common," near the same place, a clever and careful piece of handling. Full of atmosphere, and pleasing in its treatment and colour, is Rose Barton's "St. Patrick's Bridge at Sonning" (63); another lady, Maud Peel, gives a pleasing sketch of children in a field, in which the sunlight is well indicated. Of the stronger landscapists is W. Rupert Stevens; his work is always direct, natural, and healthful in tone. No. 75, "A Northern Suburb," clothed in a mantle of snow, with a row of brand-new red brick houses, is a clever sketch of a building estate. One of the chief works of Mr. Stevens is "By the River" (94) full of delicate tones and broad handling. The artist knows how to give light and atmosphere. The same soft and broad touch is seen in drawing of a cornfield (121), "Floods near Pulborough" (289), and in several sketches on the screen. A charming sense of colour and feeling is shown in a Langham sketch (301) and the "Sketch on the Stour" (325). "The Lazy Scheldt" (170), in which Mr. Stevens has selected a new field for his talent, is undoubtedly promising; the still, sleepy atmosphere of hazy light blends water and sky, broken only by the warm colour of the craft which lie motionless on the river. "Sketch for Decorative Panel," by G. Sheridan Knowles, is a graceful drawing of three children under the blossom of an almond-tree; the colouring is harmonious. Pleasant colour and broad treatment of water and sky reflection are observed in Walter Tyndale's "Evening" Dordt (89). Amongst woodland subjects, the charming and delicate colour in Celia E. Culverwell's "Sentinels of the Wood" (95), a glade of silver beeches, and the old beech-tree on the Liffey (336), with its subtle rendering of tortuous roots, and the delightful handling, deserve mention. The president, Walter Severn, has five pictures. "East Cliff, Mentone," a favourite resort of Mr. Severn, occupies a prominent place. Here we find the painter in his happiest mood; a long stretch of rocky cliff, separated by a fissure, a blue sky and sea, all under a bright sunlight, such as the president can give us—perhaps a little too placid. The other view of Mentone, the old town, is less pleasing; the drawing of the houses is somewhat tame and spiritless, but the scene is tranquil and luminous. "Crinan Canal" is full of serenity, light, and air. In the several works of Reginald Jones, his "Early Spring" (224), "In Winter Grey" (102) we find much tender colour and sweetness. These two are especially strong in their masterly drawing of woodland, and the charm and delicate colour of birch-stem and foliage. No. 224 is a large and broadly-handled study of a birch glade, the mingled tints and foreground very suggestive of spring beauty. A delightfully crisp sketch of church tower and village "Lambourne" (112) is by Yeend King, the sunlight effect being suggested by strong and decisive touch, and well selected points of colour. So we must admire R. H. Nibb's "On the Orwell, Ipswich" (129); the strength and grey tone in "April Weather," by David Green, and J. Carlisle's sketch at Blackheath (108). The former's "Sea Breezes" (147) is a masterful drawing of jetty and sea, powerful in colour; air and

mist are fairly rendered in Newton Benett's drawing of "Streatley" (190), and we must pay a tribute to the work of R. A. K. Marshall, for his sunny and well-finished sketch on the river Usk, near Abergavenny, and other Monmouthshire views on the screens. The seascape (212) by Helen O'Hara, with its crested wave and charming grey light and reflection; the quiet colour in F. Burgess's "Barges" (235); R. Werner's "Medieval (?) Gateway" (202), a Roman work more correctly; D. H. Williamson's broad sketch on grey paper (287); Nathaniel E. Green's views of Holland House (312, 318, 220). David Green's sketches at fishing ports (314), Margaret Bernard's Surrey sketch (297), are other works calling for note. Of figure and *genre* subjects little need be said. Henry Terry has a figure of a Gleaner (97) and a cottage interior with old woman engaged in darning, and a little girl who looks somewhat dejected—"A Weary Task" (265), both works exhibiting careful execution. Eleanor E. Manly's little episode is cleverly drawn in the daintily-dressed figures of little girl and boy, who are in the costume of the Cavalier period. The same lady has a nice portrait study, "Nina" (241). With these exceptions the Gallery is not particularly strong in subject studies.

#### SOCIETY OF ARCHITECTS.

AN ordinary meeting of this society was held on Tuesday evening, Mr. William Allport, Member of Council, in the chair. Four nominations for membership were read, and the following ten gentlemen were unanimously elected as members:—Herbert Archibald Ayle, Bradford-on-Avon, Wilts; J. Bartlett, 64, Tonsley-hill, Wandsworth, S.W.; Stephen Colclough, 75, Rathgar-road, Dublin; E. W. M. Corbett, Y-Fron-Pwllpant, Cardiff; F. J. Eedle, 8, Railway Approach, London Bridge, S.E.; F. J. Lewis, 64, Clifton-hill, St. John's Wood, N.W.; E. W. Monro, 63, Bedford-road, Clapham, S.W.; G. W. Plank, 163, Buckingham Palace-road, S.W.; R. Frank Vallance, Mansfield, Notts; and T. Winder, Duke of Norfolk's Estate Office, Sheffield.

#### LIFTS.

A paper on this subject, illustrated by numerous diagrams and plans, was read by Mr. C. E. Gritton, A.M.Inst.C.E., Member of Council. The author explained in his preliminary remarks that he is not in the slightest way connected with any lift company, his desire simply being to bring out the good points of some of the many varieties now in the market. The catalogue of the American Elevator Co. contains, he continued, a number of effective sketches showing crude mechanical devices of primitive man for lifting purposes, consisting chiefly in the first place of rough forms of lever of the first order with a fixed or moving balance weight at one end, and afterwards of drums and wheels. It is only during the last eighteen or twenty years that efficient mechanical lifts have come into use, and the application of hydraulic power, peculiarly adapted as it is for lifting purposes, was first extensively used by Sir W. G. Armstrong, the "pioneer" of hydraulic engineering, for cranes and other lifting machines in 1846. For lifting purposes hydraulic power is undoubtedly the best. During the last three years even in this country immense progress has been made. It is curious to observe how the use of lifts in England advances in substantially the same path as that which it followed in the United States, except that so far the progress has been less rapid here. First came the question, Was it worth while; would it pay? This was soon answered, and experience as well as statistics showed that, in office buildings, the effect of a good elevator service was to increase the rental value from 40 to 200 per cent. Directly this was proved, the movement became general. This was necessarily so, because the owners of buildings unprovided with lifts lost their tenants, and were obliged to put them in to meet the demand, and to save their property from becoming useless. Then, still later, someone thought that if one was good, two would be better; that it would be an advantage to his property to give even a more rapid service than could be provided with one

elevator, and even though there might not be any distinct economic gain, yet the fact of having two would give him an advantage in the shape of *éclat*. The result was to show that there was a real advantage, for active business men would naturally go where there was a greater certainty of a rapid service, and the minimum of delay. But the first to use two made the mistake of fixing them in different parts of the building. It has since been found better to put them close together. There are six elevators in the Mills Building ceaselessly ascending and descending. One of the most striking instances of the modern style of high office buildings in New York is that known as the Morse Building. This stands upon ground 80ft. square. It is eight stories in height, and the two elevators run side by side. To make the service as perfect as possible it was determined that there should be no signals or call bells, but that the conductors should be instructed to run their cars perpetually, one up and the other down, starting although even no passengers were waiting. It was also determined to make all floors uniform as to height of ceiling, style of finish, &c., and not, as had been the practice, to make the upper stories inferior; and, having determined upon this, it was also settled that from the first floor up there should be a uniform rental upon the theory that the upper floors would be at least as good as those below. The results have proved the soundness of the theory. The highest floors let first, and from that day to this the building has been a model investment. Although in London the laws of "ancient lights," &c., render it impossible on most sites to build houses of American altitude, there can be no valid reason why they should not be carried to the utmost height possible, on wide streets, nor why they should not, as in the States, get as good a rental for offices upon the sixth floor as upon the third. In reply to a question as to what was the rental of his offices on the 10th floor, a New York solicitor recently replied in the most matter-of-course way, "Oh, we have to pay a high rent for offices upon this floor—we pay 1,800dols.; if we would go down to the 6th, we would get as good accommodation, and save 400dols." While upon the subject of high buildings, where a serious fire may have such frightful results, it may be added that lift "wells" should be lined with brickwork, and have stout permanent doors at each floor opening, in addition to the usual sliding doors of the cage. These doors should only open from the lift side, otherwise fire frequently spreads with astonishing rapidity to all the floors of a building. The absence of such doors is one of the great objections to lifts of the "Cyclic" or "Continuous" pattern. Hydraulic lifts of good type have the following advantages:—Extreme simplicity; the minimum amount of machinery; absence of all entirely rotative parts, except the sheaves over which the ropes run, dispensing entirely with the use of steam at high pressure used in complicated machinery working at high velocities, and requiring nice adjustment and the close attention of skilled engine-drivers. Hand-power, steam, air, gas, and electricity have also been applied. With steam and gas there is some danger of overwinding; the shock of the explosions in a gas-engine also cause extra strain on the mechanism. The use of hydraulic power at once removes the risks resulting from the use of brakes, necessary with other systems. One valve controls hydraulic lifts, hence little danger of the working parts failing. When horizontal cylinders are used, constant working pressure is obtained. This has also been accomplished recently with vertical cylinders. To quote Mr. E. B. Ellington, M.Inst.C.E., an authority upon lifts and all pertaining to them, in his paper read before the Mechanical Engineers' Institution, he said: "In properly-constructed hydraulic chain lifts there is practically no element of danger beyond that incurred by the use of the chain or rope, and that on the score of safety as well as economy, even in chain lifts hydraulic power is to be preferred to any other." The hydraulic form in its simplest shape (where it is supplied directly from the mains) requires no moving machinery except the pistons, and possibly sheaves. Even in its more elaborate form, where water cannot always be obtained at a suitable pressure, no machinery is required other than a simple direct-acting pump (easy of manipulation) to raise the water into a tank, thereby obtaining the head necessary to work the piston. Hydraulic lifts are broadly divided into two

classes—viz., "Direct acting" and "Suspended." The former are those in which the cage or car is carried directly on the top end of a ram or plunger, whose length slightly exceeds the full height of lift travel. In raising the car, the ram is thrust out of a strong hydraulic cylinder, by the admission of water into the cylinder, through the "working valve," which is controlled by the hand rope passing through the car, from top to bottom of the shaft in which the lift runs. These lifts are silent and work steadily and evenly, being always rigidly supported from below. From the same cause they are inherently safer than those which depend upon the support of chains or ropes. In large lifts, balancing the dead weight of the moving parts becomes necessary, to prevent waste of water, for if this be not done, much more water is expended on useless than on useful work. This has been done in various ingenious ways, beautiful in their simplicity, by Messrs. Waygood, Ellington, and others. Other advantages of efficiently-balanced lifts of this type are that the total dead and live loads are carried directly by the foundations; no overhead beams, sheaves, ropes, chains, or hanging weights are employed, and consequently they may be fixed in a handsome staircase without causing disfigurement or appreciable obstruction of light; no cogs, belts, or shafts liable to fracture are between the applied power and the passenger car; the attachment of the ram to the underside of the cage becomes of less paramount importance; the most frequent source of accidents in suspended lifts—viz., the holding up of the car while descending by obstructions which may be accidentally placed so as to project beyond the floors at the doors of exit, arresting the car while the ropes unwind, leaving the car unsupported, and then when the temporary obstruction yields the car falls—is removed. The fearful accident in the Grand Hotel, Paris (from another cause), could not have occurred had the lift been a good hydraulic-balanced one. Some of these machines now utilise fully 85 per cent. of the water-power. The principal repairs are the renewal of the water cylinder packing, an easy and inexpensive operation. "Suspended lifts" are those supported from above by ropes or chains which pass over sheaves at the top of the lift-well, and carry the total weight of the car and its load, the car being raised by power conveyed by these ropes, preferably from an hydraulic hauling cylinder or jigger. The best forms are sustained by two, three, or four ropes, so that one rope may become stretched or broken without any serious result. Ropes of steel wire are generally preferred, as they work smoothly, and signs of weakness or actual flaws are more easily and promptly observed. Only suspended lifts can be adopted for very considerable heights, or indeed in the majority of cases; and they are the least expensive form, except when the lift travel is a very low one. In New York there are now 130 "Otis" elevators, each lifting from 100ft. to 150ft. Each rope should be of sufficient strength to bear the car and its maximum load alone; giving a wide margin for safety. The expense frequently prevents the adoption of the safest types for goods lifts. Two types are therefore called for. Where safety is of most importance, as in passenger lifts, cost should be a secondary consideration. Real safety means the avoidance of every kind of accident possible to the machinery. Attachments should be considerably stronger than the chains or ropes. A long paper might be written upon safety gear alone. Great ingenuity has been displayed, and the combination of safety devices as applied to the present Otis elevator seem to leave little to be desired. A strong proof of this is that in over 4,000 of these elevators now running no real accident has occurred. In five new buildings in New York they carry 67,000 persons per diem. Unfortunately, all "safety appliances" are not what they profess to be. The *American Architect and Building News* gave, in 1880, instances of eleven falls, in only two of which were the cages unprovided with so-called "safety catches." The important inference drawn was, that "It is impossible to be too careful" in the selection, regular and skilled inspection, and testing "of these appliances, whose action is very uncertain under the various unfavourable circumstances of actual use." All depending upon springs to bring them into play should at least be regarded with suspicion. All cars should be arranged to stop automatically at the top and bottom of their travel. The first

essential of a true safety catch is its instantaneous action at the commencement of a fall. Some are now so sensitive that the slightest inequality occurring in the tension of any of the suspending ropes throws the safety catches into action, and at once stops the descent of the cage. Conclusive proof of the increased safety of lifts is afforded by the fact that, despite the enormously greater number in use now, accidents are not only relatively but actually less frequent than they were a few years ago. Lifts are now accepted as the important aid in saving time and human power, which they were bound to become as soon as the safety of their working had become undoubted. Low water pressure, seldom exceeding 40lb. per square inch, whether from the mains or from a tank at the top of the building, involves one of two drawbacks—either the water is wasted after being used for one journey of the lift, or in the case of the tank, the exhaust, or waste water from the lift, has to be pumped up again for use. Such favoured towns as Brighton, Eastbourne, Liverpool, and Nottingham have a great water pressure, extending upwards from 40lb. to 120lb. per square inch. High water pressure is obtained by pumping and forcing the water into an "hydraulic accumulator," which is a loaded ram working in a cylinder similar to an hydraulic press, and forms a reservoir of power: the pressure generally adopted being 600lb. per square inch. The useful effect of an accumulator is from 75 to 80 per cent., and the cost of repairs almost nil, as the wear and tear is but small. The first cost is also in most cases less for high-pressure lifts than for low-pressure ones of like power. Increased working pressure reduces the size of the lift cylinders, and increases the speed of the lift. Other advantages of the high-pressure system are—the smaller cost of the lifting machinery and of working, when any considerable number of machines are worked from the same pumping plant; the less volume of water dealt with; and the more compact machinery used. Where the public hydraulic power is available, for both small and large consumers, as it now is in London, Liverpool, Hull, Sydney, and Melbourne, the cost of hydraulic machinery is no more than that of any other system, and the high-pressure supply gives the most satisfactory and economical results. The London Hydraulic Power Company claim that they can in some cases raise one ton 50 to 60ft. high for one farthing. Cost for cost the energy stored in the power supply is more than four times that of the average low-pressure service. There are very few instances in which any one company or firm requires so large an amount of power that the use of the public hydraulic pressure will not effect a considerable saving. Each house built upon the "Kensington Court" estate is fitted with one of Ellington's improved passenger ram lifts, constructed by the Hydraulic Engineering Co., Limited, of Chester, and worked by the above mentioned Power Co. The power is available day and night, all the year round, at a pressure equivalent to that which would result if large supply tanks were placed at 1,600ft. above ground level. This pressure enables small machines to perform a large amount of work with a very slight expenditure of water. During the seven years that the London Co. has been working in no single instance has the use of their power been given up in favour of any other system of lifting machinery. A distinct class of lifts is that variously termed "Cyclic," "Continuous," or "Endless." The advantages claimed for this type are: 1st, no delay in waiting for cages; 2nd, no attendant; 3rd, working expenses less than half those of any other; 4th, safety. The latter claim is, however, debatable. It must be confessed that the unprotected openings to the lift-well at each floor level appear to be dangerous. The motive power may be applied either at the top or bottom of the building. A few details respecting the most striking lifts yet constructed—viz., those at the underground stations of the Mersey Railway and those erected at the Eiffel Tower—may be interesting. The former were the first used for dealing with large railway traffic, and were constructed by Messrs. Easton and Anderson. Three of the lifts, running simultaneously, are able to raise a heavy train load of 300 persons (100 each) to the surface in about a minute (usual speed about 2ft. per second). The total cost of the six lifts with their machinery was about £20,000. V-shaped guides were adopted, so that the guide-brackets sliding over them can be readjusted after

wear by packing them out in one direction only. Great pains were taken to keep the wells for the cylinders as nearly plumb as could be, it being of the utmost importance that the upright hydraulic cylinders employed should be as truly vertical as possible. Landore-Siemens steel was used for the ram tubes, tested by Professor Kennedy to bear a load of nearly 63,000lb. per square inch before breaking. The ornamental panel-work was designed by Mr. Grayson, of Liverpool, the architect for the station buildings. As no ordinary shackle will pass through the links of short link chain, the chains were attached by long U-shaped shackles and cotters, giving a strong and reliable connection, with the additional advantage that a chain can be cut at any point, and attached. The hand-ropes are made of hemp with cores of wire rope. The large lift at the Army and Navy Stores, Westminster, is of very similar construction, but of only about one quarter the capacity and power. Leathers appear to be superior to packings for main ram-glands. The first cylinder on the Mersey Railway was lowered into place at the end of August, 1885, and the lifts were officially tested and passed for work on December 29th, 1885, by General Hutchinson, R.E. On the closing day of the late French Exhibition the author ascended the Eiffel Tower by means of the splendid lifts working there; and descended on foot part of the way by the winding stairways, in order to examine the construction and working of the different types then in use. Two "Roux" lifts to the first platform, 184ft. up, can raise together 2,400 passengers per hour; two "Otis" lifts, together, 800 per hour, from the first to the second floor; and one "Edoux" lift, from the second platform, 376ft. high, to the third platform, 863ft. high, 800 per hour. Speed: "Otis," 394; "Roux," 197; and "Edoux," 177 feet per minute. The accident which happened to one of the lifts, but which was kept very quiet by the authorities, was not to either of the "Otis" elevators. In addition to Mr. Ellington's paper, information has been obtained from "Hydraulic Lifting and Pressing Machinery," by Mr. F. Colyer, M.Inst.C.E.; Mr. C. J. Appleby's "Hoisting Machinery"; a Report of Professor F. Reuleaux, Engineer of Berlin; and a Report upon Elevators by a Board of American Engineering Experts to the United States Treasury.

A vote of thanks to Mr. Gritton was proposed by Mr. E. TIDMAN and seconded by Mr. H. D. HATFIELD, the latter remarking that the weak points about all lifts seemed to be the protection of the openings from the spread of fire, for too often the elevator-well acted as a furnace shaft on an outbreak of fire. Where overhead chain gear was used there appeared some risk of the pivot breaking and letting the wheel and chain fall on top of the cage. He had pointed this out to lift makers, but they made little of the risk, saying that the top of the cage was made of steel to withstand the shock of such a fall; he still felt doubtful, however, whether the result of the fall of the wheel and chain would not be serious if the cage were at the bottom of the well, and thought manufacturers would do well to provide safety gear against such an accident.

Mr. E. B. ELLINGTON said English makers of lifts need not play second fiddle to Americans. There were now a greater number of lifts at work in London than in New York, and for speed, capacity, and safety, the English systems were quite equal to those in use in the United States. In America many lifts were still worked by steam, whereas ours were nearly all actuated by hydraulic power.

Mr. C. G. MAJOR, from Messrs. Archibald Smith and Stevens, of Queen's-road, Battersea, said English makers of lifts could well compare with Americans. English lifts were no longer slow, but could be run to 500ft. per minute without difficulty if required, and prices were always favourable to English manufacturers. The high-pressure system was the best, and was becoming increasingly adopted in preference to the other. Fireproof doors could not be provided, as no attendant could move them as required. Experiments had shown that a closely-fitting thin steel door was a more secure protection against the spread of fire from a lift than a heavy iron one, which bulged and failed to keep in position under fire and water.

Mr. MORGAN, of Messrs. R. Waygood and Co., of Falmouth-road, Great Dover-street, said in his recent visit to America he found little was known about high-pressure lifts. The American machinery was often cumbrous, and the usual

pressure employed was 200lb. per square inch, while in New York steam was largely used to supply motive power. High pressure such as we had undoubtedly gave a great advantage over low pressure, as the pipes and machinery were much smaller. The reason English lifts were not worked at greater speed was because of the comparative lowness of the buildings. At Melbourne his firm had an express lift running a height of 76ft. without a check, and a speed of 600ft. per minute was easily maintained. He had always been in favour of direct-action balance lifts over suspended ones, as there was then no risk of anything falling on the top of the cage. Nowadays no passenger lifts were made with chains, as wire ropes, which gave warning before breaking, were employed for all but goods lifts. If our building laws, and especially those affecting light and air, were amended, English makers should show far greater progress, he believed, than American ones. The difficulty too often was that in the Metropolis lifts were required in premises put up by speculating builders, who sought after not the best but the least costly apparatus.

Mr. AITKINS, Mr. C. F. ARCHER, and others having spoken, Mr. GRITTON replied, explaining that he had given most prominence to the American systems of elevators because, when seeking information on the subject he visited and wrote to all the makers on the subject, the Americans were the most business-like and prompt in replying, and in affording him every information.

#### MR. WILLIAM MORRIS ON GOTHIC ARCHITECTURE.

MR. WILLIAM MORRIS lectured on Saturday afternoon at the Artists' Club, Liverpool, on the subject of "Gothic Architecture." The lecturer said that the word architecture was commonly understood to mean the art of ornamental building, and in that sense he should often have to use it in his lecture. Gothic architecture is, he observed, the most completely organic form of the art which the world has seen. The break in the thread of tradition could only occur there; all the former developments tended thither, and to ignore this fact and attempt to catch up the thread before that point was reached would be a mere piece of artificiality betokening not a new birth, but a corruption into mere whim of the ancient traditions. In order to illustrate this position, the lecturer sketched the historical sequence of events which led to Gothic architecture and its fall. East and West overran the world wherever men built with history behind them. In the East it mingled with the traditions of the native populations, especially those of Persia of the Sassanian period, and produced the whole body of what we erroneously call Arab art (for the Arabs never had any art), from Ispahan to Granada. In the West it settled itself in the parts of Italy that Justinian had conquered, notably Ravenna, and thence came to Venice. From Italy, or perhaps even from Byzantium itself, it was carried into Germany and pre-Norman England, touching even Ireland and Scandinavia. Rome adopted it, and sent it another route through the South of France, where it fell under the influence of provincial Roman architecture, and produced a very strong, orderly, and logical sub-style, just what one imagines the ancient Romans might have evolved if they had been able to resist the conquered Greeks that took them captive. Then it spread all over France—the first development of the architecture of the most architectural people—and, in the north of that country, fell under the influence of the Scandinavian and Teutonic tribes, and produced the last of the round-arched Gothic styles we call Norman, which those energetic warriors carried into Sicily, where it blended with the Saracenic Byzantine, and produced lovely works. But we know it best in our own country, for Duke William's intrusive monks used it everywhere, and it drove out the native English style derived from Byzantium through Germany. It was the first style since the invention of the arch that did due honour to it, and instead of concealing, decorated it in a logical manner. It had shaken off the letters of Greek superstition and aristocracy, and Roman pedantry, and though it must needs have had laws to be a style at all, it followed them of free will and unconsciously. The cant of the beauty of simplicity—viz., bareness and barrenness—did not affect it. It was not ashamed of redundancy

of material, or superabundance of ornament, any more than nature is. Material was not its master, but its servant. Marble was not necessary to its beauty. Stone would do or brick or timber. Smoothness it loves, and the utmost finish that the hand can give; but, if material skill fail, the rougher work can so be wrought that it also shall please us with its inventive suggestion. During the 12th and 13th centuries, as far back as the art of beautiful building is concerned, France and England were the architectural countries *par excellence*. The period in which Gothic architecture reached its zenith was marked by the Battle of Courtray, where the chivalry of France turned their backs in flight before the Flemish weavers. All over the intelligent world was spread this bright, glittering, joyous art, which had now reached its acme of elegance and beauty. Dante, Chaucer, Petrarch, the German hero ballad epics, the French romances, the English forest ballads, the Icelandic Sagas, Froissart, and the chroniclers represent its literature. Its painting embraces a host of names of Italy and Flanders chiefly, the two great realists, Giotto and Van Eyck, at their head. The few pieces of household goods left of its wreckage are marvels of beauty; its woven cloths and embroideries are worthy of its loveliest building. In the middle of the 14th century Europe was scourged by that mysterious terror, the Black Death, and in the years that followed it Gothic architecture began to alter its character. It began to lose its exaltation of style, and to suffer a diminution in the generous wealth of beauty which it gave us in its heyday. In England it grew more crabbed and even commonplace. In France it lost order, virility, and purity of line. At last, at the close of the 15th century, the great change became obvious. This change we have boastfully, and as regards the arts, called "The New Birth." In short, the age of commercialism was being born. There are many artists at present who do not sufficiently estimate the enormity, the portentousness of this change, and how closely it is connected with the Victorian architecture of the brick box and the slate lid, which help to make us the dullards that we are. St. Peter's in Rome, St. Paul's in London, were not built to be beautiful and convenient. They were not built to be houses of the citizens in their moments of exultation, their supreme grief or hope, but to be proper and respectable, and therefore to show the due amount of cultivation and knowledge of the only people and times that in the minds of these ignorant builders were not barbaric. From this brief historic review of the progress of the arts it results that to-day there is only one style of architecture on which it is possible to found a true living art which is free to adapt itself to the varying conditions of social life, climate, and so forth, and that style is Gothic. What we now call architecture is but an imitation of an imitation of an imitation, the result of a tradition of dull respectability or of foolish whims without root or growth in them. It is true that the world is uglier now than it was 50 years ago; but then people thought that ugliness was a desirable thing, and regarded it as a sign of civilisation, which no doubt it is. Art cannot be dead so long as we feel the lack of it. Unhappy and slavish work must come to an end. In that day we shall take Gothic architecture by the hand, and know it for what it was and what it is.

## CARPENTRY AND JOINERY.—XXIX.

## FINISHING OF WINDOWS.

**B**EFORE dealing with framed jamb linings, splayed linings will occupy our attention for a little; and these, as their name indicates, are bevelled or inclined so as to allow more light to enter the room, or rather to allow of its rays diverging, so as to illuminate the room much better. This method of finishing gives also more space in the room.

Fig. 200 gives a plan of such a style of finishing provided with a window-board. It will be understood, for the purpose of this finishing, the wall is built level to the bottom of the sill of the frame; wood blocks are usually built in to nail the window-board to; if these blocks are not level both ways, pieces are nailed to them to make them so. The jambs are splayed in building, and bond timber is built in or other provision made for fastening the splayed linings to. It has been already treated of, the method of grounding for such finishing.

Fig. 200 shows the breadth of window-board

required. Of course, in practice, the rough walling will require to be lined down on the drawing board or rod, and the distance from the inner face of the frame to the inside of rough wall, which, with the addition of  $\frac{1}{2}$  in. or lin. for plaster, will give the distance measured square.

Having set this out, then, all the other can be drawn after that. It is customary, unless the window is very large, just to fit the respective parts, that is soffit board or bottom, and jambs, and then take out and nail them together and put the whole back again and fasten in its place, viz., to the casings and grounds. When the window is very large, each piece is fastened in the order of soffit, window-board and jambs. Sometimes these splayed linings are formed of sheeting in narrow widths; if so, the above arrangements would be adopted. The sheeting should be of such width as that the breadth would be equal, and if the soffit is level, narrower widths would be required in order that the V or beaded joints would correspond. The only point calling for particular notice is how to get the bevells where the jambs join the soffit.

It will be readily seen that the plan, Fig. 200, shows the inclination of the jambs. Now if the soffit has the same splay as the jambs, Fig. 201 shows how to obtain the full (real) length of the line along the top of the jamb, so that it will correspond with the inclination of the soffit.

In Fig. 201 dotted lines show the distance from the face of the frame inwards and the

amount of inclination the jamb lining has to the square; in other words, the hypotenuse of the triangle of which the other two sides are shown by the dotted lines. This is the plan of the jamb-lining shown in Fig. 200. From one extremity of the hypotenuse draw a line at the angle of  $90^\circ$  with it, as shown; measure along this line the inclination of the jamb-lining from the right-angle, in other words, the amount of splay, and you have, by joining this point with the other extremity of the hypotenuse, another hypotenuse which is the length of the line which must be measured along the face of the jamb-lining at the end, which is intended to fit to the soffit. That is, the second hypotenuse is the intersection of the jamb-lining with the soffit.

Now, it will be understood that given a certain width of board (the breadth of jamb-lining as shown in plan), the length of a line across that board determines a bevel. The shortest line across a board is at right angles, and you can have almost any inclination across it after that. The other bevel, that is that on the end grain, is obtained as follows:—

In Fig. 202 the inclined line on the left is the splay of the jamb-lining, a horizontal line is drawn from a (any) point in this, and from this same point a line is drawn at right angles to the inclined line. Take any point (convenient) in the horizontal line, and for a radius that which will touch the line at right angles to the inclined one, describing an arc terminating in the horizontal line, project down the centre of the base of the cone, and join the point where this projector meets the inclined line with the point in which the arc terminates in the horizontal line, and you have the part elevation of a cone, and this is also the bevel required for the top end of the jamb-lining, so as that it will fit tight against the soffit. This method is given by Riddell in his "Carpenter and Builder" for a somewhat similar purpose to this. A ready method to get this end grain bevel is to divide the amount of inclination the jamb lining has into eight parts, and having taken three of them set the bevel to that, and it will suit. It can be readily seen that the soffit and window-board may be *trenched* for the jambs, if all is nailed together before being put in; but if not, pieces can be nailed on soffit and board so as to nail the jambs to after they have been fitted. The pieces nailed on the soffit

require to have the edge bevelled a little to correspond with the bevel on the top end of the jamb, so that the jamb may lie close against it. These bevells apply also to framed jamb linings; but a simpler method will be stated for the splay blocks where there are shutters. When the jamb-linings, window-board, and soffit are all in position, and nailed, the grounds for the architraves can be put up, which, with the architrave level on the back side as shown in Fig. 200, would fill a straight edge laid against the edges of the jamb-linings. Of course, it might be necessary, and often will be, to have the grounds of the architraves up in order to meet the plastering, in such a case, a parallel distance from the inner face of the frame will guide the workman. The architraves require to be scribed and fitted neatly to the window-board.

In regard to mitring the head, if the architrave has been *got out of the solid*, it must be mitred through; but if the architrave is *built*, that is, if the moulding is nailed on to the *architrave plate*, then the plate of the top architrave may be mitred as far as the bead only, similar to what was described in Fig. 194; and when this part has been fitted, the moulding is fitted and the plate taken down, and the moulding nailed permanently to it; before taking moulding and plate down, however, the moulding should be tacked to the plate or so marked as that it can be put in its right position when permanent nailing is being done. Now nail the top architrave firmly in its place to the grounds provided for it, and the best ground at the angle is one the length and breadth of the *breadth* of the architrave, this forming a good foundation at each

upper corner. If the plastering is done (which in case of good work it will be), scribe the capping to the wall and window-board and nail it to, mitring the side pieces with the head at least  $\frac{1}{2}$  in. or lin. back. If thought advisable, a small bead, say  $\frac{1}{8}$  in., may be wrought on the capping to break joint with the plaster. There may in some cases be reasons why the window-board should not occur, under which circumstances the building will require to be accommodated to the altered design—that is, the window will be recessed.

The building (brick or mason work) from the sill of the frame downwards to the floor will be plumb with the inner face of the sash frame, and the jambs will be splayed from the level of the floor to the lintel over the window-frame. The jamb linings will be continued to the floor similar

Fig 203

3" Scale

to what was described of the narrow square linings, only, of course, in this case they are splayed from floor to soffit, and the building under the window frame is hidden by a window back, such as is shown in Fig. 199. It will be understood that the architrave and capping continue to the floor. The skirting of the room will abut against the capping under these circumstances. Here, perhaps, it is well to mention, and it will likely be referred to again, that it is no uncommon thing for the skirting to abut against a block (base-block) attached to the bottom end of the architrave.

Fig. 203 gives a plan of a simple kind of block suitable for this purpose. The plan of the architrave has sectional lines drawn through it to allow the plan of the block to be distinct.

Fig. 204 shows the part elevation of block, and

Fig 204

3" Scale

also part of the architrave, indicating how the connection is made—viz., by a dovetail which is glued and screwed—of course, the dovetail is sunk only, say,  $\frac{2}{3}$  the thickness of the architrave. That is, one third of the thickness of the architrave, where the dovetail is formed, is taken away from the front or face side of it. The method shown in Fig. 204 is somewhat superior, as oftentimes there is no dovetail, the part let into the block being parallel both ways, and the necessary groove is taken out of the block throughout its entire length at the circular saw bench; and even lengths of blocking are grooved in this way, and cut to the necessary lengths afterwards. It is even the case that the block is scribed to the floor and fastened in its position, and then the architrave scribed down upon it without any connection at the back, merely resting upon the block. This method, of course, saves labour and material.

Whenever the method shown in Fig. 204 is adopted, the blocks are wrought and fitted and attached in the workshop, and care must be taken to pair the blocks and architraves. The height of the block varies, of course; first, according to the depth of the skirting or plinth, and, in addition, according to the style of plinth. Sometimes a small scotia, as shown in Fig. 205, is wrought upon the plinth, and this would be

Fig 205

2" Scale

worked upon the base-block, and the top of the block and the line of the top of the plinth would be continuous, the base moulding being stopped against the capping of the architrave. The window-back being fitted in between the jamb linings, sometimes a plain plinth is fixed against the back, and none along the jamb linings; but if the jamb linings are framed, the plinth is usually carried around these also.

#### CONTEMPORARY BRITISH ARCHITECTS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THE tenth sheet of architects' portraits is given herewith to-day, commencing with Mr. George Gordon Hoskins, F.R.I.B.A., of Darlington, the architect of the new town-hall and municipal buildings, Middlesbrough, which he won in open competition in 1882. Mr. A. Waterhouse, R.A., acting as assessor. Mr. Hoskins commenced practice in Darlington in 1864. His quarter of a century's work embraces a list of buildings too numerous to refer to here; but we may mention mansions—Elm Ridge, for the late Mr. John Pease; Woodburn, for Mr. Theodore Fry, M.P.; Dryderdale, for the late Mr. Alfred Backhouse; Blackwell, for the late Mrs. Eliza Barclay; The Rookery, for Mr. Jonathan E. Backhouse; and the rebuilding of Blackwell Grange for Sir H. M. Havelock-Allan, Bart., V.C., M.P.; Banks at Sunderland, Bishop Auckland, Middlesbrough, Barnard Castle, and Thirsk; the Johnson Memorial Hospital, Spalding; the Darlington Fever Hospital, also the new infirmary and dispensary; the Queen Elizabeth Grammar School, Darlington; the Henry Smith High School, Hartlepool; Mrs. J. B. Hodgkin's Training Home for Girls, Darlington; the Gas Company's offices, Sunderland; the Edward Pease Free Library, Darlington; the Hartlepool's Exchange, West Hartlepool; cemetery chapels and lodges at Darlington and South Stockton, and many other buildings both of a public and private character throughout the north-eastern counties. Mr. Hoskins's *chef-d'œuvre* is the Middlesbrough Buildings, which were opened by their Royal Highnesses the Prince and Princess of Wales on January 23 of last year. A perspective view and notice of these buildings appeared in our issue of January 18th, 1889. Mr. Hoskins is immediate Past-President, and now one of the Vice-Presidents, of the Northern Architectural Association. Mr. Hoskins is also the author of several professional works, those best known being "Designs for Chimney-pieces" and "The Clerk of Works." His portrait is from a recent photograph by Mr. James Cooper, of Darlington.

Mr. Thomas Worthington, F.R.I.B.A., is a native of Manchester, and was articled to the late Mr. Henry Bowman, of that city. During the period of his pupilage he obtained the Gold Isis Medal of the Society of Arts, Adelphi, London, for an architectural design, and

also the Institute Silver Medal of the R.I.B.A. for an essay on the "History and Manufacture of Bricks." After completing his articles he spent about two years as an assistant to the late Sir W. Tite, residing during that period at Carlisle, in connection with the Citadel Station, and was also there engaged in the preparation of plans for a large number of stations and other buildings for several of the railways then in course of construction in the North of England and Scotland. Subsequently he spent a year in foreign travel and study, chiefly in Rome and several of the more important Italian towns. On his return to England in 1850—although some inducements were held out to him to settle in London—he decided to commence practice in Manchester, where he at once took an active part in the proceedings of the Local Committee of the Great Exhibition of 1851, to which he acted as secretary. He has made hospital architecture a special study, and has built a considerable number of hospitals. Some of his more important works in Manchester are the Memorial to the late Prince Consort, the City Police and Sessions Court-house, the Nicholls Hospital for the education of one hundred poor boys, the Churchwardens' and Overseers' Offices, several blocks of public baths and warehouses, and numerous churches, schools, and country residences in the neighbourhood. He has also carried out many works in other parts of the country; but his practice has been chiefly in the Northern and Midland Counties. Mr. Worthington, apart from his profession, has always taken a deep interest in the promotion of art education. He has served for about forty years on the Council of the Manchester School of Art, and for nearly as long a period on the Council of the Royal Manchester Institution. For many years he acted as honorary secretary to the latter institution, and was for a long period chairman of its Exhibition Committee previous to the transfer of the Institution to the Corporation of Manchester, since which time he has been one of the seven representative members on the City Art Gallery, elected by the Governors of the Royal Institution. He has twice filled the office of President of the Manchester Society of Architects and once of the Manchester Architectural Association. For many years he was a member and frequent attendant at the Council of the R.I.B.A., from which he retired a year ago, after serving for four years as one of its vice-presidents. In 1881 Mr. Worthington took into partnership his former assistant, Mr. Elgood, and among their more recent works is the Harrogate Bath Hospital, which was opened last year by H.R.H. the Prince Albert Victor of Wales. They are now engaged in preparing plans for the Manchester New College, Oxford, the works for which will commence very shortly. Mr. Worthington resides at Alderley Edge, Cheshire. His portrait is the work of Messrs. A. Brothers and Co., of Manchester.

Mr. T. Mellard Reade, F.R.I.B.A., President of the Liverpool Architectural Society, is architect to the Liverpool School Board—an office he has held for over 14 years. He has erected during that time eleven public elementary schools, of various types, of from 1,000 to 1,300 scholars each, the Truant Industrial Schools at Hightown, Day Industrial Schools in Queensland-street and Addison-street (the latter in progress), as well as many extensive additions to other schools. Among other school work he was architect to the Wallasey Grammar School, the Birkenhead Institute, the Training College for Teachers, Edge-hill; the Reckleford-street Board Schools, Yeovil, Somerset; the British School, Penmaenmawr; additions to Dr. Williams's School for Girls, Dolgelly, and various church schools. Among other of his works are the Llandudno Junction and Llanwrst Stations, private residences, Ramleh, for Sir W. B. Forwood; The Lodge, Edgewater; Ingle Lodge, Holmside, Seacroft, Uplands, The Glen, Beach Side, and other residences on the Blundellsands Estate, which was laid out by Mr. Reade for Col. Blundell. Additions to Little Crosby Hall, for Col. Blundell; Bassenfell, Westmoreland; and Holms Hey, Sefton Park, for Mr. Sam Rathbone; completion of Muncaster Hall, for Mr. R. Pennington; additions to Druid's Cross, for Col. A. H. Brown, M.P., &c., &c., also business premises and residences in various parts of the country. Mr. Reade is an Associate Member of the Institute of Civil Engineers, and has devoted much attention to

sanitary engineering, having, in conjunction with his late partner, Mr. Goodisson, carried out the sewerage of Much Woolton, Walton-on-the-Hill, Birkdale; and since that of Hightown; part of Great Crosby, Blundellsands, &c. As a practical geologist, and Fellow of the Geological Society, Mr. Reade's services are in request in cases of underground water supply, stability of sites of embankment foundations, tunnels, stone quarries, and kindred geological questions. He is the author of about 50 scientific papers, mostly on geology, which have appeared in the Proceedings of various scientific societies, and in scientific journals at home and abroad; he is a corresponding member of the New York Academy of Sciences, and author of the "Origin of Mountain Ranges," a scientific work published in 1886. The photograph of Mr. Reade is from the studio of Mr. Barraud, of Oxford-street, W.

Mr. Charles John Phipps, F.S.A., F.R.I.B.A., commenced practice in Bath in the year 1853, and removed to London in 1866. He was born in 1835, and was articled to Messrs. Wilson and Fuller, of Bath, with whom he remained till 1857. His first work was the rebuilding of Bath Theatre in 1862, after the fire. His principal works in London comprise—The Devonshire Club, St. James's-street; the Lyric Club and Prince of Wales Theatre in Coventry-street, forming externally one block of buildings; the Gaiety, Savoy, Haymarket, Shaftesbury, Lyric, and six other theatres; the Savoy Turkish Bath; The Mansions, No. 1, Portland-place (flats); Hengler's Cirque, Argyle-street; the pavilion buildings and ball-room of the Star and Garter Hotel, Richmond. Amongst 27 theatres in the provinces may be named those at Exeter, Bath, Bristol, Plymouth, Portsmouth, Brighton, Nottingham, Worcester, South Shields, Darlington, Leicester, Northampton, Leamington, Liverpool; the Royal and Lyceum Theatres, Edinburgh; the Opera House, Aberdeen; the theatres at Belfast, Cork, Londonderry, and the Gaiety, Dublin. Amongst other works—the Leinster Hall, Dublin; the barracks and stores for the Militia, Bath; schools and mortuary church at Pewsey; schools at Lea, and rebuilding of Lea Church. He holds the appointment of architect to the Company of Proprietors, Drury-lane Theatre, and for two years was a member of the Council of the Royal Institute of British Architects. His portrait is by Mr. Bassano, of Bond-street.

Mr. H. H. Bridgman, F.R.I.B.A., is a native of Torquay, Devon, and is 44 years of age. He was educated at Chudleigh Grammar School, Devon, and commenced as architect and surveyor at Torquay in 1861, and was subsequently for six or seven years engaged in assisting in laying out some estates and designing villas and terraces. In London Mr. Bridgman was with Mr. John Gibson, Westminster, and in 1869 he was elected one of the surveyors to the St. Pancras Vestry, under Mr. William Booth Scott, C.E., chief surveyor. He has been practising as an architect and surveyor on his own account since 1871. In 1875, in consequence of the death of his brother, Albert Bridgman, also an architect, he succeeded to his practice. Mr. Bridgman designed a comprehensive scheme for a central fish market for London, proposed to be erected on the Lambeth side of the Thames, and projecting over the river between Waterloo-bridge and Charing-cross railway bridge. This plan obtained the Corporation of Liverpool Prize of Fifty Guineas at the International Fisheries Exhibition, 1884. Both the essay and design were subsequently published. He also obtained first place, with a prize of £100, awarded by the Society of Arts, 1885, in the Westgarth Competition for the best essay on "Street Re-alignment and Reconstruction of Central London," to meet the future needs of the traffic of the metropolis. Mr. Bridgman is patentee of the new street-watering post adopted in the metropolis, and of the Ligno-concrete system of fireproof flooring, which obtained a silver medal at the Inventions Exhibition, 1885; also of a new combination rolled iron joist for economising girder construction. His travels have extended through the Netherlands, France, Italy, and in the Mediterranean from Spain to Egypt. Mr. Bridgman entered the Corporation in 1884, and is a representative of the Ward of Cheap in the Court of Common Council, the central ward of the City, and has been three times churchwarden of the parish of St. Mary Colechurch, Poultry; and is a member of the Wheelwrights' and Glovers' Companies. He is also a member of the

Commissioners of Sewers. Mr. Bridgman has filled the chairmanship of the Gas and Water and Law and City Courts Committees of the Corporation, and is a member of the Bridge House Estates Committee, and now of the City of London School Committee. He commenced practice at Camden Town, St. Pancras, some of his first works being the reconstruction and extensive additions to the St. Pancras Vestry Hall, obtained in open competition; also the lying-in wards, dining-rooms, kitchens, &c., at St. Pancras Workhouse for the Guardians of the Poor, at a cost of £35,000; the Canterbury Music Hall, Lambeth; reconstruction of St. Anne's Home, Streatham-hill, for the St. Pancras Guardians. Amongst other works carried out by him since are the following:—The "Mother Red Cap," Camden Town; the Camden Turkish Baths; Bushby Board Schools, obtained in competition; Steyning Union Infirmary, Sussex; 25 houses and shops, Camden Town; 13 ditto at Kentish Town; warehouses and business premises in Chancery-lane, St. Bride's-street (five warehouses), Railway-place, Fenchurch-street, Queenhithe, Buckingham-street, Strand, and Queen-street, City; private residences at Highgate (terrace of 20), Hadley, Barnet, Ilford, Tottenham, Clapton, Anerley, Brondesbury, and Willesden; Memorial Fountain and new schools, St. Stephen's Church, Westminster, for the Baroness Burdett Coutts, and stud stables at Holly Lodge, Mission Halls at Islington; Reredos, St. Thomas's Church, Blackburn; and numerous smaller matters. He was architect for laying out the Ashburnham Estate at Bedford, where about 60 detached and semi-detached villas have been erected since 1881, and expended £50,000 in the Lansdown, Linden, Dynevor-roads, and Waldeck-avenue for the Mayor of Bedford, and has also been engaged as architect to the Baroness Burdett-Coutts. Mr. Bridgman was appointed architect to the Kensington Board of Guardians in July, 1886, and was engaged on important improvements at the workhouse and infirmary buildings at a cost of £33,000. His portrait was produced by Mr. Bassano, of Bond-street.

Mr. Archibald M. Dunn, of 23, Eldon-square, Newcastle-upon-Tyne, is the senior partner in the well-known firm of Messrs. Dunn, Hansom, and Dunn. Previous to being associated with his partner, Mr. Hansom, Mr. Dunn was known in connection with many R.C. churches and other buildings in the North of England, the most notable amongst his churches being the large Romanesque one built for the Dominicans at Newcastle-on-Tyne. Many of his important works have been done in conjunction with Mr. Hansom, such as the colleges and chapels at Stonyhurst for the Jesuits, and the church and college at Downside for the Benedictines—all on a large scale; the College Chapel at Ushaw, St. Bede's College, Manchester (terracotta), and the New University College of Medicine at Newcastle, &c. Amongst the churches in various towns their most important is the new Roman Catholic Church at Cambridge, hardly yet completed, and of which we gave a view in the BUILDING NEWS for June 26, 1885, and we shall shortly give an interior of the building. Mr. Dunn appeared as an author a few years ago, publishing "The Notes and Sketches of an Architect." In the BUILDING NEWS for Feb. 28 last we published the portrait of Mr. Hansom, and gave at the same time a list of the more remarkable buildings carried out by this firm, so that a repetition here is unnecessary. Mr. Dunn's portrait is by Mr. Downey, of Ebury-street, S.W.

#### THE EDINBURGH INTERNATIONAL EXHIBITION.

RAPID progress is being made with the preparation of this exhibition for the opening ceremony by the Duke of Edinburgh, on Thursday week, 1st May. Ten days since the buildings were practically completed, and the workmen are now decorating the building and erecting the stands for the exhibits, and joiners and painters are alike kept busily employed. The members of the Edinburgh Architectural Association, to the number of upwards of a hundred, visited the Exhibition on Saturday afternoon, and were conducted over the buildings and grounds by Mr. W. Allan Carter, C.E., the architect. Starting from the east entrance, the party passed through the various courts, beginning with those set apart for the foreign exhibits, and visiting in turn the

music hall in the centre of the building, the British section, the art galleries, and the machinery department, finishing up with an inspection of the grounds. The different courts have still an empty appearance, very few of the stands being as yet erected, and none of the exhibits placed in position. The recreation ground with its track has been completed; the electric railway has been laid; the construction of the Chemin-de-fer Glissant, a water-power railway brought over from France at a cost of £2,000, is in an advanced state; the double switchback line has been finished, and is in a working condition; and good progress is being made with the building for housing the panorama of Trafalgar. At the close of Saturday's visit, Mr. W. W. Robertson, of Her Majesty's Board of Works, proposed a vote of thanks to Mr. Carter, and, in doing so, expressed the high opinion which the party had formed of the skill and taste displayed in the construction of the buildings.

#### CHIPS.

The parish church of Giggleswick is about to be restored, from plans prepared by Messrs. Paley and Austin, of Lancaster.

The local board of Alfreton have accepted the tender of Mr. E. Tempest, of Leicester, at about £6,500, for the enlargement of the reservoir at Butterby, near Ashover, in accordance with plans prepared by the engineer, Mr. V. Hill.

A circular has been issued by the vicar and churchwardens in connection with the restoration of St. Mary's Church, Barton-on-Humber, in which it is stated that a careful inspection has been made by Mr. James Fowler, F.S.A., of Louth, who estimates the total cost of the repairs to be about £1,650. This includes the reflooring and reseating the nave and aisles, additional stove, new south door, cleaning down the masonry, rebuilding three columns of the south arcade which are unsafe, restoring the masonry of the windows and reglazing them, opening out the tower arch and other work about the arch, restoring St. James's chapel, and lowering the soil on three sides of the church.

The parish church of St. Michael at Meath, near Tottington, is about to be restored, from plans by Messrs. Medley Fulford and Harvey, of The Close, Exeter.

Mr. George Palmer, formerly M.P. for Reading, has just provided a park of 49 acres at the east end of the town for the benefit of the inhabitants. He will fence in the land, plant trees, and lay it out for games and for public gardens. Mr. Palmer has already given over 20 acres in another part of the town for a public recreation ground near the Thames.

The organ in St. Giles Cathedral, Edinburgh, is being considerably enlarged. A 32ft. open diapason to pedals is to be added, also many other important stops, and the whole instrument renovated and adjusted. Mr. Eustace Ingram, of London, is carrying out the work.

The new railway-station and pontoon for Dartmouth, situate on the opposite bank of the Dart, were opened for traffic last week. They have been constructed for the Great Western Railway Company, from plans by Messrs. Margery and Elans, their engineers for the Plymouth section, and the contracts have been carried out by Mr. Jinkin, of Plymouth.

The Duke of Connaught laid at Hong-Kong last week, with great ceremony, a stone commemorative of the scheme for carrying forward the sea wall about a mile, and adding to the town an area of about 60 acres.

A mural brass has been placed in one of the panels of the north aisle of Winchester Cathedral by Messrs. Hart, Son, and Peard as a memorial of 133 officers, non-commissioned officers, and men of the Rifle Brigade, who were killed or died in the Burmese campaign from October, 1883, to March, 1888. The apex of the tablet has a cross surmounted with a crown and with the label I.H.S.; under this the regimental badge and honours in bronze, and the angles of the brass the Light Infantry horn, all in relief. A margin of laurels runs round the brass, and the lily decorates the upper part round the cross.

Mr. Richard Fawcett, C.E., has resigned his position as manager to the Hopton Wood Stone Company, which he has filled for several years past, and the appointment has been accepted by Mr. John Simpson, M.S.A., surveyor, &c., of Buxton.

The rural sanitary authority of Pocklington, Yorks, having applied to the Local Government Board for sanction to borrow £4,200 for sewage works for the parish of Pocklington, Col. Hasted, R.E., Local Government Board Inspector, held an inquiry there recently. Mr. Bohn, C.E., of Hull, explained the scheme.

## WAYSIDE NOTES.

A FITTING companion to the story of the punting-pole operation at Tintern Abbey may be found in the action of a company of English soldiers who recently amused themselves with breaking off pieces from the weather-beaten visage of the great Egyptian Sphinx. Such, at least, is the tale of "A Pittsburgh Member of the American-Egyptian Exploration Fund," who, writing to an evening contemporary, complains bitterly of this act of vandalism. On or about March 4, he says, a company of soldiers were taken to drill to the Pyramids of Gizeh, and while there essayed to climb the hoary granite head—of "comely" mien, according to the author of "Eothen"—and endeavoured to procure chips, as relics doubtless. Perhaps they didn't do a vast amount of damage, since it was stone against stone, or granite against granite, at the worst, and destruction cannot be reeked at any great rate of speed where the weapon is no harder than the material assailed. So I don't think the authorities will take the Pittsburgher's hint and dismiss the officers of the company: but the playfulness of Tommy Atkins should be restrained if it exhibits itself in the chipping of the only Sphinx, and it certainly should be the duty of officers to shield from harm the venerable monuments of remote antiquity that are to be found in the land that our soldiers are intrusted to protect.

Destruction, of malice aforethought, proceeds apace in Sicily. Mr. E. A. Freeman, in a communication recently made to the *Times*, complains of the havoc in old buildings, of historical and architectural interest, wrought at Palermo by the municipal authorities, who, in their zeal for innovation and modernising, are not only destroying material creations, but effacing memories by re-naming thoroughfares that have so long borne designations proclaiming to all their antiquity and their intimate association with classical times. Mr. Freeman wrote from Taormina, and bewails the loss of many a landmark in Sicilian history. Nor is he alone in his protests, for many known and learned Sicilians are complaining of the same destruction, a writer, under the name of "Panoritan," having contributed a lengthy article to the *Giornale di Sicilia* upon the subject of the destruction at Palermo. Most deplorable among the recent doings of the zealous municipal reformers are the destruction of the wall just north of the Porta Nuovo, and the resolution to destroy the Favara of King Roger—one of the country houses of the Norman kings. To ourselves it would appear that an ancient wall containing "drums of Greek Doric columns" would be a feature for any city of modern times to preserve with just pride. Not so the reformers of Palermo. It ruthlessly goes "by the board." So also the Favara of King Roger being an "admirable example of the style in which their (the Norman kings) Saracenic artists built for them," one would consider it a work to be carefully preserved for the general public delight; but, according to "Panoritan," its death warrant is signed and its destruction merely a matter of time. And this, says Mr. Freeman, "is the way in which men in Sicily can rage against the monuments of the age in which the Sicilian kingdom was the wonder of mankind, when Palermo had no rival save Constantinople and Cordova."

Whilst the St. Alban's scandal exists, it is impossible for any Englishman to hold up his finger and point with scorn at the action of the Palermo municipal authorities. Moreover, unlike much of the vandalism in this country, the Palermo destruction is wrought under the plea of sanitary reform, and the men responsible for the destruction of, and intention to destroy, many more interesting structures than the Porta Nuovo wall and the Favara of King Roger doubtless persuade themselves that they have easy consciences. More light and air may be required by the inhabitants of Palermo, though it is difficult to see how the alteration of the names of ancient thoroughfares will assist sanitation, and it is easy to imagine that reforms might have been carried out without necessarily pulling down historic buildings. Nevertheless, such has been done, and will continue to be done, unless the small numbers of protesting Sicilians gain in power and are able to restrain the destruction. This, however, would seem to me to be a very remote eventuality in a country like Sicily. It would

seem, indeed, that the authorities at Palermo are fired with a desire to emulate Rome, and to Romanise everything in connection with their city. And it will be remembered how, a very short time ago, complaints got abroad as to the destruction, and rumoured destruction, of ancient buildings at Rome.

The death of the discoverer of the ruins of the wondrous Temple of Diana at Ephesus has been greatly deplored on all sides, and if the loss is not outwardly apparent, it is because Mr. Wood was of too modest and retiring a disposition to keep his name before the public. If not externally a marked incident, his death is yet a matter of the deepest regret to those who knew him, and who knew his works, and have stood in wonder and astonishment before the fragments of beautiful Grecian workmanship—now resting in the galleries of the British Museum—which his laborious and indefatigable researches brought to light, and which testify to the pristine glory of a truly magnificent temple. To me, the discovery of the Temple of Diana is one of the most fascinating and romantic incidents in the history of architectural and archaeological research. It appeals strongly to the imagination, and the discoveries made supply just so much information as to enable us to gain some idea of the original structure. And with such a building it is only in our own imagination that we can conceive some sense of its former glory. Paper restorations are useless, nay, to many, they are worse than useless. To delineate a Classic temple the beauty of which was dependent on its grand scale and the perfection of its sculptures, is to vulgarise and disgust our own imagination, just as we are disgusted when we find the heroine of a romance, though winning our admiration in the description, yet represented on the cover of the book as a positive guy. Paper restorations I much dislike, and class with the fancifulness of travellers' tales, preferring, if I would get at some idea of the original structure, to become familiar with the plan and extent of the remains and then to stand before accessible fragments of detail such as those of the Temple of Diana, and give free play to my own imagination. Of course, if any one had a right to restore, on paper, this beautiful Classic fane, it was Mr. Wood; but the sculptured drums and graceful capitals, and other fragments in the possession of the trustees of the British Museum are really, as guides to the what was and has passed away, of more value than all the restorations in the world. The latter are to the material remains as the word is to the deed.

Archæological discoveries continue to be made in the course of the excavations conducted under the auspices of the British School of Archæology. The labours of this School at Negalopolis, in the Peloponnesus, have resulted in interesting finds. The site of the Greek theatre reported to have been discovered may be more or less interesting, according to the remains found. Some interesting discoveries were made in a tumulus, but they seem of an insignificant nature. It is hoped, however, that further examination of the interior of the tumulus will result in more finds. The relics already found are noteworthy as including two pieces of gold ornament similar to those discovered by Dr. Schliemann at Mycenæ and elsewhere.

Sheffield is accredited with having the most abominable atmosphere of any city or town in England, and it was fitting that a place so smoky and gloomy should have been selected by Mr. Ruskin as the site for a museum for his art treasures, since people under the influence of smoke and fog require objects of beauty to which they may turn when opportunity occurs. Mr. Ruskin's museum has now been reorganised, and should be an increasingly valuable possession to the great cutlery-making town. Hereto the museum was placed in an out-of-the-way corner of Sheffield, but now it is arranged at Meersbrook Park. Meersbrook Park is a pleasantly-situated piece of ground recently acquired by the Sheffield Corporation, who offered to Mr. Ruskin and the St. George's Guild—the trustees of which body will henceforth be associated with the management of the museum—the use of the "Hall" on condition they, the treasures, brought together by Mr. Ruskin, should remain in this spacious building for at least 20 years. It is said that the reorganised condition of the museum greatly enhances its usefulness, and as Meersbrook Park

is pleasantly situated and easily accessible, it is to be expected that the collection will be largely visited. We all know that it deserves to be highly valued by the inhabitants of Sheffield, who, in spite of the claim to consideration as dwellers in a smoky, fume-laden town, should consider themselves very favoured in having easy access to a collection of beautiful things that Mr. Ruskin has spared neither pains nor money to render complete.

It is somewhat of a relief to hear of competitions where the inaugurators take the trouble to select competitors, as this method of procedure must often save large numbers of men from throwing away their labour in vain efforts. I see that the guardians of the Grantham Union have adopted this principle in the competition they propose to hold for their new workhouse. It may be said that this system shuts out many young architects well qualified to compete, yet lacking credentials sufficient to warrant their being invited to compete. On the other hand, it certainly is a labour-saving device, and as such is to be welcomed in the competition world; for the great evil in the competition system is the waste of time, money, and patience it occasions to members of the profession. Perhaps it is too much to hope for a day when the public requiring the benefits—or evils?—of a competition will be expected to pay exes. out of pocket of competitors. If there is ever going to be any solidification and binding together in true brotherhood of the architectural profession, the idea may not be so Utopian as, at first sight, one may think. Meanwhile, however, we should welcome anything that tends to minimise the waste of labour.

The A.A. *soirée* to-night; pipes, baccy, and general good-fellowship, as heretofore on these pleasant evenings; and perhaps I may add an old hat that will be batter-proof, and whose style of architecture and manner of construction shall defy the clamorous rush for coats, &c., that, from past experience, one anticipates on these occasions.

Just another instance of the estimation in which "an architect" is held by the world in general, and will be till we get Registration. The *Times* this week, chronicling the death of Mr. Matthew Harris, late Nationalist M.P. for East Galway, who was evidently a man of mettle in many respects, and a good fellow, I have no doubt, says:—"He was originally a working bricklayer, but subsequently became a road contractor and architect, builder and contractor." If Mr. Harris's advancement in life came in the order recorded, it is apparent that his preparation for the discharge of his architectural duties was a little irregular; but the public knew little of that, and doubtless congratulated him when in due time he attained the higher dignities of builder and contractor. GOTH.

The Town Council of Luton have appointed Mr. Lovegrove, of Croydon, as Borough Surveyor.

A large clock and chimes have been erected this Easter at Portishead parish church, Somerset, by John Smith and Sons, Midland Clock Works, Derby. It shows the time on three skeleton dials, each 5ft. 6in. across, fixed in the upper part of the tower; the Cambridge quarter-chimes are played upon four bells, and the hours are struck upon the largest bell. The clock is fitted with all modern improvements to insure perfect accuracy of time-keeping. It has a double three-legged gravity escapement, and a very heavy pendulum, which is compensated so that changes in the temperature will not affect the timekeeping; there is also apparatus to continue the action of the clock during the time of winding, and a small dial on the frame by which all the various sets of hands may be regulated and set to time simultaneously. All the wheels throughout the clock and dial works have machine-cut teeth, so as to be perfectly accurate. The main frame of the clock is of one solid iron casting planed smooth, and all the wheels, levers, and other working parts are arranged upon it in such a manner that any separate part may be removed without interfering with the remainder; this is a great advantage in large turret clocks. Steel wire ropes of the best quality are used to carry the weights which work in one corner of the tower. The addition of this clock to the church will be of very great use to the town, where they have been short of a standard time-keeper. Messrs. Smith and Sons have recently fixed similar clocks at East Teignmouth Church, Thorncombe Church, and others in the West of England.

CONTEMPORARY BRITISH ARCHITECTS.

(See description on p. 546.)

PAINTINGS FROM THE ROOD-SCREEN, BARTON TURF,  
NORFOLK.

We published in the BUILDING NEWS for Nov. 15th and 29th, 1889, some drawings by Mr. C. J. W. Winter, of the celebrated screen at Ranworth, in Norfolk, and to-day, by permission of the Norfolk and Norwich Archaeological Society, we give a similar selection of drawings by the same hand, in illustration of the paintings on the Rood Screen at Barton Turf, and taken from the folio published some years ago by this Society, with notes contributed by the Rev. John Gunn, M.A., F.S.A., then Vicar of Barton Turf with Istead. The church was ruined by so-called "repair" in 1793, during the absence of the incumbent, who had gone abroad for a tour while the church was "done up." On his return he scarcely recognised the fabric, so completely had it been remodelled. Fortunately he saved the paintings on the screen. The benches of oak, enriched with carved poppy-heads, had been taken away to make room for deal family pews, which Dr. Hook called comfortable places to pray in. The fresco paintings on the walls, and the stained glass in every window, had altogether disappeared. Low-pitched roofs were put on in place of the ancient high-pitched ones, which were adorned with choirs of angels above and saints below, carved out of the solid. The nave was, in fact, ceiled flat, and the whole interior reduced to the character of a meeting-house of the period. The bells, said to be cracked, were sold, and the proceeds applied to this wanton piece of ignorant restoration. The absence of the vicar seems to afford but little excuse to be urged on his account, seeing that he ought to have been near to prevent such proceedings. Barton Turf Church is dedicated to St. Michael. The nave is in the Decorated style, and the tower, of good proportions, is said to have been built about 1400, the chancel being contemporary with it. The screen was erected early in the 15th century, though the paintings are somewhat later in style. The screen has a projecting cornice (enriched with the strawberry-leaf pattern), under which were covings springing from crenellated capitals on the main divisional uprights. The archway in the centre was richly crocketed, and there are remains of double-cusped tracery within the open interspaces of the buttresses facing east and west. The beam of the rood-loft has been removed, and the whole upper part is very much mutilated. The great attractions are the figure-paintings in the lower part. Every portion is richly gilt and painted. The subjects consist of the Heavenly Hierarchies, and of three female saints—viz., St. Zita and St. Apol-

lonia on the Gospel side, and St. Barbara on the Epistle side of the screen. For the convenience of our readers we will follow the order in which the figures are arranged on our sheet; but this is not quite the order in which they rank on the screen. The first figure represents one of the first order or choir of the Inferior Hierarchy, and coming under the term "Principalities." The figure is on a green diapered ground. The nimbus and crown are highly ornamented. The angel has four wings, with light red plumage. The girdle has two rows of bells, the upper ones with clappers, the lower circular. The tippet is richly embroidered and has a golden morse. A vessel like a bottle is held in the right hand, in the left is a palm-branch, indicative of the spiritual nature of their dominion. The second figure is a representation of "Thrones," and is on a red diapered ground. It occupies the second panel on the south side of the screen, instead of the first panel, its proper place, apparently for the better arrangement of the colours. The head is crowned with a wreath of golden oak-leaves, with nine rays of gold above. He has six wings of varied plumage, a plain tippet fastened with a golden morse, and a green mantle with jewelled border. A pair of scales in the right hand, and a throne upon the clouds in the left, indicative that the throne is established in righteousness. The third figure is that of an archangel on a red diapered ground. He stands on a citadel, which he guards in accordance with the description given in the *Aurea Legenda*, with a mace in his right-hand, and a sword in his left. The archangel wears a belt or girdle of bells of different sizes. A green mantle is thrown over all, and he is clad in plate armour without the hausse-col and helmet, but crowned with an embossed orle adorned with leaflets, with two wings above alone visible. The left solleret is partly shown. The fourth figure is an angel on a green diapered ground. Angels form the third order of the Inferior Hierarchy. Their representative here is placed on the last panel of the south side. He wears an ensigned crown upon flowing hair, and is vested, as at Southwold and other places, with the alb and girdle. An alms-box is attached to the girdle, and two naked figures (the conventional representation of souls) are kneeling upon what appears to be a rock. The right hand rests upon the breast, and in the left is a heavy spear of gold for the defence of those assigned to the angel's care. The fifth or last figure shown in the top row on our sheet is that of St. Barbara, V.M., A.D. 306. The saint is drawn on a green diapered ground, and has a rich nimbus and small rays, similar to those borne by St. Apollonia. A narrow fillet of gold upon her head confines her flowing hair. She is vested in a mantle fastened with a morse and kirtle richly diapered, as in the Ranworth screen. A tower is in her right hand, and she is holding her dress with the left. She was of high family, the daughter of Dioscorus, a noble of great wealth at Heliopolis. He persecuted his daughter, and shut her up in a great tower to keep her from marriage. While there she embraced Christianity, which enraged her parent, who, after having his child scourged and horribly tortured, cut off her head with his own hand. The sixth figure standing first in the lower series on our plate represents "Powers" ("Potestates.") They form the third order or choir of the Middle Hierarchy. This is St. Raphael, and he is placed fourth on the north side of the screen on a red diapered ground. He is crowned with a wreath upon the helmet, with an enriched nimbus, and small rays; clad in gold and varied plated armour, helmet with the hausse-col, and aces with vertical lines of the plates, tuilles, and pointed sollerets. He has four wings, a girdle of bells, and a richly diapered golden mantle fastened with a morse embossed, and a rich ornament attached to the breastplate. He stands upon a demon in chains. The calm and unruffled face of the angel forms a contrast to that of the vanquished fiend. He holds a scourge high up in his left hand, and a chain in his right. The seventh figure, coming second in our bottom division, represents "Virtues." He wears a crown of pure white with gold. He has four wings and blue plumage, a linen girdle, a plain tippet with a collar fastened by a morse, and a light-coloured mantle. The background is in red diapered, and the prevailing colour of white is indicative of purity. The right hand is laid upon the breast, while the left bears a sceptre. "Dominations" comes next in the

eight panel on a green ground. The golden tiara or triple crown gave great offence to some bigoted Puritans, who damaged the face of the figure as well as that of the Seraph shown next. A Mr. Dowsing and his followers have the credit for doing this foolish wantonness. The figure is vested in a red-coloured chasuble, with a jewelled orphry, the amice visible to the neck, and dalmatic with a fringe of gold. He has four wings. A golden sceptre is in the right hand, and the left hand is raised. The Seraph figured next (or ninth in our order of grouping) is on a green diapered ground. Seraphim form the first order or choir of the sovereign, or superior hierarchy, called Seraphim, or "Fiery," as mentioned in *Aurea Legenda*. On this account the figure which represents them here is painted with red wings and plumage (on the Southwold screen also with red hands and face and feet), emblematic of the fire of Love, which is God's own being, Love. Thus endued with Divine essence, they are said, as "Cubylers" or chamberlains, to be ever in attendance on the Almighty. In the glowing language of Mrs. Jameson, "they are absorbed in perpetual love and adoration immediately around the throne of God." They precede the Cherubim or the "plenitude of knowledge." This figure occupies the place of honour on the screen—namely, the first on the north of the entrance to the chancel. He is crowned with a wreath of foliage, with nine large golden rays. He has six red wings and red plumage, a golden girdle of clouds, an ermine tippet with border and morse of gold and a mantle, green without and light coloured within; a thurible in the right hand, and the left hand rests upon the breast. The last or tenth figure here shown (there are twelve really on the face of the screen) represents a Cherub covered all over with eyes emblematic of omniscience, and he occupies the second place of honour on the screen; that is, the first on the south side of the entrance to the chancel. He is crowned with a pink-coloured orb, with large golden rays and a cross fleury. He displays six wings of golden plumage, and wears a girdle of linen tied in a single bow, an ermine tippet with an ornamental border and golden morse, and a blue mantle, which colour is always recognised as emblematic of knowledge. Both hands are lifted up as if in adoration of Him who is the source of all wisdom and knowledge. There are no signs of doors to the chancel, and such is the case with the side screen, which separates the Chapel of St. Thomas of Canterbury from that of the "Name of Jesus," which was at the east end of the south aisle. This screen had been concealed behind one of the high-backed pews erected in 1793. The figures on it are of St. Edmund, St. Edward the Confessor, and St. Olave of Denmark, and also of Henry VI. King of England. The latter was painted by a different hand to the other three figures. This screen is coeval with the chapel. The paintings on the rood-screen are probably Flemish, and will bear comparison with the early masters at Antwerp and elsewhere in Belgium. We are indebted to Mr. Harry Hems, of Exeter, for the loan of the folio from which these illustrations are, by special permission, borrowed.

## SKETCHES IN SOMERSETSHIRE.

IN reply to our usual request for a few words of description, we have received the following:—"I am extremely busy. I don't think the Somersetshire notes need any explanation. They speak for themselves, in my opinion.—E. GUY DAWBER."

CATHEDRAL CHURCH OF ST. ALBAN AT PRETORIA,  
TRANSVAAL, SOUTH AFRICA.

THE building aims at being something more than a mere parish church, although the dimensions of the nave will be only 70ft. by 23ft. Originally the extreme dimensions were to be about 190ft. by 80ft.; but the cost of building in that country being about three times as great as in England, it became needful to reduce its scale by about one-fourth. Its plan is cruciform, with apsidal terminations to chancel and transepts, and a central tower, to be finished eventually with a timber spire. The material is red local brick, of dimensions  $9\frac{1}{2}$  by  $4\frac{1}{2}$  by  $2\frac{1}{2}$ , purpose-made. About thirty-five brick moulds, to work with them, have been sent out, for special mouldings for plinths, strings, and cornices, windows, doors, and arcades. The carriage of stone from the mountains, and its extreme hardness for working, precludes its use for anything

but the pillars of the arcades, with caps and bases of the simplest description. The only available timbers are planks and square poles 4in. by 4in. and 5in. by 5in., so that the construction of the roof has demanded very special treatment. Galvanised iron has been recommended by the local authorities as the most available material for the covering; but being liable to decay, and its texture being depreciated by the galvanising process, Mr. White proposes to send out leaded iron for the purpose. This material is free from the difficulties attending the use of galvanised iron, possessing as it does the ductility of lead, and readily taking a common soldered joint, though equally requiring freedom for expansion and contraction. It is free likewise from decay from atmospheric or other acids. It must be laid on boarding and felt, and will not then be liable to be riddled with Cape hailstones, as galvanised iron is. It is proposed at present to commence at the east end of the temporary church, only one bay of nave and aisles, the local estimate for which, before its reduction in size, was £3,000.

#### NEW BATHS, BROUGHTON.

On the 2nd of October last year the County Borough Council of Salford confirmed a resolution of the Baths Committee selecting the plans of Messrs. Mangnall and Littlewoods, of Manchester, for the Broughton Baths in competition. Seven sets of designs were sent in, each under a special motto, and to those marked "Leander" the committee have awarded the first position, and intend them to be carried out. The second premium of £30 was given to Messrs. Darbyshire and Smith under motto "Greater Salford," and the third to Messrs. Booth and Chedwick, who adopted the motto "Simplex." The other designs were by Messrs. Hewitt, Messrs. Beaumont, Messrs. Smith, Willoughby, and Woodhouse, and Mr. T. Cook. The site selected is a plot of land situate in Great Clowes-street. There are two principal entrances from Great Clowes-street—one for first-class and the other for second-class bathers, with a ticket-office for attendant in the centre. The first-class entrance is at the left-hand, and leads to the first-class swimming-bath, to the gentlemen's first-class slipper-baths, and to the ladies' baths, the entrance to the latter being immediately to the left after passing the turnstile, and a pass-door is provided from them to the first-class swimming-bath, enabling this to be utilised for ladies at certain periods of the day, as may be arranged, and thus making the ladies' department thoroughly private. The right-hand entrance-door is for the second-class bathers, and leads to the second-class swimming-bath and second-class men's slipper-baths. The passages are spacious, yet not of unusual length or wasteful, and the arrangement is compact. *First and Second-class Slipper-Baths for Ladies.*—There are three first-class ladies' slipper-baths, and six second class. In the first-class department there is provided a vapour-bath, with cooling-room and shower-bath, and each class has a w.c. The slipper-bath rooms are 8ft. in width, by 6ft. 6in. in depth, and are fitted as per instructions issued. *Gentlemen's First-class Slipper-Baths.*—There are eight first-class slipper-baths for gentlemen, each room 8ft. by 6ft. 6in., and one larger room, 9ft. 3in. by 6ft. 6in., containing slipper-bath and vapour-bath. On each side of the vapour-bath room, with door communicating therewith, there is a cooling room 7ft. 6in. by 6ft. 6in., with couch. To each first-class bath there is a shower-bath and w.c., and all are fitted as per instructions. *Second-class Gentlemen's Slipper-Baths.*—There are twelve second-class slipper-bath rooms, each 7ft. 6in. by 6ft. 6in., with w.c. thereto. In each compartment there would be room for a seat for persons waiting. There is no shower to these baths, which will be fitted up complete as required by the instructions. *Swimming-Baths.*—The first-class swimming-bath is 69ft. by 43ft. within the walls, with a water area of 60ft. by 25ft. The second-class swimming-bath is 97ft. 6in. by 46ft., with a water area of 75ft. by 28ft. The depth is 5ft. 9in. at the deepest end, and 3ft. at the shallowest. *Utilisation of Swimming-bath Room in Winter.*—One or both of the swimming-baths will probably be closed in the winter months. It is here suggested (and has been elsewhere adopted) that one or both of the bathrooms could be used for recreation-rooms, assemblies, or public meetings. The large, second-class bath is well adapted for this, on account of its galleries and numerous means

of exit. A special exit-door is provided in the side wall to Lucy-street for use only on such occasions. If the bath be required for a gymnasium, the principals are strong enough to support swings or similar apparatus. *Committee Room.*—A committee room is provided, 16ft. by 13ft., convenient to the deep end of the swimming-bath, having lavatory, w.c., and urinal. It will be well lighted from the roof, and will have a convenient private entrance from the back street, to obviate the necessity of passing through the general bathrooms on gala days or on special occasions. *Manager's House.*—The manager's house forms the centre portion of the building, over the entrances and ticket offices. The living-rooms and one bedroom are on the first-pair floor, and the remainder of the bedrooms on the second-pair floor. The approach is through the ticket office by staircase, and cut off from the baths; but, if desired, a separate entrance could have been arranged near the gentlemen's second-class baths. *Elevations.*—The architects have given considerable attention to this design. A reasonable amount of adornment was considered desirable, as the baths will be in the midst of a respectable residential population, and it was thought that red terracotta would be suitable as the principal material, the cost being moderate, especially with a repetition of panels, capitals, or ornaments, as in the present instance. As the building is surrounded by streets on three sides, this class of work, mixed with best stock-bricks for plain-faced work, but less ornate, will be also adopted for the side streets.

#### "CROOKSBURY," FARNHAM.

THIS house is now being erected at the foot of Crooksbury Hill, near Farnham, Surrey, from the designs and under the superintendence of Mr. Edwin L. Lutyens, of 16, Onslow-square, S.W. It is intended for the summer residence of Mr. F. Chapman. The walls are built of local red bricks, and the roof of local red tiles. All the external woodwork is of oak, of which material the staircase and screen in hall are also constructed. The terrace walls are to be of rough local stone, with bands and quoins of ironstone. Messrs. Mitchell Bros., of Shalford, near Guildford, are the contractors.

#### "SKETCHES IN BELGIUM."

DINANT, a small town on the Upper Meuse, forms a centre for many a tour in the Forest of Ardennes, and it is in itself a source of interest, possessing a 13th-century church, and numerous picturesque, if late, specimens of domestic architecture. Anseremme, a village two miles further up the river, is of no particular interest, if we except the combined church and farm on the outskirts. The Maison du Tonlieu, Bruges, is too well known to need description. Brussels possesses more old work than many people think; but it needs searching for on the banks of the winding Senne and old canals in the lower part of the city.

WILLIAM H. KEEL.

John Robert Acton, 69 years of age, a retired builder, living at Cromwell Cottages, Hounslow, committed suicide on Sunday by hanging himself in a closet. The jury returned a verdict of "Temporary Insanity."

Nearly £5,000 having been produced by the premium on some debenture stock issued by the Midland and South-West Junction Railway Company, for the construction of a railway between Cheltenham and Southampton, a dispute arose as to whom the premium belonged, the contractors claiming it, as they had undertaken to make the line and to be paid in debentures. Mr. Baron Huddleston and Mr. Justice Grantham decided on Tuesday that the contractors were entitled to the money in question.

On Saturday afternoon Mr. S. Williamson, M.P., laid the memorial stone of the new Chalmers Memorial Church in Anstruther. Built in the Gothic style of architecture, the church will accommodate 750 sitters, and will cost £6,500. The church consists of nave and side aisles, with a tower and spire at the north-west corner. The nave is 75ft. by 28ft., and is lighted by a clerestory carried on pointed arches resting on cast-iron pillars. The area will be lighted by ten windows under the galleries on both sides, and these will contain life-size portraits of ancient and modern ecclesiastical reformers and martyrs. The architect is Mr. D. Henry, F.S.A., Scot., St. Andrew's.

#### ROBERT BOYLE AND SON, LIMITED.

THE directors of Robert Boyle and Son, Limited, ventilating engineers, London and Glasgow, have resolved to pay an instalment on account of dividend at the rate of 12 per cent. per annum for the half-year ending March 31st last, which has been the most prosperous since the formation of the company.

The directors attribute the success to the great and ever-increasing demand for the latest improved form of the self-acting air-pump ventilator, upon which further improvements have recently been effected by Mr. Robert Boyle, adding considerably to its power as an exhaust ventilator, absolutely weatherproof and free from draught.

It is now made of a more ornamental character, of the best rolled steel plates, galvanised and painted with enamel paint, and though greatly superior to all other forms previously manufactured, is sold 50 per cent. less in price, constituting it not only the most efficient and ornamental, but also the most substantially-made and cheapest ventilator in the market. The company have just applied their system of ventilation to the Lord Mayor's Court, Guildhall; H.M.S. *Conquest*, the new White Star Line steamers *Teutonic* and *Majestic*, and the new steamer of the Compagnie Générale Transatlantique, *La Touraine*. These vessels are the largest and finest of their class yet built.

The company have at present some very important ventilating contracts in hand and in prospect, and plans and estimates have been sent in for the ventilation of the drainage system of Bombay, and the ventilation of the Khedive's Palace at Cairo, which was surveyed by Mr. Robert Boyle, the managing director, who is now in India, arranging contracts for Government buildings, and establishing agencies, after which he proceeds to China and Japan, where other important ventilating contracts are pending.

#### CHIPS.

Plans have been prepared by Messrs. Paley and Austin, of Lancaster, for the proposed extension, at an estimated cost of £5,400, of St. John the Baptist's Church, Atherton. The church, which was originally erected in 1723, was rebuilt in 1814, and again (at a cost of £10,000) in 1879.

Over the altar in the undercroft of the Ancient Guesten Chapel of St. Augustine's College at Canterbury, there has been erected a reredos in the memory of the late Right Hon. A. Beresford Hope and the Rev. E. Coleridge, the founders of the college. It is of bronze, with aluminium figures, and has been carried out from Mr. R. H. Carpenter's designs by Messrs. Singer and Forsyth.

The Société du Souvenir Français has decided to cause to be erected at Waterloo a monument to the memory of the French soldiers who fell on that battlefield.

The new bridge which is to be built across the North River at New York, in accordance with the Bill unanimously passed by Congress on Friday, will be seven miles long, extending from Hackensack Heights, New Jersey, to a point beyond New York city not yet determined upon. The estimated cost will be £8,000,000. The bridge will have eight tracks, for railways, vehicles, and foot-passengers.

Mr. John Hutchinson, R.S.A., of Edinburgh, has just completed a bust in marble of the late Dr. William Wright, Professor of Arabic, Cambridge, which is to be placed in the Library Hall of the great English University, in which for so many years he was a teacher.

The Victoria Parade at Pwllheli, South Carnarvonshire, was inaugurated by the Postmaster-General last week. It has cost £1,000, and consists of an esplanade 60ft. wide and covered with asphalt, protected by a sea wall 250 yards in length, while on the landward side is a roadway 45ft. in width. The designs have been prepared by, and carried out under the superintendence of, Mr. R. G. Thomas, C.E., Menai Bridge, and executed by Mr. Evan Williams, contractor, Garth, Bangor. A site has been reserved for the erection of an hotel, the preparation of the plans having also been entrusted to Mr. R. G. Thomas. Already several lodging-houses are springing up in Victoria-road, the architect being Mr. O. M. Roberts, of Portmadoc.

The site of the old Lyceum Theatre, which has been vacant for some time past, situate off High-street, Sunderland, has just been acquired by the Salvation Army for £2,000. Mr. J. Williams Dunford, architect, of 101, Queen Victoria-street, E.C., is preparing plans for the erection on the same of a large citadel capable of accommodating 3,000 persons, at an estimated cost of £3,500.

## CHURCH FITTINGS.

AN ordinary meeting of the Royal Institute of British Architects was held on Monday evening, Mr. Alfred Waterhouse, R.A., the President, in the chair, when Mr. John P. Seddon read a paper on "Church Fittings," illustrated by many drawings and photographs of works carried out from his own designs. It is, he remarked, a question depending on the special circumstances of each case how far the fittings of a church should correspond in character with the architecture of the fabric. It is doubtful, as this age possesses no special style of architecture of its own, whether artistic harmony or archaeological consistency be the more important. A good rule where an old church is concerned is to leave it alone; but when one has to be refitted, its furniture should not be of an earlier, but may be of a later, style than that which is the prominent one of the structure; while with regard to wholly new buildings, they and their contents should certainly correspond. The introduction of novel materials or modes of workmanship, and of the highest class of the subsidiary arts employed, may well serve to distinguish church fittings as being of the 19th century, and not merely slavish copies of old examples. As to church planning, the native Gothic style is elastic enough to admit of any change needed to accommodate modern use and ritual; whereas that now fashionable for secular architecture does not seem, even in its *chef-d'œuvre* of St. Paul's Cathedral, to have been able to assimilate a frank expression of constructional and ecclesiastical needs with its empirical rules of design. Simplicity of plan and amplitude of scale are more preferable for modern use than elaborate but diminutive detail. Church fittings, without reckless abandonment of precedent, should, he considered, as a first requisite subserve utility, but may at the same time be made objects of beauty, and admit of ornamentation of high class and varied nature. Among them fonts have in past times been distinguished by the lavish thought and art bestowed upon them and their accessories, and nowhere more so than in this country. Those of the Norman period are generally the richest and most vigorous; those of the 13th and 14th centuries are more refined in their ornamental detail, but display less fancy in design; the Perpendicular fonts of the 15th century are no longer grotesque, but graceful in proportion and more appropriately enriched. The exquisite canopied spire of the font cover of Ufford Church, Suffolk, and the noble baldachino-like inclosures of the fonts of St. Peter Mancroft Church, Norwich, and of Trunch Church, Norfolk, were referred to as examples of the magnificence often indulged in as regards this particular feature of church fittings in the 15th century. We have now at disposal for the purpose still richer marbles, with cloisonnée and other kinds of mosaic, and the zealous services of able sculptors if we would only employ them. In the fonts of Llandaff Cathedral, Rotherham Church, St. Margaret's Church, Westminster, and others, executed from the designs of the author, some of these means have been made use of as far as funds have permitted. Pulpits, as Ruskin has said, may be over-ornamented, and in some of the extravagant examples in Continental cathedrals this has obviously been the case; yet the moderate richness of design seen in the specimens collected and published by Mr. F. T. Dollman from old churches in England cannot fairly be so censured. In the pulpit in course of erection for the choir of Norwich Cathedral, in honour of Dean Goulburn, from the designs of the author, the material employed is oak; that for Llandaff Cathedral is in stone, with marble columns, while others are entirely of marble, as at St. James's Church, Paddington, and Betchworth Church, Surrey, in the latter mosaic having also been extensively employed. The use of lecterns as the places in churches where the lessons are read dates only from the 17th century. Many old examples of lecterns are, however, to be found, and those which take the form of eagle-desks were no doubt intended for the reading of the Gospels from the north side of the sanctuary, and other simpler ones were provided for the Epistles to be read from. As one lectern only is now employed in moderate-sized churches, there seems no reason to object to this being of the eagle-desk variety. This is generally made in brass. That at Llanbadern Church, near Aberystwith, has an eagle made in majolica ware, with stone support. The altar, with its

surroundings, is, of course, the principal object in a church. The altar-table should be of sufficient width and height—not less than 8ft. long, as a rule, nor more than one-third the width of the chancel; 3ft. 5in. is the minimum height, 2ft. 3in. is sufficient for the width, as such will permit of the retable being then conveniently reached. The table itself does not require elaborate ornamentation, as its purpose is to be vested with rich altar-cloths; at the same time, it should not be mean. Wood is the material most in use, but the altar-shelf behind it should be a part of the structure of the east end, and may be of stone or marble built into it. The reredos is the background to the altar-table, and is enriched in order to concentrate attention to that. Consequently it should not appear as if its object were to draw all eyes to itself. Even though the whole east end be combined into one scheme of decoration, prominence should be given to what is the reredos proper—the immediate background of the altar-table, extending but little on either side of it, and rising to no great height above it, and not encumbered with sensational sculpture. This is the position generally chosen for a carved panel representing the Last Supper—a subject essentially picturesque in contradistinction to sculpturesque, and in white marble ineffective at a distance. Such a panel was placed in the reredos designed by the author for St. James's Church, Paddington, to his great regret. In St. Saviour's Church at Bath the reredos is of stone, executed by Mr. Hems, with a white marble cross in the central panel surrounded by foliage, with seven doves; and in the side ones are the four Evangelists' emblems, and all are in high relief carved in alabaster. The seats for the congregation are the principal fittings for a church, and it is essential that they should be comfortable, and yet not conducive to lounging, and that they should afford proper facilities for kneeling. The variation of practice in so simple a matter is astonishing, and the subject is now under the consideration of the Committee of Architecture of the Incorporated Church Building Society. Mr. William Butterfield has given his views, founded on great experience, in a pamphlet entitled "Church Seats and Kneeling-Boards," which deserves consideration. Mr. Seddon showed an attempt to provide suitable kneeling accommodation in cases where churches are furnished with chairs instead of fixed seats, which has been worked out by Mr. J. Coates Carter, joint architect with himself for Grange Town Church, near Cardiff. Church screens are objects of extreme importance with regard to the effect of church interiors, but against them there is a modern prejudice, and in one diocese they are all but prohibited. They have, however, a useful purpose as marking the separation of the sanctuary from the congregation, and, aesthetically, a church seemed, to Mr. Seddon, unfurnished without one. Wood is the ordinary material employed for screens, and admits of great variety of treatment, whether simple or rich. Mr. Seddon urged that in designing architects should, whenever able, call to their assistance sculptors and painters; and thus, by re-establishing the unity of the arts which is an essential to their success, strive to enlist the sympathy and interest of the public, and render our churches once more museums for the people.

## CROSSE'S VENTILATOR.

THE danger of breathing vitiated air is now so generally recognised that the smallest builders see the necessity of providing in dwelling-rooms some means for the exit of foul air; but seldom does one find any means provided for admitting fresh air. The inventor of the ventilator under notice, in designing what is now known as Crosse's Invisible Flush Inlet Ventilator and Disinfectant combined, has given us a means of admitting fresh air without in any way interfering with the decorations of the room, or taking up space. The Crosse ventilator is a well-made cast-iron box. At the bottom of the tube is a movable well for the purpose of placing disinfecting fluid, mixed with water. These preparations giving off ozone, it is claimed that the air admitted, united with their vapours, is richer in its vital properties than if admitted without. The fluid in the well at the same time acts as a filter, by taking up the dust from the air in its passage through the tube. The back of the ventilator being movable, it can be fitted to any wall from 9in. upwards. The ventilator is

suitable for buildings of any size; and for dairies, cow-sheds, and stables it is invaluable, as cattle cannot gnaw it; and as it can be placed immediately over the manger, it insures each animal getting a perfect supply of fresh air without draught. Messrs. Comyn Ching and Co. have taken up its manufacture, and that is sufficient guarantee that its workmanship is of the best quality.

## DEATH OF MR. WILLIAM BROWN.

LAST Saturday at noon the mortal remains of Mr. William Brown, who for the last thirteen years has had charge of the works (under his employers, Messrs. Longmire and Burge) that Lord Grimthorpe is carrying out at St. Alban's Cathedral, were carried by sorrowing men, whose labours he had so long directed, into the nave of the Abbey he knew so well, and after a preliminary service they were taken to St. Alban's Cemetery and buried. Mr. William Brown, like the late Mr. Chapple, so long associated with him as clerk of works, was a West-country man, having been born at Merevale (sometimes written Merrivale), a village near Tavistock, in Devonshire, on Oct. 19, 1832. He spent the earlier part of his career in the West, principally at Tavistock, and came to London in 1864. There he entered the employ of Messrs. Longmire and Burge immediately afterwards, and remained with them to the day of his death. He possessed the fullest confidence of the heads of the firm, and acted as its representative throughout the whole course of the works at St. Alban's, which Lord Grimthorpe is carrying out, it is said, at a personal cost of considerably over £100,000. Mr. Brown lost his wife last year, which shook him a good deal, and he himself was taken ill towards the end of last December with congestion of the lungs, liver, and kidneys. He gradually got weaker, and on Monday night, the 7th inst., matters assumed a very dangerous state. He never recovered consciousness afterwards, and at ten o'clock the next morning passed peacefully away, at his residence, Holywell Hill, St. Alban's, in the presence of all his sorrowing family.

## CHIPS.

On the completion of the restoration of the old Parliament Hall at Edinburgh Castle it will be placed in charge of the senior Ordnance Store officer in Scotland, and be adorned with decorative arms and armour. It will be open to the public without ticket or fee daily (Sundays excepted) during four hours in winter and six in summer.

The partnership between Messrs. Barton and Jefferson, Princes-street, Westminster, architects, has been dissolved.

The Glasgow Corporation Water Committee have given the contract for the construction of the Blane Valley portion of the new aqueduct which is to connect Loch Katrine with the Mugdock and Craigmaddie reservoirs to Messrs. James Young and Co., Glasgow. The contract extends over about 5½ miles of ground.

The magistrate at the Southwark Police-court imposed on Tuesday fines amounting to £21 7s. on the owner of a house in Surrey-row, Blackfriars-road, for failing to comply with the order of the St. Saviour's Sanitary Authority to put the premises in proper sanitary condition.

A new organ built by Mr. Joseph Tucker, of Bourton, Dorset, was opened at the Wesleyan Chapel at Norton Down, Somerset. Mr. Orlando Baker, of Swindon, was the architect.

Messrs. Archibald Smith and Stevens have received instructions to erect one of their "Reliance" hydraulic lifts at the Badminton Club Chambers. They are also erecting similar lifts at Ashley Mansions, Victoria-street, Westminster; at Chambers in Throgmorton-avenue for Mr. J. Morris; at the Blue Hart-court, for Messrs. Cosh and Co.; at Chesterfield-gardens, for Mr. J. W. Beer; and for Messrs. Carruthers Bros., of Luton.

A new mission church in connection with the parish church has just been opened in Satchwell-street, Leamington. The whole of the interior fittings, including the lighting apparatus, have been supplied by Messrs. Jones and Willis, of Birmingham and London. The same firm has also been intrusted with the execution of a reredos of carved oak for Christ Church, Coventry.

Six large shops and citadel buildings capable of accommodating 1,000 persons are to be erected in the High-street, Walthamstow, for the Salvation Army. The total cost will be about £4,500. Mr. J. Williams Dunford, of 101, Queen Victoria-street, E.C., is the architect.

## Building Intelligence.

**BOLTON.**—The inauguration of the Drill Hall and Riding School for the Bolton troop of the Duke of Lancaster's Yeomanry took place on Saturday. The buildings have been built from designs by Messrs. Bradshaw and Gass, of Bolton. At the entrance is a lecture hall, 36ft. by 21ft., and above this are store-room, dressing-room, &c. The lavatories are on the ground floor. The drill hall is 120ft. by 43ft., and lofty. The interior walls are of local-made patent bricks, the sides being arched with semicircular arches, and relieved by lines of moulded bricks. The roof principals are trussed with light iron rods. Along the whole length of the building, and supported by cast-iron trusses, is a ventilating roof-light, semi-octagonal in form. The glazing here has been done by the British Glazing Company, of London. The floor of the riding school has been covered with tan bark and sawdust, mixed together and deposited in layers, the total thickness being 18in., and to avoid the possibility of a rider being hurt by his horse getting too near the wall, the dado, which is of pitch-pine, and 5ft. 2in. high, is made to slope, projecting at the foot. There are no internal columns; a clear view of the interior from end to end being thereby secured from any point. The exterior walls of the building are constructed of pressed bricks, the treatment being left plain, but relieved by being divided into panels, with over-sailing courses at the top. Immediately adjacent to the drill hall is the riding yard and parade ground, fenced round, but uncovered; it is 245ft. long and 164ft. wide, levelled, and laid with cinders, which are well rolled, and constitutes a first-class equestrianising area. The contract was let to Mr. William Bryce, builder, of Hanover-street, Bolton; the sub-contractors being—for the excavating and draining, Mr. William Pollitt, of Pool-street, Bolton; brickwork, Mr. James Hamilton, of Altrincham; and stonework, Mr. John Dickinson, Bark-street, Bolton.

**EDINBURGH.**—The increase of business at the General Post-Office has been so enormous, it has become absolutely imperative that additional accommodation should be provided without delay, and plans are now in course of preparation by Mr. W. W. Robertson, of H.M. Board of Works, by which additions are to be made to the building at a cost of £30,000. These consist of an extension of the south front of the present building to the eastward, over some unoccupied ground adjoining the railway. The present elevation will be extended to about double the present width, and when completed will form a façade about 180ft. long and 100ft. in height. Over the present sorting office an additional story will be erected, and the north-eastern angle of the building, behind the Revenue Office, will also have a story added to it. The telegraph department will be transferred from the basement to the top story. It is expected that a commencement will be made with the additions in the course of the present season, but they will be carried on slowly and by piecemeal.

**CARLISLE.**—The Board schools for infants which have been erected in Ashley-street, Caldewgate, at a cost of £2,500, were opened on Tuesday week. The schools will accommodate 300 infants. The schoolroom measures 41ft. 6in. by 24ft.—is heated by a large hot-air stove, and is lighted on the east side by sash windows, and on the west by two dormer windows. There are also two large galleries, each having accommodation for 50 scholars. At one end is a baby-room, with a French gallery, with accommodation for 80 children, and also two classrooms, with platform and immovable desk for 60 infants. Between the classrooms and the vestibule, the mistress's room is situated. The flooring is of wooden blocks. On the north side of the site is the covered playground, 44ft. by 24ft., and a caretaker's house. The contractors have been: building work, Messrs. J. and W. Laing; joinery, Mr. J. Reed; plumbing, Messrs. W. and R. M. Hill; plaster work and concrete floors, Messrs. R. M. Ormerod and Son; slating, Mr. Nanson; painting and glazing, Mr. W. Palmer; and ventilation, Messrs. R. Boyle and Son, London.

The corporation of the Trinity House have decided to build an additional lighthouse on the Yorkshire coast between Flamboro' Head and Spurn Point, and the site selected is stated to be at Withernsea.

## COMPETITIONS.

**LEEDS.**—The Corporation of Leeds have awarded to Mr. John Johnson, A.R.I.B.A., of Queen Victoria-street, London, the second premium of £25, for his design for the proposed galleries in the Victoria Hall. Mr. W. H. Thorpe, of Leeds, was awarded the first prize, and his plans have been confirmed, as we stated last week. The work is now to be commenced.

**LONDON.**—Seventy designs have been received by "The Tower" Company, Westminster, for the "Watkin Tower," proposed to be built in London. The jurors have not yet made their award, and the drawings are not yet open to public inspection, neither have the competitors seen them. As might be expected, some of the designs are eminently original, and as examples of novel construction are interesting. We shall give an account of them shortly.

**RAMSGATE.**—At a meeting of the Ramsgate Town Council, on the recommendation of the Sands and Cliffs Approaches Committee, Mr. W. A. Valon, C.E., Engineer to the Gas and Water Department, was appointed the engineer to the Corporation for the purpose of preparing the plans and specifications to be annexed to the proposed agreement with the Board of Trade relating to the improvement of the sea front. The committee recommend that the plans and specifications relating to the proposed front improvements as now submitted by Mr. W. A. Valon be forwarded to the Board of Trade for their approval. The improvements may be summarised as under. The north side of the inner harbour is to have a new sea-wall extending from the corner of Harbour-street to the west end, which gives an opportunity of building the front walls of the ornamental arches on the present wall of basin, and forms a good wide road in front of them. On their completion it is intended to clear away the Harbour Stores, Customs' House, and harbour-master's house, at present in the pier yard, and throw it open to the sea, thus widening and improving the approach to the L.C. and D. Railway Station, making the road in some places 75ft. wide. On the completion of this work, the Albion Hotel will be removed and a road formed, rising at a regular gradient from Harbour-street, so that when the whole is finished there will be an easy and improved approach to both cliffs. By the deepening of the basin, coal-vessels and merchant ships will unload alongside the new Military-road and Crosswall opposite, leaving that part immediately facing the hotels and streets clear for gentlemen's yachts. The total cost of the improvements, including compensation, but without recoupments, which will be considerable, amounts to about £65,000.

H.M. Board of Works have accepted the tender of Messrs. Foster and Dicksee, at £49,833, for the erection of the superintendent's office, new Bankruptcy Offices, in Carey-street, Lincoln's Inn.

At a meeting, on Monday, of the Town Council of Yeovil, a committee appointed to consider the borough surveyor's duties, recommended that the present surveyor be offered an appointment as consulting surveyor, at a salary of £100 a year for five years, and that a borough surveyor be advertised for, at a salary of £350 a year. The recommendation was adopted, and Mr. Vining (the present borough surveyor) thanked the Council for their consideration, and hoped he should live to see the end of the term.

At Sheffield on Tuesday the Earl of Carlisle, by the invitation of the corporation, opened the re-organised Ruskin Museum, which has been removed from the suburb of Walkley to Meersbrook Park, a piece of ground recently acquired by the corporation, who offered to Mr. Ruskin and the St. George's Guild the use of the Hall, a spacious mansion, on condition that the collection should remain at Sheffield for twenty years at least. The museum contains specimens and reproductions of some of the most beautiful art work in existence, selected by Mr. Ruskin.

The prizes offered by the Drawing Society have been awarded as follows to the drawings now on exhibition:—Sir Frederic Leighton's prize to W. K. Hinchliff, Sir James Linton's to C. Francis, Sir John Gilbert's to J. Mothersole, G. F. Watts's to D. Stockings. Of the 62 schools competing the following have received the largest number of awards:—Clapton High, Rochester Mathematical, Sevenoaks, Walthamstow-hall, Camden, Clergy Orphan, Kensington High, Cambridge, Westward-Ho, Gravesend Proprietary, Halifax High, Bradford Girls' Grammar, Sheffield.

## ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

**EDINBURGH ARCHITECTURAL ASSOCIATION.**—At the usual meeting of this association, held on the 10th inst., a paper on "The Accessories of Architecture" was read by Mr. John Keppie, the president of the Glasgow Architectural Association. Professor Baldwin Brown (president) occupied the chair. The subject of site, which is one of the most important with which the architect has to deal, and which in a great number of instances does not receive the attention it deserves, was the first accessory to which attention was drawn. Comparison was made between the setting out of cities in Britain and on the Continent, considerably to the advantage of the latter. Paris particularly was alluded to as a city in which most of the fine buildings were beautifully situated, and the lecturer said that, consequently, they received a much greater degree of public appreciative attention. The use of sculpture work and metal was next alluded to as valuable aids to the architect, not only on account of fine form, but of the texture and colouration of which they were capable and which was as valuable in architecture as in painting. Some remarks were made on the correct method of designing in different materials, such as cast-iron and plaster. In concluding, the lecturer said that, owing to the increase of interest in the various accessories, these arts were now in a more flourishing condition than they were fifty years ago, and, consequently, architecture ought now to be, if it was not, more interesting and thorough than it was then.

## CHIPS.

The boring operations at Lyndhurst for the local gas and water company have resulted in finding a good supply of water at a depth of 125ft. Messrs. Schofield and Lacey are the contractors.

The new stained glass just placed in the west window of St. John's Church, Chester, at a cost of £1,000 borne by the Duke of Westminster, was designed by Mr. Edward Frampton.

The John Bright Memorial Committee, at a meeting held at Manchester on Friday, decided to give a commission for a statue of Mr. Bright, to be placed in some prominent position in Manchester, to Mr. Bruce Joy. A sketch model of the proposed statue was shown, and Mr. Joy's suggestion was adopted that the statue should be in Sicilian marble, and from 9ft. 10in. to 10ft. high, on a pedestal of 12ft. The cost is to be £2,700.

A new recreation hall at Coton Hill Asylum, Stafford, was opened last week by a ball. The room is 54ft. by 28ft., and 24ft. in height. The windows are filled with stained glass, and the floor is of polished pitch-pine. Mr. N. Joyce, of Stafford, was the architect, and Mr. Jervis, the builder. The cost was £1,600.

Mr. Matthew Harris, member for East Galway, died on Monday night, near Ballinasloe, from cancer in the stomach. Deceased, who was 60 years of age, was originally a working bricklayer, but in the *Parliamentary Companion* is described as "architect, builder, and contractor." He had held his seat since 1855.

The public lighting of Chelmsford by electricity was formally inaugurated on Monday night. The light has been installed by Messrs. Crompton and Co. (Limited) whose works are situated at Chelmsford. The three main streets of the town are lighted by means of 18 arc lamps, and the other streets by 200 incandescent lamps, the total annual cost being £873 6s. 8d. This is against £768 formerly paid to the Gas Company for 188 lamps. The contract is for five years.

The chancel of the parish church of Timberland, Lincolnshire, has been enriched by an east window, designed and executed by Mr. Dixon. The subject is the "Institution of the Holy Eucharist." On Palm Sunday this was dedicated in memory of the Rev. C. C. Wheat, who died in 1872, having been vicar of the parish for 30 years.

The local board of Otley, near Leeds, decided at their last meeting to proceed forthwith with a drainage and sewerage scheme prepared by Messrs. Brierley and Holt.

An artist's villa residence is being erected at Burton-on-Trent, for Mr. Geo. Parsons, on the site of the former old Burton Bridge close to the river Trent. The architect is Mr. R. E. Carpenter, M.S.A., of Burton. The contract has been taken by Mr. Jno. Varlow, of Burton.

The contents of the Royal Burg Museum at Nuremberg, embracing the armour and manuscripts and other treasures accumulated by the Landgraves of Brandenburg during many generations, are about to be dispersed by auction.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 90c.). To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

## NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII, XLVI, XLIX, L, LI, LIII, LVI, and LVII may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—A. E. and Co.—L. E. L. B.—B. of B.—B. of G.—J. A. and Son.—H. T. and Co.—J. B.

A. B. O.—(On your facts you seem to have a right of action; but an actual inspection of the premises would be necessary before giving a reliable opinion. You should consult a solicitor.)—H. C. Shaw. (W. H. White, 9, Conduit-street, W.)

## "BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Box" and "N. B." in a circle. ("Box" should not have coloured his drawings. See rules.)

## Correspondence.

## ARCHITECTURAL REGISTRATION.

To the Editor of the BUILDING NEWS.

SIR,—Before the question of Registration goes any farther, it is as well to understand what an architect is and what he is not.

In the opinion of some of the speakers at the Institute meeting, an architect is a "member of a learned profession," "the servant of the public," "nothing if he is not practical," and architecture is a business about which "there is a certain amount of fine art, more or less."

We all know that a certain section of the public hold this view of architects and architecture; but surely even the most humble "servant of the public" has, at any rate, a vague idea that architecture is an art and not a matter of "light and air," drains, diameters of cast-iron columns, and the like, and that an architect is an artist, and not a sort of compound animal, partly builder, partly lawyer, and the rest policeman to see that the builder does not cheat.

Of course, if architecture is a learned profession and architects learned professors, let them be examined, found correct, and registered without loss of time.

It is an old remark that building is not necessarily architecture; but apparently this truth is not generally accepted, and many seem to think that building, at any rate when it is ornamented, is architecture.

An architect must possess a very considerable

amount of technical knowledge, but this is a means to an end, not the end itself.

By all means let the Institute examine and give certificates of proficiency in technical knowledge, but let us once for all face the fact that it is the one quality that makes an architect which cannot be tested by examination.

Let people once realise what an architect is (and in order to do this architects must make haste to realise what they are meant to be themselves), and there will be no necessity for Registration; only those who are fit to do the work will get the work to do; the "business architect" must call himself by another name, and the "undertaker architect" can bury himself.

Finally, let our endeavour be to get altogether out of our minds the "learned profession" idea, and remember that the only reason for our existence is that we may—in the words of the Architectural Association motto—"Design with beauty and build in truth."—We are, &c.,

ERNEST NEWTON,  
MERVYN MACARTNEY,  
JOHN BELCHER.

## R.I.B.A. EXAMINATIONS.

SIR,—*"Goth"* is invariably lively and often amusing; but I blushed to read his grave insinuations against the Board of Examiners of the Institute, though I do not believe that they were advisedly made, and certainly his "Notes" of the past week confirms that belief; but he calls to his aid a paragraph from the Architectural Association Notes, where Mr. Fred. M. Simpson undertakes to define the requirements of candidates for the examination as being no more than "elementary knowledge."

Well, it is just that practical knowledge—elementary knowledge, if you like (the greatest engineering work of the age, the Forth Bridge, is elementary in principle)—which makes the architect respected on the works. With the higher calculations which must necessarily be done at the office the builder rarely troubles himself, for he is not responsible if the design is at fault. Recently I was engaged upon work where I had undertaken both architect and builder's duties, employing my own men and paying weekly wages. I had occasion, during the progress of the work, to change my plumber. My new man must have had some conversation with the other man on the job before I appeared, for he soon took the liberty of saying that for what I had spent on the plumbing he could have done the work throughout, and made "a good sanitary job of it." I made no reply, but merely asked him how he would set to work on the job I had called him in to do (bath waste and draw-off sink adjoining). He would "join the sink waste to the bath waste." *The sink was considerably lower than the standing level of the water in the bath*, so I asked him to contemplate the result to the ceilings below when the bath waste happened to be stopped beyond the junction with the sink waste. He was contented therefrom to follow my instructions, and after all proved to be a very decent workman.

"Goth" declares himself "open to conviction." I will endeavour, from my own experience of the examination, to refute the statement, and to remove from his mind such an erroneous expression, so far as I can recall the circumstances of six years ago. But, in order that he and others may estimate the value of what I have to say, it will be necessary to say briefly what my experience had been prior to passing the examination.

I was six years a pupil and a year as assistant in a provincial office. Then I had the good fortune to enter Mr. Waterhouse's office as an assistant, and had for eight-and-a-half years worked under Mr. Waterhouse's instructions and personal supervisions, preparing first the sketches, then the working drawings, and frequently practically the whole of the detail drawings of works of varied character, and some of considerable magnitude. During the same period I also worked fairly industriously out of office hours.

Consequently, I was not unjustified in assuming that my qualifications should be equal to any reasonable examination, without special preparation, excepting a little quiet "at home" reading up of history. I was not mistaken in that view; but the examination was a week of really hard work. The questions were not to be called hard questions; but they were practical and very numerous and comprehensive, requiring

prompt application of knowledge, or many would remain unanswered when the time was up. Reference to notes or memorandums of any description was not allowed, nor was there any intimation or possibility of gaining information of the nature of the questions (in that respect the candidates of later years were better off, for the questions of previous years are now published). The examination was in periods of three hours morning and afternoon, no leaving the room upon any pretext during that time, and upon each occasion a fresh paper. In one instance only did the subject extend over morning and afternoon, that was in "Design." The subject, a Provincial Mechanics' Institute, site at least 100ft. by 50ft., and accommodation consisting of about twenty rooms, including a lecture-theatre, and with restrictions as to the position of some of the rooms. This we were to design and give to one-eighth inch scale, plans of each floor, sections, and elevations—in six hours. I never worked harder either before or since than I did during that spell of six hours. Here let me say that the knowledge of one style of architecture was not enough; Gothic men were expected to know something of Classic—Classic men of Gothic. I had selected 13th-century Gothic (a style I have long ago forsaken for secular work). Finally came the "oral examination," each candidate being seen separately. The examiners sitting on one side of a table and the victim—pardon, I have heard it pathetically described as "waiting to go on the rack"—the candidate placed opposite. After a few ordinary questions I was requested, then and there, to "Sketch a Greek Temple."

Membership of the Institute I did not seek nor value whilst it was to be obtained easily; but when it became "membership only by examination," I thought it both desirable and valuable, and this I believe to be the motive which is now inducing so many to present themselves for that which is not too easily obtained.

Let me now suggest that both "Goth" and Mr. Simpson should go in for the examination. If I am not much mistaken, they will thereafter write of it with respect, at any rate with *practical knowledge of the subject*.—I am, &c.,

T. FREDK. PENNINGTON.

Bedford Park, W., April 15.

## "REGISTRATION" AT THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

SIR,—At the special general meeting held under the chairmanship of the President, Mr. Alfred Waterhouse, on March 31st, in his speech at the close of the debate the President said:—"The two leading provincial societies (Manchester and Liverpool) were dead against it" (Registration). As referring to the former, this is far from correct. The Manchester Society, with a membership of about fifty, no doubt supports the Institute; but the Association, with double that number of members, has petitioned Parliament to pass the Bill.—I am, &c.,

J. SPENCER HODGSON.

Manchester, April 14.

## THE ARCHITECTURAL ASSOCIATION.

SIR,—I cannot agree with your remarks on the President taking the chair for a second year in imitation of the R.I.B.A. and the S.A. In the A.A. there are two excellent vice-presidents, either of whom would perform the duties well, and nobody deserves the honour more than Mr. T. E. Pryce. If the two vice-presidents will not accept office, there are plenty of past vice-presidents who might undertake the duties. A president serving for a second year looks like stagnation, and shows that the A.A. is not the success it once was. I admit that Mr. Cole Adams served for two years, but under special circumstances, and there are no special circumstances this year.

There is still time to remedy this grave defect and get somebody nominated.—I am, &c.,

OBSERVER.

## PROVISIONS IN QUANTITIES.

SIR,—Adverting to your admirable article on "Provisional Amounts" in your issue of 4th inst., I should be much obliged if you would allow me the privilege of laying the following before the interested public, through the medium of your influential columns.

In connection with provisions there exists at present among certain quantity-surveyors, what ap-

pears to be a most reprehensible practice frequently resorted to by them, unknown to the client, and presumably so, in many instances, by the architects, whereby provisions are insidiously inserted, not of amounts, but of quantities, such as immediately following "Cube yards. Excavate, &c., &c." we find "200 do. do. do. provisional," and after "yards cube concrete," "200 do. do. do. provisional," and similarly after the brickwork in rods, and the timber in feet cube, and so on.

These quantities all help to swell the amount of the tenders, and consequently the surveyor's commission, and it seems scarcely the correct thing that a man should be entitled to 2 per cent. commission on the amounts they produce for simply writing these items down, or that the client should be charged with this commission for quantity-taking when there is none done. This, however, is not the worst, or the last of it, for when the works are completed, and the accounts made up, these provisional items, with their attendant amounts, are deducted from the contract amount, and crop up again in the form of a "bill of omissions" on which 2 per cent. commission is again charged. I am aware the plea is advanced that these omissions are set against the extras, and that the client will be delighted to find he has had some subsequent additions carried out for little, or possibly no, extra cost on the original contract; but then there is also 2 per cent. commission charged for these very extras. It is the principle of the thing that is bad. Two wrongs do not make a right, and the fact still remains that the surveyor twice charges 2 per cent. commission for doing nothing at all. No doubt it brings grist to the mill; but is it right?—is it perfectly straightforward and above board, for professional men belonging to an honourable body like the quantity surveyors to indulge in this practice? As these provisions are noticeably becoming more and more frequent in bills of quantities, I should be glad to hear the opinions of some of your readers on the subject.—I am, &c.,

TWICE CHARGED.

#### THE RIGHT OF SELECTION OF BUILDERS' EMPLOYER.

SIR,—We inclose copy of a paragraph inserted in bills of quantities for erection and completion of new showrooms and factory (from ground-floor level) in Davies-street and South Molton-street, Berkeley-square, for Messrs. Bolding and Sons, together with copy of our letter declining to tender under such conditions. We think builders as a whole ought to resist such interference with the management of their business, and this is the reason we send you the particulars, in case you may desire to make any comment in your paper upon this matter.—We are, &c.,

HIGGS AND HILL.

Crown Works, South Lambeth-road,  
London, S.W., April 12.

#### PARAGRAPH INSERTED IN BILLS OF QUANTITIES.

Memo.—The present foreman of works to be retained and employed during the carrying out of these works, at a salary of £3 10s. per week.

#### COPY OF LETTER SENT TO ARCHITECTS.

Crown Works, South Lambeth, S.W.,  
April 12th, 1890.

Messrs. J. T. Wimperis and Arber.

DEAR SIRS,—As we notice in the bills of quantities for Messrs. Bolding and Sons' showrooms and factory a clause stating what amount of wages we are to pay our foreman, and stipulating the man we are to employ, we must decline to send in a tender for the work. We will not submit to have our freedom of action interfered with as to who we shall employ and what we shall pay, and we do not think Messrs. Bolding themselves would submit to be controlled in a similar way by outsiders in the conducting of their own business.

We remain,

Yours faithfully,  
(Signed) HIGGS AND HILL.

The Dean and Chapter of Chester Cathedral have just fixed a tablet on the north wall of that edifice, in memory of Mr. Robert Platt and his wife, of Stalybridge, Cheshire. Mrs. Platt, at an expense of some thousands of pounds, covered the entire north wall of the nave with mosaics, while Mr. Platt was a large contributor to the restoration fund of the cathedral.

Sir Horace Davey, Q.C., M.P., formally opened on Friday the new schools which have been erected in Oxbridge-lane, Stockton-on-Tees. The schools, which are in the Queen Anne style, have been erected from the designs of Mr. Henry Weatherill, of Stockton, and have accommodation for 829 children; but provision can be made to increase the accommodation to 1,076 scholars. The cost of the buildings is £5,495.

## Intercommunication.

### QUESTIONS.

[10268.]—**The Label in Architecture.**—May I ask if the label over windows is a token of Tudor architecture, or is it found in earlier styles?—WARWICKSHIRE.

[10269.]—**Topmost Story.**—In the by-laws relating to new streets and buildings, such as are in force at Bournemouth, Folkestone, and other towns, do the words "topmost story" apply to the roof space between the rafters and the ceiling joists, which are on a level with the top of walls, or only when the space is occupied by a room; also I should like to know if a house having a ground floor and a first floor and a roof is a two-story or a three-story house, and what thickness must the party-walls be?—BUILDER.

### REPLIES.

[10249.]—**Beam.**—The bending moment of one of the three sections divided by the columns is the product of lever arm at which the weight acts into the weight, and as the load is distributed over one span it will be  $\frac{wl}{8}$ . By removing the columns the length of the lever arm is increased three times, therefore the bending moment will be increased three times. G. H. Ward assumes the load is also increased three times, which it would be if the load were uniformly distributed over the three spans, in which case, of course, the bending moment will be nine times greater than it was when the load was distributed over one span.—G. H. G.

[10265.]—**Sound-proof Fire-proof Floor.**—Sawdust filled in under the floor boards would not be so good as pugging of lime-and-hair mortar. Slag wool packing would be still better. The space under the floor should be filled, and the space between ceiling battens. The construction of the concrete and ironwork is not described; but if it is that usually adopted, the course suggested will be found effectual.—G. H. G.

### PARLIAMENTARY NOTES.

**THE ARCHITECTS' REGISTRATION BILL.**—Owing to the long discussion on the Rating of Machinery Bill, the Architects' Registration measure, which was set down for second reading for Wednesday, was not reached, and it now stands over till Wednesday, the 14th May.

### STAINED GLASS.

**ST. STEPHEN'S CHURCH, BRISTOL.**—The last window on the south side of this church has now been filled with stained glass, the subject being that of the Ascension, which occupies the three lights. In the centre is Our Lord in the act of ascending; beneath Him, on the hill, are St. John and another Apostle kneeling, gazing upwards. On the right and left are groups of the other Disciples, and above them are the two angels descending. The whole has been designed and executed by Mr. Alfred O. Hemming, of 47, Margaret-street, Cavendish-square, W.

**OLDBURY CHURCH, BRIDGNORTH.**—Four south-aisle windows in this church were dedicated on Easter Day, the work and execution of Mr. A. O. Hemming, of London. The subjects are Abraham entertaining the Angels, the Angels appearing to the Shepherds, the Sacrifice of Isaac, and the Crucifixion, the whole being executed with various tints of white glass, with the smallest possible introductions of any possible colour.

The Duke of Fife has consented to open the East Marylebone Free Library on Thursday, May 1.

Mr. Bruce Joy has just despatched to Cloyne a statue of the famous Bishop Berkeley, which is to be placed in the Cathedral of the See over which the great idealistic philosopher presided for eighteen years.

At a meeting of the Tees Conservancy Commission at Stockton, on Wednesday week, Mr. G. J. Clarke, of Milford Haven, was appointed chief engineer to the commission, in succession to Mr. Frederick Jopling, who died recently from influenza shortly after receiving promotion. The salary is £700 per annum. There were 32 applicants for the post. Mr. Clarke, before going to Milford Haven, was successively engineer for the Aberdeen Breakwater Improvements, assistant resident engineer for the Victoria Dock (London) Extension, and was connected with the Bengal Central Railway, Calcutta.

The parish church at Kilmallie is at present being renovated from designs by Mr. D. Mackintosh, architect, Oban, and it has been decided to place a memorial window in stained glass at the east end of the building in memory of the late minister, Dr. Clark. The window has three lights, the centre figure in which represents the Resurrection, and over this is a circular light containing a Celtic cross. One side-light shows the emblems of the law, and the other those of the Gospel. The work will be executed by Messrs. James Ballantine and Son, of Edinburgh.

## Our Office Table.

IN its annual report, just issued, the Northern Heights Footpath Association reviews its work in Hendon and Hampstead, and says it is proposed to publish maps on which all the footpaths and the roads with which those paths are connected will be carefully marked. Another object in view is the preservation of the public rights in Fortune Green, West Hampstead. Counsel have advised that the supposed grants made by the Lord of the Manor are illegal, and that the rights of the commoners remain intact. But, in order to assert these rights, it is necessary that a former copyholder of the manor, who was enfranchised before 1870, should bring an action against the encroachers, and a guarantee fund to meet the expenses of this action is to be raised.

At the annual meeting of the District Council of Edinburgh and the East of Scotland of the National Society for the Registration of Plumbers—an independent body to the London Company of Plumbers, which has also extended its organization to Scotland—held on Saturday afternoon in the Philosophical Institution, Edinburgh, Sir Douglas MacLagan presided, and less than twenty persons were present. Mr. James Rennie, S.S.C., secretary, read the yearly report, which showed that the district council was formed in February, 1888, and that of 173 plumbers who had applied for admission 13 were refused on account of their failure to pass the examinations. Sixteen ordinary business meetings had been held, and two public meetings—one at Galashiels and the other in Edinburgh—and lectures had been delivered. The adoption of the report was carried, and office-bearers were elected.

The finest bridge in Southern India is, according to *Indian Engineering*, the new Chittravati bridge opened last month by Mr. H. R. P. Carter, chief engineer of the Madras Railway, and by Col. C. J. Smith, R.E., consulting engineer for Indian railways. The bridge is over half a mile in length, "and is divided into nineteen openings of 140ft. each spanned by N. lattice girders 139ft. 8in. long, 20ft. wide, and 17ft. deep, supported on cast steel fixed and roller bearings at alternate end." The engineer in charge is Mr. E. W. Stoney.

CALCUTTA is not a city of any architectural pretensions, and, like other cities in India, it has been spoiled by European military engineers and builders. A building council to control the more important building schemes, questions of frontage, and other matters, is talked about; the council to comprise the chief engineer of the buildings branch as president, the engineers of the corporation and port, and two representatives of the building profession in Calcutta. Government red tape and engineer architects have destroyed the amenities of the city.

A memorial stained-glass window, executed by Messrs. Burlison and Grylls, of London, has been placed in St. Michael's Church, Lyndhurst. It is of two lights, the subjects being "Christ blessing the Children" and the "Good Shepherd."

The first section of the restoration of St. James's parish church of West Teignmouth, was completed last week. The church is a perfect octagon in shape, with a domical roof carried on iron columns. The present works have included the replacement of high pews by low seats of pitch-pine, all looking towards the east, and the relaying of new floor, after covering the vaults with Portland cement. Mr. Lloyd, of Birmingham, was the architect, and Mr. Elsworth, of Teignmouth, was the builder. The outlay was £700. The committee have decided to proceed forthwith with the second section of the work, comprising the addition of an apse and two vestries on the south side.

The large east window in St. James's Church at Inverleithen, N.B., built two years ago, has been filled with stained glass, and was the occasion of a special dedication service in this church on Saturday by the Bishop of Edinburgh. The window is entirely filled with figure illustrations appertaining to the Creed. In the two left-hand compartments are the subjects of the Annunciation, Incarnation, Presentation, and Adoration. The central compartment, of wider dimensions, contains larger groups of the Agony and Crucifixion. On the right-hand lights are four scenes of Resurrection and Ascension, with representations above in the tracery of the glorified Trinity and Seraphs. The work was designed and carried out by Messrs. James Ballantine and Son, of Edinburgh.

## MEETINGS FOR THE ENSUING WEEK.

**SATURDAY (To-Morrow).**—St. Paul's Ecclesiastical Society. Visit to the Battersea Churches of St. Mark (3.15 p.m.), St. Peter (4 p.m.), and St. Mary by the Park (4.45 p.m.), under the direction of Wm. White, F.S.A.

**MONDAY.**—Royal Institute of British Architects. Special Business Meeting, 8 p.m.

**TUESDAY.**—Society of Arts. "The Danube and its Trade," by Sir John Stokes. 8 p.m.

Institution of Civil Engineers. Discussion on "Electricity for Welding and Stamping." 8 p.m.

**WEDNESDAY.**—Society of Arts. "Coal in the South-East of England," by W. Whitaker. 8 p.m.

**FRIDAY.**—Institution of Civil Engineers. "Applications of Electricity in Engineering Workshops," by C. Frewen Jenkin, B.A. 7.30 p.m.

**Architectural Association, 9, Conduit-street, W.**—April 26. Visit to Albert Gate Mansions, Messrs. Archer and Green, architects. Meet at 3 p.m.

FRED. R. FARROW, Hon. Secs.  
ERNEST S. GALE.

## CHIPS.

During the ceremonies of Holy Week a fire broke out in the Chigi Chapel of Sta. Maria della Pace amongst the decorations of the altar, and destroyed one of the 16th-century pictures of the chapel and an important picture by Baldassare Peruzzi. The "Sibyls" of Raphael barely escaped the fate of the "Peter Martyr" of Titian and the great altar piece of Bellini, which were burnt at Venice by a similar fire.

The works in connection with the women's jubilee memorial of the late Prince Consort in Windsor Great Park are progressing satisfactorily. The bronze equestrian group by Sir E. J. Boehm is finished, and Messrs. Macdonald, of Aberdeen, are constructing the base and pedestal around the foundation-stone laid by the Queen in the jubilee year. The foundation stone will be entirely concealed. The bronze casting, owing to its height (16ft.), will not pass under the railway bridges, and will consequently have to be conveyed from the foundry by road. The statue will face Windsor, and dedicatory inscriptions in English, Latin, Gaelic, and Sanscrit are being cut in relief upon the panels. The memorial will be over 33ft. high. The unveiling will take place about May 6 or 7.

The foundation-stone of St. Cuthbert's Roman Catholic School Chapel, Slatford-road, Gorgie, near Edinburgh, was laid on the 10th inst. by Archbishop Smith. The building will serve the double purpose of a school and a chapel, and is Gothic in character, plainly treated. There will be room in the school for 160 children, and when it is used as a chapel the building will hold about 300 persons. The architects are Messrs. Buchanan and Bennett, George-street, Edinburgh. The cost of the building will be about £1,700. A church for 600 persons will hereafter be erected adjoining the present building.

The Master of the Worshipful Company of Plumbers, Mr. Bishop, and the secretary of that company attended a meeting at Plymouth on Friday, for the purpose of promoting a branch for Devon and Cornwall of the Plumbers' Guild, by which examinations might be held and certificates granted. The Earl of Morley moved a resolution affirming the desirability of establishing a western branch of the Plumbers' Guild. Subsequently resolutions were passed appointing a council representing the operative plumbers, the master plumbers, and the general public in about equal proportions.

Mr. W. H. Miles, formerly an architect at Bournemouth, and more recently town engineer at Port Elizabeth, has been elected town engineer and surveyor to the sanitary board of Johannesburg from among 29 candidates. The newly appointed general manager to the Johannesburg Waterworks Company, Mr. Andrews, is also from Bournemouth, where many readers will remember he held in succession to his father, the late Mr. G. R. Andrews, the post of borough engineer.

A miners' hall at New Seaham was opened on Saturday. Designed by Mr. Shields, of Sunderland, the building is Domestic Gothic in style.

A portrait of Mr. Harry Hems, of Exeter, with biographical notice, appeared in the *Western Weekly News* of Saturday last.

Good progress is being made with the scheme for improving the carriage approach to Gloucester Cathedral, to which we called attention in our last issue. A meeting in furtherance of the project was held at Gloucester on Saturday, when it was formally decided to float a company to be known as the Gloucester Cathedral Approaches Co., to raise the £7,000 required to meet the liberal offer of Mr. Knowles. An executive committee was appointed, and the minimum width of the street was fixed at 30ft.

## Trade News.

## WAGES MOVEMENTS.

**ABERDEEN.**—The granite polishers in the employment of three Aberdeen firms went out on strike on Monday, against a rule framed by the masters, that men absenting themselves during working hours without leave should, besides losing their wages for the time so absent, be fined sixpence per hour or part of an hour. A meeting of the men was held, when a deputation waited upon the masters, with the result that the dispute was satisfactorily settled, and the men resumed work on Tuesday.

**ALLOA.**—The operative slaters and plasterers of Alloa have received an advance of  $\frac{1}{2}$ d. per hour on current rates of wages.

**DUNDEE.**—The joiners of Dundee threatened to strike on Monday if the new by-laws proposed by them were not signed immediately. The masters held a meeting on Tuesday, when it was agreed to ask the men to send a deputation to meet and adjust the proposed by-laws.

**EDINBURGH.**—A crowded meeting of joiners was held in the Trades' Hall, Edinburgh, on Tuesday night—Councillor Telfer presiding—chiefly for the purpose of considering the strengthening of their organisation. After a two hours' discussion, it was agreed that it would be advisable, with a view to avoiding strikes, to have a Conciliation Board, formed of representatives of the masters and men, for the purpose of considering matters of dispute. A committee was appointed to draw up a constitution for the proposed Board, to be submitted to another meeting, which will also consider the approaching of the masters on the subject.

**PERTH.**—The master painters have agreed to concede an increase of  $\frac{1}{2}$ d. per hour to their workmen, bringing up their wages from 6 $\frac{1}{2}$ d. to 7d. They decline, however, to increase the extra pay for country work from 3s. to 4s. per week. The men have accepted the compromise.

**Holloway's Pills** purify the blood, remove all obstacles to its free circulation through the lungs, relieve the congested air tubes, and render respiration free, without reducing the strength, irritating the nerves, or depressing the spirits; such are the ready means of escaping from suffering when afflicted with colds, coughs, bronchitis, and other chest complaints.

**EDINBURGH.**—For enlarging the Harperidge reservoir, for the Edinburgh and district water trustees. Messrs. Leslie, Edinburgh, engineers:—  
Young, J., and Sons (accepted).

**GLASGOW.**—For the construction of the Blane Valley section, 5½ miles in length, of the new aqueduct to connect Loch Katrine with the Maydoch and Craigmaddie reservoirs, for the town council:—  
Young, J., and Co., Glasgow (accepted).

**GLASGOW.**—For alterations to windows on the first floor of the Municipal Buildings, for the town council. Mr. W. Young, London, architect:—  
Morrison & Mason, Ltd., Glasgow (accepted) £153 9s. 2d. per window.

**HALBERTON, N. DEVON.**—For reseating in pitch-pine and restoring the Bible Christian chapel and replacing present pulpit by a rostrum:—  
Castle, A., Bow (accepted).

**HAMPTSTEAD.**—For the erection of one pair of semi-detached houses on the Frolgan Mansion Estate. Mr. J. Neale, F.S.A., 10, Bloomsbury-square, W.C., architect and surveyor. No quantities supplied:—

	A.	B.
Langdale, Hallett, and Co., London ...	£6,500	—
Holloway Bros., London ...	5,420	£5,214
Garlick and Horton, London ...	5,395	5,193
Foster and Dicksee, Rugby ...	5,252	4,994
McCormick and Sons, London ...	4,387	4,198
A.—Corsehill stone. B.—Monk's Park stone.		

(The tenders do not include mosaic floors, tile hearths, stoves, mantelpieces, painted glass, door furniture, painting, or papering.)

**HIGHWORTH.**—For alterations and additions to house in Westrop-terrace, Highworth, Wilts, for Mrs. Padley. Mr. W. Drew, M.S.A., 22, Victoria-street, Swindon, architect:—  
Wiltshire, G., Swindon (accepted).

**KINGSBRIDGE.**—For erection of buildings at Instert Farm. Mr. W. M. Tollit, architect. Quantities supplied:—

Yabsley ...	£756	10	0
Ruth and Son ...	723	14	7
Warren ...	640	0	0
Hooper ...	622	10	0
Steele Bros. ...	614	0	0

Lawrence, E., and Sons ... 1,979 0 0  
Ansell ... 1,970 0 0  
Higgs, J. ... 1,957 0 0  
Shurmer, W. ... 1,746 0 0

**LEWANNICK.**—For the restoration of the parish church of Lewannick, near Launceston. Mr. A. B. Peters, of Launceston, architect:—  
Hems, H., Exeter ... £2,045 0 0  
Reed, J., Plymouth ... 1,666 0 0  
Blowey, P., Plymouth ... 1,556 0 0  
Rendle, Callington ... 1,500 0 0  
Rosekelly, Calstock ... 1,325 0 0  
Burt, J., Launceston (accepted) ... 1,250 0 0

**LONDON.**—For pulling down and rebuilding warehouse No 5, Heneage-lane, Bevis Marks, E.C. Mr. H. P. Monckton, F.R.I.B.A., 32, Walbrook, E.C., architect:—  
Greenwood, J. ... £1,153 0 0  
Harrison and Spooner ... 1,087 0 0  
Turtle and Appleton ... 1,013 0 0  
Roome, E. A. (accepted) ... 845 0 0

**LONDON.**—For alterations at Nos 186 and 187, Queens-gate, Mr. T. Searancke Archer, F.R.I.B.A., architect:—  
Builders' work:—Stone, B.  
Decorator:—Witt, T.  
Hydraulic lifts:—Smith, A., and Stevens.  
Heating:—Rosser and Russell.

**LONDON.**—For the reinstatement of office fittings, at the International Headquarters of the Salvation Army, 101, Queen Victoria-street, London, E.C., for General Booth. Mr. J. W. Dunford, 101, Queen Victoria-street, London, E.C., architect and surveyor:—  
Coxhead, J., Leytonstone (accepted) ... £1,107 2 4

# HAWKSLEY'S PATENT TREADS.

Proprietor & Manufacturer: J. WESTWOOD, Jun.

NAPIER YARD, MILLWALL, E.

Telegraphic Address—"Westwood," London. Telephone No. 5065.

Recommended for durability, simplicity, firm footing, elasticity, and are perfectly noiseless; they excel lead, oak, teak, or stone; applicable to wood and iron staircases, new and worn-down stone stairs, spiral and other staircases, footpath flaps to cellars, covers for drains and coal-cellars, flooring for public buildings and aisles of churches, &c., &c.—The best and most durable Tread or Step yet invented.

## STORIES AND PARTY-WALLS.

ONE of the questions repeatedly occurring in towns under the control of the Public Health Act is the meaning to be attached to the by-law with respect to the number of stories and the thickness of walls of new buildings. The question mainly arises in regard to the construction of houses of two or more stories, and turns on the interpretation of the term "topmost story." We shall here discuss the subject from the builder's point of view, and also from that which the framers of the by-laws appear to have taken. Ordinary builders, as well as architects, have been accustomed to regard the term "story" as meaning a floor, or as a space inclosed by walls, not as the space included between the sloping sides of the roof and the triangular ends or gable walls, and they have therefore interpreted the phrase "topmost story" as a floor space constructed or adapted for habitation, whether wholly or partially in the roof or not. According to this construction of the by-law, a house having two floors, the upper one ceiled on a level with the wall-plates and a roof of ordinary construction over, would be called a two-storied house. A three-storied house would imply a third floor obtained either independently of the roof, or partially included within it, having windows or dormers, as the case may be. But the Model By-laws which have been sanctioned by the Local Government Board expressly state, in the interpretation of terms prefixed to the By-laws for New Streets and Buildings, that "Topmost story" means the uppermost story in a building, whether constructed wholly or partly in the roof or not, and whether used or constructed or adapted for human habitation or not."

According to this definition, the word "story" implies either a floor to be used as a room, or merely a space included between the rafters of the roof and the ceiling joists of the story below. This is evident from the words "whether used or constructed or adapted for human habitation or not." But the 18th clause further says that: "(a.) The height of a topmost story shall be measured from the level of the upper surface of the floor up to the level of the under side of the tie of the roof or other covering, or if there is no tie, then up to the level of half the vertical height of the rafters or other support of the roof." (The italics are ours.) Here we have a more explicit statement as regards the vertical height of a topmost story—viz., that it is to be measured to half the height of gable or triangle formed by the rafters, and the clause leaves us in no doubt as to the lower limit of the measurement. It says, "from the level of the upper surface of the floor," and the builder naturally thinks that a floor is meant; certainly not ceiling joists or roof ties. The clause we have considered is the turning-point upon which the rules as to thickness of walls depend, because the rules regulating them are governed by the question of the number of the stories.

Referring to the clauses on the thickness for walls of domestic buildings, we shall see that they have been regulated first by their height, and secondly by their length, the latter being taken between cross or return walls of the prescribed thicknesses. A distinct instruction is given as to height. Clause 20 says: "The height of a wall shall be measured from the top of the footings to the highest part of the wall, or, in the case

of a gable, to half the height of the gable." From these definitions as to topmost story and to heights and lengths of walls, it will be seen that in an ordinary house with span roof the length of wall will be measured between the front and back external walls, and the height from top of footings to half-way up the gable. We have next to apply the schedule to practical cases; and to simplify the subject as much as possible we confine our attention to the smaller class of houses in which the height of party-walls does not exceed 25ft. to 30ft., and their length 35ft.

First let us take walls which do not exceed 25ft. in height. Under this height there are two cases mentioned in the schedule, one in which the wall "does not exceed 30ft. in length, and does not comprise more than two stories," and the other where the wall "exceeds 30ft. in length or comprises more than two stories." In the first case the wall is to be 9in. thick for its whole height; in the second the wall is to be 13½in. below the

that shown in Fig. 2, where the topmost story is partly in the roof. For a wall, then, comprising three stories a 13½in. wall has to be used below the topmost story, as shown at *a*, and the same thickness is required for a wall which exceeds 30ft. in length, but having only two stories. So that a 13½in. wall below the topmost story is required in each case as is clearly the intention of sub-clause *a*. For walls which exceed 25ft. in height and are up to 30ft. high, the old model by-law prescribed 13½in. below the topmost story and 9in. thick for the rest of its height. This clause has been repealed by some local authorities, and the new clause reads thus: "Where the wall exceeds 25ft. but does not exceed 30ft. in height and 35ft. in length, it shall be 13½in. thick below the topmost story and 9in. thick for the rest of its height, and where the wall does not exceed 30ft. in height and is more than 35ft. in length, it shall be 13½in. thick below the topmost story and 9in. thick for the rest of its height." Sections *b b*, Fig. 4, explain this rule, which is in force at Bournemouth among other places. According to this regulation the same section and thickness are prescribed for a wall over 30ft. high and above 35ft. long that are prescribed for a wall 25ft. high and over 30ft. long.

It is unnecessary to enter further into the schedule. From what we have explained, it is not surprising that builders in provincial towns should find it perplexing to follow the by-laws. As we have shown, the clauses are ambiguous; the term "topmost story" is interpreted in a manner that leaves it doubtful what the exact meaning is, though it certainly implies that a space in the roof not inhabited or adapted for the purpose of a story may be considered one. Taking this clause, and the one interpreting the height of topmost story, it appears evident that there are two ways of counting according to the roof construction. First, when the ties rest on the plate-level on the top of walls, the topmost story is the story beneath the ties, as shown by *A*, Fig. 1. Second, when there are no ties the story is the space between the upper surface of floor to half the vertical height of the rafters, as shown by *B*, or as in Fig. 2. To say the least, there is room for misapprehension. When the roof space is left for a lumber-room, and the roof ties made to serve as joists, the space evidently is reckoned the topmost story, and the others beneath count from it, and the party-walls must be made 13½in. thick below the top story; but if there is no floor surface on the tie the house is only of two stories, and the wall can be built of 9in. from top to bottom, although in both cases the height of the wall is the same, or does not exceed 25ft. Why should the extra story make the difference? One would have thought the height of wall and its length ought to be the guiding factors. Builders often utilise their roof span by turning it into a small store-room, but find to their own cost that it renders them liable for a thicker wall. They naturally ask why? All the interests of good construction and sanitary laws could be secured by making the height and length the determining rules without reference to stories. We do not complain of the thicknesses prescribed: we think they are the least compatible with good construction and the non-transmission of heat and sound. As regards three-storied houses we should like to see the thicker wall always adopted. A brick-and-half wall is not too much as a minimum between three-storied houses. All that is needed is a well understood rule of regulating the thickness. If the number of stories be adopted, it should be clearly stated what a topmost story is, and what it is not, so that the question of a story in a roof be understood. With the help of a diagram, the clauses could be rendered intelligible to anyone. Those towns like Liverpool and Manchester which

topmost story, and 9in. thick for the rest of its height. Our sections *a a*, Fig. 3, show these cases. The height is taken half-way up the gable, and the length between the front and the back walls. As this class of dwelling is common in towns, the importance of the rule is evident.

Let us endeavour to determine each of these cases. Suppose the wall does not exceed 30ft. in length, but comprises more than two stories. We have to understand how the stories are to be reckoned, and which constitutes the "topmost story," because till the meaning of the latter is defined it is not easy to say whether a house has two or three stories. Is the roof-space above the plate level a story? If so, then there are three stories in the section we have given. Is the top story to be measured as at *A* (Fig. 1), or as at *B*? The definition of "topmost story" already given seems to show that *A* is the height intended—that is, "to the level of the underside of the tie of roof." If there is no tie, then the story is measured as at *B*. Between these two definitions there is a difference of half the height of roof. Probably the most ordinary arrangement of a three-story house is

have framed new by-laws, have seen the importance of this question, and we shall be glad to record any deviations or modifications that have been suggested or made by local authorities.

The recent appeal heard and dismissed by the Master of the Rolls and Lords Justices Fry and Lopes, brought by a Local Board in support of their trespass in demolishing building without a sufficient notice is another proof of the arbitrary exercise of powers by local authorities, and we are glad to see that the three judges sitting as a Court of Appeal followed the ruling in leading case of "Cooper v. the Wandsworth Board of Works," that local authorities, before demolishing property which transgresses the by-laws, must give full and clear warning to the owner.

#### ROYAL SOCIETY OF PAINTERS IN WATER COLOURS.

WITHOUT doubt the old Water Colour Society in Pall Mall retains its supremacy, in spite of new-comers. There is a capital show of drawings. We can admire the delicate manipulation of John W. North and Paul J. Naftel, the strong and powerful colouring of W. Eyre Walker and R. W. Allan, and the fine impressionism of Clara Montalba and George Clausen. Among the crowd of clever pictures we see on entering, is Arthur H. Marsh's feelingly-painted "Gathering Fuel" (4), a well-drawn study of wooded upland, two women-toilers engaged in earnest labour; Miss Clara Montalba's "Ponte della Paglia, Venice," a delightful piece of colour, radiant in the warm sunlight of which she is so consummate a limner; S. P. Jackson's fine "Watergate Bay"; and Cuthbert Rigby's rich colour study of autumnal woodland. In Paul J. Naftel's "Cliff at Alport" (7) we have one of his subtly-rendered landscapes full of delicacy and tenderness. These Derbyshire views such as the "Lathkill River" (18), the "Village of Alport" (73), and "Old Cottages" (102) charm by their evidence of patient study of colour and atmosphere. We cannot see much beauty in the large picture by H. Clarence White (6), of "Harvest in Cambria." The wildness of the mountain scenery clashes rather strangely with the quiet harvesting operations in the foreground, the masses of rich colour and vapour produce a diversified but unrepulsive effect. Mr. White has a vivid sense of colour, and his other views of Welsh and Cumberland scenery display some fine renderings of sunlight and mist. In "Fishermen of Old" (137), the scheme of colour and the handling is decidedly Turneresque. Mrs. Allingham, whose work always lends interest to the gallery, sends a delicate drawing of "Blabre's House, Hampstead" (11), the tree is tenderly drawn; near which H. Stacy Marks, R.A., has a capital study of an old *cognoscente*, in 18th-century garb, examining a rare and early book (13). The face is full of expression and character, though the blue colouring may be objected to. But landscape and coast take the lead here, and we hardly know to whom the honours are chiefly due. Landscape has many to divide the favours amongst. W. Eyre Walker stands high. His "Gleam of Sunshine" (9), the broad handling of the hilly landscape, "On Ingleton Fells," with its deep ravine; the delicate colour and drawing in "January in the Woods, Wharfedale" (99); the powerful colour of "A Thundercloud" (160), and the admirable bit of woodland, "Ivy-clad Stems" (187), all in the same favoured locality, amidst the dales and fells of Westmoreland and the North Riding, represent a wide range of treatment. K. Thorne Waite, in his delightfully fresh sketches and drawings of Sussex scenery, the Downs, Lancing, and Bramber, his cottages at Hungerford, and, above all, his fine

drawing, "The Blue Waggon" (59), has proved again his claim to rank as one of our foremost water-colour painters of open landscape in which pure colour, breadth, truth, and feeling are conspicuous. The merry haymakers in the waggon on the rough, uneven ground are a remarkably fine rendering of English rural life, and Mr. Waite knows, too, the value of abrasion and rubbing as technical methods of producing effect and atmosphere. This drawing of hayfield life and labour is certainly one of the most important contributions, to say nothing of other sketches. All of them are healthful and true, without tricks of brush, and free from the vices of thick pigment. Less vigorous is the work of J. W. North, one of the older members. His delicacy of manipulation and subtle technique render his landscapes unique for their tenderness of expression, light, and atmosphere. Mr. North works in a thick body colour, and upon this ground the finer ramifications of branches and twigs are deftly expressed by removal and scratchings of the colour. His "Late Autumn" (110) is a lovely study of wood and cascade, preserving by this method breadth and tone, and the finer interlacings of foliage. "Old Castle Walls and Mounds" (191) is another crisply-painted study of distance and tone, both poetical and feelingly rendered. In the same category we may place the work of Wilmot Pilsbury. "Late Autumn" (35) is a wonderfully clever study of woodland, the leaves and stems sharp and clearly expressed. "Marshy Ground" (78) is sweet in colour; "A Wood in Autumn" (104) is bright and sparkling in its grey tints lighted up by the sun, and "Worcestershire Cottage" (173) and "Gorse in Bloom" (202) are each delicate transcripts of nature into which the painter has infused his own earnestness and emotion. A strong contrast is presented between these and the sterner mood and handling found in the works of R. W. Allan, Arthur Melville, and others. The charge of effeminateness has been brought against the delicate handling of Naftel and North—is it not rather more correct to say that refinement has been studied by this class of landscapist? The vigorous blottesque style of touch seen in R. W. Allan's work, as in his "Market Place, Poitiers" (2), "The Dutch Fishing Village" (74), "At Pauillac," "Landing Hay" (165), "Vintage in Medoc" (167), is clever. Strong colour, a full liquid brush, brilliancy of effect, are the leading characteristics of these drawings or sketches, the grouping of fisher-folk, excellent; on the other hand, there is a degree of hardness inseparable from the style. A. Melville's "North Gate, Bagdad," is clever and bright. C. B. Phillip in his "North British Views in Argyllshire" (30), "Thirlmere, Cumberland" (60), is a powerful disciple of this school; but his drawings are somewhat hard and cold, characteristic of the mountainous districts of the North. Herbert Marshall, on the other hand, in his "Arnheim" (22), and "Woodbridge" (208), sketches with his usual brilliancy and sharpness of touch.

Four charming contributions of Miss Clara Montalba are hung. Her "Tower" (12) "Old Mill, Zaandam," and the "Thames Barge" are full of silvery-grey light or opaline tints; nor has this lady painter of Venetian lagoons and river craft forgotten her power of investing these objects with poetical meaning and interest. Light and colour are in her hands made to tell their own tale, as we see in the silvery light on river and sky and the murky grey of the barge. Tom Lloyd's one picture is "Rush Cutters" (29), a barge, towed by two men, filled with the spoils of the day's labour, the ruby glow of the evening sun lighting up the standing figure of a girl-peasant and a love-making pair—delightful in its serenity and rich, hazy colour. No wonder that it is the

favourite picture. Wm. Callow's sketches are less interesting as a whole, though we can admire the drawings of Amsterdam (31), Coblenz (32), the colour, light, and shadow of the Grand Rue, Lisieux, Normandy, with the fine spire of St. Pierre, the "Juden-Strasse, Frankfort" (109), and the sketch of Mary-le-Port-street, Bristol (188). The Venetian studies are clever, but less characteristic of Mr. Callow's skill as a delineator of architectural landscape. Sir John Gilbert's—the President's—large picture, "Autumn," has much of the romantic and poetical of early days in its composition. There is freedom, but the landscape full of knolls is strangely in keeping with the poem, which has suggested the subject. Alfred D. Fripp, the secretary, is a master of daylight effect, and his work—as the clear drawing of "Durdle Door" (90), with its shadow of rock on the sea, and his "Midday, Ringstead" (108)—show how much luminous effect can be produced by thin light washes. Mr. George A. Fripp has given one or two fine studies of mountain scenery, as the "Loch Avon, Northern Grampians" (101), and "In North Wales" (95), a sunny vale with its long cast shadow, besides several other sketches on the screen. C. Napier Henry's "Bowling Along" is a clever piece of sea painting, and the perspective of the trawler and green swirling sea well done. An old and esteemed name, Birket Foster, is represented by a large drawing, "Arrival of Hop Pickers" (63), careful and minute in the grouping of the children and peasants, though a little too suggestive of the chromo. "A Surrey Lane" is a delightful sketch. Ernest A. Waterlow has some drawings in his usual strong colour and style. "A Northern Harbour" (141) and "The Curfew Tower" are the best. A strong sea and sky is shown by Henry Moore, A.R.A.—rather hard. Matthew Hale has a nice study, "A Sandy Shore," grey in tone, with its moonlit clouds. Carl Haag sends a portrait of "A Worshipful Master"—clever in its strong light on a pleasing countenance—surely that of Mr. Wyatt Papworth. We can only glance at a few others. E. K. Johnson's idyllic composition (38) is rather weak in drawing. No. 98, Edward J. Goodall's "Interior of Mosque, Cairo," is a large, warm-toned drawing, carefully rendered in the details. We must also briefly notice Albert Goodwin's "Sinbad the Sailor's Voyage," where he is on a raft asleep, a masterly study of light and colour; and Charles Robertson's picture, "The Serpent Charmer," a clever drawing, in which the colour and light are well managed. As a figure study, Edward Radford's "Faute de Mieux" (135) deserves mention for good drawing—the colour is rather glaring. As classical figure subjects we may also refer to G. Lawrence Bulleid's "After the Bath" (181), and "In Cynthia's Garden" (162), both luminous and delicate drawings. There is much refinement and cleverness shown in the figures and textures, the schemes being more decorative than pictorial. David Murray's "Showery Weather" is clever and effective as a study of cloud and atmosphere. Arthur Hopkins has a charming subject, "When All the World is Young" (150). "Stepping Stones," by Cuthbert Rigby, is pretty in sentiment. George Clausen's studies (125, 211), especially "Hedgers," are admirable; and A. E. Emslie has a feeling sketch, "The Old House," on the screen.

#### "REGISTRATION" AT THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A SPECIAL general meeting (for members only) was held at Conduit-street on Monday evening last, to receive the report of the scrutineers appointed at the special meeting held on March 31st (see BUILDING NEWS, April 4th, 1890) on the result of the poll demanded at that

meeting. There was only a sparse attendance, and Mr. Arthur Cates, vice-president, took the chair. The following is the text of the resolution submitted to the members to vote upon. It was originally brought forward by Prof. Roger Smith as an amendment to Mr. J. Wreghitt Cannon's resolution:—"That at as early a date as possible statutory powers should be sought to establish, as in other professions, a system of compulsory examination to be held by the Institute, and to be extended to all architects hereafter entering the profession 'whether as members of the Institute or not.'" The amendment (which was carried by 106 against 37) was then passed as a substantive motion:—"That, while not opposed to the principle of compulsory examination as applied to those about to practise architecture, the Royal Institute of British Architects is of opinion that the difficulty of restricting by statutory powers the practice of architecture to those who have passed an examination is at present so insuperable, that it is undesirable to make an immediate application for such powers." A demand was then made, in accordance with provisions of By-law 62, by Messrs. H. Roumieu Gough, H. H. Collins, Oswald C. Wylson, Robert Walker, Maurice B. Adams, and Zeph. King, Fellows, that the resolution be suspended, and a poll thereon be taken by voting papers. The voting forms were thereupon issued to all members of the Institute resident in the United Kingdom, a space being left for each person to insert the words "for" or "against" the resolution in question. The report of the scrutineers, which was read by the chairman on Monday, showed that 708 papers had been returned, but of these 6 came too late, and 18 were informal, and so disqualified. Of the 684 remaining total, 520 voted in favour of the above resolution, and 164 voted against it, giving a majority of 356 for Professor Smith's motion. The result was received with scarcely any demonstration by those present. The principle of Registration has thus hereby been recognised beyond dispute by the Institute, although only about half the total number of professional members have given their vote on the question. Indeed, a very considerable number were unable to record their opinion on the matter at all as presented by the resolution thus submitted to them, because of its dual form. Though really anxious for Registration, they realised that if they voted against the latter part of the above motion, which insists upon delay, they would be taken to have voted with equal force against the adoption of the principle of Registration involved by the first part of the resolution. There is no doubt that the wording was very cleverly managed, and to some extent it has checkmated the demand which was made for a poll. This was certainly not fair fighting; but possibly it may be urged on behalf of the Council that the simple issue of Registration was not before the body of members of the Institute as a clear and definite question. This remains to be done, and no doubt before long a means for accomplishing it will be found by those who have taken the question seriously in hand. At present the matter stands as a drawn game, and those members who have advocated Registration, in spite of the narrow-minded and unworthy imputations which certain interested persons have made in print against them, may well congratulate themselves on the results already arrived at. A vote of thanks was passed on the motion of the Chairman at Monday's meeting to Messrs. Wylson and Middleton for acting as scrutineers. Professor Roger Smith was too unwell to take part in counting the votes. Mr. Blagrove complained that special inscribed envelopes for the return of the voting papers were not issued, it being left to members to post their votes to the secretary, who, in many cases, had to open the envelopes to see whether the letters were ordinary correspondence or not. The Chairman promised that on any future occasions envelopes of the kind mentioned by Mr. Blagrove would be sent out with the voting forms. This was the first time such a poll had been taken of members of the Institute. There was no discussion, and the meeting terminated.

#### THE A. A. SOIREE.

THE annual soiree of the Architectural Association took place on Friday evening last at Westminster Town Hall, and attracted

between 400 and 500 members. The area of the hall was rearranged with seats surrounding small tables, and smoking was the order of the evening. Mr. Leonard Stokes, the President, made a genial chairman, and was supported by his vice-presidents and secretaries, and by Messrs. Cole A. Adams, Thomas Blashill, S. Flint Clarkson, H. L. Florence, E. G. Hayes, and J. Slater, past-presidents. In lieu of the elaborate farce teeming with topical allusions to current architectural questions, given during the past three or four years, the programme consisted of a concert followed by a variety entertainment. In Part I. Mr. C. D. Imhof played the opening overture on the piano, violin solos were rendered by Mr. E. A. Lambert and E. H. Homan, and received encores, and songs were given by Messrs. J. Dixon Butler, A. C. Bulmer Booth, Arthur Thomas, and Captain Watson, Mr. E. G. Killmister closing with a sketch entitled "Some Musical Notes." In Part II., a dozen members of the Association appeared with blackened faces and in the garb of negro minstrels, Mr. H. O. Creswell, as the President, being distinguished by a large tin plate hung round his neck, after the fashion of the royal gold medal. A travestie of an Institute meeting at 9, Conduit-street, followed, the hits being received with hearty applause. The President called on his secretaries (Messrs. Bulmer Booth and C. H. Brodie) to read the minutes, after which he gave an address dealing with the three subjects of Education, Examination, and Registration, all difficulties in the path of progress being proposed to be brushed aside by the easy expedient of allowing those to educate, examine, and register themselves that wished for it, while those that objected to it might do without it. Some interruptions being threatened by bones and tambourine (Messrs. S. B. Beale and E. A. Lambert), the President quieted them by threatening that unless they deferred to his ruling he would have their portraits published in the BUILDING NEWS. At intervals, between the speeches and conundrums, Mr. E. Garth whistled a melody from "The Holly Bushes" in excellent style, Mr. Killmister rendered an American song with chorus, Mr. J. Dunn gave a banjo solo, accompanied by Messrs. P. Bower, R. Welsford, and T. Rutter, and the whole was brought to a close at 11.30 by a break-down led off by Mr. Brodie.

#### "BUILDING NEWS" DESIGNING CLUB.

##### A ROW OF FIVE COTTAGES.

THE designs sent in for this subject are not only very numerous, but they are in a way very good, and show how serious a set of workers have joined our Club. We had no small difficulty in making our selection, because the best of the plans were on one point or another, taken in a general sense, very nearly equal in merit. More particularly is this the case with the second, third, fourth, and fifth designs. "Fiddler" is without doubt the best; "Skull and Cross Bones" comes second, and "North Star" ranks third. These are the conditions set for the competitors to work to:—

"Subject F.—A row of five cottages, the centre one to be a grocer's general shop. Each house to be on two floors, and to comprise living-room, 163ft. superficial area; kitchen, 144 superficial area; scullery, w.c., pantry, tool-house, and coal place (the shop to the central house to be provided extra to this accommodation), three bedrooms and store cupboard to each house on first floor, separate and large wash-house for general use to the rear. The building to face a village street, and have frontage set back from public footway 14ft. Back way to cottages from either end of row. Style left to competitors. Material, stone, or walls with tile-hanging above, optional; roof covered with tiles, scale 8ft. to the inch. Sufficient drawings to show design, including sketch."

We publish the drawings of the first three designs, and in this way their several faults and varied merits can be compared. "Tyne" is placed fourth, and "The Red Rover" next. "Fiddler's" designed is well-suited for a village street, and the houses look like cottages in a row, though perhaps the shop is not emphasised sufficiently—the window, in fact, would do equally well for a private dwelling. "North Star," the third design, errs a little in the other direction in this respect, making rather too much of the shop-front, though we are bound to admit it looks more like business with more light, if not more

air. In "Fiddler's" plan we fear the grocery would make the shop rather stuffy, the living-room, too, opening directly out of it, with all the smell of dinner and display of domestic arrangements. "Skull and Cross Bones" on the other hand cuts off his shop too much, so as to place it beyond control of those sitting in the living-room. A glazed hatchway would have met the case exactly. In neither "Red Rover's" plan nor "Tyne's" could this be done, as in both of them the shop adjoins the kitchen. "Fiddler's" shop is too cut-up; but it gives room for the display of goods, though the door opens the wrong way for a shop where many heavy things have to be got in and out. The staircase to this house is only lighted from the top. The other cottages seem fairly good, and the elevations are very pretty. The landings on the first floors are wasteful of space, except as affording room for boxes and the like kind of "portable property."

"Skull and Cross Bones" gives a shop front which hardly agrees in style with tile hanging, though in ancient examples Georgian bays may be seen inserted in older-gabled buildings. We do not call it a convenient shop, and it would be more in character with some other business than a grocer's general store. The wash-house is not well placed, and it takes up too much space in the yard of the shop premises. The other cottages are rather clever, and the design generally would look well. In the perspective sketch a false effect is obtained by making the windows too small.

"North Star," though unobjectionable in his façade, somehow makes the cottages look like rather more ambitious houses, such as villa places, and his plan, with the long passages and staircase facing the front door, is typical of the speculating builder's favourite arrangement. The exigencies of cheap buildings no doubt lead somehow in this direction, and the long passage does place the external doorway some distance from those of the dwelling-rooms, which is an advantage. The yards are very small, but the wash-house is of good size. The drawings are nicely delineated.

"Tyne" is improving, but his perspective is inaccurate. Note the porches are shown projecting much more than the shop-front bay, whereas they all are of the same depth, and the real effect is quite lost. The elevation is good, and above the average, though the shop-front looks pimping and wanting in breadth. The width—12ft.—is not enough for a central door arrangement. The shop-windows also are shut off too much from the interior by the deep show space the whole depth of the projection. The hall behind the staircase would be shockingly dark, and the wash-house built into the main block is quite a mistake. His plans for the other cottages are unobjectionable. "The Red Rover" has carefully drawn out his plans in full, and on the whole they are very well contrived, with care and skill. There is an attempt, too, in general composition, which we have taken into account. The shop we do not like, and the entrances of all the houses seem somewhat too roomy. The outbuildings are capital, and the wash-house is detailed properly. The covered porch to the scullery would be useful; but the space would be of more service inclosed into the sculleries and larders, and would cost more as at present. "Wallaby" makes his shop look too much like a tavern, and the circular bay is too clever, and is out of scale with the door. The arrangement of the shop is crude, and the top-lighted staircase is out of character with a village. The rooms are ill-shaped and poor in planning; but there is a "go" about the design which shows that this contributor is improving. Such large writing on the plans dwarfs their scale. High-pitched roofs cost money to build, and the space inclosed by them should not be wasted, as is here the case by "Wallaby." "Syak" ranks higher this time than usual. We are glad of it. There is a want of detail in his plans, and they are badly contrived on the sheet. The shop stands under a verandah, over which sails forward the upper story. "So-and-So's" shop is too small, with a very narrow door, much smaller than the other entrances. The elevations are drawn roughly, and the plans show absence of care. "Y" in a circle is rather more commonplace, but more careful and everyday looking. His plans are well considered, too, in some respects; but the elevations are not like what cottages designed with taste should be. "Y" in a circle draws well, and should follow

better types of work. "Horseshoe" sends one sheet in brown and another in black. The plans are too drawn out, giving needless extent of roof. The shop door is round the corner out of sight, and the shop is badly arranged. As to what becomes of the kitchen chimney, or how it reaches the stack over the party-wall, we cannot venture to say, and "Horseshoe" does not explain. He sends no perspective. "Cawder" is unambitious, and he evidently believes in verandahs. He plans with care, though we do not like his shop cut off as it is from the house. The warehouse or store at the back would be useful. The pantries under the staircases would be very small and low for head room. Otherwise the plan looks a practical one. "West Anglian" recesses his shop entrance, which is a mistake, making the shop very small, and spoiling the living-room for the sake of some external effect. The plan is not so good as the elevations, which are capitally drawn. The façade is a trifle too ambitious. "Ko Ko" cramps his front by narrow little windows, and his shop has no larger a window than the living-rooms. There is considerable ingenuity in his planning, and he will do better if he sticks to his work. "Glaucus" has improved already. The projecting shop standing in front of the main block is a novel arrangement, and the whole block would look picturesque enough if a trifle overdone. The other designs are difficult to exactly place in order—they vary so much, some good in one thing and faulty in another, some bad in plan, but having merits in the elevations. "Niger" cuts his group into three blocks, overdoing the central house, though he contrives a roomy, useful shop. The two entrances, one to the shop and one to the house, are exactly alike, and the doors to the other cottages face one another, which is an objectionable arrangement. "Skip Jack" comes next with not a bad design, openly drawn—his trees very much "skip-Jack." "Country Bumpkin" has a plan too small in parts, such as the pantry, coal-place, and tool-place accommodation; elevation over-diversified. "Dot" draws weakly with too fine a line; but if he wastes space over passages, he plans neatly. "Menelaus" sends an elevation, which is really rather good; but his drawings scarcely do it justice. His plan is poor. "Streona," "Noryb," "King Bruce," "Van Roke," "Cyclist," "Attempt," "X.Y.Z.," in a circle, "Icky," "Coombe," "Grafton," "Waverley," "Sea Foam," and "Anvers." This last is spoilt by the wash over the drawings. "Pippit" came in too late. The design is evidently by a good man, who has, however, much to learn before he produces either a good plan or a really suitable elevation. The waste of space in his high-pitched roof would never do for modern cottage-building.

#### CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—IV.

By BANISTER FLETCHER, JUN., A.R.I.B.A.

##### GUTTERS.

IN consequence of the enormous area to the great nave which has to be carried off, an intermediate gutter is formed at A (No. 14) at the point where the glass leaves off. This gutter

#### Palais des Machines

No 18

Intermediate Gutter

collects all the water from the glass on the upper portion of the roof, and it was necessitated in order to break the force of the descending water, which in a roof of this size becomes enormous. This gutter, of which a section is given (No. 18), follows the outline shown, and is fixed to the wood bearers by screws. The gutter A collects the water and empties itself by means of gutters, B, formed in the slope of the roof, into C, which are the main gutters to the roof. Details of B and C (No. 19) are here given, and their

No 19

#### Palais des Machines

Section of Sloping Gutter

Gutter to Main Roof

No 23

From "Engineering"

position may be seen by reference to the figure No. 14. B is a gutter having two channels running side by side, made in this form to prevent the two opposing sheets of water from meeting at the point where the gutter A meets the gutter B. The gutter B is formed on the outside of the

composed of sheet and angle-irons, and by a backing of wood secured to the back of the girder supporting the rafters by square-headed screws. The zinc bottom runs up the sides and has an apron placed over; over this apron comes the zinc covering of the roof, and on the outer side a cover-plate of zinc is put over the apron and falls also outside the outer part of the gutter. The

#### Palais des Machines

No 20

Gutter to side aisle Roofs

No 21

width of gutter is 2ft. 1in., and it is divided into five parts by drips, each part 16ft. 3in. long; the depth from the zinc coping at the height to the bottom of the gutter is 5in.; at the lowest point it is 1ft. 9in. From this main gutter at the back of every main truss is conducted a down-pipe leading to the gutter formed by the junction of the roofs to side aisles (No. 20). This gutter having to carry off the whole of the water from the top to the bottom of one bay had to be

trusses, and is of the width of 0.65 centimetres, or about 2ft. 1in. These gutters, B, therefore intercept the water on the glass part of the roof by the gutter A, and conduct it to the gutter C by means of the duct B. The gutters C are of the form, shown in No. 14 gauge zinc, and are supported at intervals by wrought iron brackets

specially considered by the architect, with the result that the one given below was designed. As will be seen, it is in reality a double gutter, the secondary gutter being placed below the upper one. This was done in case of leakage or overflowing in the case of a storm or of a sudden thaw with snow on the roof, in which case the water overflows into the bottom gutter, and is carried away to the down pipes, rendering the inside perfectly safe from overflow. The lower gutter is composed of No. 12 zinc in one width throughout its length, carried on fir boarding; above this lower gutter are placed at intervals iron stirrups, on which the bearers which carry the rough bearing is placed. This upper gutter is No. 14 zinc, and is composed of a bottom and aprons on either side; above this, and covering this last, another apron, which is worked in with the zinc squares of the side aisles, which are roofed with zinc squares placed diagonally.

These two gutters both lead in the R.W. head. The upper gutter is divided into three lengths by two drips about 3in. deep. It is nearly 2ft. wide, 12in. deep at its highest point, and 2ft. at its lowest point. The down pipes in which these lead are in No. 14 zinc, bound together at points by zinc rings. Their diameter is 30 centimetres, or nearly 1ft.

**Joints in Side Aisle Roofs.**—Special methods of forming joints had to be studied here in consequence of the slate covering of the side aisles meeting the upright sheet-iron forming the side of the principal gallery. The sketch of the joint (No. 21) formed by the junction of the zinc turn-up, the zinc apron, and the two pieces of sheet iron is given, from which it will be seen that a different system entirely has to be adopted to that of the junction of a roof against an ordinary brick or stone wall, because in a case of this kind there is nothing on which to fasten the flashing. The sketch sufficiently explains the construction, which is as follows:—A flat piece of iron, A, is put between the two sheets of iron; these are then riveted together, the piece of iron A allowing of a space being left for the zinc flashing B, which is pushed up underneath, and is tightly secured by a screw bolt passing through the inner sheet-iron, the flashing, and the outer sheet iron, a lead washer being for greater safety placed between the outer sheet iron and the outer bolt. This same arrangement, however, could not be followed in the following case, which was that of forming a joint between the gutter and the back of the Principal (No. 22, drawn from *L'Architecture*); a most difficult operation, as M. Dutert told me, and one requiring a good deal of thought. A piece of cast iron was made, following the section of the back of the principal, weathered and throated as sketch, and is bolted to it. On the upper side of this is formed a rectangular sinking 1 centimetre (5-12in.) square, which is filled with lead, well beaten, and which forms a perfect joint. On the under-side of the cast-iron ledge, and attached to the wood framing, the zinc forming the side of the gutter is taken up and tucked under this cast-iron piece. This zinc covering and wood backing is also carried round the whole of the back of the principal, as is also the cast-iron top, till they meet the zinc flashings to the side of the roof itself, described previously. The down-pipe to the main roof of the "Palais des Machines" is fixed to the back of the main truss. Great care was necessary in performing this, in order to prevent water entering the building in case of an overflow.

**The Connecting Dome.**—The dome connecting the 30-metre gallery (Figs. 23 and 24 are a sec-

Palais des Machines  
No. 25 Construction of Gallery Floors

tion and plan of this dome) with the Palais des Machines is inclosed in a space 98ft. 6in. by 120ft. 6in., and is carried on four great piers in wrought iron. Between these wrought-iron standards are semi-circular arches, which support a wrought-iron ring, from which the dome itself springs by means of curved rings, which unite in a circular ring 32ft. 9in. in diameter, upon which the central lantern rests; this is also framed with 16 ribs meeting in a ring 3ft. 3in. in diameter. The ribs are connected by circular purlins and rafters on which rest the exterior glazing. The dome itself has suspended from it a spherical ceiling, which serves the purpose of hiding the exterior ceiling and for the reception of the stained glass panels, in the centre of which is fitted an electric light at night time. The pendentives are filled in with painted plaster panels in figure subjects and the inclosing portion to the staircase is fitted in with decorative plaster and ceramic work. These staircases, sketches of which will be given further on, are extremely interesting, the standards being formed entirely out of "fer de commerce," of simple yet elegant design. The covering is in zinc, lead, and glass. At the bottom of the glazed portion of the dome is formed a circular gutter in zinc, in which are formed a series of trapdoors, which admit the electricians who have charge of the lighting of

the dome at night. The pendentives, and the side covering to the staircases are covered with lead; the divisions to this last are 20ft. long and radiate by rolls, at the top they are 6ft. wide at the bottom 4ft. 6in. The dome itself is 84ft 6in. in diameter.

**The Contents of Main Roof Covering.**—The main roof to the grand hall has 258,336sq.ft. of zinc roofing. The side aisles have 165,765sq.ft. of zinc roofing in lozenge shapes. The total amount of lead work is 10,764sq.ft. The total weight of zinc is 258 tons, and that of the lead 32 tons.

**The Flooring to the Ground Floor and Galleries.**—Almost the only parts in the interior in wood are the floors and the treads to the staircases on iron frames. The ground flooring calls for no special remark; the boarding is 1in. thick, nailed directly to the joists, 3in. by 3in., about a foot apart, which rest on the ground and held in position by pins. The flooring over the lines of railway (which had to be kept open till the last moment owing to the trains bringing the heavy machinery into the hall) is covered with movable wooden flooring panels. The same lines were used to move these great machines at the close of the Exhibition.

**The Construction to the First Floor** is interesting, yet simple. As will be seen by the sketch, No. 25, the iron joists formed by four angle-irons joined

PAVILION FOR FINSBURY SQUARE. By Messrs. CROMPTON AND FAWKES.

by a deep iron web plate, carry the wooden joists of the floor, and as these simply rest on the upper floor and require holding in position, pieces of boarding 27 millimètres (or about 1 in. in thickness) are nailed to their sides, between the iron joists, with the end fitting under the iron joists. The bays are nailed alternately on each side of the joist; these prevent the wooden joists from rising. No pugging being used, this makes an extremely light floor, and as the architect had to expedite this part of work, no time was required to enable it to dry. The ceilings are formed by

panels of "staff" laid on the lower flange of the joist, and kept in position by the triangular piece of iron shown.

#### THE CORDWAINERS' EXHIBITION.

THIS Exhibition was opened last Monday at the Hall of the Cordwainers, 7, Cannon-street. Among the specimens of early typography is a treatise on War, and is the first dated book executed in Italy with wood engravings. It was lent by Mr. J. B. Calde-

cott. The Roman Breviary, from the famous Giunta press, plentifully illustrated with woodcuts, is in fine condition, and is a good example of typography and early wood-engraving. It is contributed by Mr. Frederick Clarke, while Mr. Rose lends a treatise on Geometry and Perspective, by Albrecht Dürer, the great German artist. Hans Holbein is represented by a series of ninety-two drawings on wood, illustrating the Old Testament. There are also many excellent examples of bookbindings which we cannot enumerate here.

Mr. Sherwood contributes no less than three oil paintings by Leader, and the Master of the Company sends "The Adoration of the Magi," a fine water-colour after Perugini, by Gigliarelli. Mr. H. L. Doulton exhibits "A Scene near Rome at Sunset," a large water-colour by Alfred P. Newton; while Sir Henry Doulton sends to this section "Worcester," "Oxford," and "Rouen," by Turner. Among the pen-and-ink drawings are some by Rossetti, and many drawings by Sandys. These are lent by Mr. Anderson Rose; while Mrs. Rose contributes a case of French, Spanish, and Japanese fans. The well-known mezzotint of "Mrs. Siddons as the Tragic Muse," after Sir Joshua Reynolds, is lent by Mr. John Fraser; and Mr. Chatfield Clarke sends some good etchings by Haig.

The pottery exhibits contain some excellent specimens of Greek and Etruscan vases, lent by Sir Henry Doulton, who also contributes largely with terracottas. Amongst these latter figure the artistic productions of George Tinworth. The Company exhibit their gold and silver plate, amongst which is a silver tankard, with their arms and crest. This tankard was the first piece of plate this Company had after the Great Fire of 1666, and was "the gift of Thomas Palfray to this Society for admittance into the Freedom of the same." The Master also contributes some interesting articles in this section, and sends a great variety of glass-work—old Roman, old and modern Venetian, and modern English and French.

#### PAVILION FOR FINSBURY-SQUARE.

WE publish the design of Messrs. Crompton and Fawkes, horticultural builders, of Chelmsford, accepted by the committee of the inhabitants of Finsbury-square for a pavilion in the centre of the square. The building will be 24ft. by 18ft., and about 40ft. high, cruciform on plan, with ornamental gables facing four ways,

and filled in with enriched panels in relief, surmounted by an octagon leaden lantern, in which a four-dial clock will probably be placed at a future time. The base will be red-rubbed brick-work, and the sides will be glazed for the remainder of the height. The roof will be covered by red tiles. It is contemplated that the building will be opened the first week in June. All the details have been designed by Mr. Fawkes, the well-known expert in horticultural buildings and mouldings.

#### THE SURVEYORS' INSTITUTION.

THE following student candidates have passed the examination for the Professional Association:

Cecil Hugh Aylen, Frederick Herbert Bancroft, Thomas Barclay, Maurice Frederick Beadel, Herbert Tudor Buckland, George William Cobham (special prize, 1890; "Crawter" prize for field work, 1890), Arthur Norman Garrard, Alexander Ernest Green, George Frederick William Hampton, Frederick George Hayward, Vivian Davey Lake, Henry John Leaning, Arthur Walker Merry (Institution prizeman, 1890), Herbert Ernest Molyneux, Alfred George Nockolds, Michael Guy Ogden, Herbert George Potter, Edwin Savill, James Smith, William Walter Rix Spelman, Joseph Charles Summerfield, Francis Charles John Swainson, Ernest George Verity, Claude Henry Watson, Hugh Calthrop Webster.

The following non-student candidates have also passed the examination for the Professional Association:

Francis Reginald Armytage, Arthur Body, Gilbert William Booth, Frederick Edward Boulting, Frederick Henry Brackett, Henry James Cope, Charles Ernest Maitland Desborough, Frank Minshull Elgood, Francis Ellis, William Fraser, William Forest, Harold Griffiths, Hedworth Herbert Grogan, James Henry Hodgkinson, Gilbert Plantagenet Mitchell Innes, Walter Robert Kay, Richard Webster Larkin, Arthur Llewellyn Lewis, Graham Harley Mould, Harry Ekermans Oakley, John Hubert Oakley, George Ossenton, jun., Edward John Partridge (Driver prize, 1890), Richmond Pinder, Herbert Edward Prall, Thomas George Rogers, Charles Frederick Slater, James Frederick Kemp Smith, Walter Wadman Soallum, George James Townsend, Edward Bryan Wood, Charles Bruce Wood.

The result of the examination for the Fellowship will appear next week.

#### BOOKS RECEIVED.

*Primitive Architecture*, by BARR FERREE (New York), is a reprint from the *American Naturalist and Anthropologist*, in which the author shows the sociological influences at work in shaping the types of dwellings and other buildings. Thus communism, like the nomadic phase of life, has produced modifications in structure. Of the communist types, Mr. Ferree points to the terraced buildings of the Pueblo Indians; also to the circular houses of the Mandans and the houses of the North American Indians. The interior arrangements show the influence of this mode of life more than the exterior. The number of partitions vary. The communistic houses are larger than those for single families; means of intercommunication exist, such as continuous awnings. The fireplaces are differently arranged—one is sometimes made to serve for four cabins, as in the dwellings of the Iroquois and the Uraupes. In New Guinea there is a fire to every two cabins. Rank and wealth have had their influence; they have increased the size and height of dwellings, and added to the ornament and number of roofs. The climatic influences are also traced in the height and steepness of the roof, in the adornment of the dwellings by painting. A diversified climate as that experienced in the Temperate zone has led to a progressive architecture. Uniform environment, on the other hand, has resulted in uniformity in thought, in art and manufactures, as we find to be the case in the Frigid and Torrid zones, where the variation of temperature is small. Then there is the effect of environment on construction, as in the shape of houses and in the structure of walls. Rain and wind have been potent factors, flat roofs existing in countries where there is little rain, and steep ones where there is an abundance. Difference of material is another result of climate, but we cannot extend these remarks. Mr. Ferree's brochure gives interesting and instructive contributions to the subject which may serve to whet the appetite of others who pursue this inquiry.

*Health and Comfort in House Building*, by J. DRYSDALE, M.D., and J. W. HAYWARD, M.D. (London: E. and F. N. Spon).—The third edition of this book, which is written by two physicians in advocacy of ventilation with warm air by self-acting suction-power, has just been published. The authors point out that any system of ventilating in single rooms is, and must be, defective, and recommend the addition of a general system of ventilation of the house by means of the kitchen-chimney, the fire here being in most dwellings the only one kept alight daily throughout the year. They advocate the use of open fires and hot-water pipes, and explain that their system is unprotected by any patent. The work is illustrated by sections and plans, including those of the houses of each of the authors, built on the system they recommend, in Liverpool and London respectively.—In *National Health*, Messrs. Longmans, Green, and Co. have published at 4s. 6d. a cheap abridgment of Dr. B. W. Richardson's review of the works and labours of Sir Edward Chadwick. The more practical and popular parts of the larger work have been condensed into a handy volume, which has as a frontispiece an excellent likeness of the venerable "Father of Sanitation."—Vol. IX. of the *Journal of Decorative Art* (London and Manchester: Henry Vickers) has just been issued; and also from the same office a portfolio of "Flower Studies," containing eight well-executed chromo-lithographs of familiar garden annuals, after originals by Miss Kate Rogers, with descriptive letterpress.—The *Transactions of the American Society of Civil Engineers* con-

tain several interesting papers. "On the Fresh-water Algae and their Relation to the Purity of Public Water Supplies," by George W. Rafter, is an important contribution, showing the value of a knowledge of plant-life inhabiting our water supplies. The paper is devoted to freshwater algae, about 1,500 species having been described as peculiar to America. Very beautiful microscopic illustrations are given, occupying nine plates. The author shows that great advantage would be derived in the consideration of sanitary questions by a study of the relations of algae to public water supplies, and a system of classification is suggested as necessary. The algae are considered as purifying agents, changing a part of the dissolved organic matter into insoluble substances. Nitrogen is necessary to their growth, and therefore certain kinds of algae may be considered a useful warning, others as necessary. The discussion on "American Railroad Bridges," by Theodore Cooper, forms another interesting subject. The advantages and demerits of pin-connected and riveted structures are discussed, and one of the speakers urges strongly, and, we think, with much reason, the value of riveting. The connection of stringers to floor beams is generally made by riveting, rivets being used in all first-class pin-connected bridges. Riveted bridges have generally stood well, and are becoming more general in America.

#### CHIPS.

The Royal Academy Architectural School's course of lessons on "Architectural Modelling" has terminated for the session, and Mr. Stannus will commence a series of demonstrations on "Architectural Ornament: in Panel, Frieze, and Capital," on Monday, May 5, at 6.15 p.m.

In the list of Receiving Orders the name appears in Tuesday's *London Gazette* of Edward Brown, Liverpool-street, City, and Vicar-terrace, Forest-gate, late of Hanbury-street, Spitalfields, and Bow-road, E., "architect and surveyor and licensed victualler." The combination of professions is peculiar.

The memorial-stone of a chancel which is being added to the church of St. Michael in Upper Orwell-road, Ipswich, was laid by Lord Elcho, M.P., on Friday. The chancel will harmonise with the nave, and is being carried out from designs by Mr. E. F. Bisshopp, of Ipswich, from whose plans the nave was built nine years since. It will be 31ft. deep and 22ft. wide, and on the north side will be organ-chamber and vestry. The church will, as completed, seat 700 persons, and the present work will cost £1,800.

The Gresson memorial pulpit in the parish church of West Worthing has just been unveiled. It is of Caen stone, octagonal on plan, and Early English in style. Mr. R. S. Hyde, of Worthing, was the architect, and Mr. Harry Hems, of Exeter, executed the work.

The memorial-stone of Highbury School, in connection with St. Philip's Church, Bristol, was laid on the 16th inst. The buildings will be three stories in height, and built of red bricks with freestone dressings. On the ground-floor are a hall, 43ft. by 38ft., and 22ft. in height; Bible-classroom, 38ft. by 17ft., and other classrooms; and on the first floor are other rooms, the second floor being arranged as 18 classrooms. Messrs. Foster and La Trobe are the architects, and Mr. T. H. Brown, also of Bristol, is the builder.

The quarrymen employed in the West Dean district of Gloucestershire, who gave a week's notice for 10 per cent. advance in wages, brought out their tools on Saturday.

A new Baptist chapel at Sudbury, Suffolk, was opened on Wednesday week. It is in the Decorated Gothic style. Its internal dimensions are 56ft. by 36ft. 6in. wide, and 42ft. wide in transept; height to collar-beam of roof, 33ft. The chapel is divided into nave and aisles by moulded iron columns. A gallery runs on three sides. The interior woodwork is of red deal, stained and varnished, the platform gallery front and benches being of pitch-pine. The baptistery, which is lined with white glazed bricks, is placed in front of the platform beneath the choir seats, which are movable. The building is of white brick, with stone dressings. The building will seat inclusive of gallery, 520 persons. The work has been executed by Messrs. Geo. Grimwood and Sons, Sudbury, from the plans and under the direction of Mr. W. Eade and Mr. E. T. Johns, architects, Ipswich.

A new Congregational school-chapel is in course of erection at Bexley, Kent, from plans by Mr. George Baines. It is of Kentish rag, with open-timbered roof, will seat 300 persons, and will cost £3,000, including site.

(See description on p. 604.)

A PUBLIC DAY-SCHOOL FOR BOYS. — R.I.B.A. FIRST MEDAL DESIGN.

MR. FRANCIS W. BEDFORD'S prize design submitted in competition for the Soane Medallion at the Royal Institute of British Architects, was illustrated in the BUILDING NEWS for March 7th this year, when we gave the perspective view and principal plan. In our issue for Feb. 28th, the second medal design also, by Mr. Chas. Spooner, was illustrated. To-day we print a reproduction of Mr. Bedford's detail drawing, showing the main façade to a large scale. The notes written upon this elevation furnish various particulars as to the materials intended, and the ample description of the work which accompanied our former illustrations leaves nothing to be added on this occasion.

"BUILDING NEWS" DESIGNING CLUB: A ROW OF FIVE COTTAGES.

(For description see page 579.)

CLECKHEATON TOWN-HALL.

THIS building, which is to be commenced immediately, has the benefit of an exceptionally good site, the front being set back a considerable distance from the road, thus leaving a large open space or square, from which the town-hall will be seen to the greatest advantage. Every care and thought has been bestowed upon the arrangements by the committee, not only for the business requirements of the district, but also to the adaptability of the building to the means of social enjoyment and recreation. The irregular outlines of the plan, which resulted from the various alterations, have been carefully studied, that the elevations might group well together and in picturesque outlines, and the building, when completed, will be without doubt the principal architectural feature of the town. The large hall is planned to accommodate 1,000 persons, and 100 more on the orchestra, the latter having ample retiring-rooms in convenient proximity. The ceiling will be in plaster, elaborately panelled, and with a bold, enriched cove running completely round. The Board-room is a handsome apartment, with an open-timber roof, and enriched plaster panels between the purlins. The Local Board offices are all situated on the ground floor beneath the large hall, and provision has been made that they may be greatly enlarged at any future time, if necessary, without interfering with the light and ventilation of the existing building. The basement is devoted to the kitchens, &c., from which there is a lift in connection with the large hall. The front and return sides are to be built in

hosted wallstones with ashlar dressings, the roof being in dark-green Westmoreland slates. The heating will be by means of hot water on the low-pressure system, the pipes being placed beneath the windows to correct the refrigerating influence of the glass, fresh air being admitted through Tobin's ventilators. The architects are Messrs. Mawson and Hudson, The Exchange, Bradford.

NO. X. FORE-STREET, E.C.

THESE business premises have been built by Mr. William F. Coney, from the designs of Mr. Delissa Joseph, F.R.I.B.A., of Basinghall-street, and have been specially planned to meet the trade requirements of the district. Constructional ironwork has been extensively used throughout. The elevation is in Portland stone, the ground-floor bases being in grey granite. The building occupies a conspicuous position at the corner of Wood-street and Fore-street, and is in close proximity to Cripplegate Church, over the churchyard of which the rear windows look; the tower of the church itself forming a pleasing object in the perspective view.

## CHIPS.

The modern chancel of the parish church of St. Julian, Wellow, Somerset, has been pulled down and rebuilt, from plans by Messrs. Bodley and Garner, as a memorial to the late vicar. The style is that of the 15th century, to correspond with the nave; the walls are faced externally with local ashlar, and the roofs are of oak, barrel vaulted, with ribs and carved bosses at the intersections. A vestry has also been built on the north side of the church. The new east window has been filled with stained glass. The builders were Messrs. Stephens and Bastow, Bristol. The east window is the work of Messrs. Burlison and Grylls, Newman-street, W., and the organ has been erected by Messrs. Gray and Davison, Euston-road, London. The church was consecrated on Wednesday week.

Professor Francis Elgar, Director of Her Majesty's Dockyards, distributed on Saturday the certificates gained by the students in the Crystal Palace Company's School of Practical Engineering. A report showing the prosperous state of the school was read. The chief distinction, the bronze medal, was gained by Mr. A. M. A. Struben, a student from South Africa.

The Burntisland and Inverkeithing Railway was formally inspected by Major Marindin, of the Board of Trade, on Friday. It has been constructed by Mr. Waddell, of Edinburgh, contractor, for the North British Railway Company.

It is reported that considerable alterations and additions, including a new wing, are shortly to be made at Osborne House, Isle of Wight, the residence of the Queen, and that Messrs. Cubitt are the contractors who will carry them out.

The new line of railway between Driffield Junction and Market Weighton, projected by the West Riding Junction Railway Company, was opened for traffic on Monday. It has cost £250,000.

The town council of Ramsgate propose to carry out an extensive scheme of improvement on the sea front, from plans prepared by Mr. W. A. Valon, engineer to the gas and water department. The estimated gross outlay is £65,000.

A new mission church is about to be erected at Gly Farrel, Breconshire. It will accommodate 120 adults, and will be situated about two miles from the mother church. It will be built of hard native stone with local and other stone dressings. The designs are by Messrs. Kempson and Fowler, of Llandaff.

The United Asbestos Company, Limited, whose chief offices are at Dock House, Billiter-street, E.C., have recently opened an additional branch house at Provident Buildings, Clare-street, Bristol. The company's business is rapidly extending, and they have now branch houses in Glasgow, Newcastle-on-Tyne, Manchester, Liverpool, Cardiff, Bristol, Paris, and St. Petersburg.

The Enfield Local Board of Health have appointed Mr. R. Collins, sanitary inspector to the Southgate Local Board, as their road surveyor. There were 113 applications received for the post; the salary is £200 per annum.

In the Divorce Court on Monday, Mr. Justice Butt granted a decree nisi in the petition of Mrs. Harriett Matilda Hill for dissolution of marriage on the ground of the cruelty and adultery of her husband, Alfred T. Hill, builder, formerly of Red-ditch, and lately of Birmingham. The action was undefended.

Professor W. B. Richmond has been commissioned to paint a portrait of the late Dr. Lightfoot, Bishop of Durham, to be hung in the hall of Trinity College, Cambridge.

## COMPETITIONS.

SOUTH SHIELDS.—On Monday, the 21st inst., a meeting of a committee of the South Shields town council was held at the Marine Board Offices, Mill Dam, to receive the report of Mr. G. G. Hoskins, F.R.I.B.A., the assessor appointed to make a selection from the 33 sets of competition drawings. As the scheme is estimated to cost £10,000, great interest was manifested in the decision. The three sets selected by Mr. Hoskins in order of merit are those bearing the following mottoes:—(1) "Constable"; (2) "Ad Rem"; (3) "Magistrate." Mr. Hoskins's report having been unanimously adopted, the sealed envelopes were opened, when the names of the successful competitors were found to stand as follows:—(1) Messrs. Perkins and Bulmer, of Leeds; (2) Messrs. Clarke and Moscrop, of Darlington; (3) Mr. J. H. Morton, of South Shields.

YARDLEY SCHOOL BOARD.—Acting on the advice of Mr. William Henman, A.R.I.B.A., of Birmingham, the assessor in a limited competition for schools at Red Hill, Coventry-road, for 1,000 children, the Board has selected the design of Messrs. Crouch and Butler for execution, and awarded a premium of £15 to Mr. W. N. Gething, and one of £10 to Mr. J. F. Yates. Six sets of designs were received.

## ARCHITECTURAL &amp; ARCHÆOLOGICAL SOCIETIES.

CARDIFF.—The architects of Cardiff held a meeting on the 16th inst., and adopted rules drafted by a committee appointed for the purpose at a previous meeting held on March 12th, when it was resolved to form the Cardiff Architects' Society for the advancement of the profession of architecture, and the consideration of questions of professional practice. The architects in practice in Cardiff number about thirty, and the society will doubtless include all these members in addition to many others in the surrounding district. The hon. secretary is Mr. F. Baldwin, Church-street, Cardiff.

A sculptured mural tablet has been placed in a chapel of the parish church of St. Mary Magdalen at Morthoe, North Devon, as a memorial of Miss Heddon. It is 7ft. high, Jacobean in style, and consists of a panel containing three sculptured figures in white statuary marble, with polished surroundings of Staffordshire alabaster and Devonshire marbles. The sculpture is in high relief, and, together with the rest of the memorial, is from the studios of Mr. Harry Hems, of Exeter. The sculpture represents the deceased carried by angels to paradise. Mr. Alexander Lauder, of Barnstaple, was the architect.

At the request of the Parliamentary Committee of the Trades Council, Mr. Broadhurst has given notice that he will move the rejection of the Employers' Liability Bill. The great objection of the working-class leaders to the Bill is its unsatisfactory dealing with the doctrine of common employment, and its still leaving, under certain conditions, the right of contracting out of the Act.

Mr. S. J. Smith, one of the inspectors of the Local Government Board, held an inquiry at the town-hall, Wincanton, on Wednesday week, into an application by the rural sanitary authority of Wincanton for sanction to borrow £500 for works of sewage disposal for the parish of Castle Cary. The engineer, Mr. Farrall, of Sherborne, explained the system about to be adopted, and stated that it was intended to enlarge the existing tanks and treat the sewage by the system known as the international purification of sewage process, and that the effluent would pass direct from the tanks into the stream. The inspector pointed out that it was a practice of the Local Government Board never to sanction a chemical process except where the effluent passed over land. It was explained to be difficult to get land; but the inspector intimated that in all probability the Local Government Board would send their scheme back for revision, and that, no doubt, another inquiry would be necessary.

A meeting of the surveyor's committee of the Carnarvonshire County Council was held on Saturday, when the county surveyor (Mr. Thomas) tendered his resignation, having been appointed to a similar position in Buckinghamshire. The resignation was accepted, the committee passing a resolution complimenting Mr. Thomas upon the most efficient discharge of his duties, and recommending that the council should give him a gratuity of £30 in acknowledgment of extra services. A new county surveyor will be appointed on May 15th, and there are already many candidates in the field.

## WAYSIDE NOTES.

THE atmosphere of the Golden Horn is evidently unsuited to the constitution of the Crimean Memorial Church. According to statements made in the course of a meeting convened on the 21st for the express purpose of raising funds for its repair, this building is in a deplorable condition. Seeing that the church has only been in existence some 26 years, it would be not a little interesting to the architect to know the exact causes of its premature decay. Speakers at Monday's meeting stated that it is "falling into serious disrepair"—"in impending ruins"—its roof "rotten," and likely to become a "mass of damp and mouldy ruins." Neglect and want of timely repair is assigned as the primary cause of these troubles. When first founded, no endowment was provided, and now the object is to raise by subscriptions a sum of £10,000 to be devoted to prompt reparation and the foundation of an endowment fund. Since the building was originally intended as a monument to the Englishmen who fell in the Crimean war, I take it that the Duke of Cambridge, the Archbishop of Canterbury, and others who spoke at Monday's meeting are justified in looking to the country for ample support in their endeavours to repair it, as it would be highly discreditable to the nation if the church went to rack and ruin for the want of a few thousand pounds.

Perhaps the building suffers from the ill-management that attended its very beginnings. If I remember rightly, the competition for the work was anything but a creditable piece of business. Should not the incomparable William Burges have had the job; and was it not taken out of his hands and given to Street?

Mr. William Morris is very sanguine as to the prospect of another Gothic revival. It is to be feared that he will find he is deluding himself and others in proclaiming a day when Gothic architecture shall take root and flourish again in this country. Pan is dead. Mr. Ruskin has done his best to resuscitate and give enduring life to a modern style of Gothic. That admirable writer, and Pugin, and others, have failed, and to most thinking persons it is apparent that they failed, and why they could not but fail. The labours of the zealous Gothic revivalists have been of immense benefit to modern architecture, in that they have impressed architects with a full notion of the value of truthful architectural expression and honest construction. By their writings, and by their works, they have taught many deeply-significant lessons; but in their endeavours to revive old form for its own sake, they failed as signally as did the men who wanted us to admire nothing but Greek and Roman porticoes. I think that Mr. Morris will find the game of Gothic-reviving played out, and worth the candle to no one; and, further, that he will be better employed in expounding to the public the principles of his favourite style; for the truth and honesty, and the power and vigour, and every other good ethical attribute of old Gothic will influence the design of the true architect of to-day, and of to-morrow, and, indeed, of all time that architecture may endure.

What is an architect? Nothing, if not practical? Certainly! No true architect in days past or present has been above his practical and matter-of-fact duties. I rather think it is the other class—say, the "artist architect," who will have to look for a new designation, one expressive of velvet-coatism, dilettantism, façades-without-constructionism! It is a wee bit disheartening, after everyone, apparently, has been so long urging the futility of architectural knowledge without a knowledge of construction and practical work-a-day matters, to read a letter like that of your correspondents, Mr. Ernest Newton, Mr. Mervyn Macartney, and Mr. John Belcher. What is the result of a spread of the idea that an architect is an artist pure and simple? Is it not that we see in the highways the legend, "Elevations designed by Mr. 'Architect'; buildings erected under the supervision of Mr. 'Erector-of-works'?" Is this the sort of thing that your correspondents who look with disdain upon "drains, diameters of cast-iron columns, and the like," would like to see increase in this country? If so, then they could wish for an evil day. If, as your correspondents say, the reason for an architect's existence is that he may "design with beauty and build in truth," how is

he to effect the latter without sound, practical knowledge—scientific knowledge, in which he may be examined as to its extent and thoroughness? Surely *building in truth* means building well, solidly, skilfully, *scientifically*. Then, putting aside pure art questions and constructional matters, how about *planning*? Cannot we ask an architect to draw out a plan, and, if competent ourselves, say, with unerring and mathematical certainty, "This is a splendid plan, a good plan, an indifferent plan, or a wholly bad plan"? Is not the planning and arrangement of a building in which men live and work a matter that should take precedence of all others in importance? I always thought so, having been imbued with the idea through words spoken by men who have held high places.

Many have been led into false views of the nature of an architect by misapprehending Mr. Ruskin's aphorism, "Architecture proposes an effect on the human mind, not merely a service to the human frame." Reading this, people rush to the conclusion that architecture is something very lofty indeed—a very *high art*; architects become puffed up with pride, and look upon their productions as really *too good to be used*—the house too architectural to serve the purpose of a home; and one almost expects to find such persons regarding their churches as too fine specimens of their architectural skill to be employed as temples for the worship of their Creator! I have often observed that there are many architects who, by their talk and writing, regard music, painting, and sculpture as mere businesses, prosaic and matter-of-fact, wallowing in the mud, as compared with Architecture—with the big, big A. They would read the above aphorism of Mr. Ruskin, "Architecture proposes an effect on the human mind, and has nothing to do with any service of the human frame." Whereas it will be seen that the sentence states that architecture, in addition to serving the human frame, affects the human mind. Something of practical service to man is pre-supposed, and it is a super-addition that Mr. Ruskin employs to distinguish architecture from building. It seems of importance that this should be understood, for, in considering the nature of an architect, we must first decide as to what constitutes architecture. And it is my position that even Mr. Ruskin, than whom no one could take a more dignified aspect of architecture, regards it as first and foremost serving some actual need of humanity.

If one firm of builders won't tender for work on Messrs. Wimperis and Arber's conditions, others will be found cheerfully so to do. And that seems all there is to say on the point.

We all enjoyed the conviviality of the A.A. soirée, but I doubt whether we were equally pleased with the entertainment provided. The songs were all right, but the nigger minstrelsy was of the feeblest. Had it been more carefully worked up and practised, it might have proved more of a success. The idea was not bad, but the feeble jokes, and the jokes that didn't tell, were of the crudest. "Looking forward" was scarcely a success, and altogether the evening was by no means so enjoyable as in years gone by.

Five hundred and twenty members of the Royal Institute of British Architects voted in favour of Professor Roger Smith's amendment, 164 voted against. The majority thus shrinking back before the "insuperable difficulties" is 356. Be it noted that the voting papers were so worded that, vote as one might, it was against Registration! An artful manoeuvre, and to a certain extent a successful one. Many, I understand, did not return their voting-papers solely on this account. The result of the polling at Conduit-street certainly will not discourage the Registrationist. It evidences a great advance of thought on the topic, and the widespread dissemination of the principles we advocate. These cannot but grow and develop, and sooner or later bear fruit. We have seen how the feeling for the necessity of reform has increased on every hand, and can now afford to wait, confident, more than ever, of ultimate success.

Earl Compton, speaking at a recently-held meeting of the East London Church Fund, said that he should like to see a wholesome system of fining of landlords of insanitary tenements let to the poor. So should we all; but this evil, as

that of jerry-building, seems to be ignored, and out of the reach of legislative interference, to an extent, that is to say, such as would be effectual in putting down the landlord of rotten tenements and the builder of shoddy houses. In the case of the former, the evils will probably continue until the due letting of London rookeries is affected by a great increase in the number of buildings specially erected to suit the needs of the poorest of the population. Much of this is contemplated, and much has been already done, so that in the near future we may hope that the owners of the garrets and hovels will find they must rebuild or lose all their tenants. Even at the present time the landlords of these foul dens must find that the increase in the number of dwellings for the poor, arranged on sound principles of construction and sanitation and well-planned, tells on their incomes. We may hope for still better signs when some thousands of Sir Edward Guinness's trust-money has been expended. In this matter, reforms will be effected by the planting of virtues rather than by the rooting-out of vices.

Your correspondent Mr. T. F. Pennington's communication, published by you last week, may be interesting as a fragment of a biography; but as to proving the nature of the Institute exam., I failed to grasp its value. I rather fear—judging by his present well-known ability as an architect—that what really happened was that Mr. Pennington worked unnecessarily hard; if so it was to his credit, but scarcely proves that the examination was difficult. The plumbing incident, I think, is rather foreign to the subject of his letter; and *practical* and *elementary* are not synonymous terms. One means one thing, and the other something quite distinct. The incident about the Greek temple is also very ineffective. To sketch in perspective, I presume, a Classical temple, Greek or Roman, should not give an ordinarily earnest student any difficulty. If Mr. Pennington didn't score over that question he ought to have been plucked, whether he studied Early English or Early Greek. The general composition and outlines of Classical temples impress themselves vividly upon the memory in early student days. It would have been a totally different thing had the examiners requested your correspondent to draw out details of a Greek temple to proportions. The "rub" comes in then.

GOTH.

## CHIPS.

Mr. H. Tucker, of Brackley, has been appointed surveyor of main roads to the County Council of Rutland. There were 24 candidates.

The free public library at Edinburgh, built from the designs of Mr. G. Washington Browne, of that city, will be opened on the 4th June.

The tender of Mr. H. L. Holloway has been accepted for the erection of Clarendon Baptist Chapel, Camberwell New-road, S.E., from plans by Mr. G. Baines. The cost will be about £5,000, and the present works are exclusive of a proposed tower and spire.

The completion of the last contract in connection with the sewerage of Freemantle, near Southampton, being the contract for the construction of two Shone's ejectors at the sewage reservoirs at the bottom of Southbrook-road, Fourposts, and the laying of the air and sludge mains from Fourposts to the platform, under the arrangement made with the Corporation of Southampton for dealing with the sewage sludge, was made the occasion on Thursday, the 10th inst., for an inspection of the works at Fourposts. The works have been carried out from plans by, and under the superintendence of, Mr. H. J. Weston, surveyor to the Shirley and Freemantle local board. Mr. H. I. Sanders, of Southampton, was the contractor for the general works, and Messrs. Hughes and Lancaster, have constructed the ejectors.

The memorial stone of the Highbury New Schools, on the Broad Plain, St. Philip's, Bristol, was laid on Wednesday. The new buildings will have frontages of 98ft. and of 40ft. respectively, both faced with red pressed bricks from Shortwood, with freestone dressings. On the ground floor there will be a hall, 48ft. by 38ft., and 22ft. high; and also a room, 38ft. by 17ft.; infant school, 21ft. by 15ft.; lavatory, and a kitchen. On the first floor are two large rooms for the boys' club and mothers' meetings. The second floor will be occupied by 18 classrooms, averaging in size 11ft. square. The cost of the site and building will be about £4,200. The contractor is Mr. T. H. Brown, of Cotham, and the architects are Messrs. Foster and La Trobe, of 20, Clare-street, Bristol.

## LYCH-GATE · LLANGEFNI · ANGLESEY

ROBERT · GRIERSON · ARCA · ARCHITECT.

## LYCH GATE, LLANGEFNI CHURCH, ANGLESEY.

THROUGH the exertions of the Rector (the Rev. Canon E. Williams), a much-needed improvement to this church has been effected by the addition of a spacious chancel. The old east window tracery and glass have been replaced in the new chancel. The floor has been laid with encaustic tiles, of special design, from the Ogwen Tile Works.

The Lych Gate illustrated forms a new approach to the churchyard. Interments here have for some time been discontinued; hence it was not necessary that a coffin-rest should be pro-

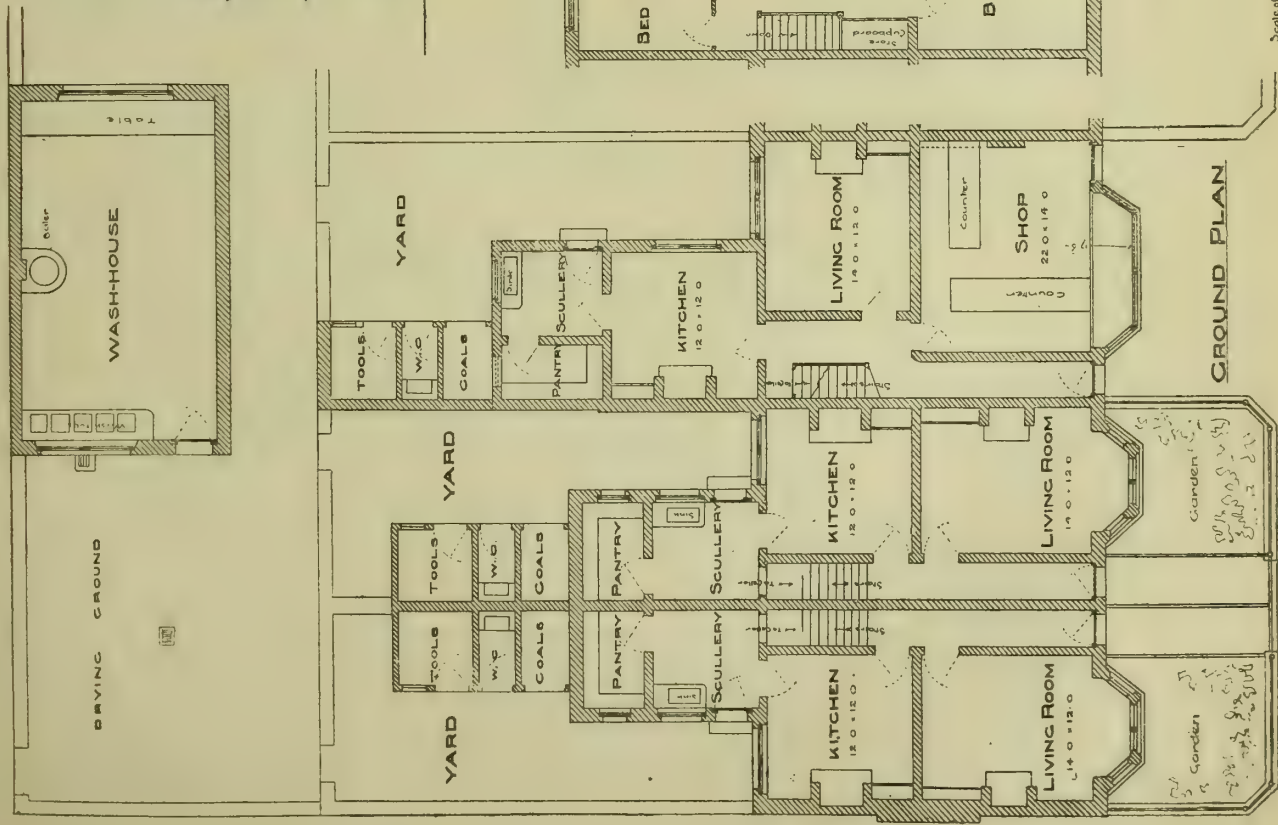

vided. This entrance is placed at the end of an avenue, lined with ancient oaks, by which the church is approached from the village, and these, together with the old church in the background, form a piquant and pleasing village picture. The masonry is of local limestone. The contractor for the work was Mr. John Roberts, Llangefni, and the architect was Mr. Robert Grierson, A.R.C.A., of Masonic Chambers, Bangor.

The schools for St. Mary's parish, Truro, are about to be built at a cost of £2,000, from plans by Mr. Swift, of that city.

A stained-glass window in the south aisle of the parish church of Whitechurch, Salop, has been erected as a memorial of the late rector. The subject is "The Incredulity of St. Thomas," and the work has been executed by Messrs. Bell and Sons, of Bristol.

Mr. Arnold Taylor, on behalf of the Local Government Board, opened an inquiry at the town hall, Burnley, on Friday, respecting an application by the corporation for a provisional order enabling them to borrow £100,000. Of this, £30,000 is required to complete the new waterworks, £10,000 to extend the gasworks and for other purposes, including the laying out of two public parks which have been presented to the town.

## CONTEMPORARY BRITISH DECORATIVE ARTISTS.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

NO words of introduction are necessary with reference to the six well-known designers represented on our portrait-sheet to-day. Their work is more or less familiar to all who have any knowledge of decorative art, while one and all of them are associated prominently with the development of ornamental design.

Mr. J. Aldam Heaton was born in 1830 at Leeds, and was educated at Repton, Derbyshire, one of the old Foundation schools. He is a son of Mr. John Heaton, partner in the old firm of Aldam, Pease, and Co., dealers in Yorkshire fabrics. At the age of 16 he drew a repeating design for a Halifax damask weaver, and his drawings gave evidence of a taste for design. He was, nevertheless, brought up to Yorkshire manufacturing, and went through a short apprenticeship as dyer and weaver. At that time there was no such profession as a designer in connection with matters of this character. At the age of 30 Mr. Heaton was engaged in manufacturing in Bradford, and introduced many small improvements in the Jacquard loom. Design being more attractive to him than the commercial side of his business, he removed to London in 1875, and commenced work as a designer of embroidery, designer for the general trade, and frieze-painter. At this time he drew designs for Messrs. Jeffery, Woollams, Templeton, Crossley, and other manufacturers. As business extended, finding the "trade" way of doing things generally wrong in form and colour, Mr. Heaton has been obliged to take up successively upholstery, cabinet-making, painting, and wall-decoration and stained-glass making. Lately he has designed and furnished complete the reception rooms of the *Teutonic* and *Majestic* steamers, and is now engaged on the decoration of four dining cars for the L. and N.W.Ry. Amongst other things he has just completed five large lancet windows (figure-work) for the apse of Aintree Church, near Liverpool. Mr. Heaton is still most at home as a designer, especially of marquetry and of stencilling, which he finds far superior to printing for wall-papers. He is engaged editing a book on 18th-century furniture and decoration for Mr. Bumpus, the publisher, and recently two articles on "Colour" and "Form" appeared in the *Art Journal* from his pen. He employs about 70 hands. Mr. Heaton's portrait is by Mr. T. Fall, of 9 and 10, Baker-street, W.

Mr. Henry Holiday is now in America, and, as he will not return till the summer, we are unable to give those personal particulars which he alone can furnish. His work, however, is very well known, and it extends over a wide field, including sculpture and the painting of cabinet pictures and portraits, as well as decorative subject painting and stained-glass design. The Cavendish Memorial window in St. Margaret's Church, Westminster, is an example of his skill. "Charity" (see *BUILDING NEWS*, May 27, 1887), and "Of Such is the Kingdom of Heaven" (see *BUILDING NEWS*, June 14, 1889), are other instances executed by Messrs. Powell, from his cartoons for a building in Philadelphia. At the Royal Academy in 1883 the Lord Fredk. Cavendish Memorial, erected by the House of Commons, was exhibited, and also some of the principal figures were shown in the same gallery—viz., "The Man of Sorrows" and "The Agony of Christ" (see *BUILDING NEWS*, June 16, 1883). In 1888 Mr. Holiday painted "Aspasia" in oils, and some years earlier we remember some water-colour work of his, also at Burlington House, "Sara, belle d'indolence," &c. The same year another work, entitled "Adam: In the Sweat of the Face shalt thou Eat Bread." In 1879 we had "Theology," a large cartoon for decoration. Of Mr. Holiday's sculpture we may name "Jacob's Ladder" and "Sleep," both exhibited at the R.A. (1881-4). Among the portraits painted by this artist are "Mrs. Gilbert Scott," "The Children of the Rev. Clement Prance," and "The Duet," in water-colour, giving portraits of Alexandra, daughter of the Rev. G. W. Kitchen (now Dean of Winchester), and Winnifred, daughter of the painter. In 1877 he exhibited two other water-colour designs, "Ara Innocentie" and "Diana." Mr. Holiday has in many ways helped to forward the improved treatment of domestic architecture in the matter of furniture and interior design. His own home, Oak Tree House,

Branch Hill, Hampstead, built many years ago now, from the designs of Mr. Basil Champneys, was among the first erected in the so-called "Queen Anne" style, and it had some influence in the design of other artists' homes. We illustrated it among our series of such dwellings in the *BUILDING NEWS* for June 4, 1880. The portrait is from a photograph specially furnished by the artist himself.

Mr. Madox Brown, who was born at Calais of English parents, began the study of art early. At the age of thirteen he was enrolled among the students of Gregorius, a pupil of David, and Directeur of the Academy of Bruges. At fifteen he entered the Atelier of Vanthanselaert, Directeur of the Academy of Ghent. At the age of seventeen he was one of the numerous pupils of Baron Wappers at Antwerp. Mr. Madox Brown's attention was early directed to decorative matters. In 1850, or perhaps before, he and Dante Gabriel Rossetti gave their thoughts to the improvement of picture-frames. About 1861 Mr. Brown was one of the original founders of the firm of Messrs. William Morris and Co., from which establishment the decorative arts in this country have received such an impetus. For the last ten years Mr. Madox Brown has been busied with the mural paintings of the Manchester Town Hall, the last painted one of which is at present exhibiting in Bond-street. Also what establishes Mr. Brown's place among the decorative artists of the day is his decoration of the spandrels of the dome of the Manchester Jubilee Exhibition in 1887. These large and important works were executed by Mr. Madox Brown, with the aid of seven assistants, in five months. Since the clearing away of the exhibition buildings, these large works, which are on canvas—eight colossal figures, each one illustrative of one of the industries of Lancashire, and each figure accompanied by an angel denoting energy—have been acquired for the Technical College in course of construction in Potter's Park, Manchester. Mr. Madox Brown's photograph was taken by Mr. Pae, of Newcastle-on-Tyne.

Mr. George T. Robinson, F.S.A., commenced practice as an architect in 1848, and was extensively engaged in public works, amongst them being the market-halls of Bolton, Wolverhampton, Tunstall, and Monte Video, the town hall of Burslem, and many other municipal buildings. He was also largely engaged in the erection of new, and the restoration of old, churches in the Midlands, as also in works of domestic character, and was for some time partner with the late Mr. Paull at Manchester. Being amongst the early followers of A. W. Pugin in endeavouring to raise the character of design in industrial art, he occupied himself largely in designs for paper-hangings, textile fabrics, metal-work, furniture, and ceramics. These gradually withdrew him from the ordinary routine of architectural practice, and, resigning his Fellowship at the Royal Institute of British Architects, he devoted himself entirely to designing and practically carrying out the various branches of decorative art. Of late years he has been much engaged in designing the internal decoration of ships, and those of the *City of York* and the *City of Paris* for the Inman and International Line, the *Majestic* and *Teutonic* for the Star Line, the four largest ships afloat, have either entirely or in part been designed by him. In literature he has written critical and historical essays in the various professional and artistic journals, contributing many to the *BUILDING NEWS*. At one time he was connected with the *Manchester Guardian*, whose war correspondent he was during the Franco-Prussian war, and wrote the history of the siege of Metz, he being the only English press correspondent who succeeded in remaining there when the others were expelled. Mr. Robinson's photograph was specially taken for us by Mr. T. Fall, of Baker-street, W.

Mr. William Morris, the founder of the works at Merton Abbey, and author of "The Defence of Guinevere (1858)," "Jason," and the "Earthly Paradise," was born in 1834 at Walthamstow, in Essex, and educated at Marlborough College and Exeter College, Oxford. His father was wealthy, and intended his son for the Church; but instead he was articled to an architect, and for about nine months was a pupil in the office of the late G. E. Street, R.A. At college and afterwards his personal friends were pre-Raphaelites. In 1861, in association with Messrs. Ford Madox Brown, E. Burne

Jones, A.R.A., Philip Webb, H. Holiday, and others, including the late Dante Gabriel Rossetti, Mr. Morris commenced his present business in Queen's-square, now in Oxford-street. In prose work, "Hopes and Fears for Art" may be named, and a translation of the "Odyssey." Mr. Morris's interest in Socialism must also be mentioned, in connection with which movement he has long been an ardent worker, as well as for a time in the ranks of the Democratic Federation. His wall-papers, fabrics, tapestry, furniture, and stained glass are of world-wide reputation. He is one of the promoters of the Arts and Crafts Exhibition. He lives on the Upper Mall, Hammersmith.

Mr. Walter Crane was born at Liverpool in 1845, and is the owner of a name related to the knights of Suffolk. His father, Thomas Crane, born at Chester in 1808, was educated in the Royal Academy, where he obtained the distinction of a medal in 1825, and, until his death in London in 1859, practised with considerable success as a miniature painter at Chester, Liverpool, and Torquay, to which last town he had been driven by ill-health. His miniatures were much admired for the grace and vivacity of their designs and compositions. He exhibited in London at the Academy, Suffolk-street, and the British Institution, and, after 1832, almost invariably at Liverpool. Mr. Walter Crane narrates the history of his early impressions of the current art of his youth's time, beginning with a visit to the Academy Exhibition of 1857, when Millais's "Sir Isumbras crossing the Ford" was the cause of infinite discussion. Although little more than a lad, he was already disposed by taste and education to overlook the cruder and imperfect features of this astonishing picture, and to be warmly affected by it. These sympathies had been exercised at a still earlier period than that in question, when, as with scores of young artists, Crane made fancy pictures to illustrate Tennyson and Scott, "copying out," he tells us, "the text, and making bordering illustrations to the words." Thomas Crane must have been an excellent teacher who succeeded so well in instructing his son that the latter so far profited by his counsel as, before he was sixteen years of age, to be able to paint and win a place on the Academy walls for his little picture of "The Lady of Shalott." This was in 1862. Mr. Crane states that on his father's death "I was thrown very much on my own resources." Another authority says, "he studied as an apprentice for three years under Mr. W. J. Linton, becoming thoroughly acquainted with the conditions of wood engraving and its demands on the draughtsman and designer." In those days it was necessary to draw directly on the wood itself, now relieved by photography, which transfers a design from paper to the wood, and thus allows the original work to be preserved. "I consider it was an advantage to me thus to have been assisted with a definite handicraft, as well as an art like wood-engraving, instead of going through the usual academic or school course; besides which, I was just on the way of getting a living, then a matter of pressing necessity." Otherwise, and most effectively, his art thrived "by constant practice, doing anything and everything almost that came in my way, and, sketching out of doors, [I] gained a certain facility both in oil and water-colour." At this period he made many studies in the Zoological Gardens, and thus carried out his plan of drawing everything from nature. This was from about 1859 till 1862, when the apprenticeship to the wood-engraver terminated, and the picture of "The Lady of Shalott" was exhibited. The influence of Mr. Linton made Crane's entrance into the practice of book-illustrating a comparatively simple and easy matter. About 1863-5 he was accustomed to work at Mr. Heatherly's then well-known art school in Newman-street. Here was Crane's work of the evening, and the antique as a model for style in the higher order of design which is manifest in his graver efforts, was thus learned in Heatherly's school. In 1865 he had begun to make designs for picture-books for children, some of the finer instances of which marked a new era in that sort of work, are now treasured by collectors, and will assuredly, in times to come, be valued very highly indeed. "The Fairy Ship," a romance describing in vigorous colours how a certain wonderful craft was laden with almonds and raisins and navigated by a crew of mice, and "The Little Pig who went to Market." To these succeeded "King Luckiboy," and a host of others. While such things as these occur-

ied no small part of his energies, the painter ent, as he tells us, picture after picture to the Royal Academy for exhibition, which the committees of that body as steadily rejected until 1872, when "At Home," a portrait, a water-colour drawing, found a place for the second and last time in Mr. Crane's career. Since 1877 the artist has ceased to court for his later works that gnomonious fate which befell their forerunners. Meanwhile, the Dudley Gallery opportunely opened its doors to the Academy's rejected genius, and, in 1866, its second exhibition contained an important instance of our artist's power of dealing with the pathetic aspect of nature in "Twilight," which in later years was followed by other landscapes and diverse instances, such as a "Shelleyan illustration," 1868; "Spring," and "Ormuzd and Ariman," 1869; "The Red Cross Knight in search of Una," 1870; and, as time went by, similar water-colour drawings. The Dudley Gallery Exhibition of Cabinet Pictures in Oil comprised successively his "Endymion," 1870; "Home News," 1873; "Cupid and My Dame," from Spenser, 1874; "A Daughter of the Vine," 1878; and "This is the Dog that Worried the Cat," 1879. He contributed occasionally to that very interesting exhibition in black and white which, with the Dudley Gallery proper, came to an untimely end in 1882. These instances collectively illustrate the activity and energy of the artist. By means of illustrated books, some of the more important of which have yet to be named, has Mr. Crane become known to the world at large. In the United States his children's books enjoy that sort of popularity which culminates in sticking the coloured plates on screens and in similar places. In Paris and in Germany the picture-books of Mr. Crane and Miss Kate Greenaway are as well known as in England, and with equal warmth admired by differing classes. It was not till 1875 that he essayed a little higher in book decoration, and, under the auspices of Messrs. Macmillan, issued "Tell me a Story." In the next year came, with admirable cuts, "Mrs. Mundi at Home," and Mrs. Molesworth's capital story called "Carrots" (Routledge and Co.). "The Baby's Opera," 1877. In 1879 "The Baby's Bouquet," and, in 1881, the "Herr Baby," Mrs. Molesworth's touching story. In 1881 "The First of May: a Fairy Masque" (Sotheran and Co.), which was followed by "The Sirens Three" written and illustrated by W. Crane (1885), "Flora's Feast: a Masque of Flowers, penned and pictured by Walter Crane," and "Echoes of Hellas" (1888). "The Chariots of the Hours" is undoubtedly one of the finest, if not the finest, and most vigorous of the artist's inventions. The figure of "Flora" is a contrasting illustration of Crane's invention and taste. It is more Greek, yet thoroughly a piece of the Renaissance. "Pegasus" and his god-like owner form a splendid group, exhibit also more of the Renaissance than of Greece. This design, like those of "Flora" and "Sunrise," was lately at the gallery of the Society of Painters in Water-colours, a body in which the artist has recently been welcomed. Mr. Crane's contributions to the Grosvenor Exhibition in 1886 were "The Chariots of the Hours," and a design called "Sunrise," an angel kneeling on heaven's floor and adoring the Creator in this type, the Sun. Another work was "St. George Slaying the Dragon." Mr. Crane's designs for wall papers and plaster decoration have been often illustrated in our pages, as well as some of his chimney-pieces and furniture. He was the originator and President of the Arts and Crafts Exhibition Society. He was a member of the Royal Institute of Painters in Water-colours, but retired when he took up the attack against the Royal Academy a few years ago. His photograph comes from the studio of Messrs. Elliott and Fry, of Baker-street.

The new church at Falmouth, erected from designs by Mr. J. D. Sedding, of London, was consecrated on Thursday, the 17th inst. It has been built at a cost of £4,100.

The proposed reconstruction of St. Cuthbert's parish church, Edinburgh, which has now for so long hung fire, and which has led to some correspondence in our columns, seems threatened with another hitch in the shape of an objection from certain heritors on the ground that the operations will interfere with the interments close to the edifice. A general meeting of the heritors is to be convened early in May to consider the whole matter.

## PRACTICAL ARCHITECTURE WITH DETAILED ESTIMATES.—LXIV.

By HENRY LOVEGROVE, F.S.I., Surveyor.

ESTIMATE FOR A VILLAGE ELEMENTARY SCHOOL.—ABSTRACTS.

		202	0
		6in. by 2in. fir wrought and framed upright.	
		12	0

## Building Intelligence.

**BILLINGSGATE CHRISTIAN MISSION.**—This building was declared open by Lord Kinnaird on Wednesday, the 16th inst., at 4 p.m. The mission entrance is out of St. Mary-at-Hill through a lobby. A stone staircase leads up to the mission hall on the first floor, which, with a gallery at one end, will seat about 200 persons. A retiring room leads into mission hall, and two offices are placed over this retiring room off the landings of stairs, one for the librarian on second floor, which also comprises a reading-room and library with an oriel window at angle. The ground floor and basement comprise two large rooms, 37ft. by 19ft. each, which are leased to the post-office authorities. The upper part of all the windows are filled by stained glass lights by Messrs. A. O. Hemming and Co., 47, Margaret-street, Cavendish-square, W. The exterior is faced with red Bracknell bricks, with Ancaster stone dressings, and red glazed brick pilasters to ground floor. An oriel is placed at the corner of the two streets, carried up from first floor over the entrance to post office up to second floor, and on the third floor it forms a clock turret with four faces, the clock being the work of Messrs. Gillett and Co., Croydon. The turret terminates with an ogee lead roof and iron nial. The contract for the building has been carried out at £4,025 by Mr. R. G. Battley, 21, Old Kent-road, S.E., from the plans and under the superintendence of Mr. George Baines, architect, 4, Great Winchester-street, E.C. Mr. James Hollett acted as clerk of the works.

**EAST KESWICK.**—The memorial-stones of the Laurence Memorial Chapel, in course of erection at East Keswick for the Wesleyan body, were laid on Easter Monday. The new building, which is to cost £1,500, is from the designs of Mr. George Danby, of Leeds, and is Gothic in style. The chapel will be 50ft. by 29ft., and will give accommodation on the ground area for 100 persons, while the gallery at the west end, over the entrance lobbies, will accommodate 50 scholars. The roof will be open-timbered. The front of the chapel will consist of a large central gable, inclosing a four-light traceried window, with an octagonal spirelet at the north-west angle, rising to a height of 52ft., and a projecting staircase to the south-west. The Communion-table will be placed in a large arched recess at the east end of the chapel, with pulpit at one side. Over the Communion-table there will be a circular traceried window, filled in with stained glass. The seats will have stall-ends. At the rear of the chapel there will be a schoolroom, 28ft. by 16ft., and 13ft. 6in. high to the ceiling, accommodating 70 scholars. The building will be of Harehills stone, with Killinghall stone dressings. The walls will be lined with brick, and the internal woodwork will be of pitch-pine varnished. The contractor for the whole of the work is Mr. Robert Brelsford, of East Keswick.

**KINGSTONE.**—The parish church of Kingstone, Herefordshire, was re-opened after restoration, on Thursday, the 17th inst. The building dates from the 13th century, and consists of two naves and two chancels. In the north chancel the north wall has been taken down and rebuilt, and the plaster ceiling removed, exposing to view the ancient timbering. The roof itself has been boarded in oak, and felted over the rafters; and it has been recovered with stone tiles. The north wall was taken down and rebuilt, and the windows renewed. The floor has been re-laid on a bed of concrete, and the new flooring consists of stone memorial slabs and of encaustic tiles. The south chancel has been re-floored with slabs and tiles on concrete, and a new roof of oak constructed; stalls of oak, and new windows provided. In the north and south nave the plaster ceiling has been removed, and the ancient timbering being exposed to view, and repaired where necessary. The boarding and felt over the rafters has been renewed and the roof retiled. The floor has been repaved with a bed of concrete, and oak blocks throughout, and the west gallery has been taken down. New oak seating and west doors have been put in. The windows are new, and the arch between the north aisle and the tower has been opened. The architect for the restoration of the chancels was Mr. Ewan Christian, and the builder Mr. W. Cullis, of Hereford. The restoration of the naves has been accomplished at a cost of about £1,100. Of

this part Mr. T. Nicholson, of Hereford, was the architect, and Mr. H. Smith, Kidderminster, the builder.

**MIDDLETON.**—On Saturday last a new cricket pavilion was opened at Middleton, Lanc. The structure is well elevated, and commands a very fine view of the cricket field and country around. The style of architecture is made up of Gothic and Old English, a half-timbered black and white gable in the front roof being a conspicuous and important feature of the design. The plan consists of a public room and two dressing-rooms with separate lavatories and conveniences. The external walling is built with grey-ended Alkrington bricks, and Ruabon red stock bricks to all quoins. The roof is covered with red tiles obtained from Mr. J. C. Edwards's works at Ruabon. The architect is Mr. T. A. Fitton, of Middleton and Manchester, whose design was selected out of about twenty others submitted in competition, and the builder is Mr. Thomas Jackson, of Middleton.

**PRENTON, BIRKENHEAD.**—On Friday last the new Congregational school-church, Prenton-road West, was opened by the Rev. Alex. Mackennal, D.D., of Bowdon. The church has been erected at the junction of Storeton-road and Prenton-road West, and is the first section of a comprehensive scheme, which will include a church to accommodate about six hundred people, having tower and spire, and schoolroom for 250 children, having five classrooms for senior scholars. The present building will be used for Sunday-school, in addition to congregational purposes. Accommodation has been supplied for about two hundred adults. The chancel is fitted with carved pulpit, Communion-table, and organ. All the internal woodwork is of pitch pine, varnished. The contract has been carried out by Mr. John Shaw, of Birkenhead, from the designs and under the personal supervision of the architect, Mr. Thomas W. Cubbon, of the same town, whose plans were selected in competition.

**SOUTHAMPTON.**—New premises have just been completed at Southampton for Messrs. E. Jones and Co., being an extension of existing buildings. The building has a façade of about 100ft. to the Parks, and is of four stories in height, exclusive of the basement. The front and returns are of buff-coloured bricks, with moulded and carved Corsham Down and Portland stone dressings. The centre portion is carried up and forms a clock-tower, in which is an illuminated dial 4ft. in diameter, by Messrs. Potts and Co., of Leeds. The clock-tower is surmounted with an iron railing, terminating with a crown, encircling a lofty flagpole. The cast-iron work has been supplied by Messrs. W. Macfarlane and Co., of Glasgow. The wings have a balustrade parapet, with terracotta vases at angles. The whole of the lower portion of this frontage is utilised as lofty plate-glass shopfronts. A complete fireproof wall has been constructed, dividing the entire building on a line running from east to west, and where openings occur in this division there are two sets of cast-iron fireproof folding insurance doors, with an aperture of 6ft. between each other, the intermediate space being brick-and-stone lined. This division wall is carried up from the concrete foundations to a point above the apex of roofs. The site covered is about a quarter of an acre. The height to the top of the tower is about 70ft. The several floors are served with one of Messrs. R. Waygood and Co.'s passenger and luggage hydraulic lifts. The contractors for the works were Messrs. Joseph Bull, Sons, and Co., Limited, of London and Southampton, and the architect was Mr. William Burrough Hill, of Southampton. Boyle's ventilators are used to all the lantern lights.

The latest addition to the National Gallery collection is a small 15th-century picture of the Umbrian School, representing an equestrian figure with city and mountain in the background, while flames burst forth from the earth in front of the horse. It is numbered 1,304, is known as "Martius Curtius," and is hung in room No. VI.

The new Board School for boys at Newtown, Exeter, was opened for scholars on Friday. The building adjoins schools erected some years ago for girls and infants, and contains large schoolroom, two class-rooms, master's private room, and cloak-room. The designs were by Messrs. Hayward and Son; Messrs. Stephens and Son were the builders, and the desks were supplied by Messrs. Wippell and Son, all of Exeter.

## Engineering Notes.

**GLASGOW.**—The ceremony of laying the foundation-stone of the Great Western Bridge, which crosses the river Kelvin at the Great Western-road, and connects Glasgow with Hill-head, took place on the 10th inst. The arranging for the erection of the bridge has been carried out by a joint committee of the local authorities of the city of Glasgow and the burgh of Hill-head, and the Road Trustees of the Lower Ward of Lanarkshire. The new structure is to consist of two arches of 91ft. span each over the Kelvin, and two land arches, each having a span of 31ft. The abutments, piers, and wing walls are to be of stone, while the arches are to be of cast iron, and the platform beams of steel. There will be a carriageway paved with granite setts, and granolithic pavements at each side 12ft. wide, while the total width of the bridge between the parapets is to be 60ft. Altogether the undertaking will cost £38,578, of which £34,251 is to be expended on the new bridge, and the remaining £4,327 has already been spent in the erection of a timber accommodation bridge. The new bridge has been designed by Messrs. Miller and Bell, C.E., of Glasgow; the contractors for the masons' work are Messrs. Morrison and Mason; and for the steel and iron work Sir William Arrol and Co.

### CHIPS.

It is proposed to erect a memorial of the late Dr. Parry, Bishop of Dover, in Canterbury Cathedral.

A new tower is to be erected to St. Anne's Church, Heyhouses-on-the-Sea, at an outlay of about £1,000.

Operations will commence at once in the erection of the proposed new church at Crawshawbooth, Rawtenstall, for which drawings have been prepared by Messrs. Paley and Austin, architects, of Lancaster.

Mr. T. Mellard Reade has been nominated by the council of the Liverpool Architectural Society for re-election as president of that body, at the annual meeting to be held on Monday week.

At a meeting held in London, under the presidency of the Duke of Cambridge, it was resolved to raise a sum of £10,000 for the repair of the Crimean Memorial Church at Constantinople, and the formation of an endowment fund. The church was built by the late Mr. G. E. Street after a competition, and Mr. R. Herbert Carpenter has just been out to Constantinople to inspect and report on the state of the building.

The Bishop Poole Memorial School at Osaka, Japan, was opened by Bishop Bickersteth on the 10th March. It occupies a site at the intersection of the two central streets of Kawaguchi, the foreign settlement, having frontages of 70ft. and 180ft., with a wing 52ft. long on the east. The remaining side of the square is partly occupied by a bath-house and servants' quarters, while the intervening quad forms a playground for the inmates of the school. The school comprises on the ground floor six classrooms, a meal room, and, in the east wing, dormitories. The upper floor of the main building consists of dormitories divided into cubicles of 4½ mats each, by partitions 6ft. high, opening on to a central passage. It accommodates 82 pupils. The building consists of red brick, with stone dressings, high-pitched roofs, and stone-coped gables. It has been erected from the designs and under the immediate direction of the architect, Mr. Alex. N. Hansell (late of London), of Osaka and Kobe.

The whole of the barracks of the Royal Berks Militia at Reading have been retrained with air and water-tight drain-pipes, under the directions of the Royal Engineers of the Home District, the works being carried out by W. Goodchild, builder and Government contractor, Weldale-street, Reading.

A new cemetery at Newcastle, serving the east end districts of Byker and Heaton, was consecrated by the Bishop of Newcastle on Saturday week. The total cost has been nearly £14,000. The land, twelve acres in extent, cost £700 per acre, and the works have been in the hands of three contractors, as follows:—No. 1. Mr. Edward Edgar, of Heaton Town Farm, Newcastle, road-making, drainage of the ground, and large sewer down Benton-road, £1,350. No. 2. Mr. G. H. Mauchlen, of Tamworth-road, Newcastle, boundary walls, iron palisading, and entrance gates, £1,205 5s. No. 3. Messrs. Milburn and Gibson, of Blackhill, superintendent's lodge and two chapels, amounting to £2,238 16s. 4d. The whole has been carried out under the supervision of the architect, Mr. J. W. Taylor, of Westgate-road, Newcastle.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

## NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII., XLVI., XLIX., LI., LI., LIII., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—W. G. and Son.—G. G. H.—A. M. D.—W. B. W. and Co.—R. D.—J. and Co.—G. T. and Son.—O. S. B.—G. E. and Co.

## "BUILDING NEWS" DESIGNING CLUB.

## EIGHTH LIST OF SUBJECTS.

Subject H.—A Parish Hall and Soup Kitchen, to be erected on a corner site with a side frontage of 125ft. deep, and a frontage of 35ft. to the main road of a small village. The best-sized room obtainable on the site to be provided, allowing for a good roomy stage with a retiring room, suitable for class and committee purposes, or as a green room for theatrical performances. These parts of the hall to have a rear entrance, and the soup kitchen may be in a half-basement. Provide good main entrance, lobby, and stairs to gallery at end of the hall only. The floor of the stage is to be 3ft. above the level of the hall, and to have an arched opening dividing off the wings from the assembly-room. Hall to be heated by hot-water coils in recesses in walls. Style, Late Tudor Renaissance, in stone, and roofs covered with green slates. Provide for ventilation. Scale, 1/4 in. to foot. Sufficient drawings to show design, including sketch view.

DRAWINGS RECEIVED.—"Skull and Cross Bones," "Red Rover," "N. B.," "Sector," "Hubby," "Saxon," "Box," "Coombe," "X. Y. Z.," "Theta."

## Correspondence.

## ARCHITECTS' REGISTRATION BILL.

To the Editor of the BUILDING NEWS.

SIR,—Will you allow me to state, in answer to the many inquiries received, that this Bill has been set down again for the second reading on the 30th inst.; but having regard to the state of business in the House, it is questionable whether it can be reached.—I am, &c.,

EDGAR FARMAN, Hon. Sec.

The Architects' and Engineers' Registration Act Committee, 39, King-street, Cheap-side, E.C. London, April 18.

## ARCHITECTURAL REGISTRATION IN FRANCE.

SIR,—The vexed question of Registration is still taking up much attention in France, as it is in England.

I have just seen a report of the "Commission d'Etude du Diplôme," the last meetings of which

took place at Paris on the 15th and 16th April, under the presidency of Messieurs Garnier et Laroumet. A report was read, giving the answers returned by provincial societies to the questions asked by the central society. These answers varied much; the greater part, however, seemed to demand the obligatory diploma, a large number the voluntary diploma, and a few only the rejection of either. In regard to the answers and ideas, it was remarked that the provincial and central societies do not represent all the architects. Many "confrères" of merit do not belong to any society, and so their opinions are not known. A number of the members of the Commission gave their opinions for and against the obligatory diploma.

In the general discussion Monsieur Mulle, Professor of Legislation at the Ecole des Beaux Arts, spoke at length, bringing forward reasons against the obligatory diploma. He said that, as regards the situation of advocates, medicine, and pharmacy, &c.—for which a guarantee or diploma was exacted, it is especially the public interest that is taken into account, and not the interest of either professions. In order to create a privilege a certain amount of public interest is necessary, and does this really exist for architecture? Guarantees are already made for the profession in the shape of administrative rules and code of constructors' responsibility. The complaints do not come from the public, but from the architects. It is, then, solely in the interest of the profession that the diploma is demanded. Monsieur Mulle proceeded to state that architecture is not the only profession that is overcrowded, that many others suffer from the same overcrowding. The remedy, M. Mulle avows, rests in the good sense of the public. The obligatory diploma for architects would be a disastrous example. Every other profession—civil engineers, shipbuilders, plumbers, carpenters, electricians, &c., would claim the same favour.

The consequences would be that industry would become divided into an infinity of closed "castes," and the régime of the last century—the enemy to all progress—would return.

If the obligatory diploma were created, a new law would be necessary, couched in like terms: "Whoever, without possessing the diploma, shall do deed of architect will be pursued according to the law," &c. Such a law the legislative powers would never consent to pass—a law against an action which is, in principle, most honourable. If a proprietor were himself to build, thus doing deed of architect, would he be arrested and forced to employ a diplomaed architect? It would no longer be the diploma, but the architect, that would be obligatory. Monsieur Mulle wound up by saying that the obligatory diploma would be an attempt against the public conscience, and could not exist. I see by the "Construction Moderne" that the Commission has so far decided by votes: for the obligatory diploma, 3 votes; against, 15; for the voluntary diploma, 6 votes; against, 12. The obligatory or voluntary diploma is, for the present, rejected. I send you this short report, thinking it may interest your readers, and not as in any way giving my views of the matter for or against.—I am, &c.,

ARTHUR VYE PARMENTER.

Palais des Beaux Arts, Lille.

## THE INSTITUTE EXAMINATIONS.

SIR,—I am extremely sorry that I cannot follow Mr. Pennington's suggestion, and oblige him by going in for an examination—which I have already passed. It is, however, a great consolation to me to find that we are so thoroughly in accord as regards this examination at the Institute. I agree cordially with him when he says that the knowledge which enables one to pass it, is just that "which makes the architect respected on the works"—i.e., by the bricklayers and carpenters. The builder, too, as he says truly, "knows nothing about the higher calculations"—but why calculations?—"done in the office"; and the inference one naturally draws is, that Mr. Pennington considers it is unnecessary for the architect to trouble himself much about them either. This is the only point upon which we differ, and it is, of course, a trivial one. I hold that the possession of practical knowledge alone no more makes an architect than the being able to write proves a man to be an author; that an architect is an artist; and that if his work does not possess artistic feeling, it is not architecture, and its designer consequently not an architect. Mr. Pennington, "who undertakes both architect's

and builder's duties, who employs his own, pays weekly wages, and changes his plumb, apparently thinks differently. I am sorry; as it is not worth arguing about so small a matter, we must, I am afraid, continue to disagree.—Your, &c.,

FRED. M. SIMPSON.

## ARCHITECTURAL DEVELOPMENT.

SIR,—The power of the Institute for would be entirely gone if the views of Council on every question were to be submitted to the vote of a general meeting. I notice certificate for membership is in course of circulation, and that the Great Seal has been affixed—no doubt up to the time of its being called into requisition it has been sheltered the Tower of London. The cats dancing rampant have taken a turn for good, their hook tails still exhibiting a large amount of vitality, have developed into the Florid Tudoresque style and their beards are wanting. Notice the crowns, how regal they are! and their contorted tongues, symbolical repose in architecture, all exhibit learning of a very high standard. The column in the ceiling has obviously shunted Norman and adopted the 19th century style—why shouldn't it? The sh-rock, rose, and thistle are all manifestly present—all highly symbolical again; and I do not know whether the design was intended to give a jar of piccolilli or a certificate of membership of a Royal Institute; but obviously the design was never submitted to a general meeting of the Royal Institute; and apart from its not being adopted by the body corporate, it affords a strong inculcation of the lesson that art cannot be taught by examination.—I am, &c.,

CHAS. GUY HALL.

St. Alban's-road, Kensington.

## PROVISIONS IN QUANTITIES.

SIR,—Your correspondent "Twice Charged" has managed to write a very long letter on a small matter, and I think that, with insufficient grounds, he finds fault with the honourable body of professional men.

Does he actually state, and is he prepared to prove, that, for the sake of a pound or two commission, any respectable surveyor writes down provisional sums or quantities?

In a large experience I have never heard of such a case, and think it altogether absurd. The specification states that certain items are to be provisional quantities, say concrete, digger, framed timber, lead, or any other portion of the trade, what is the surveyor to do?—he cannot ignore them altogether.

Then, as to the measuring-up after, I am sure most surveyors will agree with me that measuring jobs are of no benefit at all to the surveyor.—I am, &c., HENRY LOVEGROVE.

26, Budge-row, E.C.

SIR,—As the letter signed "Twice Charged" in your last week's issue reflects somewhat upon surveyors, who, after being charged of matters of forethought with a dishonourable act, are designated generally an honourable body of men, I crave permission in your interest columns to make the following few remarks. I ask on what grounds a surveyor is justified in putting into his quantities provisional quantities of labour and materials, when he is aware alterations may be required, necessitating using the said materials? and where the difference between this and putting in a lump sum of money? And, moreover, the advantage in the former case is that when making the accounts the items are priced by the contractor, and the prices may be used. Who is the surveyor who charges 2 per cent. commission "omitting" the above items? There are, if any, surveyors who get this for taking quantities. I have seen 1½ per cent. charged, works omitted, but more usually 1¼ per cent. only; and why should not a surveyor charge omissions of said items? Who is responsible for the event of "Twice Charged" finding that these items, of, say, concrete and digging, &c. have not been credited? I imagine your correspondent (if he be a "client," which I must doubt) would have few scruples in trying to recover from the "honourable" or "dishonourable" surveyor; and is this responsibility nothing! Why does not the writer argue that making up the accounts after completion included in the 1½ per cent. or 2 per cent. charged for taking out the quantities? The argument would not be much more unreasonable

nd, Sir, if surveyors are to be stabbed in the back in this mean and cowardly fashion, let s have names, and not *noms de plume*, at the foot f the accusations.—I am, &c.,  
A DISGUSTED SURVEYOR.

Sm,—In answer to "Twice Charged," I will ate a case that has happened lately to myself. In the bills of quantities a large item was erted over and above what was required, and pon which 2½ per cent. was paid. At the ttlement, in bills of deductions, another 2½ per ent. was charged for deducting said amount. he work in connection with the above item was en measured, and another 2½ per cent. paid.— am, &c.,  
BUILDER'S MANAGER.

## Intercommunication.

### QUESTIONS.

[10270].—**Provisional Sum.**—Where a provisional um is put in quantities for "Special fittings fixed" from ie price submitted by sub-contractors and accepted by ie architect, can the contractors, after erecting the work, aim a larger sum, giving as a reason a rise in the market tetween acceptance of their tender and the carrying out 'the work? or may they demand an allowance for men's 'drinking" or travelling expenses when the work carried it is situated several miles from their workshop, know- ing the same beforehand? This is a case I have to con- und with, and the tenderers seem to think themselves istified in rendering their account for more than the iginal sum sent in, although the demand is for several unds more than the price they offered to do the work, and the settlement stands over accordingly.—FAIR- AN.

[10271].—**Nuisance from Saw-Mill.**—A. and B. y adjoining plots of land. A. erects workshops and ores; B. builds semi-detached villas to within 3ft. 6in. of A's boundary. A. then lays down a saw and planing mill ithin the above stores, the noise and vibration of which annoy B. A. not wishing to annoy B., would be glad of y suggestion that would abate the above annoyance.— ORTHAMPTONSHIRE.

[10272].—**Percentage.**—Will someone kindly inform e what per cent. on the amount of sales I should have r the following work:—Measuring the land, making lan and section (with duplicate) of three acres of building nd for dwelling houses, showing position of every house, utting out the drains, with junctions to every house, con- nuously inspecting the same; selling the building sites, nd making out the accounts; preparing plans, specifica- ons, sections, and agreements for the letting of the rains and the street formation; supplying quantities (no charge to the contractors for quantities supplied)?

### REPLIES.

[10264].—**Prime Cost.**—As there is no answer in tercommunication to this query, although there was an rticle touching on the subject in the same issue of the BUILDING NEWS wherein the question appeared, yet I did of find the point raised treated on. I thought perhaps n explanation might elicit a reply from someone xperienced. I told the proprietor that I thought the ntractor would be entitled to the trade discount on aying the amount in the usual course of business; but e contends that as he is the actual paymaster, he is ntitled to what discount or allowance can be obtained, as e considers he has the right to order the special work if ecessary, and deduct the amount included from the con- tract. Not having done so in the first instance (although e went to see the goods prior to delivery), I told him I ought the discount, if any could be got, would, in the customary way, go to the contractor. On seeing the akers of the specialties, they state that the prices for eir goods specified and inserted into quantities (giving e p.c. for contractor's guidance) are not subject to dis- ount in the ordinary course, the prices having been given e the selling prices.—FAIRATION.

Waterloo House, in Westgate-street, Ipswich, hich for nearly half a century has enjoyed the restige of having the finest shop front in the Eastern Counties, has just been remodelled and reted. The window frontage of 115ft., hitherto roken up by broad piers, is now almost continuous, nd the central shop is surrounded by two tiers of alleries. The lantern lights above the three new howrooms are fitted with Robert Boyle and Son's entilators. Messrs. Grimwood and Sons, of Ipswich and Sudbury, were the builders, and Messrs. F. Sage and Co., of London, the shop eters.

At St. Paul's Cathedral, Mr. William E. F. ritten is completing the designs to fill the spaces etween the arches under the whispering gallery. f the eight spandrels, three have already been mpleted. Two of them are by G. F. Watts, .A., representing St. Matthew and St. John. The hird is from the design of the late Alfred Stephens, ho executed some twenty years ago designs for ur of the spaces, the subjects being the prophets aniel, Ezekiel, Isaiah, and Jeremiah.

On Monday week a new mission-room, erected dja-cent to St. Jude's Church, Wolverhampton, as dedicated to the Bishop of Shrewsbury. The om, which corresponds in character with the urch, has cost £500. The builder was Mr. H. illcock, and the architect Mr. T. H. Fleeming.

### LEGAL INTELLIGENCE.

JAGGER V. DONCASTER UNION RURAL SANITARY AUTHORITY.—This case was heard in London on Tuesday and Wednesday week by Mr. Justice Cave without a jury. The plaintiff, in making additions and alterations to his dwelling-house in Bentley-road, near Doncaster, had neglected to comply with the requirements of certain by-laws of the sanitary authority, whereupon the authority, acting under the powers conferred upon them, demolished a part of the premises. The plaintiff now claimed an injunction restraining the defendants from a repetition of the acts complained of, together with £1,500 damages for injury to his property. By-law 55 provided that 16sq.ft. air space should be left open in the rear of any new building. It was not denied by the plaintiff that he had failed to observe this, but he contended that the by-law did not apply to his case. But, even assuming that it did, the defendants exceeded it by demolishing beyond the 15sq.ft., and were therefore liable for excess of damage. It was proved that the premises were unroofed beyond the proper limit, that the debris fell in, and that that part of the premises was left uncovered all night. The defendants admitted that the 15sq.ft. were exceeded, but contended that it was only to a necessary and inappreciable extent, though it was proved that a man was employed for 14½ hours in retiling the roof. They further alleged that specific instructions were given to the contractor not to exceed the 15ft. limit, and that if the Board's authority was exceeded the Board was not responsible. At an earlier stage of the proceedings the Board had summoned the plaintiff before the magistrates for not submitting a plan of the proposed alteration in accordance with another by-law, when he was fined 40s. Mr. Justice Cave, in giving judgment, said: The plaintiff contended that the proceedings of the defendants were wholly wrong, inasmuch as he had entered into a covenant with the owner of the adjoining land for its purchase; but there never was any agreement between Jagger and the adjoining owner, and so the defendants were justified in pulling down such parts of the building as were not in conformity with the by-laws. No doubt the persons employed did go beyond the part of the land which belonged to the plaintiff, and as to that excess there was a default. But the defendants, besides employing a contractor, in addition directed a servant of their own to assist in the demolition, and I do not find such circumstances as to make him a servant of the contractors. The sanitary authority would, therefore, be liable jointly with the contractor. There is no suggestion that the servant thought he was going beyond his instructions—probably they were not sufficiently definite. Doubtless the parties engaged in unroofing the part abutting on Jagger's own land thought they were doing their duty, and so the sanitary authority is liable. What is the extent of their liability? As to the portion standing on the plaintiff's own land, a considerable part of the slates was stripped off, and for this the defendants would be liable. The sanitary authority could not have pulled down that part without pulling down the whole, including the slates, and on that ground they are not liable. Jagger had persistently disregarded the by-laws. He built, knowing he had no right. He was given an opportunity of either acquiring the land at the back or pulling down what he had built, but he did neither; and so the sanitary authority were right in saying that they had a right to pull down the part in excess, even if the whole should fall, and to do it in the most convenient way to themselves. They are not allowed to do it in a dangerous way, but consistently with safety may effect their object in the way they please. On another ground the defendants are not liable, for, assuming they were not justified in removing the tiles, yet no damage has been proved. The damage would have happened just the same from the dust and mortar, and as to any damage caused by rain, the evidence was insufficient. On the whole there would be judgment for the defendants.

CARAVANS AND THE BUILDING ACTS.—HALL V. SMALLPIECE.—This case of a conviction by a magistrate of the owner of caravans and tents, for a supposed violation of the provisions of the Building Act, raised a question as to whether such erections can be considered as buildings within the scope of the Building Acts. The original Act contained provisions as to buildings with walls, &c., and a question having arisen as to whether they applied to temporary buildings, the 45 Vict. c. 14, section 13, extended them to "any wooden structure or erection" of a movable character set up without a license in writing from the Metropolitan Board of Works, which is now superseded by the County Council. The defendant had set up at Hampstead five structures or erections of a movable or temporary character without a license from the County Council. These structures were a steam round-about and three caravans, all on wheels, and a shooting-tent, &c. The magistrate convicted the defendant, but stated a case, on which he appealed. Mr. William Smallpiece, district surveyor for East

Hampstead, appeared in person to support the conviction, claiming that these were structures or erections within the recent Act. The Court came to the conclusion that the magistrate was wrong, and that the conviction could not be supported. Lord Coleridge said that if the conviction had been under the original Act it must be admitted that it could not be supported, as these things were certainly not buildings. But these were plainly not intended to be used in any sense for the habitation of man. They might be in some sense structures, but not surely within the meaning of the Act, the scope and object of which were to supplement the Building Act. The words "structure or erection" must be construed in the same sense as in the Metropolitan Building Act, 18 and 19 Vict. These, therefore, were not structures or erections within the recent Act. The conviction was wrong, and must be set aside. Mr. Justice Mathew concurred, and said it was a strange straining of the Act to make it apply to mere caravans or things on wheels. Conviction accordingly quashed.

POWERS OF LOCAL AUTHORITIES TO DEMOLISH BUILDINGS.—HOPKINS V. SMETHWICK LOCAL BOARD.—This appeal, from the decision of a Divisional Court consisting of Mr. Justice Denman and Mr. Justice Wills, was heard on Tuesday by the Master of the Rolls and Lords Justices Fry and Lopes. On October 12, 1888, the plaintiff deposited with the Smethwick Local Board for approval the plans of certain buildings which he intended to erect in their district. The plans were considered and rejected, and notice of the rejection and of the reasons for it were given to the plaintiff. The plaintiff again deposited plans, which were again rejected, and this happened a third time. Towards the end of December the plaintiff, having received no authorisation from the local board, began to erect the buildings. The defendants gave him notice to remove the buildings, and, on his non-compliance, themselves, in accordance with a resolution passed by them, entered on the land and demolished the buildings. The plaintiff then brought this action for trespass, and at the trial before Mr. Baron Pollock at Stafford the learned Judge held on the cross-examination of the plaintiff that the defendants were justified in what they did. The Divisional Court reversed this decision, holding, on the authority of "Cooper v. the Wandsworth Board of Works," that it was the duty of the defendants to have given the plaintiff notice of their resolution to demolish his house before proceeding to demolition. The defendants appealed, but the Court now dismissed the appeal. The Master of the Rolls said that the power which the Local Board had assumed to exercise was a power affecting the property of the plaintiff in the most highly penal way possible. Those who had the authority to exercise such a power must take every care to follow out each necessary step in the strictest manner. The case of "Cooper v. the Wandsworth Board" was an authority to show that where a local board had power on the misconduct of a building owner to enter on his land and demolish the offending building, there was a necessary implication by the fundamental principles of justice that they must give the owner notice of their intention to take that step. That case appeared to be rightly decided and on sound principles, and it governed the present case. Lord Justice Fry entirely agreed. Some opportunity ought to have been given to the plaintiff to show cause against the demolition of his house. Lord Justice Lopes concurred.

On Saturday the Bishop of Gloucester and Bristol held a dedication service in the new mission church of the Good Shepherd, which has been erected in York-place, Brandon-hill, Bristol. Designed and built by Messrs. Bailey, Harding, and Vowel, it has cost about £450. It is a plain brick building with a temporary iron roof, and a permanent chancel with a slate roof. There are three stained-glass windows in the chancel.

Under the auspices of the Clifton Archaeological Club the names of some celebrities are being affixed to houses in Bristol in which they had resided. The name of Hannah More has recently been affixed to the building in Park-street, once her home, and the name of Sir Thomas Lawrence to his house in Red-cross-street. Soon the names of Chatterton, and Bird, the artist, will be appended to houses in the city associated with their memories.

At the last meeting of the Suffolk County Council an application was received from Mr. Henry M. Eyton, of Ipswich, for compensation by reason of his having been superseded in the office of county surveyor for East Suffolk. He urged that he had held the office uninterruptedly from June, 1865, and during each of the last five years had received £200 salary as surveyor of bridges and buildings, and £80 as surveyor of roads. The clerk to the council advised that as the appointment was an annual one no such claim could be sustained, and it was agreed that the application be not entertained.

## Our Office Table.

THE annual exhibition of the Royal Cambrian Academy will open on May the 26th, at Plas Mawr, Conway. The Academy is making steady progress. The coming exhibition is expected to be of special interest. Several of the leading members, including Mr. Clarence Whaithe, R.W.S., Mr. Peter Ghent, Mr. Joseph Knight, R.I., Mr. Anderson Hague, Mr. Charles Potter, and others, will probably be well represented. We are glad to see that the Academy is fully alive to the claims of architecture to be well represented in a national academy of art. The membership already includes Mr. Douglas, Chester; Mr. Baker, London (who is the compiler of a beautifully illustrated work describing Plas Mawr), Mr. Stephen Williams, and Mr. Edwin Seward, of Cardiff. At the last meeting of the members, Mr. Robert Grierson, architect, of Bangor, was elected an associate.

GREAT efforts are being made by the council of King's College, London, to meet the growing wants of the age in the direction of electrical engineering. The engineering department of this college has always had a high reputation; but now, thanks to the munificence of Lady Siemens, a new laboratory for electrical engineering, to perpetuate the name of her distinguished husband, and to be called the "William Siemens Laboratory," is to be constructed and fitted with every modern electrical appliance. The council have equipped a fine engine and boiler-room, with all the machinery requisite to provide the necessary power, and it is hoped that by this means the whole college will ultimately be lighted by electricity. A new chair of electrical engineering has been established, and the first professor has been appointed—namely, Dr. John Hopkinson, F.R.S., the President of the Institute of Electrical Engineers, than whom no better selection could be made to undertake the direction of such a laboratory. It is hoped that the new arrangement will commence with the October session.

At the last meeting of the York City Council a long discussion took place with reference to a recommendation by the Municipal Offices Committee that various extra or substituted works be carried out in connection with the erection of the new Sessions Courts, with police-station, &c., in Clifford-street, amounting in the aggregate to £2,698 6s. 3½d. The Lord Mayor explained that, since the design of Mr. H. A. Matear, of Liverpool, was selected in competition, an increase of 10 per cent. had taken place in the value of all building materials, and, in addition to that, the committee thought that the building ought not to be spoilt for lack of the proverbial ha'porth of tar. Mr. Matear explained that the increased cost was chiefly required for concrete instead of lime in foundations, and the substitution of wrought for cast iron to balustrade and railings, of lead for zinc in dormers, and of stone for concrete in steps. The recommendation was carried by 14 votes to 11.

MR. EDWARD SUTTON, architect, of Nottingham, writes complaining of the alterations which the present Roman Catholic Bishop of Nottingham is making in the Cathedral on Derby-road in that town, one of Pugin's masterpieces. Bishop Bagshawe commenced, Mr. Sutton informs us, by moving the beautiful sedilia and placing the back part on stilts to prevent its falling, and put in front of it a bench which, if painted, would just suit an Arboretum. He next erected a rail in front of the rood-screen supported by iron rods, one of which goes through the marble of the brass monument put down to Canon Mulligan by the congregation at a cost of 100 guineas. From the high altar the beautiful crucifix was removed and a more lofty one erected; the sanctuary lamp was taken away and the light placed in the piscina. The next vandalism was the introduction of two skylights, and the blocking up of two painted windows with oil paintings, which made the church darker again. Then Dr. Bagshawe took out four painted windows done by the best artists, the templates being filled in with common glass. Now there are twelve skylights introduced, in one instance by cutting away one of the illuminated principals of the roof. Mr. Sutton charges the Bishop with committing a sacrilege in taking out the stained glass, and adds that he has written to Dr. Bagshawe protesting against the alterations.

A THEATRE is about to be erected by a new company in Ipswich, under the patronage of the leading men of the district. Ipswich has greatly increased in latter years, and has now some 60,000 inhabitants. The new theatre will, therefore, fill a vacancy much required. It will be constructed to hold about a thousand people. The site is near the middle of the town, in Carr-street, a continuation of the main thoroughfare, which has been widened, jointly by an improvement company, the corporation, and the tramway company. It should prove an admirable site. The theatre will be fireproof, and will be lighted by electricity, the structure being isolated from other buildings. Mr. Walter Emden has been appointed architect, and Mr. Arthur Pearce, F.C.A., is secretary.

THE North British Rubber Company (Limited) have, with the permission of the Edinburgh town council, made an experiment with vulcanised indiarubber for pavement in front of their warehouse, 106, Princes'-street, in that city. The area of pavement dealt with is, the *Scotsman* says, about 350sq. ft., and the rubber slabs, which have been specially manufactured for the purpose, are of large size, measuring 17ft. by 3½ft. in breadth, by over an inch in thickness. These slabs, which are of the same colour and about the same thickness as the Craigleith paving-stones removed to make way for them, have been set in a bed of concrete 6in. in thickness. The vulcanised indiarubber used—which weighs over a ton—is prepared so as to stand almost any weather, being guaranteed to be impervious to heat up to 250° Fahr. The result of the experiment will, of course, be seen when the indiarubber has been exposed for some time to the traffic and the weather. Vulcanised indiarubber has just been used in place of lead to repair the steps of two stages of Sir Walter Scott's Monument, which had become worn with footsteps constantly passing up and down. The steps have each been cut in the usual way, and a plate of iron, on which the rubber had been vulcanised, set into a groove in the stone and firmly cemented. This was done under the supervision of the city authorities, and seems up to the present time to have given every satisfaction.

THE annual report of the city surveyor of Birmingham (Mr. W. S. Till), just issued, shows that during the year 1889 4 furlongs 172 yards of additional sewers were constructed by the Public Works Department, bringing up the total length under the charge of the council to 202½ miles. The number of private drains laid into the sewers was 509, against 524 in the previous year. As to works on the streets, limestone pavements were substituted for gravel during the year to the extent of 22,395 square yards. One mile, 1 furlong, and 134 yards of streets were declared highways during the year, making the total length of declared highway in the city 196½ miles. The quantities of Rowley and other stone purchased for repaving the macadamised roads during the year was 25,511 tons 12cwt.; and the total quantity of water used on the streets and roads was 52,496,330 gallons, of which 7,727,940 were used for flushing sewers. The total number of lamps under the control of the Public Works Committee is 7,460; and the cost of lighting, extinguishing, cleaning, and maintaining the same was £12,383 2s. 3d.

Messrs. C. A. Daw and Son, of Palace-gate, Kensington, the builders of the Shaftesbury Estate, abutting on the Bayswater-road, were recently twice fined for constructing gates for the exclusion of the public from the estate. The appeal against this conviction having been argued in the Queen's Bench Division on Wednesday, the Lord Chief Justice said that, as the builders derived all the advantage of lighting, watching, and drainage, they must give the public the benefit of a thoroughfare. Mr. Justice Mathew concurred, and the conviction was affirmed.

A select committee of the House of Commons passed a Bill authorising the construction of a railway, 6½ miles in length, commencing by a junction at the South Tottenham Station, passing through Walthamstow, Leytonstone, and Leyton, to a junction with the London, Tilbury, and Southend Railway at Forest-gate.

The Duke of Westminster opened West Ham Hospital on Wednesday. The new Hospital is at the rear of the dispensary, with which it is incorporated, and it accommodates beds for 12 men and 12 women; and there are wards for six boys and six girls. The total cost of the hospital was £7,000.

## MEETINGS FOR THE ENSUING WEEK

MONDAY.—Surveyors' Institution. "The Principles of the Exemption of Public Undertaking from Rateability," by F. Marshall 8 p.m.  
Leeds and Yorkshire Architectural Society. Election of officers. 8 p.m.  
TUESDAY.—Institution of Civil Engineers. Discussion of "The Application of Electricity to Welding." "The Barry Dock Works," by J. Robinson. 8 p.m.  
WEDNESDAY.—Society of Arts. "Photographic Lenses," by T. R. Dallmeyer. 8 p.m.  
Civil and Mechanical Engineers' Society. Annual meeting. 7 p.m.  
THURSDAY.—Royal Archeological Institute. "Dumy, Grenadiers from Carlisle," by Chancelor Ferguson; and "Anglo-Saxon Ornament compared with Designs in Anglo-Saxon MSS.," by J. P. Harrison. 4 p.m.  
Society of Arts. "Design Applied to Wood Carving," by Lewis F. Day 8 p.m.  
FRIDAY.—Architectural Association. "Hospitals," by Keith D. Young. 7.30 p.m.

Architectural Association. 9, Conduit-street, W.—May 2. Paper on "Hospitals," by Mr. Keith D. Young. Nomination of officers for the ensuing session. 7.30 p.m. Gentlemen wishing to become members in time to join the classes at the commencement of the session should send in their nomination forms, duly signed, before May 2. The subscriptions of those elected in May will cover the ensuing session.

FRED. R. FARROW. } Hon. Secs.  
ERNEST S. GALE. }

## CHIPS.

We have received two very ill-tempered letters from Messrs. W. Longmire and Co., of 34, Osma-burgh-street, Regent's Park—the first, demanding our authority for the short obituary notice we published last week on p. 571 of the late Mr. William Brown; and the second, in response to our refusal to comply with that request—informing us that "we have taken the liberty of using their name in connection with statements that we had no authority from them for making, and they therefore request we will make this clear to their readers," which we do willingly, wondering all the while what can possibly have excited the ire of Messrs. Longmire and Co. in the paragraph referred to.

For the post of engineer and surveyor to the Watford Local Board at a salary of £275 per year with a residence at Holywell Farm, there were 12 applicants. The local board selected seven candidates, and have appointed Mr. David Waterhouse at present engineer and surveyor to the Watford Local Board.

Mr. E. Onslow Ford, A.R.A., has been selected as the sculptor of the memorial to Christopher Marlowe, about to be erected in Canterbury.

The partnership heretofore subsisting between Edeson and Rowntree, of Scarborough, architects, surveyors, and land agents, has been dissolved.

The annual report of the directors of the National Gallery shows that during the past year, out of a total expenditure of £4,000 for ten pictures by old foreign masters, only £209 was spent on pictures by English artists.

New public buildings, in commemoration of the Queen's Jubilee, have been erected at Tunstall, and special attention has been paid to the ventilation, which is carried out on the Boyle system.

Reopening services were held on Sunday at Wycliffe Congregational Church, Warrington, after undergoing renovation and decoration. The work has been carried out at a cost of over £400. The designs were prepared by Mr. G. F. Armitage, of Altrincham, gratuitously, and Messrs. Hesket and Sons, of Warrington, have done the decorations.

A new United Methodist Free Church is about to be built at Cowes, at a cost of £2,300. Mr. S. E. Tompkins is the architect, and Messrs. J. Ball and Son are the builders.

The work of enlarging Inchmerry House, near Exbury, Hants, one of the seats of Earl De La Warr, is now nearly completed. The contract has been carried out by Mr. W. J. Martell.

The extensive alterations and works of restoration to the parish church at Monk Fryston are being pushed forward by the contractors, Messrs. John Hall Thorp and Son, of Leeds. The restoration will cost nearly £4,600.

The trustees of St. Baldred Church, North Berwick, have instructed Messrs. Seymour and Kinross architects, Edinburgh, to proceed immediately with the enlargement of the church, by the addition of a south aisle. This enlargement will provide nearly 200 additional seats.

Mr. J. Hickman Barnes, C.E., London, inspected the site of the proposed harbour works at Thurso on Friday on behalf of the Loan Commissioners. He believes that a safe and commodious harbour can be constructed at Thurso.

## AND ENGINEERING JOURNAL.

VOL. LVIII.—No. 1843.

FRIDAY, MAY 2, 1890.

### BUILDING SPOILIATION.

THE necessity for a general scheme of main thoroughfares and subsidiary streets in the districts round the Metropolis is becoming more apparent every year. We find suburbs, once delightful retreats for the busy City man, which attracted the *élite* of the professional and commercial classes, fast losing their fair name and reputation. Putney, Fulham, Richmond, Kew, on the west; Hampstead, Highgate, Hornsey, Finsbury, on the north; Clapham, Brixton, Dulwich, and Norwood, on the south, are already being irretrievably spoiled by the reckless speculator, who can build as he likes without control, and make as many streets as the limits of his land will allow. True, there are certain building regulations; but what have they done to prevent the disgraceful crowding of localities, in parts where the residents look for gardens or open spaces sufficient for their own and their children's health and recreation? Absolutely nothing, for while every acre of land is allowed to be crowded with from fifty to sixty houses, which is about the average density in many of the new localities, the higher class of suburbs are being brought down to the level of those in poorer districts. For really what is it that constitutes the distinction between higher and lower residential localities?—nothing, after all, but the difference in space for every resident. In the West End suburbs the area per individual is greater than that at the East End; not only are the houses larger, but they stand on a larger area of ground, the streets and roads are wider, and the parks are more numerous. So that space is one of the fundamental conditions of the higher and better class of localities. The greedy landowner and the speculative builder are doing more to bring about an equality between the two classes than any other individuals, for they are rendering town and suburbs as much like one another as possible, by destroying those characteristics which people of means or of higher culture seek in their endeavour to obtain some approach to country life. There must be a limit to the increasing extension of the "centre ring" of Greater London, the constant moving of the better-to-do classes further out, and it is only by timely legislation that this yearly growing evil can be checked.

What is required, in the interests alike of landowner, landlords, and tenants, and the public, is that a certain quantity of land should be given to each house, so that, instead of squeezing 50 or 60 houses on one acre of land, there should be a less number of houses built. What is the minimum area required by the Building Act? Section 29 says every dwelling-house shall have "in the rear or on the side thereof an open space exclusively belonging thereto of the extent at least of 100sq.ft.," unless all the rooms can be lighted and ventilated from a street or alley—which means a space of only 10ft. square, about the size of a small room. "The Amendment Act, 1882, Section 14," merely makes it necessary that every dwelling-house should have in the rear a space of 10ft. by the frontage, except when the frontage exceeds 30ft., when the space is to be 450sq.ft. Thus, as a rule, only about a third of the area occupied by the building is allowed as an open space, and even this bare amount is practically rendered of no value, for it is permitted that the space may be occupied by a one-story building up to the ceiling of the ground-

floor story, as the next clause sanctions. Therefore, the provision does not prevent building over the entire area, but only reserves the space above the ground floor story which may be lighted by skylights.

The rapid growth of building demands the repeal of this provision. If we look at the back yards and premises of houses in any of our streets, we shall see how the latter clause has been taken advantage of. One-story shops and offices are built over the vacant spaces both in front and rear. Legislation is required to put an end to this highly-objectionable and pernicious practice. It would not be unreasonable to require that every house built should have an open space at the back at least equal to the total area built over. An ordinary dwelling-house of two rooms deep, and of 20ft. frontage, with its projecting back offices, occupies on an average about 800 square feet, allowing 26ft. as the depth of the house proper, and about the same depth for the projection. To this house there ought to be attached in the rear a space of open ground of the same area, and no additions to the premises should be allowed to curtail it. It is lamentable to see how many private-house gardens and courtyards have been filled up for business and trade purposes after the leases have expired, or after the properties have been transferred from private occupancy to trade.

But this allowance of area for each house is quite inadequate for the newer localities in the suburbs. If we are to draw people to them for residence, some inducement is wanted. People will not go five or ten miles out of town if they are compelled to dwell in neighbourhoods that are no better off for open ground than those in the denser parts of the Metropolis. They go to dwell at Richmond, or at Clapham, or at Dulwich, because they can there find a house within a short distance of a public park or common whose inalienable rights they can enjoy. We see the power and charm of this attraction by the development of building estates in the neighbourhood of these favoured suburbs. Commons and parks are, however, few and limited, and as we cannot be always acquiring new grounds; there is the absolute necessity of providing a certain proportion of open land in all new building estates. County Councils ought to have powers conferred upon them to require landowners who are about to lay out their land for building near any town to provide a minimum area of it as an open space to be used for recreation by the inhabitants. The London County Council ought especially to have powers granted them for this purpose in the case of all building estates, say, ten miles from London. On every estate of, say, ten acres, two acres could be well spared in some part of the ground removed from the main roads, as in the centre of the estate. The space wasted in making useless and expensive roads to obtain frontages could be profitably converted into open ground. The ground so set apart would speedily return its interest in the superior class of tenants who would occupy the houses surrounding it, and the ground landlord would be the chief gainer. But a fair compensation could be given to the owner by the authorities. The space could be planned in reference to the large rental houses, which could be made to back the open ground. On some new estates plots of meadow or park land, where large trees exist and add to the beauty of the site, have been left by the owners, who have found that they have been the chief incentive to residence on the estate. At Telford Park Estate, Streatham, for instance, the plots have been left open for lawn-tennis or cricket, and reserved to the inhabitants. Unfortunately, estate agents are enemies to this sort of arrangement, because they look upon it as a sacrifice of a few fees. They, however, make the most of the natural

attractions in the first instance; the plans and captivating bird's-eye view show thickly-wooded parks not too closely studded by detached villas, and generally an open space left for a lawn or a church. But all this is done to captivate the too-easily-deceived would-be purchasers and tenants.

In the formation of our streets, the modern builder has it all his own way. If there are any "general building lines" to follow, they do not prevent him from spoiling an old thoroughfare, and if possible of obtaining the consent of the authorities to a relaxation of the rule. We have lately exposed some of these infringements. But they will continue till legislative measures are passed to prevent any one coming out beyond the old lines. Putney, with its picturesque old High-street, has been ruined by shops that have been built in advanced lines; Camberwell has been spoiled, and now Denmark Hill is also threatened; Streatham, another semi-rural suburb, is fast being spoiled by new houses and shops brought out close to the roadway, much in advance of the old buildings on each side; Fulham has lost its picturesque character from the same unfortunate yielding to speculative builders. Building encroachment is destroying our suburbs and towns as residential places. The Manchester Corporation have wisely control over their streets. We do not want hard and fast straight lines, but sufficient power to prevent encroachment, and control the frontages. Much ought to be left to discretion in dealing with old and crooked streets and thoroughfares, so that curved and even irregular lines in the old road may be preserved as far as possible when desirable. The 40ft. width of road for new estates is disgracefully narrow when the pathways are taken out of it, and we see the result in the monotonous and dreary lines of new houses which are built on recent estates. The 40ft. was tolerable when houses were generally of two stories, when front gardens and open spaces between houses existed, but the 40ft. modern straight street of four and five stories is an abomination, and any length of it is painfully wearisome. For a street of shops, a width of 45ft. is a reasonable minimum, but 48ft. or 50ft. is better. The narrow-sighted policy which fixed upon 40ft. as the width of roadways is rapidly destroying the newer suburbs. A few acres of houses so built present a dreary wilderness intolerable even to those who are obliged to live in them.

What is it that makes our towns and suburbs so intensely dull and uninteresting? Why is it that people prefer the old to the newer watering-places? The answer is, Because the builder has done everything to rob the residence of the amenities of life. Nature has been sedulously kept out of the view; sunlight has been obstructed; parks and even gardens have been absorbed; rigid building lines have made it impossible to obtain any variety in the architecture or in the interiors, while excessive ground-rents have made space in room or hall a luxury only to be purchased by the wealthy. Building legislation for the future should be directed to remove these evils in our towns. We conclude by making the following practical suggestions:—(1) Local authorities should have power to require that every public building should be isolated or open on three of its sides; that every new house should have a minimum of space back and front—the latter can be maintained by making every front set back at least 10ft. from the new road boundary. (2) Straight lines should not be enforced; curved building lines to be required in all long streets or roads on new estates. (3) On the rebuilding of old premises, the curvature or irregularity of the old building lines should be strictly preserved. (4) No frontage line should be permitted to come out before the lines of adjoining premises in main

thoroughfares. (5) These lines should be determined by a committee in which the artistic element is represented, and all questions of projections, such as bay windows and porches, should be brought under their control. (6) Elevations should be passed with reference to height and variety of treatment, no design being allowed which repeats unnecessarily the same features. (7) In old thoroughfares the extension of shops and buildings over forecourts and gardens, which have ruined our leading streets and roads, should be disallowed—Mr. Arthur Cates has made this suggestion in a recent paper. (8) The authority to have power to deal with all corner buildings. (9) In the laying out of all new estates for building, the landowner should be required to expropriate some part of the area for the public benefit, or for those who are tenants, the control of such area being vested in the central authority. (10) A plan of the new streets and roads proposed should be sanctioned by the authority, who should have power to limit the number and width of new streets and roads on a given estate, and also determine the main lines of frontage. Landowners themselves would benefit directly by these restrictions, and the fair name and repute of localities be saved.

#### ARCHITECTURE AT THE ROYAL ACADEMY.

THE most important drawing in a very good show, at the Architectural Room of the Royal Academy, is that of Mr. Norman Shaw's new Central Offices for the Metropolitan Police, now nearing completion on the Thames Embankment, where the demolished National Opera House was to have stood. The common-sense arrangements and practical character of the plan of this building are the result of no little thought, while the boldly-conceived and well-defined treatments of the façades, with their angle-turrets and elaborated gables, are as dignified as they are picturesque. The base is entirely of grey granite, and above red brick is relieved by bands of stone, the whole being surmounted by high-pitched roofs covered with green slates. The details of the work will well repay careful attention; as, for instance, the main cornice and the way in which the eaves above have been stilted by a dwarf wall between the circular turrets which emphasise the angles. The massive chimneys, grouped in four stacks, give—by simple means—a sense of scale and insure a dignity of skyline. The main range of pedimented windows, along the river front, is particularly happy in effect. Whether the obelisks on the gables are quite the best terminals is a matter of doubt, and the segment-headed windows on the return front hardly agree with the smaller ones ranging with them; neither do they gain by contrast with the others below. The main entrance is very bold and large in scale. This pen-and-ink view shows the portal front; but the river-elevation is drawn in sharp perspective. Next week we shall illustrate the design. Sir Arthur Blomfield's Church House, to be built in Dean's-yard, Westminster, is shown by two drawings, and may be named as the largest projected work illustrated in the Academy this year, while naturally from its character and purpose the design will be studied with much interest. We give reproductions of these drawings herewith to-day, together with the principal plans of the buildings. The site to be occupied by them extends along the whole length of the south side of Dean's-yard from Tufton-street to Great Smith-street, where an important elevation will follow the lines of that thoroughfare. The perspectives are hardly delicate enough to properly delineate the refined detail on which these elevations so much depend, while the absence of light and shade leaves the work unassisted by tone or

colour of drawing, and thus a crudeness is suggested which, judging from Sion College by the same architect, is hardly to be expected in the executed work. The plans, which add so materially to the interest of the illustrations, are absent from the Royal Academy. Mr. John L. Pearson, R.A., who, we understand, was intrusted with the hanging this year, contributes two modest water-colour elevations to small scale of the new wing to the quadrangle of Sidney Sussex College, Cambridge, which he is erecting, and comprising some chamber buildings. The style adopted no doubt harmonises with the older premises, and it may be described as a sort of Elizabethan style of work with broad bays, all in stone, carried up the entire height between breadths of red walling, terminating in broad squat gables. On the quad side there is a low colonnade, or, rather, an arcaded cloister. The general effect is undoubtedly dignified; but propriety is not always a sufficient substitute for interest and "go." The Duke of Newcastle's beautiful and costly church of St. Mary at Clumber is exhibited in three water-colour drawings by Mr. G. F. Bodley, A.R.A., and they all three show what a master of English Gothic work can do in the way of honestly treated and pure ecclesiastical church-building without going out of the way after novelty of effect and mere cleverness. The red stone of which it is built, like that at Hoar Cross by the same architect, gives warmth of colour both inside and out in vault and walling, for the church is handsomely groined throughout. The style is Early Decorated, with marble shafts sparingly introduced in the side chapel and elsewhere. The octagonal open lantern-like stage at the foot of the spire (remining one in a general way of Exton, Rutlandshire) seems too lofty and big in scale, and the embattled square chamber at the east end of the north aisle, built to receive the organ, looks like an afterthought. The rood and screen below it in front of the choir are very rich examples of modern woodwork based on old lines. The two bedroom designs exhibited by Professor Aitchison, A.R.A., are not of much interest, and certainly do not add to his reputation. The larger and more important of the two has a chimney-piece in mahogany, the chief feature of which is a great disc of bevelled looking-glass, and the high panelled dado has tall compartments enriched with arabesques in stencil patterns. A green wall-paper forms a frieze. In the other, the dado panels look like walnut-wood, and are quite plain, with a yellow-patterned paper over up to the ceiling of ordinary type. The same artist sends a large water-colour, made, probably, for his Academy Lectures, of "House of Pansa, Pompeii." Sir Arthur Blomfield is fortunate in having another forthcoming big work in London, viz., St. Saviour's, Southwark. The new nave, designed in a pure Early English style, is here represented by two outline pencil studies. The exterior is slightly tinted: but the interior reminds us of the drawings, now long since out of date, when correctness was thought more of than trashy flashiness and American trickery. The rebuilding of this nave will add another example to our notable works of the Gothic Revival; but we presume the architect does not aim at anything particularly original. Mr. Norman Shaw, R.A., lately built a very clever little cheap church for the Harrow Mission in Latimer-road, and he here shows the memorial reredos now being executed. The shaped frame of foliated and carved fretwork is very effective with quaint little birds perched up aloft on the verge of it to break the line. The figures in colour of the Crucifix and SS. Mary and John are being painted by Mr. Hamilton Jackson, of Chiswick, and the gesso gold ground with foliage all over it is from the hand of Mr. Lethaby. Mr.

Alfred Waterhouse, R.A., is not strong this year at the Royal Academy, owing mainly to his recent trip in Spain. He only sends one drawing, and that below his usual standard of excellence. It represents the Offices of the Prudential Assurance Company, West Regent-street, Glasgow. The windows are square-headed throughout, and the general effect is simple enough, with shops in the return front; but the over-sailing turrets, rising awkwardly in front of the narrow-splayed angle, are very unfortunate. Their arched corbels increase this effect, and the outline, though intended to give a Scotch character to the design, seems, at least from this perspective, to be anything but pleasing.

As a whole, the drawings this year are very good, and we are pleased to note that many of the Transatlantic trivialities copied by some of our rising draughtsmen during the last few years, have now been given up for more sober and honest work. Perhaps the most telling drawing in the room is one by Mr. H. Wilson, done in light washes of colour (after the fashion adopted by the late Randolph Caldecott for his children's picture-books) for Mr. J. D. Sedding, of an industrial school at Knowle, near Bristol. This is the best thing this architect has done for a long time, and it is as clever as you like. The porch, in a Tudor manner, and coming in the centre of a long line of half-timbered building, is flanked by statues placed low on the splay, with another one over the doorway, and it is admirably proportioned. The chapel, in a sort of Early Renaissance, suggested by Burford Priory and the church at Compton Wynyates, is surmounted at the end by a copper-covered and crisp-looking bell turret, oddly placed seemingly, but just where it is wanted in the picture. The end building to the right is covered with plaster, somehow calling to mind that in the Butter Market at Ipswich, and over the roof of this is a wing in quaint variety with brick chimneys, and then some smaller buildings equally picturesque. There is great skill in all this; but Mr. Sedding's ill-drawn and wild design for a proposed church at Ealing shows ability run riot, and to no good purpose. Mr. Aston Webb's house, Pevensey, Shropshire, a mansion now building for Sir Offley Wakeman, is much more to the purpose, and marks its author's capabilities as an architect. The details of the work are fresh and original, without any attempt at mere effect such as we have just complained of. The garden front is largely in half-timber, but the house is really chiefly of stone. The plans show a large living hall and a well-arranged suite of reception-rooms. The entry is marked by a low tower of quiet design. The drawings, showing three buildings, are excellent, and so is that of the new offices for the Metropolitan Life Assurance Society, by Messrs. Aston Webb and Ingress Bell. This pile of buildings is a thoroughly good piece of street architecture, with ample fenestration, having elevations broadly treated with bands of plain masonry to mark the floors. The deep reveals to the windows give good depth and shadow, while the rich angle-turret over the doorway adds point to the façades, and in spite of this being a common treatment enough, the method in which it is here managed is really original. Space fails us to describe more now in detail. Among the other exhibitors whose work we will notice next time are Messrs. George and Peto; T. G. Jackson, John O. Scott, Somers Clarke and Micklethwaite, J. Belcher, A. E. Street, Dunn, Hansom, and Dunn, T. Garner, T. E. Collcutt, J. M. Brydon, L. Stokes, Grayson and Ould, E. W. Mountford, and others. We see some very good things from the hands of Messrs. Horace Field, E. J. May, E. Newton, Chorley and Connon, Col. Edis, F.S.A., W. D. Caröe, Maurice B. Adams, John

Langham, and some more. Mr. Basil Champneys is the author of the design we illustrate from his drawing here shown to-day, giving a view of Stonehills, Hampshire—a large house of considerable merit. Mr. Langham's drawing of the Inner Court, Houghton Tower, is also shown in this gallery, and printed among our plates to-day.

## THE PICTURES AT THE ROYAL ACADEMY.

[FIRST NOTICE.]

OF the 2,000 and odd pictures on view this year we can only glance now at a few of the more conspicuous. Landscape, classical composition, historical, and domestic *genre* are fairly represented. The old school is, of course, pretty strong in "tradition," and commonplace. The essential principles of the art of painting of Reynolds, Gainsborough, of Wilson, Crome, and Constable, are to be found in strange contrast with the teachings of the "new school," in which more or less of the French and "Impressionist" methods are to be observed, in close proximity to the "Naturalistic." In these eleven galleries we meet with some marvellous imitations of the realistic kind in form, texture, and colour, in which the painter has sought to reproduce nature in the most literal manner, but has lost sight of the modifying effects of light and atmosphere. These, after all, form the most popular class of pictures. A crowd gathers round some picture of incident in which every object is depicted with minute exactness, in which the lights and shadows are most carefully rendered, the sheen of a lady's silk or satin dress, the glistening brightness of a piece of brass or bronze, the polish of mahogany, the texture of marble, of carpet or curtain, each exhibited as individual objects or studies, but without awakening any further idea than that the artist is an expert as a realist, and has studied each sensible object with the eye of a physicist. The more minute and dexterous the manipulative skill, the greater the illusion, the more perfect is the picture supposed to be. It is hard to make the public understand that these qualities are not the highest, that they are merely mechanical expedients, and entitle the painter to rank as a manipulator only. The highest aim of a picture should be to reveal nature, if it be a landscape, or to awaken some emotion of human passion, or of sympathy, if it be one of incident. If we take these rules as our guide in estimating the pictures on the Academy walls, we must come away with a far lower idea of their artistic worth. We can yet see the poetry of nature, sympathy, and power, in such works as those of G. F. Watts (437), F. Brangwyn, Frank Dicksee, T. W. Allen, J. C. Hook, T. B. Kennington, H. Herkomer, Clayton Adams, and some others.

But we now merely scan the first principal galleries. In Gallery No. I. we see a clever study, by Seymour Lucas, "The Loving Cup" (4). The picture represents a civic banquet; the dessert is laid; a sycophantic guest presents a silver cup to the master of the feast. Good humour and quiet merriment are written on the faces of the company, who are attired in the long curly wigs of the 17th century. The countenances, the silver plate, and accessories are masterly. G. A. Storey's "Hungry Messenger" is an incident of less interest and merit than we have been accustomed to see from the hands of this painter. Two of the principal pictures in this gallery are Charles Gregory's "Dinah Morris Preaching in Stonyshire," and T. B. Kennington's "Homeless." Both are works in which the painters have embodied sentiment pure and noble. Mr. Gregory's picture represents the heroine in "Adam Bede." The scene is a hilly landscape, a summer haze hanging over

it; a large group of women and children and sturdy toilers are listening to the young Derbyshire Methodist. The message she is delivering is earnest, and comes home to the hearts of the villagers who have congregated round her. The surroundings and grouping, the child who is eager to catch the attention of the evangelist, are painted with much pathetic power and feeling. T. B. Kennington's "Homeless" depicts a grey, cheerless, damp morning; a young widow stooping down, talking to and tenderly supporting in her arms a poor neglected boy—a waif—her bundle of clothes being beside her on the pavement. The scene is apparently laid in the Thames Embankment. The painter powerfully tells the tale of the young mother's tender solicitude towards the little urchin who is lying on the wet flagstones. No. 19, "The Cast Shoe," by Robert W. Macbeth, is a brightly-painted landscape representing a grey horse before the village smithy. The figures and wayside inn are true to nature. Near this Luke Fildes (20) has one of his beautiful sentimental maidens, "A Daughter of the Ghetto," this time, also, like his "Flower Girl" in a previous exhibition, dark—an Italian market girl of sallow complexion and fascinating eyes; clad in a pink frock, with a red shawl over her head and shoulders. The figure is charmingly drawn, and the tone rich, but subdued. Edwin Long's "La Pia de' Tolomei," from Dante's "Purgatorio" (26), is a figure study illustrating a stanza of the poem—a lady attired in a black dress, with a crucifix and other sacred symbols on her breast, holding a rosary; the background a wall adorned with pictures of the Virgin and Child and other sacred subjects. Minute in its accessorial details, and scholarly in its attention to practical description, this work is almost equal to Mr. Long's Egyptian subjects; but it is too incidental—we do not at once realise the painter's meaning. J. C. Hook's "Last Night's Disaster" (75), with its freshness and sandy beach; and Frank Brangwyn's "All Hands Shorten Sail" (76)—the deck of a sailing vessel during a heavy sea, the ship lurching and in a position of peril, admirable in its handling and tone of grey, are pictures which compensate for many others of mediocre quality. Amongst the pictures we can only name in this gallery is Sir J. E. Millais's grand moonlit forest (25), Frederic S. Richardson's tender and subtly-painted "The Fringe of the Forest" (86), Val C. Prinsep's "Among the Brambles," pretty and sentimental; and Furse's portrait of Sir A. W. Blomfield, A.R.A., representing that architect applying his compasses to a drawing, the head turned away as if in thought. C. H. H. Macartney has also a fine piece of "Moorland" (57) mellow and rich in colour. Gallery II. has several works of interest. "A May Day Morning" (109), by E. A. Abbey, is a piece of impressionism—a shadowless picture of an early May morning observance, the figure of maiden and her tempting suitor are well drawn; the misty, early light is cleverly rendered. B. W. Leader's "Sandy Margin of the Sea" (131), is a notable piece of coast-painting—hillocks of sand and dark, thundery-looking clouds, a breezy ripple on the sea, are the main elements of this masterly performance. Sir F. Leighton has here a figure of "Solitude"—a beautiful and pensive maiden, at the foot of a rock, or in a cavern lighted from above. She sits, in a pale blue chiton; over her seat hangs a light, amber-coloured drapery. She leans her head, bound with a scarf, on her right hand, and casts her saddened eyes into the pool of brackish water. Hubert Herkomer's "Our Village" is a very large canvas—we may venture to say needlessly large for the depiction of the scene. The village church under the shade of the trees, and the calm, summer sunset, the labourers returning after

their day's toil, make up a landscape of much power and sentiment. The children in the foreground, and gossiping groups near the cottages, are painted with both strength and tenderness. The tranquillity of the whole scene is captivating, but the foreground has rather an unfinished look. J. L. Pickering's "A March Gloaming," a ploughed field, is clever in execution and colour. F. D. Millet, in his "How the Gossip Grew" (151), is, as usual, delightfully realistic; a luminous light blue interior, two young ladies in tea gowns in 18th century costume, have just sat down to (let us imagine) a 5-o'clock tea. They are wonderfully painted; the technique is masterly, the Chippendale furniture and decorations correct to almost a fault. There is a look of expectancy on the face of one young lady, who holds her tea-cup of choice Worcester china and listens to her companion, who is reading a letter, with large-crowned hat. W. A. Mackworth's "Cloud Chariots," a cloud reflection on sea, is luminous and clever as a study (156); we must note also the excellent portrait of the Bishop of Durham (124), who, in spite of the intense black of his robes, shows a fine, thoughtful head, in which the expression of the deep-set eyes has been forcibly rendered by W. B. Richmond.

In Gallery III., one of the principal pictures is the "Redemption of Tannhäuser" (203), by Frank Dicksee, a German legend of the Middle Ages. Here the central feature is the dead body of Elizabeth on the bier, beautiful in its calmness and repose, surrounded by the bishop and funeral procession. Tannhäuser, who sees her on his return, cries, and falls dead before the bier, while the vision of Venus, on whom he has set his affections, fades away. The Pope's staff, "brought by hurrying messengers from Rome as a token of Divine forgiveness, blossoms into leaf." Mr. Dicksee has depicted the incident with true feeling and in the spirit of romance; the handling and attention to details are those of a painter fully imbued with the spirit of the legend. Sir John Gilbert's "Warrior," a warrior on horse holding a banner, is a forcibly-painted subject—we cannot say more. Sir F. Leighton has in his usual position in this gallery "The Bath of Psyche" (243), purchased by the President and Council of the Royal Academy under the terms of the Chantrey Bequest. Although not an important classical legend such as we have seen in other Academy shows, there is considerable beauty in the refined drawing of the figure, the luminous painting, colour, and handling of this study. Psyche stands undraped before the bath taking off a diaphanous chiton of pure white, which sets off her beautiful figure. At her feet lie the amber-coloured peplum that has been thrown off, which partly hangs over and falls into the placid water. Behind, a colonnade of Greek Ionic columns with gilded capitals and bases and dark purple hangings form the background. Subtle delicacy of line and colour, sweetness and softness of expression and tone mark the composition.

"Tragic Poetess" (310) is in another key of colour. The sea is a dark sea illuminated by golden clouds of light; the Tragic Muse sits buried in deep reflection on a marble terrace, by her side rolls of parchment. The soft and mellow light, the opulence of rich, subdued colour, the expression of awe on the face, make this a powerful contrast to the Psyche. L. Alma Tadema's chief picture this year is a small one, and that of a favourite subject. The painter represents the interior of a Roman Bath, "The Frigidarium" (324), in which is seen a lady, attended by a maiden, who is completing her toilet, and beyond is seen a lighted court with a large bath in the centre; round it on marble benches ladies are seated, cooling themselves before the limpid water. Between the two apartments a dark curtain of a

rich textile reveals another portion of the establishment. The marble, the reflection of sky on the polished floor, the amber necklace and bracelets of the lady finishing her toilet, are, of course, as usual, painted with all the subtle technique and knowledge of classical details which Mr. Alma Tadema can command.

The work of J. C. Hook is pleasing, honest, and natural. We may compare its intense naturalness and reality, for example, with Sir F. Leighton's "Venus," the poetic imagery and luminous colour and delicate handling of which contrast strangely with the fresh ruddy faces of fishermen in the garden overlooking the bay in "A Jib for the New Smack" (249). Nos. 309 and 317 are also in the same healthful colour and tone, and the freshness of the sea is everywhere apparent. Edward J. Poynter has a very charming and delicate study of poetic portraiture; "Pea Blossom" (212), pretty in conception, the girl's face in true keeping with the pea blossom she holds. Ernest Croft's "Whitehall, January 30, 1649" (216), is a reminiscence of the execution of Charles I. before the Banqueting House. "Meeting of the Thame and Isis at Dorchester," by Vicat Cole (234), is a finely-painted piece of whirling waters and meadows full of freshness, &c. Fred Culver's "Across the Common," the majestic portrait of Miss North, by W. W. Oulless, and of Mr. Thewles Johnson, by Henry T. Wells; Peter Graham's "Departing Day" (190), Kenneth MacKenzie's "Wind-swept Hill" (194), John MacWhirter's pictures of "Loch Katrine and Old Shearwood" (271 and 279), autumn and winter scenes, H. W. B. Davis's "Picardy Domes" (242) are a few other of the leading landscapes to which we must return. W. Q. Orchardson has no great work. His "Portraits" (235) is a drawing-room interior of warm reds and amber tones; the portraits evidently are those of a family.

#### DESIGNS FOR THE GREAT TOWER IN LONDON.

THESE drawings are now open to inspection in the Drapers' Hall, Throgmorton-street. Designs of all kinds have been received from all parts of Europe and America, numbering in all nearly ninety separate proposals. Five hundred guineas are to be paid to the author of the chosen design, and half that sum to the author of the design placed second. The minimum height specified for was 1,200ft. The judges are Sir Fredk. Bramwell, Bart., F.R.S., M.Inst.C.E.; Sir Benjamin Baker, M.Inst.C.E.; Sir Edward Harland, Bart., M.P.; Mr. E. H. Carbutt, M.Inst.C.E.; Professor A. B. W. Kennedy, M.Inst.C.E.; Mr. C. Liddell, C.E.; Mr. J. F. Moulton, Q.C., Assoc.Inst.C.E.; and Mr. Thomas Verity, F.R.I.B.A.

Many of the designs are, of course, childish, and bear evidence of a want of elementary knowledge in construction, to say nothing of any artistic ability on the part of their authors. Without pretending to follow the several schemes in any order of merit, or attempting to work out the designs in detail, we propose to offer a few remarks on the leading characteristics of some of them, taking these as they occur in the catalogue. "Circumferentially, Radially, and Diagonally Bound," is the motto of one tower (No. 5), some 1,600ft. high, designed in a series of drums, made up of endless colonnades, emphasising the horizontal construction adopted. The merit claimed for this scheme is that "the tower may be completely taken to pieces." This is a peculiar proposal. The columns are mainly of cast iron. Messrs. Kinkel and Pohl, of Washington, U.S.A., send a skeleton tower (No. 7), 1,250ft. high, and 192ft. diameter at base. The frame contains 16 lattice legs and a central tube carried up as a central shaft over a great domed winter garden, above

which is a second hall, domed in a similar manner. "My Tower" (No. 10) is an advertisement of too funny a type to describe; but the author says he has invented 1,000 improvements, and "N.B. Inventions designed to order and patented." No. 13 is a lattice design, 1,267ft. high, with a base of 400ft. diameter, and constructed of steel. The first really serious design is by Mr. J. I. Thornycroft, of Chiswick (No. 14), and although we do not like the proportions of the composition, the upper part being much too thin, it is evident that much thought has been given to the details. The total height is 1,760ft., composing a triangular skeleton, each principal member of which is a steel tube. Special balanced air-pressure lifts serve the tower, two being worked to the top at high speed, and one at a lower speed to serve the whole of the platforms. Mr. J. Horton, of Halifax, Yorks, sends a design exactly like a screw in general appearance. It is a corrugated steel tower, 1,200ft. high, with a spiral promenade provided round the outside face from bottom to top. This gives the effect just named. Lifts are also used. Another screw-like design is "The Century Tower" 1,900ft. high, with Otis lifts. "Light, Health, Rest, Pleasure," is the next design we note (No. 21) for its vastly high central hall, with pointed Gothic ribs for the structural lines and circular forms for tracery and decorative features. There are six circular staircases and four avenues of approach. The general scheme of this design is a circular column resting on a hollow hexagonal plinth with radiating wings. "Altiora Peto" is a laminated octagonal steel tower 470ft. in diameter at the base and 1,274ft. high, with a two-track spiral electrical railway up it to the village-like buildings located on the several stages of the structure. "Ajax" is only 2,000ft. high and covers just about some 64 acres. Mr. P. Campanakis, of Constantinople, has designed a triangular skeleton 365m. high of elegant outline, with arches connecting the main columns, which curve outward towards the bottom. A colonnade stage forms a balcony or belvedere, and there are vertical uprights at the angles of the base. Another tripod design, more Gothic in style, is marked by the motto "Time is Money." It is said to be an allegorical design and it carries a clock. "A. P. B." marks a French stone-built copy, in the Renaissance mode, of the leaning tower at Pisa, only that it stands upright. It has an inclined roadway up inside, and living apartments provided all the way up raking with the incline. Mr. O. C. D. Ross, M.Inst.C.E., sends a Gothic design, conceived "to differ as much as possible from the Eiffel Tower." This he has managed, but not much more. Bow Church steeple supplies Mr. W. P. Gibson with the outline for his tower, done to the height of 1,232ft. What would Sir Christopher say to this? Sir Bradford Leslie, of Willesden, is the author of a quadrangular skeleton with intermediate platforms placed at vertical intervals of 300ft., having vertical and inclined cast-iron columns trussed up into stages in-and-in all the way up. The effect is very ugly. No. 37, by Messrs. Stewart, M.I.C.E., J. M. Maclaren, and W. Dunn, A.R.I.B.A., has a good outline, treated somewhat in an Oriental style as far as the architecture goes. The square inclosure outside the octagonal base has a dome-capped pavilion at the four angles. This is certainly one of the best designs shown in the hall. It is an octagonal skeleton 1,200ft. high, and stands on a base 300ft. in diameter, all done in steel. Mr. A. F. Hills, of the Thames Iron Works, and president of the London Vegetarian Society, sends No. 38, a square, gigantic obelisk, 2,007ft. in height, and 644ft. wide at base, all in framed steel, with breeches belts, and called "Ye Vegetarian Tower." A diagram showing the "Eiffel" tower

inside this one, and all the other lofty buildings in the world alongside, is exhibited by the author. Mr. John Heath's plan assumes the form of a cross with a big hall in the centre 100ft. wide. Mr. Tertius Wood, F.G.S., of Rochdale, contributes a remarkable design, consisting of a cylindrical shaft growing out of a series of dome-like forms, rising one over the other, like three tea-cups supported by a basin. This form is made by a system of curved lattice girders used to stiffen the main upright, which incloses a spiral roadway. "Utility" (No. 42) reminds one of the Crystal Palace style of building. No. 44, marked "Ad Coelum Jusseris Ibit," is a steel mast 1,200ft. high, stayed by steel ropes. It is square on plan, and has an octagonal lift-house at the base, built between the legs of the tower. An exceedingly fine model is shown of this ingenious design, which is marked by good taste and architectural skill in its details. Mr. R. Wylie, of Liverpool, has secured only a poor outline, though he has made much of his great halls and promenade, domed floral hall and concert-rooms. It covers  $8\frac{1}{2}$  acres at the base, and would be 1,470ft. in height, standing on a masonry base 60ft. high. "Acme" is 1,300ft. high, stiffened with four radial trussed buttresses. On plan it is cruciform, with circular ends to the arms, and four lifts, one in each angle of the cross. The theatre is in one transept, and the concert-hall in the other. "Max am Ende" is too much like a French cathedral spire, done in steel 1,550ft. high. The principal platform is 1,000ft. from the ground. Messrs. Webster and Haigh, of Liverpool, contribute one of the most likely designs, 1,300ft. high; but the residential buildings at the base are no attraction in such a scheme, mixed up with cafés and eight pavilions. The sweep of the curved uprights is rather well proportioned. We cannot say we like the general outline of the very clever design contributed by Messrs. W. S. Rendel, M.I.C.E., Halsey Ricardo, and C. F. Findlay, M.I.C.E., No. 52. The lower part of the tower is covered with glass and laid out as a winter garden. The drawing of the interior is capitally done, showing this from the mezzanine floor. Above the dome is a spiral shaft 1,260ft. high. Messrs. Francis Fox, M.I.C.E., and G. E. Grayson, F.R.I.B.A., of Liverpool, are the authors of No. 53, a double octagonal steel lattice-framed tower arched between, and made up of 16 columns, each 20ft. square. On the ground floor is an octagonal concert-hall, with a carriage-drive round it between the legs of the main structure. About half-way up is a housed stage of several floors treated with turrets, and the general proportions of the composition are very pleasing and graceful. One of the most reasonable designs is by Mr. Davey, of Westminster. It is a hexagonal skeleton, built massively of tubular uprights. Mr. R. J. Gifford Read, of Ealing, and Mr. L. A. Shuffrey, of Welbeck-street, have united forces, and sent in a design of some merit, though there is not much to be said for it architecturally. The tower of steel is square on plan up to the upper platform, above which it is octagonal, and this level is 800ft. above the ground. The top stage has eight circular balconies at the ends of the arms of the diagonals. About 200ft. above the base are a concert hall, café, and restaurant, which are inclosed in a structure looking like a floating bath. The construction of the tower itself is unmasked, and the main outline is good. The promenade gallery is 940ft. above the ground. "Equilateral Triangle" is a very bold design covering a base area of 266,000sq.ft. It is a hexagonal skeleton sustained by six curved spurs connected with it at two levels of arches. Professor R. H. Smith and W. Henman, A.R.I.B.A., send a tripod tower of tapered steel tube, but we do not like the design, which is curious. Mr.

three concentric whole-brick rings, and each ring may be composed of headers and stretchers, as in a single 9in. arch, or in heading bond entirely, in which case the arch presents, at end or in section, three concentric 9in. arches; or the three rings may have the two outer worked header-and-stretcher, and the inner one in heading bond—a mixture of the two former descriptions. Colonel Pasley prefers the three rings to be worked in either of the last described methods, because “heading-bond at the intrados of the lower 9in. arch produces large voussoirs at that part where the arch-like form is of most importance.” He is speaking of segmental arches, but the same reasoning applies to pointed arches, for a Gothic arch is composed of two such segments. If we imagine these three concentric rings moulded one set within the other, we shall obtain a good idea of a moulded brick arch of large span. The intrados or heading course would be formed with its angles moulded as shown in sketch 2, p. 507, the next or header-and-stretcher course would also have moulded edges, and the outer or extrados course the same. There is more bond and coherence in the header-and-stretcher than the all-header arch, for every other brick which forms the header on the outer face bonds into the work behind, but in the all-heading arrangement the bond is more broken.

#### EXAMPLES.

Our sketches represent brick archivolt formed of moulded brickwork, in which either kind of bond can be introduced. One thing to observe is that the radiating joints break at each ring, as the outer rings contain a larger number of bricks than the inner ring. The greater the number of rings, the thinner the joints, and the more perfect the arch theoretically, though, on the other hand, we have known the independent concentric centres tend to separate—a fault which cannot, however, occur if the arch is properly constructed.

#### THE PLUMBERS' REGISTRATION MOVEMENT.

A QUARTERLY Court of the Plumbers' Company was held on Friday last at the City Guildhall, the Master, Mr. W. H. Bishop, presiding. The Chairman reported that during the past three months meetings in connection with the Registration movement had been held in that building, in Edinburgh, Glasgow, Dundee, Aberdeen, Dublin, and Cork, and in thirteen English county towns. The districts now forming plumbing classes were very numerous, and nearly all of them were preparing for a second course of a higher grade. The necessity for a special course of instruction for masters was being discussed in many places, it being recognised that employers should possess a higher degree of scientific knowledge than their men. The clerk, Mr. W. R. E. Coles, reported that during the quarter examinations for Registration had been held at Bristol, Glasgow, Manchester, Brighton, Dublin, and Leicester. The lowest passed in any of the examinations was 15 per cent. of the candidates, and the highest 70 per cent., the average being 45·8 per cent. During the quarter 444 applications for registration had been received from masters, and 849 from journeymen, making a total of 1,293. Mr. Coles further mentioned that some European and some native residents in Rangoon had adopted the English system of sanitation, and had sent a requisition to England for a number of registered plumbers to be sent out, and that several had already gone. Sir Philip Magnus stated that since the last meeting of the Court some of the members, with the assistance of expert advisers, had drawn up a graded syllabus of instruction specially adapted to apprentices in the plumbing trade, the aim being to provide for such youths a continuous course of study, which should occupy three or four years of their apprenticeship. It would consist of three parts, distinguished as preliminary, intermediate, and final courses, the syllabus being one of instruction rather than of examination. The

Lamont Young, of Naples, is more curious still in his design, placing on the top of it a large terrestrial globe and four secondary ones. “British Lion” is the motto of No. 68, which is one of the few designs worthy of study, although its quiet, ineffective outline drawings are likely to be overlooked. It shows a steel tower 1,200ft. high, having a hexagonal skeleton of latticed-webbed radial struts, and standing on eight legs supported by piers of masonry 228ft. apart, with lions on the outside faces. The maximum pressure on any abutment is calculated at 4,810,000lb. The general outline is admirable, and the detail is good, with clever points besides in the design itself. The first housing is occupied as an octagonal concert-hall. There are several other sketches too numerous to mention. We shall illustrate some next week.

#### ARCHITECTURAL BRICKWORK.—XXXIII.

##### GOTHIC ARCHES.

ONLY since the revival of brick architecture have architects given much attention to the construction of moulded brick arches, and therefore we find that, for church arcades, stone does duty in the large number of instances, even where brickwork is otherwise introduced into the plain wall surfaces. The improved manufacture of moulded brick and terra-cotta has led a few of those of the more advanced to step out of the beaten track and employ moulded brick for their arches, carrying out in a more complete and satisfactory manner the idea of

brick architecture. Stone for pillars and arches, and brick for spandrels and walls, is a combination that does not accord with any principle or system of construction. The Romans employed brick, but they used it in arches as well as in walls in numerous instances; the bricks were used often as a facing, the remainder or backing of the wall being of concrete—a material that goes with brick even better than with stone.

In North Germany, Belgium, and Italy, the brick architecture did not confine itself to walls and surface, but entered largely into complicated details. The moulded arch asserted itself in all the principal buildings. The English examples attest the same thoroughness. Lollards' Tower, Lambeth Palace; Hampton Court Palace, St. Alban's Abbey, Layer-Marney, Essex, and other buildings in the Eastern Counties, exhibit moulded brick archwork. However pleasing the mixture of brick and stone, there are objections to the combination, especially if the stone is in large blocks, and an inequality of settlement arises in consequence. Brick spandrels on stone arches have the same tendency to separate and produce fractures.

##### ARCH BOND.

We have already alluded to the importance of concentric rings in plain arches of great thickness, and this is of importance in brick-moulded arches, which are built in members one within the other. In an arch of large span, say of 10ft. or more, it is desirable to produce the required appearance of strength by having two or three concentric arches or rings, and these may be worked in different ways. One plan is to form the arch by

preliminary course took up those branches of science having a direct bearing on the plumbing trade, such as geometry, drawing, mechanics, hydrostatics, heat, chemistry, and even workshop architecture. The intermediate course carried the same subjects a little further, and the final course introduced the more advanced parts of hydraulics, building construction, the principles of sanitation, and of general plumbing. It was understood that in the future masters would be required to pass the last-named examination in order to obtain a certificate. A graded course of practical instruction in the workshop would be arranged to be carried on simultaneously with these theoretical courses. Mr. John Smeaton referred with approval to the regulations regarding house drainage which have recently been drawn up by Mr. Tomkins, surveyor to the Marylebone Vestry, and also to the regulations issued by the Wandsworth District Board of Works as to water supply and house drainage.

#### THE SURVEYORS' INSTITUTION.

THE following Professional Associates have passed the Examination for the Fellowship:

Beniah Whitley Adkin, 33, Walbrook, E.C.; John Darch, 74, Sarsfield-road, Balham, S.W.; William Cooper Dendy, 46, Fordwych-road, Brondesbury, N.W.; Herbert Moates Ellis, 29, Fleet-street, E.; Ralph Staples Ellis, 69, Palace Gardens-terrace, Kensington, W.; William Lionel Eves, Milton House, Uxbridge; Frank Foster, 37, Gower-street, W.C.; Temple Hardy, "Glenhurst," Trinity-road, Tulse Hill, S.W.; Dryland Haslam, jun., Warren House, Caversham, Reading; Frederick Herbert Jones, 35, The Broadway, Ealing, W.; Frank Melrose, 4, Whitehall, S.W.; Edward Mixer, 80, Cheapside, E.C.; Richard Parry, 22, Dagmar-road, Camberwell, S.E.

#### MASONRY AND STONE-CUTTING.\*

By LAWRENCE HARVEY.

[TWENTY-NINTH LESSON.]

CORBEL-ARCH UNDER SEMICIRCULAR PROJECTING TURRET.

LET the plan of the turret (Fig. 191) be the arc ADB projecting beyond the face of the wall; let it be supported by a corbel arch formed as follows:—In the vertical plane AC perpendicular to the face of the wall, draw the arc of a circle, as shown in Fig. 192, on which the plane AC has been turned down. Let the delineated arc of circle be the section of a horizontal cylinder parallel to the wall; then the soffit of the corbel arch will be the portion of that horizontal cylinder comprised within its intersection with the vertical cylinder of the turret. The outline of the corbel arch will have for projections the lines (AFEDFEB, A'F'E'D'E'F'B'). The elevation of that outline is constructed by observing that the generator of the soffit which passes through the point F' (Fig. 192) has for projections F'F' and FF'; and as the horizontal projection of this line meets the base ADB of the vertical cylinder in the point F, we have only to draw the elevation of that point in F' on the line F'F'.

*Points to be Noticed.*—The radius A'C' of the horizontal cylinder should be larger than the projection of the turret; otherwise the keystone would have a tendency to fall forwards. Here the radius A'C' is taken equal to OD, the radius of the arc ADB, so that the upper part of the face arch may be tangent to a circle inscribed therein of diameter AB, as it gives the neatest drawing. 2. Instead of adopting the section A'D' of the horizontal cylinder, we might take for outline of the corbel-arch the curve projected on plan in ADB and on the elevation on the semicircle A'D'B'; then let this line be the directing line of a cylinder, the horizontal generator of which would slide along the outline of the face arch, and draw from this the section by the reverse process used for drawing the face arch.

The bed-joints are taken through points found by dividing the semicircle A'D'B' in an odd number of parts, and through the line YY' perpendicular to the wall. Each of these joint-planes, such as F'Y'Y, cuts the cylindrical soffit of the arch along an elliptical line, FnfY, of which any point, such as n, is found at the meeting of a generator of the horizontal cylinder with the plane of the joint; then the bed-joint cuts the vertical cylinder from F' to K' on right-hand side of Fig. 193, and afterwards it cuts the face of the wall from K' to G', where it meets

the horizontal bed-joint of the first course of stones.

The eye of the corbel-arch has for joint line a curve, *a c d e b*, *a' e' d' e' b'*, formed by delineating the arc *a d b* concentric with ADB, then taking the intersection of a vertical cylinder of base *a d b* with the soffit of the arch. The surface of this joint should be normal to the soffit of the face arch. Therefore, if to cut that eye stone a prism be selected of which the side elevation on section is the rectangular V'Z'U', then the point (*e, e'*) will have to be found where a normal C'e' to the soffit pierces the upper face of the eye-stone. By a series of such points the intersection  $\omega \lambda \epsilon \delta \epsilon \lambda \omega$  of the upper face by the surface of the joint will be delineated. In the same way the intersections *a' e' o' w'* and *b' e' o' w'* of the joint with the back of the stone will be also delineated. The surface of that joint is a conoid.

Hence the bed joint (Ee E'e') of an arch stone will stop at the point (*e, e'*) of the soffit of the arch; then cut the conoid of the eye along a line *c l*, and then the upper face of the eye-stone along the line  $\lambda L$  parallel to YY'. Turn down the plane of that joint, and you get the bed-mould H<sub>1</sub>E<sub>2</sub>e<sub>2</sub>L<sub>1</sub>L<sub>2</sub>. By similar operations we get the lower bed-mould G<sub>2</sub>K<sub>2</sub>F<sub>2</sub>f<sub>2</sub>.

To cut the arch-stone we require the intersection of the cylindrical soffit with the operation plane taken through the chord *e' f'* perpendicular to the wall. This operation plane is turned down round its horizontal trace, which gives the mould *g e f p*. Then develop the cylindrical soffit of the arch (Fig. 194), taking the distances from AB equal to the arcs on Fig. 192  $Y_1 f_1 = A' f'_1$ ,  $Y_1 e_1 = A' e'_1$ ,  $Y_1 f_1 = A' f'_1$ ,  $Y_1 e_1 = A' e'_1$ ,  $Y_1 d_1 = A' d'_1$ , and the distances from the centre line  $Y_1 d_1$  equal to the distances from centre line on the plan (Fig. 191), and you will obtain on the development the curve of the face-arch and the joint of the eye-stone.

Now to cut the arch-stone shaded in Fig. 193, produce a stone prism, the base of which will be the polygon comprising the elevation; then place the upper and lower bed moulds on their respective planes; place also the mould of the operation plane *e' f'*, and guided by the curves delineated and guiding marks thereon, work the cylindrical soffit, the part above the line F'F' will have to be worked with a set square guided solely by the outline of the upper bed. Then squeeze on to the cylindrical part just worked the soffit mould, and delineate the curves *e o f* and EF (Fig. 195), and guided by the last line and the upper edge HR of the stone-work, the cylindrical face belonging to the turret. Lastly, after having worked progressively, the small plane  $L \lambda \omega$ , the mould of which is given on plan (Fig. 191), the entire outline of the conoid joint will be known, and can be worked with the help of a few guiding marks. I shall add that it will be safer to develop also the cylindrical face of the turret, and get thereby a face-mould by which the curve E'F' will be exactly delineated; then afterwards work the soffit, of which all the outlines will then be known.

I beg to say that I have given the construction of the eye-joint as shown by a former instructor at the Paris Ecole Polytechnique, but that I consider his construction impractical, especially when applied to other joints parallel to the eye-joint which have to be used in dividing the courses of stones of large corbel arches supporting circular apses projecting 10ft. or 15ft. beyond the face of the wall. The construction I propose is as follows:—Draw on Fig. 192 the section of a second cylinder with a radius 3in. longer than that of the section of the soffit; then draw the intersection *a' z' b'* of that cylinder with the conoid forming the joint of the eye; take this latter curve as the base of a cylinder which will form the eye-stone; draw the development of this cylinder, and place that development on the surface of the cylinder worked; then draw the curve of intersection of the base cylinder with conoid joint. By means of the soffit mould draw the inner curve of that same joint, and work the conoid with a straight edge laid from one curve to the other through guiding marks. With my construction there will be no more small plane  $L \lambda \omega$ , but a conoid joint only about 3in. wide, followed by a cylindrical surface easy to work.

In Fig. 196 is shown how a similar corbel-arch can be used at the angle of two walls. Often a spherical niche is used for the same purpose, and gives an elegant solution of the problem.

In using these corbel-arches considerable

attention must be given to studying the equilibrium of forces, so as to make sure that the corbel-arch and what it supports will not over-balance the weight of the main wall. In large corbel-arches the key-stone should always be connected by a metal tie-rod to other parts of the building, or to reversed and inverted arches constructed on purpose.

#### CHIPS.

A special service was held in the parish church of West Bromwich in connection with the dedication of an ancient chancel screen, formerly in Tewkesbury Abbey Church, but which was removed at its restoration in 1877. The screen was discovered by the vicar in the show-room of a dealer, where it had lain since its removal from Tewkesbury Abbey, and was purchased and presented by him to St. Peter's Church. The panel-work is an addition, and has been made out of old oak beams formerly in the monastery of the Black Friars, Worcester.

In accordance with the terms of the Midland Railway Act of last year, the Midland Railway Company has paid to the London County Council the sum of £12,000, to be expended on open spaces in St. Pancras. The General Purposes Committee recommended to the vestry that £1,000 be expended on a lodge for the caretaker and a greenhouse in the St. Pancras Gardens Extension, and that the London County Council be asked to acquire Munster-square and Clarence-gardens as public open spaces and children's playgrounds; to throw open Lismore-circus as a children's playground, and to purchase from the New River Company a piece of land in the Highgate-road, so as to form an improved approach to Parliament Hill-fields.

Two of the lights and the tracery of the east window of Litton Church were some little time since filled in with stained glass; the third has now been added, thus completing the window. Our Lord, as the Good Shepherd, is represented in the central compartment. On the one side is a figure of St. Mary the Virgin, and on the other of St. John the Evangelist. The window has been designed and executed by Messrs. Joseph Bell and Sons, of College Green, Bristol.

A new mission chapel is about to be erected at Kington, Herefordshire. It will accommodate 165 adults. It will be built of local stone with hard stone dressings of fine colour. The roof timbers are all of large size, and the covering will be the best North of England heavy green slates. The floors of the nave will be of wood blocks, those in the chancel of tiles. The screen will be of oak, as will also the chancel fittings. The contract has been intrusted to Mr. Wislade, builder, of Kington. The designs are by Messrs. Kempson and Fowler, of Llandaff and Hereford.

The nine-sided Jacobean oak font cover in the church of St. Mary's Steps, Exeter, has just been restored by Mr. H. Hems, of that city.

A new wing for women is being added to the Suffolk Convalescent Home at Felixstowe, together with a block of baths and lavatories. The works, which will cost about £3,000, will be completed in August next, and are being carried out from plans by Mr. E. Fearnley Bishopp, of Ipswich.

Between three and four acres of land near Avonmouth Dock, Bristol, have been covered with buildings for a petroleum supply association. Conspicuous objects on the works are four tanks, for the storage of petroleum. The two principal tanks are each capable of holding 2,200 tons, and the two others will hold 1,000 tons each. The dimensions of the former two are 64ft. in diameter and 30ft. in height, and of the latter two, 47ft. in diameter and 26ft. in height. The tanks are made of thick steel plates all through, and riveted with steel. Messrs. John Lysaght and Co., of Bristol, are the builders.

The County Council for Warwickshire have decided only to employ registered plumbers on all building works carried out under their direction.

The Turners' Company have offered their silver medal, the freedom of the company, and the freedom of the City, for any workman, whether master, journeyman, or apprentice, in the trade in the United Kingdom, who may send in the best specimen of turning in pottery, stone, and glass. The specimens are to be sent in during the week ending October 25.

The County Council of Durham decided last week that the salary of Mr. W. Crozier, the county architect and surveyor, be advanced to £600 per annum, with £150 for clerks, and £150 for travelling expenses on account of his increased duties, resulting from the main roads coming under the responsibility of the County Council, and also on his relinquishing private practice. Mr. Crozier was appointed on the 31st December, 1888, at a salary of £400 a year, with similar additional allowances to those now granted, but was allowed to retain his private practice.

CONTEMPORARY BRITISH MANUFACTURERS AND ART WORKERS.—THE CHURCH HOUSE.—STONEHILLS, HANTS.  
—L'ANGE DE LA MORT.—HOUGHTON TOWER, LANCASHIRE.  
—MARPLE HALL, CHESHIRE.—JAPANESE ART OBJECTS FROM MESSRS. ROTTMANN, STROME, AND CO.

## Our Illustrations.

CONTEMPORARY BRITISH MANUFACTURERS AND ART WORKERS.

(See description on p. 639.)

## THE CHURCH HOUSE, WESTMINSTER.

THESE drawings are on view in the Architectural Room of the Royal Academy, and are briefly alluded to in our accompanying notes descriptive of some of the principal exhibits. The plans which are drawn on the double-page plate show the chief arrangements. The block will have elevations on all four sides, with a large quadrangle in the centre, rising from the middle of which will be the chapel, standing on a vaulted open crypt. Beyond, along Little Smith-street, is the Great Hall for meetings, 118ft. long by 50ft. wide, having galleries all round. This is on the first-floor level, like the chapel, and the main entrance to it is from Great Smith-street. Archways leading to the quadrangle are situated in Dean's-yard and in Tufton-street. Overlooking the latter thoroughfare is the big library. The Upper House of Convocation, like the Lower House, is situated in the Dean's yard. The former has stalls for fifty, and the latter is arranged with benches. It measures 64ft. by 40ft. The House of Laymen, also on the principal floor, is of similar dimensions, and forms the central feature in the Great Smith-street elevation. There are robing-rooms and other conveniences between these main apartments, and the ground-floor is occupied by committee-rooms, offices, and a large refreshment-room. Bedrooms are provided on the upper floor. Red brick and stone are the materials intended. Sir Arthur Blomfield, A.R.A., is the architect. A portion of the buildings is to be forthwith commenced.

## STONEHILL, HANTS.

THIS seaside house, by Mr. Basil Champneys, B.A., needs but little description, the bird's-eye view given in conjunction with the plan printed on the same sheet readily explaining the general arrangements. Tile-hanging is largely used, and red brick walls with stone jambs and copings. The drawing is on view at the Royal Academy Exhibition, the private view to which is held to-day.

## L'ANGE DE LA MORT.

THIS splendid figure, by Mr. Geo. Frampton, the R.A. Gold Medal Student, is now on view in the Lecture Theatre at the Royal Academy Exhibition, and it is unquestionably one of the principal works of the year. It was shown last season at the Salon in Paris. In some of its best points the work reminds us of Mr. Alfred Gilbert's greater efforts, though the originality

of the statue is unquestioned. The Angel of Death carries the lamp and scythe. Our plate is from a photograph sent in by the artist.

## THE INNER COURT, HOUGHTON TOWER.

THIS fine old Lancashire house, standing on the top of a well-wooded hill, has of late years been put in repair, and it is the seat of the De Hoghtons, who have held the property, they say, since the days of Henry II. The present mansion was built by Sir Thomas Hoghton in the reign of Elizabeth. Here it was that King James knighted the beef and called it Sir Loin, and other convivial records go to make up the history of this interesting old place. The view overlooking the valley of the Ribble is very extensive, with the Welsh mountains in the distance. The drawing, by Mr. J. Langham, is now at the Royal Academy.

## MARPLE HALL, CHESHIRE.

MR. H. HARRINGTON's sketch of this house, given to-day, shows the north front. The Hall was long the property of the Vernons of the Peak, and builders of Haddon Hall, Derbyshire. In 1606 it went to the Bradshaws, of Bradshaw Hall. The building is built in the form of the letter *m*, in honour of Queen Bess, then on the throne. The entrance hall has a low, massive roof, and the long window lighting it has some old stained glass in the quarries. Over the fireplace are the arms of the family and the date 1666. Judge Bradshaw's bed, in solid oak, is here, in the room where, it is said, he was born. There is much old furniture also in the house.

## SKETCHES OF JAPANESE ART.

THE sketches given this week under the above title are of objects from the show-rooms of Messrs. Rottmann, Strome and Co., of St. Mary Axe, City. There is not much that can be said concerning them, more than that they are good specimens of the modern art-work of Japan. The cabinet of lacquer work is nicely made, and is a useful, as well as an ornamental, addition to a drawing-room, especially where the owner is a connoisseur of vases, &c., as few backgrounds show off pottery to a greater advantage than one of bright lacquer. The panels of the cabinet are richly inlaid with decorative subjects—birds, in the use of which the Japs excel—figuring in all three. Perhaps the most striking object represented on our sheet is the Bronze Lamp, which stands some 6ft. or 7ft. high, nearly every part of which is enriched. There is great force in the monster which sustains the lamp pillar—a kind of demon tortoise—with an elaborately wicked face. No animal lends itself more to artistic treatment than the tortoise, while its strength makes it a suitable beast to be chosen to sustain the superincumbent metal-work, and is a truthfulness of art which is always gratifying. There is also much character in the fish and the two pigmies: the half-supplicating and half-struggling gestures of the former are well represented, and the skilful way in which its own tail, and the feet of one of the pigmies do duty for a stand, is deserving of all commendation. The Koro, or vessel for burning incense in, is likewise bronze. It is made with a lid which is perforated for the escape of the perfume, with a grotesque animal forming the handle. Like the other two bronzes it is of good workmanship, and is decorated with raised ornamentation, beautiful Taizan work, and good shape. The Pilgrim Bottle is adapted for carrying purposes, by means of the hole in the centre, through which a strap can be passed, to be slung over the shoulders of a traveller. The ornament is of a delicate design and harmonious colouring.

On Wednesday week the memorial stones of a new Bible Christian Chapel were laid in Llanbleddian Gardens, Cathays, Cardiff. The style is Gothic, freely treated in Newbridge stone, with Bath stone facings. The cost is £2,000, and when completed the chapel will seat 700 persons. Messrs. Habershon and Fawcner are the architects, and Mr. Leonard Purnell is the builder.

At a meeting held at Christchurch, Hants, on Thursday, the 24th ult., to consider the desirability of continuing the restoration of the Priory Church, it was stated that about £20,000 would be needed to complete the undertaking, towards which there was £1,700 in hand. During the past five years £4,500 has been expended on the church, and within half a century no less than £18,000 has been laid out. It was decided to make a public appeal for aid, and a restoration committee was appointed.

## PROPOSED ARCHITECTURAL STUDIO.

THE special committee of the Architectural Association, appointed in June last to inquire into the educational methods of the Association, have just made their report. They are convinced that the mutual and voluntary system of teaching which has grown with the progress of the Association now presents great disadvantages and difficulties. Adopting the Institute programme of progressive examinations as the basis, but not the limit, of the proposed systematic course of instruction to be established by the Association, they recommend the provision of an architectural studio and the arrangement of a definite curriculum of study with a paid staff of teachers. A combination of lectures and classes is recommended as preferable to either of these methods taken separately, the system of visitors being regarded as preferable in the case of advanced students. It is further proposed to establish day classes; but, for the present at any rate, not to make these part of the regular course. The committee map out, in their suggestions for a curriculum, a four years' course, adapted for students who have passed the Preliminary Examination of the Institute, equally divided into periods of two years each for preparation for the Intermediate and Advanced Examinations, but they add: It cannot be too strongly impressed on the student that his studies should not be confined simply to those subjects included in the Institute examination. The curriculum, which seems of a comprehensive and well-balanced character, is based on a season of 32 weeks' work in each year, the attendance to be one evening each week at lectures and classes, and two evenings in the studio, in the first two years, with an additional evening for lectures and classes once a fortnight in the third and fourth years. The committee recommend that the "other existing methods" of the Association—the ordinary meetings, the sessional and vacation visits, the annual excursion, and the publications should be continued as at present, with the extension that the library be opened in the day time. The total cost of the scheme is estimated at a little over £900 a year, made up of lecturers' fees, £504; instructors, £150; and cost of increased accommodation, £250; and this, it is thought, could be met by fees to students, calculated on a scale of 10 guineas per annum for entire curriculum, or 5 guineas cash for lectures and classes, or the use of the studio. The proposal, rejected in the scheme of some years since, is revived—that the subscriptions of town members be raised to one guinea, that of country members remaining at half-a-guinea as at present, and this appeal to the pocket will probably arouse much discussion. It is also suggested that a guarantee fund be formed for a limited period to defray any deficit which may arise at the inception of the scheme, and that a permanent endowment fund be established, the present financial state of the Association, with no capital at its back, not being satisfactory.

This important report, which, if adopted, involves a new departure in the working of the Association which cannot fail to have a beneficial influence on architectural students of the future, is to be considered at a special business meeting of the Association to be held on Friday, the 16th inst. (this day fortnight) at 7.45 p.m.

A group of artisans' dwellings is about to be built in Wassail-street, Swansea, from plans by Mr. Edward Bath, of that town. The area is about 300ft. by 200ft. The buildings will be divided into 150 tenements, on the "flat" system of two and three rooms each; the ground floor being utilised for shops and business premises. There will be two main entrances, and these will communicate with a corridor 6ft. wide running round at the back. The w.c.'s and lavatories will be entirely isolated from the main building. The whole of the floors and roofs will be of fireproof construction.

The committee for providing a memorial in London of the late Field-Marshal Lord Napier of Magdala have commissioned Sir Edgar Boehm, R.A., to erect a replica in bronze of the equestrian statue of that distinguished soldier at Calcutta, with the exception that the statue should be bareheaded. The committee are also in communication with the Office of Woods and Forests as to obtaining a site for the statue in Waterloo-place, Pall-mall, between the Guards' statue and the Duke of York's column.

The Duke of Newcastle, who has given the site, will lay the foundation-stone of the St. Cuthbert's College, at Workop, on September 4.

SIR ARTHUR BLOMFIELD, A.R.A., Architect.

## WAYSIDE NOTES.

THE exhibition of the designs for the "Watkin" tower is certainly something to be seen. To miss it will be to neglect an opportunity that will surely not occur again. It is not venturing overmuch to declare that another scheme of such an extravagant character will never be promoted in this country. Those persons, then, who may be girt about the loins in anticipation of the exhibition season, might well commence their labours with an inspection of the designs exhibited at the Drapers' Hall in Throgmorton-street. A clear eight days are yet available for those who have delayed seeing the drawings. I can promise the architect and engineer plenty of diversion, for the competition is as unlike the ordinary run as can possibly be; and, although little instruction will be gained from the inspection, those with some sense of the fitness of things may obtain, from the abortions on view, not a little amusement. The designs are worth visiting if only to see how energy and talent may be wasted and misapplied.

In the ordinary, everyday competition there is not a great scope for startling novelties. Churches and town-halls bear a strong family likeness, the general effect of which we all know. The circumstances of "The Tower" competition, however, warranted our expecting an exhibition of designs that would have great novelty in character. We have not been disappointed, and ought, at least, to feel grateful to Sir Edward Watkin in that his wild scheme has afforded us a little uncommon diversion.

It was with a feeling of pleasant anticipation that, on Tuesday afternoon, I ascended by the gorgeous staircase to the still more gorgeous Hall of the Worshipful Company of Drapers, and commenced an inspection of the designs. As I anticipated months ago, Eiffelism was rampant on every side. A very large number of the designs submitted to the promoters of the Tower Company evidence a reliance—flattering in its degree—upon the principle embodied in the Parisian structure; and considering that the modifications introduced by the competitors scarcely exhibit improvement in the prototype, the feminine criticism that caught my ear, to the effect that the designs in general were "horrid copies of the Eiffel," was by no means ill-timed. Some may be said to give one the idea that their designers had a nightmare after an ascent of M. Eiffel's monster, for not a few of the compositions are positively frightful in their extravagance and deformities that outrage every principle of art and science. Considered either architecturally, or from an engineering standpoint, they fail ignominiously. Among the miscellaneous designs there are, indeed, some terrible and ghastly productions. And how their authors would construct them is best known to themselves! Of the whole set it may be said that it is all very well to draw up elevations and make up pictures; but how about the working drawings? I rather fancy that the majority of schemes couldn't be made to work anyhow, and in very many of the designs that took the popular fancy on Tuesday—because in this case the public hadn't a ghost of an idea of the practical problems involved—collapse would inevitably result before a third of the structure was erected.

One of the most practical designs would seem to me to be No. 55, prepared, I believe, by Mr. Henry Davey. If modified in several points, it would be a suitable design. The simplicity of its construction contrasts well with the complication of others. It gives an effect of its vast height, and it is only a few of the designs that show a composition likely to give an observer any idea of extreme loftiness. In the coloured elevation of this design there is a certain impressiveness not observable in any other. Whether the same effect would be observable in reality is uncertain; but the fact that it results from simplicity of composition would warrant our supposing that it would. It is an engineer's design, evidently, and while putting it forward as a practical scheme, and as likely to possess a certain dignity and impressiveness, I am, at the same time, bound to confess that it is frightfully ugly. But we did not expect material loveliness in this proposed steel and iron monstrosity, and one does not expect it now after seeing the designs. I maintain, moreover, that the work is an engineer's work, and that the problem is to be solved

in a scientific manner. The iron fretworks and Gothic tracery and arcading that characterise many of the designs would look simply barbarous in execution. The vanity of introducing "architectural" embellishments may be seen by critically examining some of the more fanciful and elaborated designs, and endeavouring to realise what each feature would appear like in hard reality.

One of the best of those essaying a more architectural treatment is undoubtedly No. 54, a design by Mr. J. Sinclair Fairfax. It is of an exactly opposite character to No. 55, being composed of a multiplicity of parts, and is undoubtedly a work of high merit. Although I prefer an engineering solution of the problem, this design is certainly as artistic as any, more so, perhaps. Its chief fault may be said to be that its composition and outline imitates, or suggests, that of a building in solid materials; but it has the merit of looking practical and eminently stable. Mr. Fairfax's design will probably be the favourite.

In the whole collection there is but one design, I believe, showing solid construction, and that is No. 43, an architectural composition, intended to be realised in blocks of cement concrete, and strengthened with tie-rods, &c., of Bessemer steel. The design is impracticable for many reasons; but it is none the less remarkable. Judging, however, by the appearance of the colossal superimposed mass, the crushing-weight of the lower layers of material must be reached. No. 51 is a fine design, having a clearly-defined, graceful outline to the main structure, which is pleasing, after the extraordinary excrescences that are appended to some of the compositions. No. 44, illustrated by a model, would be cheap, and is a sensible enough design, if height, with economy, is to be the chief consideration. One might have expected to have seen one design, at least, on this principle, where a vast lattice-work structure of the signal-post type is stayed round with many wire-ropes.

What next? Having got the designs together, and arranged for an early adjudication as to their merits, is the execution of one of them to be proceeded with as soon as possible? If so, then may the new monster be removed as far as possible from our midst! The designs certainly do not make one think any more favourably of this mad, purposeless adventure. If there were any use in the tower when constructed, it would be a different thing. As it is, I can see none, except the amusement of a few people by taking them up to a breezy elevation in the lifts. An idea has got abroad that the tower will be useful for observatory purposes, which is a ridiculous notion, since on the calmest day, or night rather, an object seen through a telescope would, by reason of never-ceasing vibration, appear to jump about the field of the instrument like a parched pea on a drum. Better urge no excuse than one so feeble as this.

The Central London Railway Bill incites a larger amount of opposition than the majority of new railway Bills. Ignoring a large number of small fry, there are opposed to this railway the Ecclesiastical Commissioners, the owners of the Paddington Estate, the Gas, Light, and Coke Company, the Metropolitan, and the London, Chatham, and Dover Railway Companies. Counsel for the opposition must be rather hard pressed for valid excuses when it descends to urging because a lady might find herself descending the lift to the stations with a sweep on one side of her and a dusty miller on the other! If that were all, there might be first and third-class lifts, without incurring a vast expense. On the other hand, the opposers of the railway may reasonably question the need for the new means of communication. This plea has been largely urged by those representing the vested interests at stake, which, in this case, are unusually formidable, and disposed to give trouble to the promoters of the proposed undertaking. As to the relative merits and demerits of the railway, I have no authority to speak. That being the case, I rely on a safe and professional argument, and that is, that the new line would mean so much work in the hands of the engineering, architectural, and building trades, and, as such, is welcome. On this principle, one may even reconcile oneself to the idea of a realised Watkin tower. All is grist to the mill.

I rather fancy that the railway will be made

sooner or later. Vested interests are always strong, and in the Metropolis there is never a new work proposed, but what the vested interest bogey makes its appearance. In the least instance it is light and air, and we know how often owners of "ancient lights" seek to extort compensation for imaginary wrongs. If all the undertakings that are commenced during the year were killed by "ancient lights" or "ancient rights," viz., vested interests, the architect, engineer, and contractor might shut up shop, and business generally become sluggish, in sympathy with that of the constructing trades, and in harmony with a saying of the French that "when building goes, all goes." Actual damage to property should be, and always is, respected in England; but vested interests want careful sifting to find out whether the harm is real or imaginary. How far this is the case with respect to the opponents of the Central London Railway Bill, we shall learn when the Select Committee of the House of Commons has concluded its labour and made its report.

"Many a mickle makes a muckle," said the Scotch architect as he poured back a few drops of the black sludge that remained in the saucer when his day's work was done. He doubtless referred to the muck he had made of the good Indian ink. Who would have thought that the County Council would have had to consider in one year, two thousand nine hundred and seventy cases of dangerous structures? The few we hear of in this quarter, and the few more in other quarters, as days go by, evidently make the "muckle" at the year's end. So in the case of new streets. Lord Rosebery, in reviewing the year's labour of the Council, stated that the Building Acts Committee had sanctioned the opening of eight miles of new streets. This looks encouraging on the face of things, but in reality means little; for whole miles of streets in outlying neighbourhoods are yearly laid out only to remain unfringed by buildings of any sort. Within the last few years an enormous length of street and road has thus been made, and as yet for the most part without buildings abutting upon them. A return of the number of miles of streets thus lying half-deserted would be interesting, and, to many persons, astounding.

GOTH.

## CONTEMPORARY BRITISH MANUFACTURERS AND ART WORKERS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THIS is the second sheet of portraits in this series, the date of the first plate being April 11th, 1890.

Mr. William H. Godwin is sole proprietor of the well-known firm of Messrs. William Godwin and Son, Lugwardine Works, Withington, near Hereford, encaustic and art-tile manufacturers. The business was founded by his late father, Mr. William Godwin, in 1848, who soon obtained considerable reputation as a masterful manufacturer of ecclesiastical tiles, and as he paid particular attention to the reproduction of Mediaeval patterns in their entirety, both as to fac-simile of form and ornament, and antique appearance of surface, and in other essentials to artistic effect. He thereby attracted the attention of the late Sir Gilbert Scott, R.A., who was so well satisfied with his productions that he invariably specified Mr. Godwin's tiles to be used in the many ecclesiastical works with which he was connected. When we mention that Mr. Godwin's tiles have been used to pave no less than ten English, one Scotch, three Welsh, and two Colonial cathedrals, besides many thousands of churches and secular buildings, both at home and abroad, it will be easy to understand how highly they are appreciated. Mr. William H. Godwin entered the service of his father after completing his education, and in 1883 was taken into partnership. In that same year his father died, and Mr. W. H. Godwin became sole proprietor, and has since carried on the business; and has lately brought out several specialties, notably patent tile chimney pieces, patent tile fenders, and patent tile angle panels for sides of grates and dog-grate interiors. We observe Mr. Godwin secured First Order of Merit, Adelaide Jubilee Exhibition; Gold Medal, Sydney, 1888; Highest Award, Ceramic Art, Melbourne, 1888-9. Among the secular buildings in which Mr. Godwin's tiles have been used we may mention the following:—Windsor Castle, Eaton Hall (seat of the Duke of Westminster), Manchester Town Hall, Hove Town

Hall; Albert Institute, Dundee; Assize Courts, Manchester; Bedford Town Hall; Baliol College, Oxford; Cardiff Castle; Kildangan Mansion, Ireland; and Wigan Hall, Lancashire. The productions of this firm may be seen in Tewkesbury Abbey; the Priory, Great Malvern; Bolton Abbey, Yorks; Catholic Apostolic Church, Edinburgh; Crimean Memorial Church, Constantinople; Hughenden Church (historical as the home church of the late Lord Beaconsfield), Dorchester Abbey, Ewenny Abbey, and Military College, Oxford; whilst in town, among other churches, his work may be seen at the following:—St. Mary Magdalene, Paddington; St. John the Divine, Kennington; St. Mary Abbots, Kensington; St. Paul's Church, Paddington, and St. John's Church, Chelsea. Mr. Godwin is County Councillor for the Withington division of Herefordshire, and his portrait is the work of Mr. Norman May, of Malvern.

Mr. W. H. Burke's connection with the marble trade commenced in 1860, when he joined his brother-in-law, Mr. Alfred Edwardes, who had been connected with the London Marble Company, which had an early influence in the extension of this particular trade. For many years Messrs. Burke and Co. had a large establishment in Regent-street. Among the earliest works with which Mr. Burke was connected was the Liverpool Exchange, under the late Mr. Thomas Henry Wyatt, where marble work to the extent of several thousand pounds was fixed in the large room of the Exchange; and the doorways in the Royal Academy, under the late Mr. Sydney Smirke, R.A. A very beautiful chimney-piece was designed and carried out by the firm for Mr. Holford, at Dorchester House; the marble work and chimney-pieces at Marton Hall, for the late Mr. H. W. F. Bolckow, M.P., amounting to about £10,000; some very elaborate chimney-pieces, one of which took the prize at the Paris Exhibition, 1867, for Kylemore Castle, Galway, for Mr. Mitchell Henry. The pulpit in Buckingham Palace Chapel, under the late Sir James Pennethorne, for H.M. the Queen; large works at Marlborough House, and also at Sandringham, for H.R.H. the Prince of Wales; the grand hall and staircase at the Goldsmiths' Hall; the hall, staircase, and grand saloon at the Grand Hotel, Charing Cross; the marble decoration at the Holborn Restaurant, which constitutes the most extensive undertaking in this material in modern times; marble balustrade and staircase, and marble mosaic pavements at Clumber, for the Duke of Newcastle, under Mr. Charles Barry; the entrance hall, grand staircase, and grand salle at the Hotel Métropole; the marble and mosaic work at the Junior Carlton Club, under Mr. J. Macvicar Anderson; the Constitutional and the Badminton Clubs, under Mr. R. W. Edis, F.S.A.; the marble and mosaic work at St. Marylebone Church, under Mr. Thomas Harris. The revival of marble mosaic for pavements and the introduction of marble mosaic for wall decorations in this country is largely due to Mr. Burke. In the early part of 1870 Mr. Burke engaged the services of a large staff of Italian workmen, and has since then carried out some of the largest marble mosaic works on record, among which may be specified the Manchester Town-hall, the Natural History Museum, Eaton Hall (for the Duke of Westminster), all under Mr. Alfred Waterhouse, R.A. The firm has just carried out, under the same architect, in the chapel of Eaton Hall, twenty-six pictures in marble mosaic, representing figure subjects from the Old Testament, from the cartoons designed by Mr. Frederic Shields; the mosaic pictures both at the Guards' Chapel, Wellington Barracks, and at Chester Cathedral, in each case from cartoons designed by Messrs. Clayton and Bell; the marble mosaic pavement in Cork Cathedral, under the late Mr. W. Burges, A.R.A.; the pavement in the chancel and the dado round the church of St. Mary, Portsea, under Sir A. W. Blomfield, A.R.A.; and, under the same architect, the pavement in the chancel and chapel of St. George's Church, Cannes (the latter was to the memory of the late Duke of Albany). In 1875 the firm restored and added to a fine old mosaic pavement at Clarence House, for H.R.H. the Duke of Edinburgh. The photograph of Mr. Burke is by Messrs. Fradelle and Young, of Regent-street.

Mr. Thomas Peard is the senior active partner in the firm of Hart, Son, Peard, and Co., London and Birmingham, the other active members being Mr. Frederick Jackson and Mr. C. J. Hart. The

subject of this notice is a native of a rural parish in North Devon, whose education was first at the village school, and afterwards at the "Bridge" Commercial School, Bideford. At the early age of 13 he became an indoor apprentice to an ironmonger of that town, who was not only a shopkeeper, but also an employer of workmen in several trades—smiths, brass and iron founders, plumbers, tinplate workers, and braziers. Of a mechanical and constructive turn of mind, he availed himself of every opportunity he could take during the seven years of knowing "how the thing was done," and for which he got more serious scoldings than from a widowed mother when caught at the village smithy, where he first acquired a love of the blacksmith's art, and from which the choice of a trade resulted. Having made himself tolerably proficient as an ironmonger, he received, before the completion of his term, an invitation from his master to remain with him, and almost simultaneously, through a mutual friend, an offer from the late Mr. Charles Hart of a situation in the establishment of Hart and Son, and the autumn of 1853 found him behind the counter in Wych-street, where his acquaintance with manufacturing was soon utilised in the production of Mediaeval art metal-work upon which the firm was just entering, in addition to the specialties for which it had a wide reputation. Here he remained for six years, compiling catalogues, organising the "Gothic" department, and otherwise assisting in the development of the manufacturing branch of the business. Having learnt something of elementary drawing at school, he now studied designing, in which from previous knowledge of the metal-worker's arts and construction, his success in that line was greatly facilitated. A disagreement caused him to retire from the employ of Hart and Sons, and in 1860 he commenced business in High Holborn, where he was shortly afterwards joined in partnership by Mr. Fredk. Jackson. Here they together worked for, and substantially secured the recognition so essential to a new departure, issued catalogues of their manufactures, with the outlines of the principle on which they were produced, set forth in clear terms and well illustrated by examples. Eventually the two firms, Hart and Son, and Peard and Jackson, were amalgamated, and became Hart, Son, Peard and Co., Mr. Hart giving special attention to the works recently established at Birmingham (where he resided); Mr. Peard, the general oversight of the London establishments, and Mr. Jackson that of finance. Mr. Peard delivered in March, 1873, two of the Saturday afternoon lectures to the students of the Architectural Museum on "The Production of Artistic Ironwork," reported fully in this Journal, and all the firm's catalogues have been the work of his hands. All the most important works of the firm have been executed under his supervision, as well as the erection of their extensive factories in Drury-lane, as well as the adaptation and arrangement of the Regent-street galleries. The firm has a large combination of manufacturing departments. The great variety of their work precludes any detailed notice; but a few of the more important may be mentioned: the brass work in the chancel and Lady-chapel, Exeter Cathedral, under the late Sir Gilbert Scott; the iron-work and gas-fittings of Manchester Town Hall; of St. Paul's School; and the great gates and screen facing the entrance to the Natural History Museum, under Mr. Alfred Waterhouse, R.A.; the lighting, screens, lecterns, and furniture of numerous churches, under Sir Arthur Blomfield, A.R.A.; also similar works under the late Mr. Wm. Burges, A.R.A.; Messrs. Paley and Austin; James Brooks; Goldie, Child, and Goldie, &c.; and the extensive wrought-iron balcony framing, with its elaborately filled foliation and scroll work in cantilevers (the largest work of the kind), for the examination hall of the University of Bombay. Mr. Peard's portrait was produced specially for our series by Mr. T. Fall, of Baker-street, W.

The firm of Messrs. Gillow, of which Mr. Samuel J. Harris is a partner, was established at Lancaster, then the only port in the North, as far back as the 17th century, and possesses an unbroken record of books from the year 1730; those preceding this date were unfortunately destroyed. In the early portion of the career of this interesting house Messrs. Gillow exported furniture largely to the West Indies, receiving the value in produce. In the middle of the last century the firm opened a branch in London, and the transactions in reference to this

extension of their business in their Lancaster books are referred to under the heading of "Adventure to London." It will thus be seen that the Gillows were co-temporary with the Brothers Adam, Chippendale, and Sheraton. Although a house of great antiquity, Messrs. Gillow keep abreast of the times, thus forming an interesting link between the furniture of the past and the present. They are large builders, and employ a vast number of hands. Their decorative designs and works of furnishing are too numerous to mention. Mr. Harris's portrait was produced by Mr. Bassano, of Bond-street.

Mr. Walter Macfarlane was born in Glasgow in 1853, and succeeded to the headship of Messrs. Walter Macfarlane and Co. on the death of his late uncle, Walter Macfarlane, who was the founder of the business, and who died in 1885. Educated in Glasgow, and going through the usual curriculum of the University here, he entered the works about 19 years ago, and became partner in 1880. The works of the firm embrace the largest area of any in the same way of business in or around Glasgow, covering thirteen acres. Their castings are world-wide known, and have secured the highest awards wherever exhibited as being "sharp, clean, and full of character." Their works are surrounded by the suburb of Possil Park, which has sprung up entirely within the last fifteen years. Possil Park has now a population of nearly 7,000 inhabitants; when the firm secured the ground there was a population of ten persons.

The late Mr. James Holroyd, who died only a week or so since, was managing director of the Burmantofts Works, recently incorporated with the Leeds Fireclay Co., Limited. Under Mr. Holroyd's care the extensive works at Burmantofts have developed and established their reputation for terracotta, faience, pottery, glazed bricks, &c. Amongst the numerous works carried out by him may be mentioned the National Liberal Club, London—interior decoration in tiles and faience; National Provincial Bank, Manchester—interior decoration in tiles and faience; Free Library, Edinburgh—constructional faience; Café Monico, London—terracotta; Piccadilly House, London—terracotta; Church-street Premises, Liverpool—terracotta and faience; Royal Infirmary, Liverpool—glazed bricks and faience; Liverpool University, Liverpool—glazed bricks; Menstone Asylum, Menstone—glazed bricks and faience. Mr. Holroyd's portrait, taken for our series, was done by Messrs. Donald and MacIver, of Leeds.

#### BRICKS AND BRICKMAKING MACHINERY.

By M. POWIS BALE, M.Inst.M.E.; A.M.Inst.C.E.  
Author of "Woodworking Machinery," "A Handbook for Steam Users," &c.

MOULDING AND PRESSING SAND-FACED BRICKS, ETC.

IN districts where hand-moulding is pursued or in plastic machine moulding, where it is desired to have a very clean and well finished brick, after the brick is moulded it is pressed either in a hand or steam-power press. Various attempts have been made from time to time to mould and press at the same time the sand-faced bricks made in the London district by mechanical means. No difficulty, of course, exists in pressing the brick by a separate machine after it has been moulded by hand; but owing to the mixed nature of the materials, the combination of the two operations of moulding and pressing in the same machine has proved itself not by any means an easy problem to solve; consequently, many failures have occurred—variation in size, sand flaws, and other imperfections resulting. This doubtless arose in some cases from the very divergent nature of the clays and materials, and in the composition of the bricks, rendering it difficult to fill the dies properly, and to regulate the amount of pressure most desirable.

We illustrate herewith, Fig. 17, a steam-power machine for moulding and pressing sand faced bricks, lately introduced by Mr. W. Johnson, Castleton Foundry, Leeds, who has for some time devoted considerable attention to machinery designed to improve the quality of sand-faced bricks, such as those made in the London fields. The circulating table shown in sketch is fitted with five moulds, and is arranged with an intermittent motion, which is impelled by a pawl and ratchet disc worked from the main shaft by a connecting-rod. These moulds consist of loose slides hung by hinges. The brick is fed

FIG. 17.

FIG. 18.

FIG. 19.

on to an iron pallet while the table is stationary. With the slow movement of the table, which immediately begins, the loose sides of the mould gradually close tight. This motion is obtained from a runner with which they are connected travelling along an inclined plane. The mould is brought into position, and the brick is pressed by a descending presser worked in a slide actuated from a rotating disc-plate by a connecting-rod and pin. The brick being pressed, the mould table again begins to move, and the runner descending, the plane actuates the sides of the mould, and causes it to open on all sides. Thus the pressed brick can be removed, and the mould cleaned for the receipt of another brick. It is stated that the brick all over its surfaces is thoroughly imbedded in the sand, and that it is

finished in perfect form. One press will turn out 10,000 bricks per day. It is desirable that the bricks to be pressed be made as stiff as possible, so that they can be readily handled without injuring their form. We have seen one of these machines working, with excellent results, and Mr. Johnson has undoubtedly made a step forward in its construction, and has apparently successfully overcome no inconsiderable difficulties.

In the manufacture of hand-made bricks with a sand face, the great difficulty has been to secure a good face without sand flaws, and several machines designed to obviate these defects have latterly been introduced. We illustrate a hand-power moulding machine (Hellier's patent), Fig. 18, manufactured by Messrs. Eddington and Stevenson, of Chelmsford. In this machine the

clay is placed alternately in a chamber on each side of the column, and pressed through a smaller die into the mould. It is then cut off with a wire, struck off, and delivered on the pallet boards. An ingenious opening mould is used with this machine, which we have already noticed.

Hand or machine-moulded bricks are greatly improved in appearance and selling price by being subsequently pressed in a separate machine, and where the bricks are required for facing and similar purposes this process is largely pursued. Where large quantities of bricks are required to be pressed, engines are sometimes fitted to, and combined with, the press.

Fig. 19 represents a hand-power portable brick-pressing machine, from the designs of Messrs. Clayton, Howlett, and Venables, Harrow-

road, London. It is of simple construction, and is designed to press the bricks after they have been moulded, is worked by means of a hand-lever, which closes the moulding-box and presses the brick, and the reverse motion of the lever opens the box and delivers the brick. It is fitted with a self-lubricating piston, which presses the brick and at the same time prevents it adhering to the mould. With a single-chamber machine, worked by a man and a boy, 5,000 bricks may be pressed per day, and their appearance and quality are thereby greatly improved. Paving tiles can also be pressed in a like way, and, by the addition of adjustable pistons to the chamber of the press, bricks and tiles of various thicknesses and forms may be readily treated. Altogether, it is a very useful machine.

#### CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—V.

By BANISTER FLETCHER, JUN., A.R.I.B.A.

INTERIOR AND EXTERIOR DECORATION.

THE painting of the great trusses and roof generally is performed in a dark yellow, mixed in the manner following:—

White lead..	2 kilogrammes or 4·40lb.	avordupois
Red ochre ..	45	" 99·20 "
Yellow ochre	155	" 341·71 "
Oil .....	800	" 1763·68 "
Turpentine..	400	" 881·84 "

It may be interesting to state that M. Alphand wished the great trusses to be painted blue; but

M. Dutert wished it to be dark yellow, in order, as he thought, not to destroy the constructive lines, and M. Dutert's advice was carried out.

Each of the bays to the main roof at its lower extremity is filled with painted canvas, with the arms of the different countries exhibiting, and over the "arms" is a "motif" of the principal products of the same countries. Each main bay is divided into four panels by the intermediate iron rafters running down the whole length of the bay. The canvases, as explained above, are nailed and glued to the wood boarding behind, and form a most effective decoration. In the end and central bays these canvases are enriched by reliefs in "staff."

No. 29

The Exterior Decoration.—The side façades at the bottom have a filling of glazed bricks worked in patterns of red and white. These bricks are made by the heating and compression at high temperature of sands used in the manufacture of glass.

General Remarks.—The "Galerie des Machines" has been awarded the prize of 100,000fr. by the press committee, given for the most useful work; but one is inclined to think it combines utility with beauty and architectural

we notice especially its characteristics, which at those mentioned above, of the treatment of ordinary sections of iron; for instance, the caps Nos. 26 and 27, are constructed entirely on the principle. One sees no attempted imitation of the Grecian Doric, no architrave, frieze, and cornice carefully worked out in iron to represent stone, but failing miserably in its object; none of the iron Corinthian columns which one meets so often.

The architectural world has been waiting for years for an application of iron, as this building shows; a building which will have infinitely more power in influencing architects and the treatment of iron construction than all the lectures or papers on the subject that were ever written. An opportunity for its introduction on so large a scale was probably unexpected; but the most that we can say for M. Dutert is, that when the opportunity presented itself, he was, like Wren, in an entirely different path, found equal to the occasion.

The galleries in the entrance vestibule are supported on columns of simple sheet and angle

No. 26 Palais des Machines

Sketch of cap or column to staircase leading to gallery in Machinery Hall. The caps in this vestibule when they have to carry a girder, run longitudinally along the girder, one side as at A: Irons about 1/4" thick.

grandeur. It is a great thing that an architect should have conceived a building of this sort. It is not generally so. The Crystal Palace, which formed the English Exhibition of 1851, was not designed by an architect, but by a man who was practically a landscape gardener, and that such a bold step should be taken by an

architect is a matter of congratulation to architects all over the world. Iron has been the architect's watchword, and M. Dutert has attempted as much as possible to take iron, ordinary sections of iron, or *fer courant*, and by using the iron in artistic shapes, Nos. 26 and 27, and showing the construction to produce a building which shall be as characteristic of the material in which it is built as a building in any other building material, be it in stone, wood, brick, or terracotta. It is in the inside of this hall that

iron, with its projecting plate at the top, are bound together by plate-irons by the aid of rivets (No. 27), with the base spreading out as much to strengthen it as to satisfy the eye. The treatment is something so new, and yet so simple, that one is inclined to think why some architects has not tried it before.

The balustrading to the side galleries is composed of an open and close part, the lower part of which is sheet-iron, the upper part of lattice work of the design shown, and it is by combinations such as these that M. Dutert has sought to add effect to the decorative duties of the ironwork.

One comes across two different forms of corner-irons in the "Palais," the one formed of angle-irons and sheet-iron, presenting a very bold appearance (this type is used to carry the gutters of the nave, as at A); the other description, at B, of angle-irons at the back and top, and only sheet-iron forming the bracket, may be mentioned as different modes of obtaining effect the last-named (B) having only to carry the light ornamental zinc coping to the gable (No. 28A).

The brackets formed in U-irons, ornamentally, at the foot of the staircase, to the electric lighters, are also noticeable as having nothing that is not supplied by the ordinary plant of an iron factory. In the recesses of the U-irons are the electric wires; these being thus easily inspected, besides being not readily visible. T

pushions at the bottom of the great trusses are the only cast iron, with the one or two small exceptions named, used in the building.

In conclusion, I have to acknowledge my indebtedness to M. Dutert for much of the information contained in this article, and also M. Eugene Hénard, architecte diplômé par le Gouvernement, who, being M. Dutert's chief

Palais des Machines  
Balustrade of stamped sheet-iron  
à angle-irons

inspector, has written a most exhaustive article on the "Palais des Machines" in *l'Architecture*, to which article, which M. Dutert, with very great kindness, had bound up for me and presented to me, much of the information given herein was obtained, as also some of the constructive sketches.

#### CHIPS.

St. Michael's Church, Workington, which was destroyed by fire in January, 1887, and which has been rebuilt, was opened on Thursday, the 24th ult., by the Bishop of Carlisle. The work of rebuilding was commenced in August, 1888, the contractors being Messrs. Lister and McCartney, of Cockermouth and Workington, and the architects Mr. Bassett Smith, of London, and Mr. James Howes, of Workington. The cost has been upwards of £7,000.

On Tuesday week a special service was held in St. Mary's Church, High Crompton, near Manchester, for the purpose of unveiling the Clegg memorial marble pulpit, which has cost upwards of £800. There are four front panels, with subjects in white marble representing the birth of our Lord, blessing little children, disputing with the doctors, and the presentation in the Temple; and between each of these stands a figure of one of the Evangelists, also in white marble. The pulpit was designed and executed by Mr. William Forsyth, sculptor, of Worcester.

Memorial stones were laid on Saturday, the 26th ult., of the new Wesleyan chapel at Amble, Northumberland, which is being erected from the designs of Mr. George Reavell, jun., of Alnwick.

At Huntsmoor Park, Iver, near West Drayton, Messrs. C. Isler and Co., of London, have recently completed an artesian bored tube well 200ft. deep in just over four weeks. After passing through the various beds of clay and sand which form part of the London basin, as soon as the chalk was reached the water rose 14ft. above the surface, and at 5ft. the overflow was at the rate of 200,000 gallons per day. The water is very pure.

Brunswick Chapel, Leek, Staffs, is closed for alterations and decoration. The improvements are being carried out by Messrs. Matthews, to the designs and under the superintendence of Messrs. W. Sugden and Son, of Leek. The galleries are being lowered, the old-fashioned pulpit is being remodelled into a rostrum, a panelled wood ceiling is being formed over the orchestra, decorative wood-work added to the main roof and gallery fronts, and the heating and ventilating arrangements concentrated.

The foundation stone of a National School was laid at Terrington, near York, on the 24th ult., by the Dean of York. The school will accommodate 100 children at a cost of £600, but, in addition to this, the stone and cartage have been given, as well as the site. Messrs. Monson and Worsley, of York, are the architects, and Mr. H. Stevens, of Burythorpe, is the contractor.

## Building Intelligence.

CLAUGHTON.—The foundation-stone of the new church of St. Mark, Cloughton, was laid on Friday by the Bishop of Chester. The church will consist of a nave with north and south aisles, morning chapel on the south, and parish room, priest's and choir vestries on the north side. The style is Late Pointed. The walls are built with white Storeton stone, with dressings of red Run-corn stone. The church will seat 700 persons. The contractor is Mr. W. H. Forde, Cloughton-road, Birkenhead, and the architects Mr. C. W. Harvey, in conjunction with Messrs. Pennington and Bridgen, Liverpool. The cost is about £7,000.

CONGLETON.—The improvements and renovations at the Town Hall of Congleton, built from the designs of the late E. W. Godwin, are now completed, and the building was reopened on Wednesday week. The promenade galleries have been lowered 3ft. or 4ft., and now rest on steel cantilevers cased with wood, so that all danger from decay is removed. An end gallery at the same level, containing six seats in depth, has also been introduced. By the improvement of the galleries, sitting accommodation has been provided for 210 persons. The decayed and noisy wood floor of the great hall has been removed, and substituted by an oak block floor on a concrete bed, by Mr. R. Lowe. The entrance-hall and vestibule have been rearranged, a glazed screen and swing doors have been introduced in the vestibule, and additional and improved outlets have been provided. The building has been reheated throughout by low-pressure hot-water pipes and radiators. The drainage has been amended, some main walls have been under-built, and the great hall has been re-decorated. The works have been carried out under the direction of Messrs. W. Sugden and Son, of Leek, architects, whose plans were successful in the original competition for the heating and ventilating section of the works. Mr. Thos. Brown and Mr. Kennerley were the contractors for the builder's and decorator's work.

FALMOUTH.—The new church of All Saints', at the top of Killigrew-road, was consecrated last week. The architect is Mr. J. D. Sedding. The church is 30ft. wide from end to end, with wide arches to the arcades, the aisles being narrow. The plan consists of a parallelogram, 50ft. by about 120ft., with shallow transepts. On the north and south sides of sanctuary are the vestries for clergy and choir, which are connected by an ambulatory behind the altar. The north transept is to be used for the morning chapel. A baptistry is at the west end of the nave, and above the north transept rises an octagonal bell turret. The aisles are 35ft. high to the wall plate, and the nave is about 60ft. to the ridge. The floor of nave is of wood blocks laid on concrete, and the chancel and sacrum steps are of Hopton Wood stone, and the chancel is paved with coloured marbles. The screen wall surrounding the chancel is of Hopton stone with horizontal courses of blue Pennant. The church will accommodate nearly 800 people. The contract price of the building was £4,451; but there have been many extras, and special gifts have been received to the value of about £500. The contractor was Mr. J. S. Kelway, of Falmouth; clerk of works, Mr. W. H. Dunstan. The choir stalls are the work of Messrs. Trask, of Norton, Ilminster.

KNOTTY ASH.—The new chancel of the Church of St. John the Evangelist, Knotty Ash, was consecrated by Bishop Ryle on Saturday. During the past five years the nave has been rearranged, with new seating, flooring, and warming apparatus. The additions now completed consist of a chancel, 29ft. long and the full width of the old nave, and a chancel aisle to accommodate sixty worshippers. Advantage has been taken of the eastward fall of the ground to construct under these the clergy and choir vestries, an additional vestry being placed on the ground level. The exterior is faced with Woolton stone. The total cost is about £2,000. The contractors for the work generally, including the choir-stalls, were Messrs. Brown and Backhouse, of Liverpool, the architects being Messrs. Aldridge and Deacon, also of that city. The chancel fittings are of wainscot oak. The reredos and screens are of oak, executed by Mr. Harry Hems, of Exeter, who also carved the pulpit presented to the church

at the time of the reseating of nave, and likewise designed by Messrs. Aldridge and Deacon. The reredos extends the full width of the east end, and, like the other fittings, is in the 14th-century style of Gothic art. The stained-glass east window, representing the Descent of the Holy Spirit, was designed by Mr. H. W. Lonsdale, of London.

NEW KILPATRICK, GLASGOW.—Archbishop Eyre laid, last week, the memorial-stone of an edifice at New Kilpatrick, intended as a college for the education in philosophy and theology of advanced students who are being trained for the ministry. The building is in the Domestic Gothic style of the 15th century, and is designed to accommodate fifty students, each of whom will have a separate room. The length of the main building is 176ft. by 54ft. broad. For both dressings and facings Dumfries red stone is employed, and the roof will be covered with green slates. A chapel and other buildings are provided for in the plans, and will be added in due course. The architects are Messrs. Pugin and Pugin, Westminster, and the work is being carried out by Mr. John Devlin, Glasgow.

## Engineering Notes.

EDINBURGH.—Extensive alterations and improvements are about to be carried out at the Caledonian Railway Company's Princes-street Station. Messrs. Cunningham, Blyth, and Westwood, C.E., have completed plans for the work necessitated by the rearrangement of the lines at the terminus and the rebuilding of the station. The new station will be between 700ft. and 800ft. long, with a clear span of 180ft., the roof being of iron girders and glass and slate work. The outside walls will be of ornamental masonry. It is intended to erect buildings facing Rutland-street and Lothian-road, to be used respectively as offices and waiting-rooms, but the plans for these, which are in the hands of Messrs. Kinnear and Peddie, architects, are not yet completed. The new station will have six platforms in lieu of the existing three platforms. A large portion of the present principal entrance for passengers and vehicles will be taken up by the new station, the frontage of which will be brought forward to Princes-street. The work has been planned so that, in the event of powers being granted to proceed with an underground railway scheme, the new station and that for the underground railway may be worked as one, although their levels would be different.

GLENFARG RAILWAY, N.B.—This undertaking, which has been 2½ years in course of construction, is now practically completed. It is only ten miles long, but has necessitated a great deal of heavy cutting. At the head of the Glen 60,000 yards of excavation had to be undertaken in order to divert the course of the Farg river, and 30,000 yards of excavation were necessitated by the diversion of the Great North Road. The line runs through a series of deep rock cuttings, the material being hard whinstone. One of them is 60ft. in depth and 50 chains in length. Throughout the whole line 25 rock and earth cuttings have had to be made, and of these 15 lie in the four miles north of Damhead; while about a million cubic yards of rock and earth have been excavated. There are two tunnels, each 500 yards long, and also a couple of viaducts, and three embankments, one of them a mile in length, and containing 280,000 cubic yards of material. The construction of the line also included the building of 22 bridges and numerous culverts. Throughout its whole course from Mawcarse, where it leaves the present line, to Bridge of Earn, where it rejoins that line, a double line of rails has been laid down. The only station on the line, that at Damhead (Glenfarg Station), is approaching completion. Messrs. C. Brand and Son, of Glasgow, have been the contractors.

#### COMPETITIONS.

SALFORD.—The Baths Committee of the Salford Council met on Wednesday week and selected the plans of Messrs. Mangnall and Littlewoods for the new baths, Regent-road, Salford, which were submitted in competition under the nom de plume "The Regent." The same architects were successful in the recent competition for the Broughton Baths, which we illustrated a fortnight since.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after.

All Situation Advertisements must be prepaid. Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

## NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLV., XLVI., XLIX., L., LI., LIII., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

## REGISTRATION AND THE R.I.B.A.

To the Editor of the BUILDING NEWS.

SIR,—As one of those who voted in the minority in the poll recently taken by the R.I.B.A. on a resolution dealing with the Registration question, I should like, if you will allow me, to explain my reasons for doing so, especially as I think I may at the same time be expressing the views of others who voted in the same way.

I opposed the resolution in the first place, then, because although strongly in favour of Registration, I can see no valid reason for postponing its consideration.

Secondly, because I believed that, if the resolution were defeated (which was certainly the result I hoped for), it would have been competent to have brought forward the original one, and taken a vote upon it, which would have been most desirable; whereas, as the matter now stands, the question remains practically *in statu quo*, and is likely to remain so for some time at least; for the Institute, having given a definite decision on it, cannot stultify itself by immediately reversing that decision in whatever form it may be put, and I think this is very much to be regretted, for there is no doubt that Registration will have to come sooner or later, and nothing can be gained by putting off its consideration.

The involved nature of the resolution, as you point out in your comments on the poll, no doubt caused much confusion in the minds of members as to what they were really voting on; but I cannot help thinking that if every one had carefully followed the report of the meeting furnished by the Institute, the result would have been very different.—I am, &c., A.R.I.B.A.

## THE INSTITUTE, GREAT SEAL.

SIR,—Your correspondent, Mr. Chas. Guy Hall, of Kensington, is too bad talking about the Diploma being mistaken for a symbolical sign intended for a piccalilli jar. Had this been its object, no doubt some eminent R. A. would have been engaged to design the advertisement, some copies of which would sell as "proofs," if only signed in the proper corner. As it was, I am correct in saying that the Institute's new seal was designed by a Mr. Mitchell, who only charged £25 for his design, and this was paid by the President as a present to the Institute. I do not know what it cost the members to have this precious design cut. The price is not registered, but the design is, I believe, thank Heaven.—I am, &c.,

AN ODD FARTHING.

## PROVISIONS IN QUANTITIES.

SIR,—I am much obliged for the space afforded my last and also for the replies it elicited. Mr. Lovegrove naively remarks: "Does he ('Twice Charged') actually state, and is he prepared to prove, that for the sake of a pound or two commission any respectable surveyor writes down provisional sums or quantities?" He can easily read what I state; but surely the surveyors' motives for inserting these provisions are best known to themselves.

It appears (I do not say that it is so, but it appears at present) that the reasons for inserting these provisional items in quantities are either to guard against any mistakes or else to swell the amount of the commission. If any tangible excuse can be advanced for their insertion, I shall be glad to know it. Perhaps Mr. L., as a surveyor, can enlighten us, and give the desired information.

The provisional items alluded to are what are customarily known as "surveyor's provisions," and there is a vast difference between them and the provisional amounts inserted by the architect, these latter being usually for special works or fittings, and to give him more scope and freedom of choice in the selection of articles, &c., to harmonise with the style of building as the work proceeds; also, an architect's provision for any extras is generally worded thus: "Provide the sum of £— for contingencies or extra works, to be expended as will be directed, or deducted in whole or part as may be required." This is an architect's provision, although the surveyor still obtains 2 per cent. commission for simply writing the amount down, and does not earn the money by actually taking out any quantities of work to the specified value.

"A Disgusted Surveyor's" innocent remark as to few, if any, surveyors getting 2 per cent. commission for taking out quantities is novel, to say the least of it, and quite refreshing. Poor man, how it must startle and astonish him to learn from a "Builder's Manager" that there is actually a surveyor who obtains even 2½ per cent. for this.

My original inquiries were intended simply to ventilate the matter, and if a "D. S." can throw any light on the subject, instead of indulging in vituperation, he may possibly benefit those interested in it.—I am, &c.,

TWICE CHARGED.

SIR,—Emboldened by your kindness in publishing my last letter on the above interesting question, I beg to trouble you with the following few remarks. It seems to me a very simple matter, and is very much confused by "Builder's Manager," from, I imagine, very interested motives. If, instead of expending his genius and time in blackening the character of surveyors, whose lives are made a perfect misery by passing their time in trying to satisfy the rapacious greed of the full-fledged contractor, and at the same time acting honestly by the architect and his client—if, I say, he were to write honestly in answer to "Fairation's" query, I have no doubt this matter could be easily cleared up. I beg to ask when a surveyor states in his quantities that, say, a kitchen range is to cost £20 prime cost, or as some surveyors add, "nett prime cost," and the surveyor then states that the contractor is to add his profit to this sum, can there be any possible question as to what the item means? Does "B. M." think that surveyors are such overgrown schoolgirls as to swallow his argument that the P. C. price means the very fine and large quotation given in the highly-coloured and very artistic catalogues of the stove mer-

chant? If so, instead of his dubbing surveyors knaves for charging 2 per cent. on an omitted item, he should rather call them fools. Of course, "B. M." knows better, perhaps, than I that these coloured catalogues were designed and printed 10 years or so ago, and rather than alter and reprint them every six months or year, the said merchant sends out to the trade interesting little red-ink slips, in which he states that the discount, instead of being 30 per cent. as last issued, will now be perhaps 35 per cent. Of course, I would not hurt "B. M.'s" feelings by supposing for a moment that this is done for the purpose of playing into the hands of the contractor; but the result is that this catalogue is shown by the contractor to the client or his surveyor without the red-ink slip being produced, the said contractor being proportionately disgusted when either or both seem rather to doubt that he is paying the sum shown under the before-mentioned highly-coloured plates, and he will not allow, forsooth, that the figures are not nett prime cost. If I chose to follow "B. M.'s" bad example, I could fairly call this system by a very ugly name. I happen to know a big tradesman who issued a catalogue with "nett" prices under the plates, and, strangely enough, he was at once boycotted by the trade. If you will permit me, I should like to continue this subject.—I am, &c.,

A DISGUSTED SURVEYOR.

## Intercommunication.

## QUESTIONS.

[10273].—**Fire Regulations.**—Is there any Act of Parliament making it imperative that the doors of all public buildings, such as mission-halls, should open outwards in case of panic? Have the Ecclesiastical Commissioners, or any other bodies, any control over the erection of these buildings in the suburbs, if the churches with which they are connected are not under their jurisdiction? Are there any rules, other than the ordinary local by-laws, to which such buildings have to conform?—H. E. W.

[10274].—**Hot-Water Apparatus.**—I wish information regarding the connection of an expansion tank to a hot-water heating apparatus. Should the feed from tank connect with flow or return pipes of boiler? Kindly also give reasons for and against connecting with either pipe. If you could give a diagram along with the answer, it might prove valuable information.—CANADIAN ARCHITECT.

[10275].—**Cleaning Cement.**—The houses here are mostly built of rough stone, coated outside with Lias lime, and painted every few years, which is a heavy expense. To avoid that I had my house covered with Portland cement, which now wants cleaning down. Will some of your numerous readers kindly tell me the best method of doing so?—KINGSWEAR.

## REPLIES.

[10271].—**Nuisance from Saw-Mill.**—If A. could not remove his saw and planing mill, he could see whether the beds of same are sound and solid, and whether the machines are firmly fixed on same.—R. WATSON.

## CHIPS.

A handsome brass eagle lectern has been presented to the parish church of St. Thomas, Birmingham. The work was entrusted to Messrs. Jones and Willis, of Birmingham and London.

The chapel of ease at Washwood Heath, Warwickshire, which has been built by Lord Norton was opened on Saturday. It is a branch of St. Saviour's, Saltley. Accommodation is now provided for 70 people, but the chapel at present consists of what will in time to come be the chance of a commodious church. The interior of the building is of glazed red brick with a plain wood roof. Mr. J. A. Chatwin, of Birmingham, was the architect, and Messrs. Sapote and Sons the builders.

A cross upon the steps and a platform have been erected in Southampton Cemetery as a public memorial to the late Timothy Falvey, a local journalist and orator. The memorial is executed in Sicilian marble, and has been carried out by Messrs. Baker and Grace, of Southampton.

It has been decided to build an entirely new organ in Exeter Cathedral, at a cost of about £3,000. The present instrument since its alteration and supposed amendment has never given satisfaction. The order for the new organ has been given to Messrs. Willis, of London.

The Lancashire County Council have appointed, out of 37 candidates for the post of county medical officer of health, at £800 per annum, Dr. Edward Sergeant, at present medical officer of health for Bolton.

Major Forster, architect and surveyor to the Marquis of Londonderry, at Seaham Harbour, met with a serious accident on Monday week, when he was thrown from a trap and injured.

## TENANTABLE REPAIR.

ONE of those legal phrases which are continually exposed to misinterpretation and conflicting opinion is that which binds a tenant to deliver up his premises at the expiration of the term "in good tenantable repair." The definitions that have been made by lawyers and surveyors of eminence have been found to admit of more than one meaning according as to which of the contending parties is interested, the landlord or the tenant. Naturally a landlord desires his property to be reinstated in as perfect a manner as possible, and it is equally reasonable to expect that the tenant will endeavour to do as little as possible; and, therefore, as human nature is likely to remain as it has always been in matters of business, there will always exist two meanings to any verbal definition that may be framed. We may, therefore, take it for granted that the term "tenantable repair" will constantly be liable to be construed in two different ways, and that the best thing to do to meet the difficulty is to try and limit the definition in some way—to narrow the compass of its application.

The Court of Appeal has recently heard a case of an appeal from the decision of a Divisional Court which involves an important but ever-recurring question. The facts are given as reported in the *Times*. The action was brought for a breach of a covenant on an agreement to deliver up the house at the expiration of term in good tenantable repair. The official referee before whom the action was tried gave the plaintiff the costs of painting and papering, with new paper similar to the old paper, some of the rooms, and whitewashing some of the ceilings. The Divisional Court held that the tenant, though liable for commissive and permissive waste, is not bound to repair anything worn out by age, and that, therefore, he was not compelled to repaper or repaint where such painting or papering was only decorative. While he must patch as long as patching was reasonable, he is not required to renew, nor need he clean or scour the wall-paper or whitewash the ceilings. The plaintiff appealed, and his counsel submitted the decision of the Court was wrong. "Tenantable repair," it was alleged, meant fit for a tenant, having regard to the state of the premises when the tenancy commenced. If the paper was so worn that it could not be restored, the tenant was bound to repaper. On the other hand, the defendant contended that the tenant was not bound to repaper and repaint decoratively. A question arose as to what decorative painting meant. The Master of the Rolls, referring to the Court in which he was presiding, said it was a disgrace to H.M. Board of Works, but although it might be improved, its state was, nevertheless, consistent with reasonable comfort. The appeal was dismissed. The Master said the Court agreed with the Divisional Court, that the matter must be sent back to the official referee since the principle of his decision was not correct. "Tenantable repair" did not mean that the tenant must repaper the walls with similar paper to that which was upon the walls when the tenancy commenced. If the house was not in tenantable repair when the tenant took it, the authorities showed that if he covenanted to keep and deliver it up in tenantable repair, he must put it into such repair and deliver it up so; but he was not bound to do more, and need not do anything in the nature of decorative

repair." He concurred in the definition of Lord Justice Lopes given of "tenantable repair" in the cases of "Belcher v. Mackintosh," "Moody v. Robinson," "Payne v. Hayne," and others, that "it is such repair as, taking into account the age, the character, and the locality of the house, would make it reasonably fit for the occupation of a reasonable-minded tenant of the class who would be likely to want the house." The Master said the definition was an expansion of those given in the old cases, and it appeared the right principle to apply. "Different degrees of repair would be required, according as the house was a cottage or palace, was situated in Spitalfields or in Grosvenor-square, and was 200 years old or just built." Lord Justice Lopes gave judgment to the same effect.

This decision is not only of interest and instruction to tenants in general as showing the sense in which the Court interprets the meaning of "tenantable repair," but also to landlords who are disposed to think that a tenant ought to leave a house in a better condition than he found it. This opinion has been fostered and encouraged by the common law, which has favoured the landlord by attaching responsibility to occupiers. The "age, character, and locality of the house" are the narrowing circumstances which ought to determine the liability of the tenant; for unless these are taken into consideration, it would not be hard to interpret tenantable repair to mean the general restoration of the premises, and putting them into a better condition than they were before. The liability of a tenant to do repairs is more reasonably made contingent upon his neglect, though it is very easy to say that a tenant has allowed his premises to fall into a state of dilapidation, by omitting to take reasonable precautions and to do timely repairs. "Reasonable wear and tear" is a phrase that has been very differently construed by landlords and tenants. The former frequently does not allow for age, nor for character—two essential conditions of wear and tear. Thus the age of a building determines an ever-increasing liability to fall into ruin; the timber gradually decays, the mortar gets loose and drops, plastering cracks through settlement; the character of the house and its tenant, the use to which it has been put necessarily also make it less easy or practicable to keep the premises in repair as time goes on, and every subsequent tenant ought therefore to have less to do, instead of more, than his predecessors. We are, of course, not speaking of what is called "commissive" waste—that is, voluntary acts of destruction and alteration—nor of "permissive" waste—that caused by the omission of ordinary and necessary repairs; but simply of wear caused from age. A common-sense definition has been made by one authority that "fair wear without accident is not a dilapidation; but wherever there is any degree of accident, it is one." Accident takes place suddenly and perceptibly; wear takes place gradually and insensibly; and a good example is given of the difference between the two kinds of deterioration. The nosing of a step may be quite worn away by wear, and it is no dilapidation; but if it be broken away it is a dilapidation. Neglect or permissive waste may allow a roof to fall, and thereby to cause an internal injury, and this would be held to be a dilapidation. The last is an instance of permissive waste; so any decay arising from neglect of painting is a dilapidation.

The Court of Appeal has confirmed the principle that tenantable repair does not mean a reinstatement of the class and description of materials originally found on the walls, such as the same kind of painting and the same class of paper as that on walls when the tenancy began. The tenant is not bound to do anything in the nature of decorative repair. But what does "decorative

repair" mean? Here it is evident some contention may arise. Where is the line to be drawn between plain and decorative repair? Can repapering, painting, and whitewashing be called decorative? When there are no covenants in the lease, the common covenants to repair, maintain, and uphold are generally implied. Other legal authorities maintain that the tenant is only bound to preserve the premises from occasional and accidental dilapidation. On the whole, legal dicta are conflicting as to the extent of a tenant's liabilities, and even the definition given by the Court of Appeal may be open to differences of opinion. Covenants to repair ought to be clearly understood by both parties, and the state of the premises before entering ascertained by a careful survey.

## ARCHITECTURE AT THE ROYAL ACADEMY.—II.

FOLLOWING the order of the catalogue, we may now briefly refer to a few of the other exhibits, having already in our previous notice alluded to some of the more important drawings shown in this gallery. Mr. Kingsley Oliphant's elevation for a shop premises at Dover is in good taste, and the Free Library at Notting Hill, by Messrs. Figgis and Wilson, is also a picturesque piece of work, though somewhat curious in detail, with quasi-towers at the entrance, and a sort of wall-paper scroll design spread over the front at the base of the gable, and carved in stone. Mr. W. R. Lethaby sends a strange-looking font-cover for Benthams Church, Lancashire, with open fret-carved German stall-looking uprights set diagonally on plan, and supporting a thin disc, which again carries some sparse-looking finials. Anyway, it is novel in idea, if neither solid nor good. Messrs. Pugin and Pugin's Church of the English Martyrs, Preston, is characteristic of their florid style, and Mr. Swinden Barber's square tower for St. Jude's Church, Halifax, is a bold "correct" example in good proportions. The Clock Tower designed for Newmarket by Messrs. Gordon and Brown is in a Renaissance style, worked out in red brick, with a stone spire capping it. The chancel of Holy Trinity, Reading, by Mr. G. W. Webb, is but poor and commonplace as an example of Early English 19th-century church building. Mr. Leonard Stokes, unlike the last, at all risks intends to be original, and his sketch design for the circular Church of Corpus Christi Priory, Manchester, deserves this description. Lofty pointed arched windows light the interior all round, and below these is a dwarf arcade massively treated, while above there is a semicircular wall arcading, serving as a kind of frieze in effect, below the flat segment-curved ceiling, or dome, which is enriched with plaster ornamentation in low relief. An apse for the high altar is placed facing the entrance wing, and there are chapels on either side of the chancel. Another Roman Catholic church is St. Luke's, Richmond, by Messrs. Goldie, Child, and Goldie, who show likewise St. Mary's Chapel, Mill Hill. No. 6, Carlton House Terrace (staircase and hall), by Messrs. Ernest George and Peto, shows a work limited evidently by the uncompromising lines of the existing interior which these architects have endeavoured to recast and modify. The coffered ceiling is uninteresting, and the cornice is of poor form and scale. The chimney piece seems to be a less fettered performance, and it is characteristic of Mr. George's clever pencil. Boys holding swags have, however, been introduced before in similar works, as at Craigside, by Mr. Norman Shaw, where we saw them dividing the frieze: here they stand on the face of the hooded mantel. The new organ case, filling two arches over the stalls of St. John's College

Chapel, Cambridge, is a richly-treated good piece of work by Mr. John Oldrid Scott, and another instance of unaffected and suitable design is shown by Mr. J. Belcher in the little stable buildings at Holcombe, Chatham. Mr. Gerald Horsley's Academy study for a County Museum and Institute is broadly treated, and very clever; but Mr. Wm. Alford's prize design of a like subject, published by us March 9, 1888, was somewhat similar in idea. The Gamekeeper's Lodge, Sidbury, by Mr. W. F. Cave; a Royal Yacht Club House, Hunter's Quay, Scotland, by Messrs. John Burnet, Son, and Campbell; and a house near Hampton Court, by Mr. T. P. Figgis, are all simple and effective examples of Domestic work. Mr. T. Garner exhibits his first design for the Reredos of St. Paul's Cathedral, without the wings or side screens. Blue Hart-court Offices, by Mr. Basil Champneys, show an odd piece of design with a florid turret at the corner, and a high-shouldered upper floor with Mansard roofs. The Church of Our Lady and the English Martyrs, Cambridge, is exhibited by Messrs. Dunn, Hansom, and Dunn, of Newcastle. This interior illustrates the choir and crossing of this grand church looking into the apse, which is groined, having interlacing ribs boldly treated with massively-carved bosses. A gabled baldachin incloses the high altar, and rich screens divide off the aisles. Northington Church, by Mr. T. G. Jackson, M.A., is a further notable specimen of ecclesiastical building designed in strict accord with the spirit of true Gothic work. Here the apse is in English work of Late type, with a vestry under the choir. The tower is square, and fashioned after the Somersetshire model. We illustrated it last year (*BUILDING NEWS*, Feb. 1, 1889). Mr. F. M. Simpson and Mr. T. Garratt send two staircases—the first from Renishaw Hall, Derbyshire, and the second from a house at Windsor; but fate has relegated the frames to such a height as to be quite beyond the range of inspection. No doubt both are equally clever. Trinity Hall, Cambridge, by Messrs. Grayson and Ould, is represented by a capital drawing showing two views of the new buildings, now in course of construction. The Tudor-treated cusped windows of the projecting oriels combine with the simple gables very prettily, and the Renaissance-like doorways give piquancy to the general composition. We miss Mr. John Douglas's work this year in this gallery. The new Salisbury Estate Hotel which Messrs. Tavenor Perry and Reed are erecting on the commanding site near the Savoy overlooking the Thames Embankment (1781), is represented by a pen-and-ink view drawn by Mr. Perry. The bold proportions of this work will crush the scale of the iron colonnades of the Savoy Hotel adjoining, which already begins to look like a toy by the side of it. As to the Medical Examination Buildings, they always did look poor, characterless, and paltry. The Church of the Sacred Heart at Wimbledon, by Mr. Fredk. A. Waters, has a bold and lofty Late Decorated interior, with a German-Gothic sort of baldacchino over the altar, and a curiously cusped rood and beam, overdone in detail and very heavy looking. Mr. James Cubitt sends a view from the rear, illustrating Union Chapel tower and spire, Islington, as completed last year—a work of much merit. The Central Library, Chelsea, by Mr. J. M. Brydon, is a common-sense building well planned, and won in competition. We illustrated it when the award was made (see *BUILDING NEWS*, June 7th, 1889). Armagh Cathedral is represented by Messrs. Carpenter and Ingelow, showing the interior from the high-altar steps looking west. The work is archæologically rendered without offence to good taste; but its lack of interest is self-evident. The Hall, Shiplake Court, by Messrs. George and Peto, hangs near, drawn in brown outline, showing an open-timbered

massive roof over a stone faced interior, designed in an Old English manner, calling to memory such old places as Penshurst, Kent. Brasenose College Building, Oxford, by Mr. T. G. Jackson, M.A., has some remarkably good detail about it, and here we have in No. 1794 a thoroughly good working drawing, showing one bay of the new front drawn in sepia, with a plan below the elevation. The crisply-treated carving of Tudor character over the oriel bay-window is especially worthy of note, and as a good piece of architectural drawing we commend this exhibit to student readers. The Interior of Halifax Cathedral, Nova Scotia, by Mr. Arthur E. Street, M.A., is not done justice to in his dull grey water-colour perspective. The style is pure; but if this view is correctly delineated the proportions surely must be unfortunate; at any rate, they look so. His other frame of drawings comprise new Infant Schools, St. James-the-Less, Westminster; the Thring Memorial Chapel, Uppingham; and the Guest House, St. Margaret's, E. Grinstead. Of Domestic work grouped round these last-mentioned subjects, we may name a fancy sketch of an entrance to an old house, by Mr. C. E. Mallows (1808); a house at Weybridge, by Mr. Ernest Newton, which is quiet and simple; and additions to Broxwood Court, Hereford, by Mr. Stokes, whose drawing makes too much of the gardens, leaving the house as a minor feature in the picture. The Junior Constitutional Club, Piccadilly, follows the delicately elaborated Renaissance mode adopted in some of the later works from the hand of the architect, Col. R. W. Edis, F.S.A. The façade is distinguished by three large bay windows and gables marking the skyline over them, with dormers ranging between. On the ground-floor additional richness is secured by the introduction of marble columns at the angles of these bays. The detail is refined, and the building will look like a first-class club-house. Next to it is Mr. Francis W. Bedford's prize school design, illustrated in our pages for March 7 last, "Sauchieburn," a big mansion in Stirlingshire, by Messrs. Sydney Mitchell and Wilson, is a work of some importance in the Scotch Baronial style; but the drawing is too high for careful study. Messrs. Ernest George and Peto's chief work shown this year is a country house called "Poles," Herts, for Mr. E. S. Hanbury, shown by a washed drawing in sepia. The building is sternly plain, with lofty projecting oriels running up to the eaves and dividing the front, with some Dutch-like gables interspersed. The composition is distinctly the work of a capable artist, and if not very fresh in manner, it is eminently picturesque and worthy of Mr. Ernest George's undoubted ability. Another good, well-balanced house is Barnsdale Hill, Rutlandshire, by Mr. E. J. May, who sends a roughly-drawn pencil-and-red-chalk sketch of the garden front. Mr. Beresford Pite's Marylebone Dispensary in Welbeck-street, shown by a sloppy water-colour drawing, is also worthy of commendation, though the bays do not harmonise in the least with the upper part, and the turret over seems equally out of place. St. Swithun's, Hither Green, Kent, by Mr. E. Newton, we published last year (Aug. 16th, 1889), and we likewise gave (Aug. 9th, 1889) the Valley of Rocks Hotel, Lynton, North Devon, by Mr. Rowland Plumble. Both are exhibited here. Hertford College, New Hall, Oxford, by Mr. T. G. Jackson, M.A., is here represented by a view of the staircase tower, built in stone, with raking windows following the internal arrangement. Mr. E. W. Mountford's East-end Mission House is a capital piece of plain Gothic work cleverly treated, with a squat tower and an external pulpit giving interest to the main front. An Irvingite Church is proposed to be built in Westminster, and Mr. J. Belcher has made a queer design for it in a truly

"Late and flat" style, of the type made familiar by St. Dunstan's, Fleet-street. The plan is octagonal, covered with a flattened dome, round which squat, thin dormers are ranged, filled with bald traceried lights. The four-centred arches supporting the lantern are very ugly, and the whole thing, we must confess, is beyond our comprehension from the hand of such a man as the author of this design. The altar is situated at the street end of the site, with the entrances to the right of it. The organ is on the left side, set square in the corner, under one bay of the octagon. Hereabouts there are several excellent studies of old work, amongst which we may mention Mr. H. Wilson's Church of St. Wulfran, Abbeville; the Bishop's Door, Lincoln, by Mr. John Begg; the Meat Market, Ypres, by Mr. A. E. Perkins; a Norman Doorway, Glastonbury, by Mr. A. B. Bamford; Lichfield Cathedral, West Front, by Mr. A. B. Mitchell; and Mr. J. Langham's sketch, which we gave last week, of the Inner Court, Hoghton Tower. The Garden Front Central Entrance of Hatfield House, by Mr. Maurice B. Adams, hangs next to it in the centre of the room. The British and Foreign Marine Insurance Offices, Liverpool, by Messrs. Grayson and Ould, are solid and rich, well-treated examples of street architecture, and the same may be said of Mr. J. L. Watson's clever building for the *Glasgow Evening Citizen*. Barnwell Castle, an ugly old house in Northamptonshire (1858), is shown here, with some additions by Messrs. Gotch and Saunders; but the original building is unworthy of the enlargements, which are in good taste. The Mappin Art Gallery, by Messrs. Flockton and Gibbs, hangs near, below Messrs. Somers Clarke and Micklethwaite's monumental design for the Church House, a work in true English Gothic, of grand proportions, almost too cathedral-like in scale. A square tower emphasises the entrance. Mr. T. E. Colcutt sends but one drawing, some New Music Premises in Wigmore-street, W. The recessed treatment of the first-floor windows in a sort of loggia gives an interest to the façade. The great gable is characteristic, and the round arches are so managed as to harmonise with the Renaissance style which this architect has skilfully made his own. Mr. Edward S. Prior, M.A., has gone out of his way to design a veritably ugly music-room for Harrow School in a red-brick Georgian sort of building. Nothing could be worse at the instance of a clever man than this. Fancy the vast mass of bald, heavy brickwork of the canted end carried up into a bastard gable, only supported by thin piers between the big windows at the back of the orchestra! Then imagine the flood of light coming from behind the performers right into the faces of the audience, with nothing, too, to reflect the sound but glass! What could be worse every way? The building is hideous enough in all conscience. Broughton Baths, Manchester, illustrated by us a week or two since, are shown by Messrs. Mangnall and Littlewoods, and Claybury Asylum by Mr. G. T. Hine, both utilitarian buildings. The Leeds and County Liberal Club, by Messrs. Chorley and Connon, is a creditable example of commercial architecture sensibly worked out, and the Hotel Scheveningen, by Mr. T. W. Aldwinckle, is a striking instance of a modern building illustrating the old methods of the Belgian brick style with Dutch features cleverly introduced in the main gable and tower. Mr. Somers Clarke's "Reid's Hotel," Madeira, is as simple as it is quite suitable for its site. We illustrated it in the *BUILDING NEWS* for Jan. 3rd last from this same admirable drawing. Messrs. Wimperis and Arber, still busy in adding to the architecture of West London, send a view of a block of premises in Davies-street, Berkeley-square. The Great Organ in the Library, Blenheim Palace, is a Classical treatment of

a vast instrument, by Messrs. Romaine-Walker and Tanner, and another fine organ is also shown from Paignton Parish Church, by Mr. A. Mardon Mowbray. Livesay Hall, Lancashire, is a simple old house, well drawn by Mr. H. Harrington, and Crosscombe Church is shown from a sketch by Mr. T. MacLaren. Mr. Sedding sends a view, in colour, of the Sanctuary of Holy Trinity, Chelsea, very mixed in style, including the florid Rococo. St. Catherine's Church, Melincryddan, is a small Welsh building with a timber arcade, by Messrs. J. P. Seddon and Coates Carter; the latter also contributes All Saints, Moda, Constantinople. Normanton-on-Soar Church has lately been enlarged by Mr. W. S. Weatherley, who has sent a good drawing of the building, and Mr. Ernest Turner exhibits some schools at Herne Bay. Mr. H. W. Brewer's pencil sketches from Germany are always good. Mr. Caroe's buildings in Duke-street, Grosvenor-square, will give great interest to that thoroughfare. Higher Coombe, by Mr. Fredk. Banister, is a good house, illustrated by us last year. We have no room left now to name others, and the rejected designs for Sheffield Municipal Buildings call for no special remark. Most of them are very poor, hybrid attempts at design, and deserved their fate.

#### THE PICTURES AT THE ROYAL ACADEMY.

[SECOND NOTICE.]

WE did very scant justice to the merits of the first two galleries, and we must repair our omission by singling out two or three pictures overlooked in our notice last week. Sir J. E. Millais has once more thrown his efforts into his long-loved branch of painting—landscape. Last year we had "Murthly Water" and "The Old Garden," both engaging pictures, and this time the forest scene, "The Moon is Up and yet it is Not Night" (25), suggests a hearkening back to the earlier sympathies of the painter. The margin of a forest, sparsely wooded with thicket and undergrowth, is painted in the poetic vein in a monochrome of brown. The illumined sky casts a hazy and silvery tone over the forest. Venetian colour and light are charmingly rendered in Henry Wood's "On the Riva of the Giudecca" (49); and much tenderness and beauty of expression and colour are shown in O. E. Perugini's Italian love-making scene. J. C. Dollman (69) selects a less humorous subject than usual. His study, "Polo," represents the horsemen in the game. Considerable adroitness in the players has been depicted by the painter; the horses are, it is needless to say, well drawn, and the subject is cleverly handled. J. T. Nettleship's painful but powerfully painted work "The Abyss" (110), in which a lion, firmly clutching the back of his victim, is leaping a rock, has little to attract us. Marie J. Naylor paints her own portrait, the grey tone and light draped background of which are pleasing. Andrew C. Gow's large picture, "After Waterloo" (123), is a clever painting of retreating but disordered troops, foot and cavalry. The Chasseurs mounted, the pallid countenance of Napoleon, who rides in the midst, the trampling under foot of wounded soldiers, the miry road, and other incidents are painted with much dramatic power and skill.

Gallery III., in which we have only noticed two or three of the leading pictures, contains little that need detain us very long. The green foreground and red, glowing sunset in "Departing Day" (190), in the corner of the gallery, arrests attention for its strength and vivid contrasts. Peter Graham, R.A., is a powerful painter of mountain scenery. His "mist-robed mountain" reflecting the fiery glow of the setting sun is remarkably strong in colour; the dark purple valley and

mists which hang about the heights intensify the rose tint of the reflected light. In a very different key of colour is Kenneth Mackenzie's "Wind-Swept Hill," already noticed. High in a central position, over Frank Dicksee's legendary composition, is Rob Sauber's work, "The Golden Lure" (202). The idea is, of course, symbolically treated. "Ambition" stands on a huge bubble; her laurel wreath falls, while she holds a crown of gold high above her head. The treatment of the subject is decorative, the dark, neutral colouring setting off the attenuated figure of Ambition. The effect is rather that of *tour de force*. The glare on the picture, which is hung high, prevents the visitor from seeing the clutching hands which appear above the golden circlet. "Low Tide" (215), by Peter Graham, is less satisfactory than his picture just mentioned, though it is fresh in colour. No. 242, "The Picardy Dunes," by H. W. B. Davis, is a skilful painting of sunlight on undulating sandhills, realistically treated. As a forcible study of colour, W. T. Dannat's lady in a red dress may be noticed, while, further on, W. Llewellyn has a portrait of Miss Hyacinthe Scott-Kerr (251) in canary costume graceful in pose. "La Promessa Sposa" (278), a cleverly-grouped figure subject of Venetian girls, one of them showing her wedding-ring, is full of colour and brilliancy. In subdued tone Claude Calthrop has a family group (269). J. C. Horsley's "Finishing Touches," a lady in scarlet brocade at her toilet, is garish and lacks repose. Minute execution and brilliancy in a low key of colour characterise T. Sydney Cooper's picture, "A Morning in October," a landscape recalling the work of the older school. Thomas Faed's "Highland Tramp" (285) is forcible, the figures of tramp and his wife admirable in expression and true to life. "Louis XI." is an incident which J. Seymour Lucas tells with much dramatic skill. The King, seated near the spacious fireplace of a cottage interior, is watching, apparently with interest, the child which clings to its mother; the father is engaged at the fire, preparing a meal. The accessories and furniture are carefully studied, the tone and colour pleasing. P. R. Morris's "La Belle Americaine" (292), a full-length portrait of a lady in lavender colour satin, is only of interest as a study of costume; the sheen on the dress and the rich hair are dexterously painted. Another lady, the wife of F. Goodall, R.A., attired in black silk with red moire and green background, is a graceful and dignified figure. Near it J. Pettie, R.A., has a picturesque subject—two young ladies in the 18th century costume, merrily tripping down a country lane gay with the blossoms of hedgerows, a young beau following behind. Fine tone and hazy light characterise T. W. Allen's landscape or common, "When Morn is Grey" (308), the reflection in pool and atmosphere rendered with all the delicacy and poetic charm of a true student of nature. Anna Nordgren's "Grey Day at Newlyn" (311) is also cleverly handled and powerful in tone. Fresh colour of sea and fisher-girl life in the early morning on the Cornish coast, with girls dressing fish, is the subject which J. C. Hook has so felicitously painted in "Breakfasts for the Porth" (317). P. H. Calderon, R.A., has been happy in his scene from Gen. xvi. 6 and 7, where Hagar crouches by a rock in the wilderness, fleeing from the face of her mistress, Sarai. The eyes are full of expression and beauty. J. R. Burgess's "Freedom of the Press," representing a young student reading a newspaper to an old priest who holds up his hands in pious amazement, shocked at what he hears, is a diploma work of interest. W. Q. Orchardson has also a diploma study of his daughter (328), a young girl near the edge of a cliff facing the sea, delightful in drawing and delicate tones of pale reds and green. The breeze from behind is

cleverly expressed in the figure and draperies. The portraits of W. W. Oulless, R.A., of the Bishop of Chichester and Mrs. North, of Mrs. Agnew, by Luke Fildes, R.A., and of Major Burke, by Hubert Herkomer, are good examples of portraiture.

Viewed as the *pièce de résistance* of the artistic effort of the year, the large gallery is somewhat disappointing. There is no one great composition. Sir F. Leighton's "Psyche," though beautiful in drawing and colour, can scarcely compare with his last year's "Greek Girls Playing at Ball," and Mr. Alma-Tadema's "Frigidarium" is more archaeological and descriptive than imaginative. Only in the setting and surroundings do we find any original treatment, but here scholarship has been portrayed with the resources and skill that the painter can bring to his work. We can marvel at the beauty of form of draperies, the subtle colour and gradation of light and tone, the handling of textures and reflection of marbles found in these classical and Græco-Roman studies, with the consummate power of harmonising colours, but they are not works of great invention, nor do they appeal to human sympathies. Mr. Frank Dicksee's romantic subject, "The Redemption of Tannhäuser," is more touching, it strikes a chord in the heart; just as in another way Mr. Orchardson's great picture of "The Young Duke" did last year. But on the whole we must look to the thrilling seafaring themes of Mr. Brangwyn, and the landscapes of A. D. Peppercorn, J. W. Allen, J. MacWhirter, and Vicat Cole, and the sea pieces of J. C. Hook and Henry Moore for the strength of this gallery.

In Gallery IV. the first picture that attracts the eye is Val C. Prinsep's scholarly work, "Diva Theodora Imperatrix, Empress and Comedian" (346). As a study of beautiful faces, rich jewels, and costume, this picture has merit of a high order. The empress has a majestic and dignified look, and wears a jewelled tiara and a bracelet of pearls and jewels, and rests one hand on a bronze lion. Behind stand her maids of honour, while in the background is introduced a saint surrounded by an aureole of apostles and martyrs. The treatment is allegorical and decorative. "Sea Breezes," by Julius Olsson (360), is one of the few impressionistic studies of sea and cloud; the reflection and atmosphere are luminous. F. Goodall's fine landscape, "The Thames from Windsor Castle" (366), the glimmering river like a streak of silver meandering through the distant meadows as seen from a parapet; and Vicat Cole's view of "The Thames at Greenwich," taken from the Park, overlooking the busy river, with its crowd of craft, the masts of the vessels and the *Dreadnought*, with St. Paul's in the distance—are noble examples of the English school of landscape. In the last-named the perspective and the drawing of the hospital, with its wings and palatial features, have been painted with care. A fine sense of colour and gradation of tone pervades the picture. The foreground, with its rich greens and undulating pastures and foliage of chestnuts, gives distance to the river and its grey mist and smoke, which melt into the horizon. Another powerful work is Cecil L. Burns', "The Acre of the Poor" (365), a large canvas representing the waste green at the margin of a country roadside, in the long grass and bushes of which children are playing. Nor in the category of impressive painting that is stirring and pathetic can we omit G. H. Boughton's very touching incident recorded on his large canvas, "The Puritans' First Winter in New England—Watching for the *Fortune Relief Ship*" (396), where two figures, an aged mother and her daughter, are walking on the snowy beach and rocks, within sight of the sea, and another group crouched in a natural hollow are waiting for the relief ship to

bring them provisions. The grey landscape in a low key of colour, the frosty clearness over the scene, are in sympathy with the theme. Colin Hunter's "Hills of Morven" (384), a range of purple hills with the reflection of the evening sky on the waters of silvery hue, its desolation relieved only by the seals on the islets (384); and Charles W. Eaton's "Autumnal Moon," a delightfully soft light through a wood, are two finely-painted subjects. John R. Reid is extremely natural in "The Waterman's Wife" (413); and the same mood of thought and feeling finds utterance in G. F. Watt's nobly sympathetic picture of an old white horse standing against a thick hedgerow. Almost pre-Raphaelite is the detail of leaves and stems, and the conception, simplicity, and handling of the horse suggest the title which Mr. Watts has put to his picture, "A Patient Life of Unrewarded Toil." Sidney S. Morrish (420) has a charming Lynton-like cliff and blue sea, "The Haven under the Hill." John S. Sargent's work (421), a lady in bright mauve satin holding up the folds of her dress, and the delicate steel-colour and white satin in Harry Baldry's portrait of "The Lady Carew" (385), are noticeable examples of portraiture.

A few pictures are worthy of record in Gallery V. B. W. Leader has a fine subject, "Where Sea and River Meet" (458); F. W. Jackson a cleverly-handled landscape (481). John Brett's "Echoes of a Far-off Storm" is a splendid study of a rocky coast in which the stratification is marked; a sandy beach with pools of water are in the foreground; bright and pearly hues pervade the coast, but there is a little hardness in the handling. "Oliver Twist's Walk to London," by James Sant, is a clever pictorial rendering of Dickens's narrative. The little hero looks thin and wan, carrying his bundle along the stony road through a common, a grey mist enveloping the landscape and the flock of sheep which fill up the scene. There is pathos in the treatment, hope and fear written in the face of the poor workhouse lad as he trudges along alone. Albert Moore, in a "Summer Night" (487), is in a decorative scheme and key of colour—a symphony in yellow and grey. Under a loggia adorned by festoons of pale primroses, and facing a moonlit sea, five maidens, half-clad with diaphanous yellow draperies, recline on orange-coloured couches, the figures being set off by the grey moonlit sea of leaden hue. The harmony is indeed a rather trying one, and one figure doubtful in drawing. A pleasing landscape or valley scene, dark blue in tone, a shining river pursuing its winding course through undulating pastures, is by William Pye (494), "The Valley of the Suir." Henry Moore's "Yarmouth" is in delicate silvery tone, and a lovely autumnal wood, with deer, is (491) by Frederic S. Richardson.

The next gallery, VI., has one great picture, "The Death of Cleopatra," by Hon. John Collier. This colossal canvas must be regarded as an archaeological triumph. The Egyptian Queen, who, according to tradition, was stung to death by an asp, lies on a bier of the correct type, clad in white, her faithful Charmian at her head. Prostrate across the marble steps lies Iras, who has also met a similar fate. In the background are colossal sitting deities in black granite, and the massive columns of the court or mausoleum. The work is masterly, and the materials and texture skilfully handled.

We have only space to notice the finely-painted blue sea and cloud study by Henry Moore (544), the grand river-scene in the Highlands, with its winding river and fir-clad hillside (562), by Joseph Farquharson, Arthur S. Nowell's glowing red lake scene, "Lucerne," with its sky reflection (554); Frank Walton's landscape and solitary tree, full of pathetic power (539); C. Martin

Hardie's "Unrecorded Coronation" (599), poetical in sentiment; Norman Garston's clever picture, "A Stranger" (543). A sombre powerful picture is that of John M. Swan, "A Lioness defending her Cubs" (614); and some nice sentiment is seen in E. King's "Prayer." A. Roche's "Shepherdess" (625), and the fine luminous work of Fred. G. Cotman, "Where the Stour and Avon Meet."

The 7th Gallery contains but a few notable works. John R. Reid's fresh fishing village, with boy sailing a small toy boat; Frank W. Topham's admirably-painted "In the Month of Mary" (665), a May Communion, a bevy of girls clad in white, with the Sister, preparing for the celebration under the portico of a church, a blue lake seen between the columns; B. W. Leader's very fine landscape, with its foreground of weeds and thistles—cottages and firs standing out against the evening sky, "The Silent Evening Hour"; Walter Schröder's impressionistic work, "At Break of Day" (681); and not least, the powerful work of Dudley Hardy, "The Dock Strike, 1889," with its motley crowd of labourers listening to a speaker on a grey damp morning (671) are the only pictures of merit; though commonplace incident and some ridiculous portraits abound. Of these, the gaudy portrait of a child (694), and some inharmonious colour (707 and No. 694) may be mentioned.

#### THE GROSVENOR GALLERY.

COMPARING the pictures of the Royal Academy with those of the Grosvenor Gallery, which had their private views on the same day, the critical visitor will be inclined to accord to the latter a stronger personality and freshness of treatment. The new school is more pronounced in the smaller collection; commonplace subjects which find room on the walls of the Academy are fewer in number in the New Bond-street exhibition—a circumstance which itself gives to the latter additional interest. Impressionism is represented by the works of Stanhope A. Forbes, W. Estall, Mark Fisher, W. Stott, H. Muhrman, James Guthrie, and others. Stanhope A. Forbes's "The Road from a Market Town" is a delightful piece of subdued colour. The shadowless, grey reflected light over the village nestling under a hill, with the groups of villagers and boy leading a heifer, are natural and full of sentiment. "Down by the Brook," by W. Estall (9), is equally tender in its fresh cool greens and light of spring, and the cows under the shadow of tree. Mark Fisher's "Orchard" (10) is bright in the strong sunlight which gleams through the young trees, nor need we say the anatomical knowledge in the drawing of cows is unsurpassed. In landscape, too, the "Rush Gathering" of Miss Dora Noyes is a charming piece of colour and drawing. A fine twilight effect of harvesters at work is by Henry Muhrman, whose technique and "loading" are singularly powerful. Mellow and silvery in tone is the "Evening Landscape" (35) by the same author, who delights in the sombre effects of landscape and masses of foliage as seen under the shades of evening. In the same class James Guthrie's "Pastoral" must be described. "Soft Winds," by William Stott, of Oldham, unfavourably presents the weaker qualities of the impressionist school, the bay, or lake, represented by what looks like first washes of colour, has a thin, unfinished effect. Some pleasing portraits and figure subjects are to be noticed in passing, as W. Llewellyn's "Netta" (8), a child in white satin, with a yellow daffodil in her hand, against a tapestry hanging; J. J. Shannon's portrait of a little girl in white, with a doll carelessly hanging by her side (15), and a dark curtain background; W. R. Symonds'

"Queen of the May," symbolical of spring, a prettily-treated figure of a girl, with floral emblems set off by light-green foliage. Edward E. Simmons's "Youth and Age" (31) an old man with child asleep on his lap, the light through cottage window, tender in sentiment and solidly painted. W. Q. Orchardson's portrait of himself at easel in a loose coat of light yellowish brown, in the same rich mellow colour which we see in his pictures, is characteristic and clear. Frank Brangwyn has a masterly water-colour picture of a group of old sailors, one of their number reading a newspaper (45). The painter's acquaintance with the habits and manners of life by the seaside is shown in every figure and face, and he excites our sympathy with their eagerness to know how the world is going. The picture is lifelike and realistic, the open sea and vessels lying at anchor forming an appropriate background. Mr. Brangwyn is as dexterous in water-colour as he is in oils. There is a touching incident by G. E. Harris (46): a sailor looking through casement of his cottage at wife and child in her arms bidding them "good-bye." The child holds out his little arms, but the mother is sad; on a neat little table lie the remains of the breakfast. No finer figure subject can be seen than George Clausen's "Girl at the Gate" (51), a luminous study of a country peasant girl standing resting one hand on the garden fence. The girl's face, which catches the light which is upon her, is not one of those very pretty, sentimental-looking faces found in pictures, but intensely real and natural. The face is that of an everyday working country girl, its very fidelity and life-like expression exciting our sympathy. The dress of light blue, the cottage, and the management of the light are all in keeping. John R. Reid is also a painter-poet of work-o'-day life, like Mr. Clausen, neither indulging in fairyland nor classical legend; he paints the ordinary folk of humble harbours and fishing villages. Let us look, for instance, at his "Trial Trip"—two sailor-lads watching their little toy-boat on the beach. The village and smacks are most cleverly painted, strong in colour, and vigorous in handling; or at the "Coastguard Garden" (64), "Ploughing" next blue sea, "A Busy Quay" (126), and the "Washing Day" (164)—a village with groups of women gossips on the beach—all thoroughly naturalistic in tone and handling. In these subject studies we see no effort to paint symphonies of colour, but the duties and toils of daily life in all their strength and directness. These painters, like George Eliot in her novels, excite our sympathy and admiration for the everyday life in the field, the workshop, or the home, and their pictures are true in this sense. A. Hartley's "Toilers of the Shore" (26) is large and luminous in the reflected light in the shallow waves. "Mary Queen of Scots in the Woods of Rosneath" (41), by I. Lavery, is cleverly painted, dramatic in the incident; the painter has by the dark shadows and handling of the wood given interest to the subject. The early morning light, the smoke which curls through the air from the dying embers of a camp-fire, all throw a spell over the figures of the hapless Queen and her sleeping attendant. Delicate handling and tone is found in James E. Grace's woodland scene (56), also in J. Olson's landscape (50); the spring green and yellow meadow under the cloudy, grey sky is well painted in David Murray's "Doubtful Crop"; we must pay a tribute also to A. Stuart Wortley's portraits, "The Love Birds" (3) and "Lady Hastings," both gracefully painted. Henry Moore's "Sand-laden Surf" (63), with its silvery tone, leads us to John M. Swan's sensational picture of a lioness with her cubs, entitled "Maternity," which occupies the centre position on the long wall. The desolation of the desert and the reposing lioness are

powerfully painted; but the subject is too powerful to meet all tastes; still, it is a noble animal study. "Dimanche des Rameaux" is a pretty study of a French peasant girl with her palm branch, which she devoutly carries in front of her—an incident of Palm Sunday. Henry J. Hudson, seated portrait of a lady in browns and reds, set off by a leopard fur, "Lustra"; J. J. Shannon's full-length portrait of Miss Leach (74), in black, are works of merit; but we pass them to notice A. D. Peppercorn's "Cornfield" (73), and Adrian Stokes's "Breakers," a piece of sea-painting of the impressionistic kind, and the nice broad tone in Claude Haye's "A Scene in Surrey" (81); Mrs. Marianne Stoke's "Light of Light" (82), with its strong sunlight reflection on the face of Mary, tenderly watching over the infant Jesus, is cleverly handled. Sir Coutts Lindsay, in his large, ambitious subject, "The Vision of Endymion" (102), representing the shepherd asleep on Mount Latmos, with Diana as a vision above him, has attempted a difficult theme: the colouring is rather cold, and the treatment naturalistic. A little more strength of colour in the foreground would have given more balance of tone to the design, which is clever and graceful. Tom Graham's powerfully-painted sea piece, "The Last Boat," a stormy evening, and a heavy surf breaking over the jetty, will draw attention by its bold, vigorous handling. Above is W. J. Laidlay's large and disconsolate scene, "A Long and Last Farewell" (93), an old man bidding farewell to a young girl. The seaward distance, and the expression and attitude of the figures, convey the hopeless and sorrowing nature of the scene. A cabinet figure study of a Louis Seize drawing-room, by D. T. White, "The Minuet," has nice colour. A large and remarkable canvas, 109, "Audrey and her Goats," by Arthur Melville, A.R.S.A., hangs at one corner of gallery. Mr. Melville is an impressionist of the boldest school. His solid colouring in flat and glowing touches, presenting to the eye blotches of green and copper-red foliage, one must accept with reservation. The subject is from Shakespeare's "As You Like It," scene 3, and represents Audrey with her goats. We can merely look at John Pettie's finished sketch of "The Traitor," well known to admirers of his work—pearly in its hues and tone; Miss Catherine Wood's rich "Wallflowers," H. Fantin-Latour's "Marguerites," Sir William Fettes Douglas' "Stonehaven" (139)—a bird's-eye view, excellent in colour and distance; and Miss Merrick's fine portrait of the African Explorer (140), which attracts much attention.

In the East Gallery, Ernest Parton's "Misty Morn," a graceful and delicate study of woodland and silver birch, and Denny Sadler's "First of September," an old inn parlour with two old cronies and a young sportsman with the spoils of the day's shooting, preparing a punch bowl (149), are noticeable, the latter for its thoroughness and minute detail. Overpowering in its size and colour is Sir Arthur Clay's "Court of Criminal Appeal," the judges in their judicial robes, painted, no doubt, by commission. There is an official ring about it. J. Haynes Williams paints a lady in satin evening dress in her dressing-room finishing her toilet, her maid-servant tying her satin sandal. It is dainty and delicate—that is all. James Paterson's moonlit landscape, John Reid's "Washing Day," old Dutch in style, Arthur Hooker's portrait of a lady in rich attire (159), C. Napier Hemy's large luminous picture of "Oporto" (174), with its river and craft, are striking. Clever gleams of light on common and trees are shown by David Murray in his "Evening" (181); Keesley Halswelle's fine, silvery-toned "Early Moonrise, Venice" (186); Gunning King's figure-subject (182); James Guthrie's "Orchard" (195), sombre

in colouring, but full of sentiment; and W. Stott's "Diana, Twilight, and Dawn," a shadowless green landscape in which three nude figures are reposing in somewhat strange attitudes, are works of interest. In the vestibule, R. H. Carter (239) paints a beach with a shoal of fish entitled "A Silver Mist Melting in Softest Light" in which the painter has harmonised the hazy suffused light of an early summer morning with the glistening fish. Hubert Vos has a large picture of a "Room in a Brussels Almshouse" (248), which we remember. The strange work of George Henry and E. A. Hornel (173) looks like a study for a tapestry design; it is clever as a picture of Druidical costume and colour. The other rooms contain several good works by J. MacWhirter, A.R.A.; W. L. Wyllie, A.R.A.; Hamilton MacAllum (269), Edwin Hayes, J. M. Macintosh, J. Orrock, David Green, Nelson Dawson—the latter fresh and pure studies of sea. Descending the stairs, one sees a highly-modelled and very realistic picture of two little girls, the daughters of F. St. Barbe Sladen (381), by H. de T. Glazebrook, conversing on a staircase, the young ladies in red frocks and black silk hose, the light and shade very cleverly managed, the figures, red carpeted staircase, and perspective dexterously handled to produce an illusive reality.

#### ARCHITECTURAL ASSOCIATION.

AN ordinary meeting of the Association was held on Friday evening, the President, Mr. Leonard Stokes, in the chair.

#### VOTING REFORMS.

The nominations of officers and committee having been read, and some fresh names announced,

Mr. A. O. COLLARD raised the question of the numeration of votes, urging that the existing system of counting the votes during the closing meeting of the session was becoming unworkable in the present large increase of members. He moved that they be counted before the meeting, and announced early in the proceedings. Further, as a scrutineer in earlier years, he failed to understand the reason for announcing alphabetically the names of those elected on the committee, and thought, in fairness to the general body of members, the number of votes for each name should be published—a suggestion which evoked warm applause, and cries of "No, no."

Mr. F. R. FARROW seconded both propositions.

Mr. C. H. BRODIE and Mr. OWEN FLEMING, while supporting the first part of the proposal, for changing the time of voting, objected to announcing the position of each name on the voting list as invidious.

The PRESIDENT suggested that it might be sufficient to announce the names in order of voting; the man who had 1,000 votes recorded in his favour might approve of publication; but it might be even injurious to the candidate who received, say, two votes.

Mr. COLLARD: The votes are always pretty close, and never, I believe, fell to so absurd a figure as two.

The PRESIDENT: At the last election 17 votes were recorded for the name last on the list.

Mr. COLLARD: Quite enough, too, for some candidates. (Laughter.)

Mr. F. J. BAGGALLAY demurred to the President's suggested middle course, and thought the numbers should be given.

The propositions having been seconded, the first, for the counting previously to the meeting, was carried unanimously, and Messrs. E. D. Webb, C. H. Brodie, F. Galsworthy, and E. H. Parkes, with the secretaries, F. R. Farrow and E. S. Gale, were appointed scrutineers. The second portion, that the number of votes be published, was then put and carried by a majority of about five to one.

#### THE PROPOSED ARCHITECTURAL STUDIO.

Mr. FARROW announced that at the meeting to be held that day fortnight, the 16th inst., the report of the committee appointed to inquire into the educational methods of the Association would

be brought forward, and consequent thereon a proposal to alter certain rules would be submitted.

#### HOSPITALS.

Mr. KEITH D. YOUNG read a paper on this subject, illustrated by plans and photographs. A hospital, said the lecturer, is primarily a building devoted to the care and treatment of the sick and injured poor; in its secondary, and scarcely less important function, it is a training-school for the teaching of medicine and surgery. In order that both these functions may be performed to the best advantage, it is necessary that large numbers of patients should be brought together in one building—for the task of administering one hospital for 300 beds is far easier and less costly than that of administering ten hospitals for thirty beds each; and for teaching purposes the larger the amount of material the better both for teachers and students. It is the contamination of the air of the ward which retards or prevents the recovery of the patients. This contamination of air may be accomplished in several ways: it may either be by overcrowding of patients in the wards, by imperfect ventilation, by improper arrangement of buildings, by defective drainage, or by defective keeping or maladministration. Having referred to the excessive mortality in ill-managed hospitals, as for instance, in the old Hôtel Dieu at Paris and the temporary hospital at Scutari during the Crimean war, Mr. Young added: The vital importance of cleanliness cannot be too strongly insisted upon. Cleanliness supreme and all-pervading, cleanliness of air, of soil, of building, is the key-note of every point of good hospital construction and administration. In considering the principles which should guide us in the planning of a hospital, the first question to be determined, assuming that the number of patients and staff and the necessary classification has been settled, is the position of the various buildings in relation one to another. There must be in every general hospital at least five separate departments:—1. The administration, which comprises all the purely official and domestic parts; 2, the nurses' quarters; 3, the wards; 4, the out-patient department; and 5, the mortuary. In many important hospitals of recent date these have been again subdivided, and separate buildings provided for kitchen, offices, and the operation-room. The main fact, however, is that all these five buildings should be as separate and distinct as it is possible to make them. In most hospitals erected during the last century you will find that every department, including also frequently a laundry, is housed in one building, and that every part of that building is in more or less direct atmospheric communication with every other part. The evils of this arrangement have over and over again been demonstrated, and many such hospitals have been within recent years either demolished or very materially altered, much to the gain of the patients. As an example of what is thought necessary by eminent medical authorities in our day, the plans of two recent hospitals were exhibited—the University Hospital at Halle, and the Johns Hopkins Hospital at Baltimore. The University Hospital at Halle consists of sixteen detached buildings, of which thirteen belong to the hospital proper, the remaining three being devoted to teaching purposes only. The large central block with four wings is the surgical department, and forms in itself a complete hospital in all but the kitchen offices. The E-shaped block in the south-east corner is the gynaecological department, with the director's residence adjoining; and the two blocks between this and the surgical house are respectively the kitchen offices and the engine-house. Behind these is another E-shaped block, with two detached buildings, one on either side. These together form the medical department. The long building at the extreme west contains isolation wards, and the two smaller blocks between this and the surgical house are for additional isolation, the small building between them being the chapel. The E-shaped block to the north of the surgical house is devoted to diseases of the eye, the throat, and ear. The Johns Hopkins Hospital at Baltimore occupies a site rectangular in form and thirteen acres in extent. The buildings are twenty-two in number, and are all connected together by corridors. The corridors, however, which connect the ward blocks communicate only with the basements under the wards, the communication between the wards themselves being by way of

the flat roof over the corridors. Thus the wards themselves are practically detached buildings. The principle of absolute detachment of wards is here carried out, but not quite to the same extent as at Halle, while the plan of restricting the height of the wards to one story only is strictly observed. This hospital is the outcome of the matured experience and observation of one of the most experienced surgeons in the United States, and no time, pains, or money have been spared to carry into effect what have been thought the essentials of perfect hospital hygiene. In these two hospitals the principle of absolute severance between the several parts is carried to an extent that has not been attempted in this country, and certainly could not be carried out except at enormous cost in London or in any great town. There is, too, in this country a strong opposition to the system of detached buildings, and it would probably be very difficult, if not impossible, to get any committee to approve of a plan in which no covered communication between the wards and the administration existed. Assuming, then, that the wards and the administration building are to be connected by means of a corridor, it is essential to provide that any interchange of air between the two shall be as far as possible abolished. In the Great Northern Central Hospital we have endeavoured to accomplish this upon a very limited site. The wards are attached to the back portion of the administration building by a short piece of corridor, which is ventilated on both sides, and the lifts and staircase, which necessarily form shafts of communication between the different floors, are kept entirely outside the ward pavilion. The necessity for keeping the mortuary building absolutely detached is sufficiently obvious. Nothing could be more fatal to the health of the living than any communication between the wards and air tainted with the emanations from the dead. The out-patient department should be kept separate, because the air of the waiting-rooms, and in a lesser degree of the consulting-rooms, becomes much vitiated from various causes, and also because it is practically impossible to foretell what cases of an infectious disease may at any moment present themselves. The nurses' home may, or may not, be in direct communication with the hospital proper. For the sake of the nurses themselves, probably the more complete the severance is the better. In the administration department are comprised the official quarters, including the board-room, secretary's office, and matron's office, the residential quarters comprising the rooms for the residential medical staff, the secretary or superintendent, the matron, the steward, and the servants, and the domestic department including the stores, kitchen offices, and linen-room. The detailed planning of the administration building will necessarily vary according to the size of the hospital, and no very minute rules can be laid down respecting it. Unless the kitchen offices are placed in a one-story separate building they should certainly be put at the top of the house. There is no practical difficulty attending this arrangement, examples of which may be seen at the Hospital for Consumption, Brompton, the Great Northern Central Hospital, and the Hastings Hospital. The provision of ample store accommodation is also an important point. It is far better to provide too much store room than not enough, for the difficulty of increasing store room in an existing building is very great indeed. Formerly a ward was regarded merely as a room into which a certain number of beds were to be put without much thought being taken of how the well-being of the patients would be affected by the conditions under which they were to be housed. At La Clinique, Paris, the wards were long and narrow, and the windows were placed in the two ends; between these windows no less than eight beds were placed. Again, in many old hospitals the wards formed a series of rooms arranged on each side of a corridor, which formed a channel of communication connecting all the wards together. Yet another form of ward is what is called the "double ward," which consists of two long wards placed side by side, with the windows in the sides, and with openings cut through at intervals in the dividing wall. This arrangement gives four beds between the opposite windows. The fault of all these forms is in a greater or less degree the want of efficient ventilation, and it was the recognition of the evils consequent upon a defective air-supply that resulted in the pavilion system of wards. The essential feature of the pavilion

system is that the wards are long, rectangular buildings, projecting out casually at right-angles to a main corridor. The space between the pavilions should be equal to at least twice the height of the buildings, and the long axis of the wards should be nearly due north and south, so that the maximum amount of sunshine available should be admitted to the wards. The question of the number of stories permissible in a ward pavilion is one upon which authorities differ materially. In many of the most recent hospitals in France and Germany, and notably in the magnificent hospital at Baltimore, the wards are restricted to one story only. Such a system is obviously a most costly one in the matter of site, and it is to be justified only on the score of really important benefit to be gained. Personally, I see no sufficient gain to be obtained at all commensurate to the enormous cost involved. But—and this lies at the root of the matter—if two or three stories of wards are to be superimposed, each must be absolutely independent atmospherically of the other, there must be no shafts, whether for staircases or lifts, to communicate the air of one floor with that above. In nearly all the earlier pavilion hospitals the staircase and one or more lifts, and sometimes that abomination called a dust-shoot, are all closely adjacent to the ward. It is so at the Herbert Hospital, Woolwich—one of the earliest pavilion hospitals, at Leeds, at the Norfolk and Norwich, and at St. Thomas's. At the Great Northern we have placed the staircase and the lifts in such a position that they cannot form shafts from one ward to the other. It would appear from the plan of the Johns Hopkins Hospital that the staircase and the lifts are so placed that they must form channels of communication between the different pavilions by way of the basement; but the system of artificial ventilation is intended to act in so perfect a manner that all chance of such an occurrence is obviated. In considering the internal arrangement of the wards, the first point to be settled is the space to be allotted to each patient. Space in a ward is very commonly referred to as cubic space only; but it is equally important to consider floor-space, and the distance to be allowed between each bed and its neighbour. Upon this question of space authorities differ widely. In the table given in Mr. Saxon Snell's work the floor-space varies from 69ft. per bed to 149ft., and the cubic space from 864ft. to 2,544ft. The last figures are those of the Hospital of St. Andrew at Genoa, whose wards are considerably over 20ft. high. It was the opinion of the late Professor de Chaumont that nothing is gained by making the height of a ward exceed 12ft., and in making calculations in actual practice he was accustomed to exclude all space in excess of this amount. You will see, therefore, how important it is to arrange your cubic space in relation to your floor-space, and not to increase the one at the expense of the other. In the first place, then, the wall space or distance from centre to centre of each bed should be determined. In a large ward, say for twenty beds, the space should not be less than 8ft.—8ft. 6in. or 9ft. by preference. For the width of the ward 28ft. is a good dimension. It allows plenty of free floor-space in the centre of the ward. These figures give a floor-space of 112ft. as a minimum. Taking 12ft. as the standard height, you get a cubic space per bed of 1,344ft. A height of 12ft. will, however, be found, for appearance sake, too low for a ward upwards of 80ft. long, and something must be conceded to one's sense of proportion. Having settled the dimensions of the ward, the next step is to place the beds and set out the windows. In some cases the beds are arranged in pairs with one window to every two beds. This plan of coupling the beds has many disadvantages. In the first place, each bed is unduly near one of its neighbours, instead of being placed in the centre of its own air-space; secondly, the ventilation cannot be so perfect as when each bed has a window each side of it; and, lastly, the beds are necessarily so close on one side to the windows that much inconvenience arises therefrom in the shape of draughts and cold currents of air from the condensing surface of the glass. Each bed, then, should occupy the centre of its own air-space, and should be between two windows. There is one more point to be observed in the arrangement of beds and windows. You will notice that in the wards at the Great Northern Hospital a small window is, in each case, interposed between the end beds and the end walls, and the length of the ward is

increased by the space necessary to get this window in. The reason for this is that it has been observed that when the end bed stands in a corner with a window on one side only, that particular bed has acquired a bad reputation as one in which cases have not fared as well as they ought; and the interposition of a window between it and the end wall has had the effect of correcting this bad tendency. There are certain necessary rooms and offices which must be attached to the wards, and form a part of the pavilion. These consist of a ward-scuttery (or "duty-room"), a small larder for keeping food, cupboards for the ward linen and for patients' clothes, bath-room, water-closets, sink-room, and lavatory. To these may be added a small ward, or perhaps two, for one or two beds for special cases. The ward-scuttery should be immediately adjoining the ward, and is used for washing the crockery used for patients' meals, for making poultices, warming beef-tea, and for the minor processes of food preparation usually done near the ward. It should contain a sink, a small dresser, and plate-rack, and a small cooking-range. The cupboards should be large enough, and should be well lighted and ventilated. If small wards are required, they should be placed at the entrance end of the ward, and a separate water-closet and slop sink provided for their use. The water-closets are usually placed at the further end of the ward. In a long ward there is some inconvenience in this arrangement, but it is more than counterbalanced by the interference with light and ventilation that would ensue if the closets were projected out at one side of the ward—the only alternative to the end position. The water-closets must be separated from the ward by a lobby, having windows on each side and doors at either end, so that there may be no communication of air between the closets and the ward. In order to promote the free passage of air around the building, it is desirable to restrict the height of this lobby to just sufficient to give head-room, and to leave the space between the roof of one lobby and the floor of the one above free and open. The sink-room should be in the same building as the closets, and should be large enough to hold a slop-sink, a sink for washing utensils, and a sufficient storage of vessels not in immediate use. The bath-room must be long enough to hold a bath so placed that only one end is against the wall; and large enough to admit of a patient being wheeled in and lifted into the bath. The first and last thing to be thought of in designing a ward is cleanliness. Everything that favours the accumulation of dust or dirt must be studiously avoided. All avoidable corners, all ledges or recesses, all quirks and unnecessary mouldings, are things not to be tolerated within the ward-pavilion. Floors should be as solid as concrete and solid wood-blocks can make them. The ideal wall surface for a ward has yet to be discovered. Parian cement has proved a costly failure, and glazed bricks or tiles not only have many joints, but cannot be had of sufficiently true a surface to prevent altogether the lodgment of dust. In France the ward-walls are usually finished with what is called "stuc," which is neither more nor less than some kind of cement painted and varnished. There is much to be said in favour of the plan adopted at the Middlesex Hospital. Most, if not all, of the wards were many years ago covered with Parian cement, the surface of which was polished. This proved to be by no means the impervious surface that was expected, and eventually the lower surface of all the walls was covered with a painted and varnished dado, and the space above distempered. Every year each ward is in turn emptied, the distemper cleaned off down to the bare cement, and the walls and ceilings recoloured. The ventilation of a ward is a matter of the highest importance, for upon its efficiency and thoroughness the health of the patients mainly depends. Ventilation is commonly divided into two classes, natural, and forced or artificial ventilation, the one being accomplished by the aid of open windows and the ordinary fireplaces, the other by the aid of aspirating fans or exhaust furnaces, or a combination of the two. In England the most suitable form of ventilation is the most simple. Opposite windows assisted by the extracting power of the open fireplaces supply all that is required, where properly handled, to keep the atmosphere sufficiently diluted. With our humid atmosphere and comparatively equable climate, there are very few days in the year when ventilation by open windows cannot be resorted to.

In America the changes of temperature are so sudden and excessive, and the atmosphere so deficient in moisture, that mechanical ventilation would seem to be a necessity. The best form of window for a ward is the double-hung sash, with a hopper-light above. The lower sash should have the deep bottom rail and sill-board, and the hopper should have glazed cheeks at the side, to give the entering air an upward current, and to prevent down draughts. It is desirable, also, to have some means of admitting air at the floor-level under each bed. In many hospitals abroad the wards are raised above the ground upon piers, and the space thus obtained left open for the free circulation of air. The plan is a further development of the pavilion system, by isolating the ward from the ground, and preventing the stagnation of air around the building. We have adopted this plan at the Great Northern Hospital, but in this instance there are additional reasons in the matter of levels and light and air which rendered it almost a matter of necessity. We now come to the operation-room. In large hospitals with medical schools attached the operation-room becomes a theatre, with its tiers of benches for students. Where no school exists, it should be a room of sufficient size to hold the table, with room all round it for the operating surgeons and their assistants and nurses. Its aspect should be north, and it should have a top-light and a vertical light, and means should be provided for shutting off entirely either light at will. Everything in the operation-room should be made as aseptic and impervious as possible, and floor, walls, and ceiling should be capable of being washed down with a hose-pipe. At the Derbyshire General Infirmary we have recently rearranged the operation-room with the object of rendering it as aseptic and washable as possible. The walls are lined up to a height of about 7ft. with marble, the vertical and horizontal angles being rounded to a radius of 6in. The floor is of Mischiati mosaic, laid to a fall, with a specially-made fitting of gunmetal, closing the aperture to an open pipe leading out to a gully. The walls above the marble lining are painted and varnished. The sashes, skylight, and doors are all of iron, and every part is flush, no projections of any kind being allowed. The sinks and lavatory basins are of porcelain, and the tops of plate-glass. The advantage of using glass is that it can be seen at a glance whether the under side is clean. All pipes, the lavatory-tops, and the shelf for instruments are kept clear from the wall, so that no corners are formed. Adjoining the operation-room should be a room for the surgeons, in which the instrument case should stand, and at least one room for the administration of anaesthetics. The mortuary and post-mortem room must be placed in an absolutely detached building, and must also be at a sufficient distance from the wards to put any chance of contamination of the air of the latter beyond the range of possibility. Here, again, scrupulous cleanliness is all-important, and every part must be made easily washable. Cleanliness in the post-mortem room is of vital importance, and as much care should be taken to make it washable and aseptic as if it were an operation-room. The out-patient department is really a separate institution, and except for the convenience of having a dispensary common to both in and out-patients, there is really no advantage in having both departments in one group of buildings. Very serious evils have occurred in the past through the intimate intercommunication existing between out-patients' departments and wards, and the more distinct the two are kept, the better for the patients in the wards. I have said nothing about circular wards because I wished to avoid anything of a controversial nature. That circular wards are, within certain limits as efficient, and under certain conditions of site superior to rectangular wards I am convinced, but the main principle involved has yet to be decided by the test of time—a test which will be applied in the new Royal Infirmary at Liverpool, now approaching completion from the designs of Mr. Waterhouse.

Mr. F. T. BAGGALLAY moved a vote of thanks to Mr. Young for his very able paper on a subject which he had made peculiarly his own. He should like Mr. Young's opinion on the relative value of open fires and pipes for heating.

Mr. A. O. COLLARD, in seconding the motion, observed that Mr. Young had not referred to the suggestions of the Local Government Board as to the construction of hospitals drawn up by their

architect, Mr. Percival Gordon Smith, which seemed to him to furnish a mean between the extremes of wasteful prodigality and insufficiency.

Professor McHARDY, of King's College Hospital, supported the vote of thanks, remarking that they had been favoured with an address from the highest authority in this land on hospitals. He would strongly endorse the lecturer's remarks about allowing no lodging place for dust or dirt that could be avoided in a hospital; all mouldings, ledges raised, and depressed surfaces should be effaced from a design, and as women were naturally untidy, and had a faculty for rolling up, securing with a pin, and popping into a cupboard, anything objectionable, every wardrobe and locker should have glass doors, so that no nurse might be led into temptation. No piece of dust or dirt was beneath the notice of one connected with a hospital, for scrupulous cleanliness was essential. On one occasion when he had to report on the condition of a hospital to the committee, he borrowed a damp towel, ran it over the ledges and doors, and enclosed it to the secretary, saying that formed his report. He would earnestly impress on architects the necessity for providing adequate accommodation for the nursing staff, isolated from the main building, where they could enjoy recreation. It was a lamentable fact that the death-rate among nurses was double that of any other class of women of the same age in the kingdom, and it was urgent on the architect, therefore, in devising his plans to protect their lives as far as possible, and certainly he ought never to stow them away in attics ill-ventilated and unwarmed, over the sick wards, as was so often the case. The rooms for the medical and nursing staff ought to be entirely cut off by an open space from the sick. The lecturer had not sufficiently emphasised this essential requirement. Mr. Young had referred to the horrors of the old Hôtel Dieu, at Paris; but in the new one there were defects, including a bath-room only 7ft. 6in., by 9ft., and at least 45ft. high; in fact, the old Hôtel Dieu was picturesque, but abominable; the new one was abominable without being picturesque. He believed in providing an open fire in the middle of each ward, simply for the patients to look at; but the secret of heating a hospital was to warm the walls and floors by pipes, and not the air. In England we had variability, but not extremes of climate to contend with; but as a safeguard against exceptionally cold seasons, he had found from practical experience that a balance of 80 per cent. of artificial heat should be provided for by the engineer, while he sought to maintain an equable temperature of 60° F. in each ward, or two or three times in, say, ten years, when the external temperature sank very low, there would be a heavy mortality. They heard a good deal about condensation on internal walls, but if a building was thoroughly warmed its walls could not sweat. The Local Government Board was well staffed, but its officials would be more than human if they would avoid being fettered and demoralised by red tape—no Board should be trusted to lead the public, but must be educated and led by the practical men who thought out these matters.

Mr. PERCIVAL GORDON SMITH said it had always been his aim and wish to avoid red tape. He would emphasise what had been said by the lecturer and the last speaker about warming and ventilation. Unless a building were thoroughly warmed, every ventilating aperture would be closed. He agreed with Dr. McHardy that ample means of warming should be provided, although it might not be needed to the full extent. Hospitals should be aërially separated from the nursing establishment. Among the best foreign hospitals was the small one at St. Denis, Paris, which was far in advance of any he had seen in England, although behindhand in some details; that at Halle, and a new one in Berlin, were also well worthy of study by English architects.

The PRESIDENT, in putting the vote of thanks, said he was rather disappointed that Mr. Young had not given them the pros and cons on the question of circular versus rectangular wards. Both Mr. Young and Dr. McHardy had advocated separating the residences for the medical or nursing staffs from the wards by as wide an open space as the site could afford; but he had found the officials greatly objected to go out of doors to their rooms. He should trust to natural ventilation, except in very large

hospitals, and there the mechanical means used ought to be as simple as possible.

Mr. YOUNG, in reply, said he quite agreed with Dr. McHardy that the proper place to warm wards was at the sides; but all depended on what the wards were to be used for, fever patients requiring little provision of artificial heat, whereas for consumptives the heat must be considerable and uniform, while surgical cases should not be in a high temperature, but needed to be bathed in a stream of pure air. In a fever hospital he had provided the floors of wood blocks paraffined over, and the walls of concrete, the heating being by Boyd's stoves, and the wards could be washed out, purified, and fit for use by patients suffering from a different complaint without risk on the third day from being vacated. As to circular wards, apart from the merits of the form itself, there were some sites, which could not so fully be utilised by buildings of a different form. This was the case at Greenwich, the earliest circular ward in England, and also at Hastings. Medical men always grumbled when the residences for the staff were separated by a court or garden from the wards; but their objections could be safely ignored.

#### ARCHITECTS' REGISTRATION IN NEW YORK STATE.

AT the last meeting of the New York Chapter of the American Institute of Architects a discussion took place on the Bill "to Regulate the Practice of Architecture within the State of New York," proposed by the Western New York State Association of Architects. The general tone of the discussion was that public opinion in the State is now ripe for statutory intervention in the direction of taking the practice of architecture under protection, as has already been long done in the cases of medicine and of law. The question was raised as to whether the public would, in the long run, be benefited by restricting the practice of architecture as much as the profession would be, especially during an epoch of very active art production, and it was decided that there were, during the current phase of art predilection, good reasons for making the most of whatever opportunities should offer in this community for exploiting before the public the fact that the State Legislature sufficiently acknowledges the importance of the practice of architecture to debate the feasibility of enacting and, quite possibly, of actually enacting, ordinances for the protection of its professors from insufficiently trained interlopers, and that such would be the result of the passage of a Bill covering the subject, even if, under the circumstances of its production, necessarily defective, and probably of only temporary force.

The chief defect of the Bill was thought to be in the clause reading: "But nothing herein contained shall be construed to prohibit any person in this State from acting as architect of his own building, or as architect for any person employing him with full knowledge on the part of such employer that the person so employed is not a licensed architect in accordance with this Act," as such clause would nullify all the other provisions of the Bill, for the uses of unscrupulous persons. But it was recognised, says our American contemporary, *Architecture and Building*, that the insertion of the clause was probably demanded as a *sine qua non* by legislators in the interest, whether real or only supposed, of some of their constituents, and that it might be afterwards repealed or rectified. Meanwhile, as it would not be likely to make much, if any, impression on laymen, the desirable object would be gained of the public and the legislators being habituated to any ordinance in the interest of the profession, and of the best attainable practice of the building art. The next following clause of the Bill—viz., that nothing contained in it shall "prohibit architects residing in other States, and not having an office or carrying on a general business in this State, from competing for a special building, or from visiting the State for such purpose in person"—it was also felt, allows conditions which, except under strict regulations, might also conduce greatly to unprofessional practice. Eventually resolutions were passed generally approving of the principles of the measure, but objecting to some details.

The Devon and Cornwall Banking Company, Limited, are about to erect new premises at Camborne from plans by Mr. James Hicks, M.S.A.

THE "ASCENSION," BY GEORGE TINWORTH.—CONTEMPORARY BRITISH SCULPTORS.—NEW SCOTLAND YARD.—NEW BANKING PREMISES, THREADNEEDLE-STREET.—GLENRIDGE, N.J.—COMPETITIVE DESIGNS FOR THE GREAT LONDON TOWER.—RESIDENCE AT CATFORD.

## Our Illustrations.

PANEL OF THE "ASCENSION," BY GEO. TINWORTH.

THIS beautiful panel has been fixed at St. Mary Magdalene Church, Trinity-road, Upper Tooting. Mr. E. B. Ferrey is the architect. The church has been lately built, and the walls all round up to about 12ft. high are arranged with bays in which it is proposed, as occasion presents, to place a series of panels representing incidents in the life of the Saviour. The Ascension, being the last act of the Saviour on earth, occupies the end position, and is at present the only panel fixed. When the proposal is carried out in its entirety it will have a very pleasing effect, and will, as far as we remember, be quite unique. The walls are plain brickwork tuck-pointed, and the panel, including a moulding surrounding it, about 4ft. by 2ft. 6in. The panel was made by Messrs. Doulton and Co., of Lambeth.

CONTEMPORARY BRITISH SCULPTORS.

(SEE description on p. 672.)

NEW SCOTLAND YARD.

The main building is a parallelogram of about 128ft. towards the Embankment by 168ft. deep, inclosing a courtyard 55ft. by 60ft. The buildings extend on the east and north fronts considerably, but were compelled to be kept low. The lower stories are of granite, which was all prepared by convict labour at Dartmoor, and as convicts are not necessarily masons, it had to be kept extremely simple, as it would have been beyond their power to execute any complicated mouldings. As it is, they must be considered to have succeeded remarkably well. The main entrance doorway is of Cornish granite, and is of free labour, massive and bold in design. The foundations were tedious and troublesome, in many places going to a depth of 40ft. below the level of the roadway. The trouble consisted in springs, which poured in a deluge of water, so that on one or two occasions, when the pumps broke down, the water acquired a great depth in the course of a couple of hours; but, in spite of this, the work was so well done that up to the present time not the smallest settlement has appeared. The walls are thick throughout, being mostly built of bricks from Gamlingay, in Cambridgeshire, and are all set in cement throughout, with the exception of the external red brickwork, which is in blue lias lime. The building consists of a deep front and back block, consisting of a centre corridor, with rooms on each side. Each of these is covered by high-pitched roofs, with gables at each end. The sides consist of narrower blocks, with corridors looking into the court, and rooms on outer sides only. The utmost possible simplicity of roof is thus secured. The chimneys have been much commented on. The object was

to draw the flues into a few large stacks, instead of letting them run straight up anyhow, emerging from the roof in all sorts of positions. When the roofs are of low pitch it does not much matter; but when a feature is made of a large expanse of roof it was considered that it would be undignified and somewhat unsightly, and so the existing arrangement was adopted, not without much trouble. The flues, however, are all very good, with no sharp or awkward bends. The building may be considered as practically fireproof throughout, and, indeed, with the exception of part of the roof, there is little to burn, all architraves, skirtings, &c., being of Parian cement. The works have been entirely carried out by Messrs. John Grover and Son, of Wilton Works, New North-road, under the immediate superintendence of Mr. George Grant as clerk of works. The lead-work and plumbers' work generally, as well as heating, have been done by Messrs. Wenham and Waters, of Croydon. A very large electrical plant is now being fixed for lighting the whole building. As yet the wiring alone has been done. This is all under the direction of Mr. S. S. Campbell Swinton. The whole of the gutters surrounding the summit are lined with Claridge's patent asphalt. This material was chosen also to cover the arches forming a depository for important documents, which it was necessary to protect from damp. The work has been done to the satisfaction of all concerned by Claridge's Patent Asphalt Company.

NEW BANKING PREMISES, THREADNEEDLE-STREET, E.C.

THESE premises, the freehold property of Mr. W. Brass, are being built on the sites of Nos. 43, 44, 45, 46, and 47, Threadneedle-street, and Nos. 1, 2, 3, and 4, Crown-court, which previously existed in the rear of the former, the court itself having been incorporated in the scheme and built over. The buildings are being carried out to suit the requirements of banks and insurance offices, and the sub-basement, basement, ground and first floors of about half the site have been let for a long term to the National Bank of India. Each floor is approached by a spacious stone staircase and a hydraulic passenger lift in the well-hole of the stairs. The whole of the floors are fireproof in construction. The front up to sill of first-floor windows is in polished grey Aberdeen granite, the upper part being in Portland stone. The works are being carried out by Messrs. W. Brass and Son, of Old-street, at a cost of about £20,000, from the designs of Mr. T. H. Smith, architect, of 17 and 18, Basinghall-street, E.C.

GLEN RIDGE, N.J.

THE drawing given herewith shows the new music-room wing added to the original house, which was erected some few years ago from the same architect's designs. The music-room has an alcove leading out of it into a flower porch, to which there is an arched entry from the garden. This is so contrived as to be inclosed in winter or of an evening, when the apartment, furnished like a conservatory, can be used for coffee service or light refreshments without interfering with the use of the ball room. The walls are of local stone. The room is wainscoted and has a great fireplace. On the garden front are two gables with a balustraded parapet between. Mr. Maurice B. Adams, F.R.I.B.A., is the architect.

PROPOSED GREAT TOWER FOR LONDON.

THESE drawings are merely sketches of a few typical designs, which were chosen not so much because the towers illustrated are the most suitable or likely to be selected for the prizes, but as representing some of the more original and striking suggestions or methods of construction. For our remarks upon the designs generally we refer our readers to the article published in our pages last week. The elevations printed herewith to-day are drawn to a uniform scale, and the height of the Eiffel Tower is set out by the side of the others for comparative purposes. We have received some other drawings, too late, however for the present issue.

RESIDENCE AT CATFORD, KENT.

THIS house, now nearing completion, is being built for Dr. Hammersley from the designs of Messrs. Williams and Hopton, 156, Regent-street, W. The walls are of bright stocks with red brick dressings, with Brown's ornamental and moulded bricks for cornices, strings, &c. The carved brick and stone was executed by

Messrs. Reid and Co., Berners-street, W. The staircase is of American walnut with large wrought and carved newels and turned balusters. The whole of the gates, iron and wood mantelpieces were supplied by Messrs. Jas. Allan, Senr., and Co. The building has been carried out by Mr. R. A. Lowe, of Chislehurst, at a total cost of £2,400.

## COMPETITIONS.

NEW CHURCH AT JOHNSTOWN.—Several architects were invited a short time ago to submit designs for this new church, to cost about £2,000. After careful examination by the committee of the various plans sent in, they were of opinion that the design bearing the motto "Semper Paratus" was the best. Before finally deciding, all the plans were submitted to Mr. G. A. Humphreys, M.S.A., architect and surveyor, Mostyn Estate Offices, Llandudno, N.W. (who had drawn up the "Instructions"), and also to one of the assistant architects to the Ecclesiastical Commissioners. Both these gentlemen were unanimous in their decision that the design by "Semper Paratus" was best and the most suitable for the requirements of the district. Upon breaking open the sealed envelope it was found that the successful architect was Mr. Alfred C. Baugh, Egerton-street, Wrexham.

WORCESTER.—Sixty-eight competitive designs have been sent in for the Victoria Institute, and the following firms of architects have been selected for the second competition:—1, Smith, Woodhouse, and Willoughby, Manchester; 2, Cook and Grocock, Cardiff; 3, Ryde and Bedford, London; 4, Salter and Adams, London; 5, Moore and White, London; 6, Simpson and Allen, London. Mr. Waterhouse was the assessor. The building is to cost £12,000. It comprises museum and art gallery, reading and reference library, newsroom, science and art school, and technical school in basement.

## SCHOOLS OF ART.

BIRMINGHAM.—The committee of the Birmingham Municipal School of Art have presented a report to the City Council recommending the acquisition of vacant land adjoining the Central School, in Cornwall-street, for the purpose of the extension of the building. The present building is now occupied to its fullest capacity, and is at special periods seriously inadequate to the requirements of space and organisation. The area of the proposed additional land is 968 square yards, while that occupied by the present school is 1,053 square yards. The owner, Mr. George Colmore, will let the additional land on lease for 99 years at £266 4s. per annum, and has offered £1,000 towards the cost of the extension of the school buildings. The committee have had prepared approximate plans for the extension, and estimates of cost, the probable outlay for buildings and fittings being about £13,000, and the net annual cost of the school would be augmented by about £1,500. During the autumn term of 1888 2,646 individual students were in direct connection with the school; a total increase of 667 on the number for the corresponding term of 1887, of 1,059 on that for 1886, and of 1,800 on the number for 1884. This rate of increase is maintained by the experience of the current year; and as the eleven branch schools are further developed, it may be expected that a still greater measure of progress will be realised. All the rate-aided art instruction within Birmingham is now controlled by the School of Art Committee; and the scope of the work done gives the school a position absolutely unique in England.

YORK.—The annual meeting and prize distribution of this School of Art took place on the 1st inst. Mr. S. W. North, who presided, said that the school was founded in 1842, and was one of the earliest in the kingdom. They had now upwards of 200 students, and they had been compelled to remove the work of the school to the Fine Art Institution, where they would have much larger accommodation. This removal involved them in an immediate expenditure of at least £1,000 for structural alterations. Mr. J. H. Fowler Jones (hon. secretary) read the report, which was adopted.

A new stone drinking-fountain is about to be erected at Redruth. The donor is Mr. J. Passmore Edwards, the proprietor of the BUILDING NEWS.

## WAYSIDE NOTES.

IT is not necessary to visit the exhibition at the Royal Academy in order to obtain an idea of the character of the architecture of the New Police Offices. The building may now be seen in very brick and stone, and a shilling cab ride or pleasant stroll across the Green Park will take the intelligent architectural amateur from the counterfeit at Burlington House to the real thing on the Victoria Embankment, where it stands within the shadow of the Westminster clock-tower. I vouchsafe this information for the benefit of any of your lay readers who may be visiting the Architectural Room at the R.A., and who may have noticed the question put to the Home Secretary at a recent sitting of Parliament. Such persons may feel curious about a building whose style has excited ironical remarks from more than one M.P., if we may judge from reports of proceedings in the House. Mr. Cavendish-Bentinck apparently does not like the design, and since "laughter" followed upon the Home Secretary's announcement that "the building appeared to him worthy of the site," I take it that others are in accordance with Mr. Bentinck's views.

I can well understand that Mr. Norman Shaw's fine design does not elicit much sympathy from the public. They, doubtless, consider it to be bare and barn-like, and, at the best, an unsightly eccentricity. We architects like it because it is of good outline, simple and pleasing in composition, and because it contains sundry quaint architectural conceits gratifying to the taste of the day. To the public the plainness of portions of the walls is eminently offensive, its great roof unmeaning, and its detail incomprehensible. Marked as has been the improvement in architectural taste during the last few years, the B.P. is not yet educated to the understanding of a design like the New Police Offices. One can hardly, however, express surprise at this, for the style of the design is an acquired taste even to the architect, and it is not every competent professional who will regard it with the enthusiasm of the school to whose powers of appreciation it particularly appeals. All this I can well understand, while, for my own part, falling in with the views of those who consider the design to be a unique specimen of Mr. Norman Shaw's handiwork.

It is a relief to get a really novel architectural composition for a public building in this country, where too often hackneyed commonplace has been the order of the day. The New Police Offices may never appeal to the mass of Englishmen; but the educated fraction of the community will duly appreciate it, and claim it as a welcome relief on regulation Gothic and Classic. To my mind, the building is a great ornament to the Embankment: from far or near it is pleasing to the eye, and the angle turrets are little gems of architectural design. And I doubt not but that when the works are thoroughly complete and encumbering hoardings removed, more appreciative notice will be taken of the building, and the croakings of persons unqualified to criticise anything in the way of architecture will be drowned in well-deserved applause.

Architects adverse to the competitive system will have noticed with pleasure that in the course of the remarks made by Mr. Matthews, in replying to the question about the Police Offices, the shortcomings of competition work were incidentally touched upon. The Home Secretary said that, "having regard to some recent conspicuous results in competitions of designs for large public buildings, he preferred to select an eminent architect upon whom he could rely." This statement is scarcely of such a nature as to cause the architects of the buildings referred to to swell with excessive pride. What these buildings are we can only guess, and it would be invidious to throw out suggestions as to the why and wherefore of Mr. Matthews's dislike to the competition system; but it is evidently a case of "once bit, twice shy." To my way of thinking, it would be well if more persons were inclined to be shy of competitions. They would often save themselves a lot of vexation, trouble, and loss, and architects would equally benefit, in the long run. There is a certain gratification in the reflection that often in the case of unsatisfactory results following upon competition jobs, the promoters of the

competition have only themselves to blame. The hope of gaining a lot of ideas from the architectural profession for a very small expenditure of premium-money induced them to organise the competition, and as reward they often find themselves with an unsatisfactory building, and a no less unsatisfactory architect.

The Westminster Abbey Commission has been well chosen, and seems to have given satisfaction all round. Satisfaction in this case, perhaps, means a measure of confidence that the Abbey may be not tampered with in such a way as to be offensive to true sentiment and archaeological and architectural instinct. The presence in the Commission of the Dean of Westminster, Mr. Waterhouse, and Sir Frederic Leighton should insure security on these scores. It would be difficult to hazard a guess as to the probable result of this Commission; but an idea seems to have gained ground that there will be a sifting process and sort of critical examination of existing monuments. There seems some reason to suppose that the tablets, effigies, busts, and bulky monuments at present cramming the Abbey to its utmost capacity will come before a searching tribunal. Had they sense and feeling, many might well quake with anticipation of the result; for, undoubtedly, there are not a few monuments taking up large spaces that commemorate mere nobodies, judging by what we know of the intrinsic merit they exhibited when in the land of the living.

But even supposing a clearance to be then made within the Abbey walls, the whole problem before the Commission will still be unsolved, and the National Campo Santo question must come to the fore again, whether this should be part and parcel of the Abbey buildings, or a distinct edifice of itself, will probably be one of the knotty points before the Commission. We all have a natural antipathy to the idea of modern additions to Westminster Abbey, and it is my sincere hope that the Commissioners may decide against any project to make the addition. At the same time, the practical, common-sense man who comes along and asks, "Why, in the name of fortune, if a new building is wanted, is it not built?" has got Mediaeval precedent on his side. He may point to the unexceptional practice of the old builders, who built in their own style on to the work of their predecessors, and, if skilled at argument, it would not be easy to convince him that the conditions of the present case and those attendant upon architecture in the Middle Ages are incompatible.

It is often supposed that the days of large fortune-making by contracting have passed away, and that the contractor of the period is a person who ekes out an existence by means of the meagre profits he can only secure by reason of the cutting-down of prices in the competition of the times. Nevertheless, the late Mr. Thomas Andrew Walker, contractor for the Manchester Ship Canal, managed so to conduct his business as to leave a personal estate that has been sworn at the gross value of nearly a million sterling, and a net value of £551,694. This is a comfortable amount enough, and should encourage the contracting fraternity who may be desponding about the times and manners, to believe that, even in days when quantities are a little more detailed than "provide and fix one staircase complete as drawings," there is still room for energy and enterprise, and money is to be made. We may never have such another golden age for contractors as the railway mania proved; but talent for this line of business will always have its rewards when the talent is accompanied by other qualities that render it useful, and without which it is an empty vanity.

I am glad that the promoters of the Central London Railway Bill have met with encouragement at the hands of the Committee of the House of Commons to whom the consideration of the Bill was intrusted. The few restrictions and modifications imposed by the Committee are only reasonable, and, except delaying the scheme for a short time, will not hurt anyone. If all goes smoothly, the new enterprise should pass every opposition and criticism, and, before long, work on the proposed railway be seriously commenced.

The Architectural Association Committee on educational matters has discharged its duties most creditably, and if only full benefit can be

taken of the hints and suggestions embodied in the admirably drawn-up report, the educating power of the A.A. will be presently four-fold. As in other matters, money is the first consideration. The scheme, it must be evident to everyone, cannot be carried into effect unless increased funds are available. Whether the London members will still object to the raising of the subscription to one guinea—which apparently, like Registration, must come sooner or later—or are in a different mood to that which held them when it was last proposed to increase the amount, remains to be seen, and probably will be seen at an early date. It certainly would seem to me the first step to take, for if the increased funds be not forthcoming the scheme falls to the ground; unless, indeed, there be other practical suggestions forthcoming as to how the desired end may be attained. For I doubt whether the fees expected from students could be safely relied upon to insure a successful launching of the new system; and the reforms and innovations proposed by the committee, excellent though they would prove, are best left alone unless the way seems clear. It is very bad to be too fearful of failure in new ventures, when the ventures appear just and likely to succeed; but in this case there should be a good deal of caution exercised, or an old system, which in its time has achieved great things by humble means may be overthrown for one that is untried and may be a failure. A failure does not appear probable from any defect in the principles of the proposed system, but only from inefficient means for carrying it on powerfully. I hope, for the weal and credit of the old Association, that it may be safely carried into execution, and that under the new order of things the education of the architectural student will be placed on a more scientific basis, and reduced more to a system than heretofore. From a perusal of the proposed curriculum in the May number of *A.A. Notes* there appears no reason to doubt that the labours of the committee have insured this, and that the scheme, if successfully inaugurated, will be of permanent benefit to the architectural student and, indirectly, to the whole profession. GOTH.

## CHIPS.

At Hollacombe, near Winkleigh, Devon, the foundation stone of a mission church was laid last week. The building is to be 20ft. by 20ft. 9in., and is to include tower, porch, vestry-room, and chancel. It will be built of local stone, with Bath stone dressings, and will cost nearly £700. The work is being carried out by Mr. Ellis, builder, of Northtawton, from the plans of Mr. Kelnor, of Winkleigh. The church is to be dedicated to St. Michael and All Angels.

A joint-scheme of water supply is about to be carried out for the local authorities of Insh and Premnay, N.B., from plans by Messrs. Jenkins and Marr, of Aberdeen.

Last week a chapel, attached to the Convent of the Sacred Heart, at Burnham, Somerset, was opened. The new buildings consist of the chapel, approached by a cloister from the convent, and also a chaplain's residence, the large block of buildings intended for a ladies' boarding school and apartments for the nuns. Mr. A. B. Wall, of Cheltenham, executed the carvings and altar piece in the chapel, Mr. J. H. Kitch, of Bridgwater, was the builder, and Messrs. Bradfield, of Bridgwater, executed the masonry. The architect was the Rev. A. J. C. Scoles, also of Bridgwater.

The County Council for Hertfordshire discussed at their last meeting the future duties and emoluments to be given the county surveyor, Mr. Urban Smith, and decided that he be paid £500 per annum, in addition to allowances of £300 per annum for travelling expenses, and a sum not exceeding £150 for actual outlay on clerical assistance for main road accounts. They also voted Mr. Smith an honorarium of £100 for extra services during the past year.

The new Palace of Varieties, Oxford-road, Manchester, will soon have the Salvation Army for a very close neighbour. The opposite corner site to the above, facing Oxford-road, with 90ft. frontage, and the new 60ft. thoroughfare called Whitworth-street, with 120ft. frontage, has been secured by General Booth for close upon £15,000. Preliminary sketches of the buildings proposed to be put upon the site—viz., a large citadel (accommodating 3,000 persons), temperance hotel, several shops, and offices—are being prepared by Mr. J. Williams Dunford, architect, of 101, Queen Victoria-street, E.C. The cost of the buildings will be about £12,000.

RESIDENCE. AT CATFORD. FOR DR. HAMMERSLEY

MESSRS WILLIAMS & HOPTON ARCHITECTS.

## CONTEMPORARY BRITISH SCULPTORS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

IT would be quite beyond our scope to give anything like a detailed account of the work of the eminent sculptors whose portraits we print to-day. We simply propose to furnish a few leading particulars:—

Sir Frederick Leighton, Bart., P.R.A., was born at Scarborough, Dec. 3, 1830. He commenced his art studies in Rome, under Filippo Meli, at the age of 13, a year later entering as a student the Royal Academy of Berlin. His general education was continued after this at a school at Frankfurt-on-the-Maine. Hiram Powers, the celebrated American sculptor, was consulted on the embryo painter's work, and he advised the adoption of art as his profession. He then continued his studies in Brussels and Paris, afterwards becoming the pupil of E. Steiner, of Vienna. Mr. Leighton's first exhibit at the Royal Academy was in 1855, when his large picture of "Cimabue" (representing the procession which is said to have accompanied with great honour and rejoicing through the streets of Florence, to the church of Santa Maria Novella, Cimabue's picture of the Madonna) was bought by the Queen. "The Triumph of Music" followed a year later, and ever since the walls of the Academy have been graced by this great artist's beautiful works, all of which are more or less familiar to students of art. "The Five Foolish Virgins," from the reredos of Lyndhurst parish church, is one of his notable pieces of decorative work, and the Industrial Arts of Peace and War at South Kensington are other examples. "The Dance," a decorative frieze shown in 1883 for a private mansion, and "Music," a similar work exhibited in 1885, may also be mentioned. In 1886 his bronze statue of "The Sluggard" formed one of the attractions of the year, and a design for a ceiling. In 1887 Sir F. Leighton designed the Jubilee Medallion. "Needless Alarms" was a statuette from his chisel. The celebrated "Athlete wrestling with a Python," now at South Kensington, was exhibited ten years earlier. In 1883 the decorative cartoon prepared by the President for St. Paul's Cathedral Dome attracted attention. Several books were illustrated by Sir Frederick. He was elected A.R.A. in 1864, and R.A. in 1869. He was chosen President on the death of Sir Francis Grant in 1878, and a few days later received the honour of knighthood. He was created a baronet in the year of the Queen's Jubilee. He is D.C.L. of Oxford, LL.D. of Cambridge, and LL.D. of Edinburgh. Sir F. Leighton was colonel of the Artists' Corps of Volunteers for some years, but he resigned that commission in 1883. Sir Fredk. Leighton is a member of several foreign artistic societies, and has acted as president and otherwise as member of the several International Exhibitions at home and abroad. His portrait is by Messrs. Kingsbury and Notcutt, of Knightsbridge, S.W.

Mr. Hamo Thornycroft, R.A., was born in 1850, and brought up in Cheshire. He was educated at Macclesfield Grammar School and at University College, London. He worked in his father's studio at the age of 17, and in 1869 was admitted as a student at the Royal Academy. He has studied in Italy, and in 1875 he gained the gold medal of the Royal Academy for a group of "A Warrior bearing a Wounded Youth from the Field of Battle." In 1880 he made his first success, with a statue of "Artemis," which was executed in marble for the Duke of Westminster, and is now at Eaton Hall. He was elected A.R.A. in 1881, and R.A. in 1889. His statue of "Teucer" was purchased for the Chantrey fund, and is now in bronze in the South Kensington Museum. "The Mower" in 1884 and "The Sower" in 1886 are celebrated works from his hand. "The Memorial to the Poet Gray," at Pembroke College, Cambridge, must also be mentioned, as well as the bust of Samuel Taylor Coleridge for Westminster Abbey. The statue of General Gordon in Trafalgar-square is his work. This year at the Royal Academy "The Mirror" is exhibited as his Diploma contribution to the galleries of Burlington House. Messrs. Maull and Fox are the photographers of the portrait we give.

Mr. George A. Lawson was a student at the Trustees Academy, Edinburgh. After some time spent in Italy, he gained his first public commission by competition for the colossal statue of the Duke of Wellington which surmounts the Wellington column, Liverpool, together with a

panel in bronze of the Guards at Waterloo for the base of the column. This was followed by the statue of the late Lord Cochrane (bronze), for Valparaiso; also the statue (bronze) of the late William Wheelwright for the same place. Next the statue of the late John Biggs (marble), for Leicester, and then the statue (bronze) of the late Joseph Pease, for Darlington, with four subject panels, in bronze, on the pedestal. The statue of the late John Vaughan followed for Middlesbrough. This was also in bronze, with four subject-panels. Then came the Moorhouse statue (bronze) for Christchurch, New Zealand; while at present he is engaged on the colossal statue of "Burns," which will be in bronze, with subject-panels, for his native town (Ayr). To these should be added the pediment for the new municipal buildings, Glasgow, together with apex group and frieze over principal entrance. Of ideal works, may be mentioned "Cleopatra," "Callicles," "Daphnis," "A Danaid," "Ave Caesar! Morituri te Salutant," "Summer," "Bequeathed by Dying Sire to Son," and the realistic group called "Motherless" (Academy last year). Smaller groups in marble and terracotta—amongst the principal of the latter is the "Bard," presented to the Scottish National Gallery by the Society for the Promotion of Fine Arts in Scotland. Elected H.R.S.A. in 1884. Mr. Geo. A. Lawson's portrait was produced by Messrs. Done and Ball, of Baker-street, W.

Mr. E. Onslow Ford was born in 1852. In 1870 he went to Antwerp and entered the antique school there, when he studied under M. Buffeau. A year later he went to Munich and joined the Academy, still studying painting; but before leaving he gave this up for sculpture. At 18 he was living in London endeavouring to live by his art, and at this time executed several busts. He went to Munich and became a follower of Wagnüller, and had a studio of his own. Here Mr. Ford married, being at the time rather more than 21 years old. Shortly after this event he returned to London, where he has since resided. His first important commission was the Rowland Hill statue at the back of the Royal Exchange, won in competition. His statues of Mr. Gladstone; Mr. Irving as "Hamlet"; and "Linos" are all works of known merit; his "Folly" was bought by the Chantrey Trustees; "Peace" was premiated at the Salon in 1888. The "Singer" appeared last year at the Royal Academy, and this season Mr. Ford has surpassed himself by the great statue of General Gordon, which is to stand in front of the Royal Engineers' Institute at Chatham. The hero is mounted on a camel. The bronze is to be uncovered next summer. His statue of "Music" is in the lecture theatre at Burlington House. We are indebted to the *Portfolio* of April last for some of these particulars. An illustrated notice of Mr. Ford's work was then given. Our photographic portrait to-day is from the studio of Messrs. Done and Ball, of Baker-street, W.

Sir Joseph Edgar Boehm, R.A., was born in Vienna in 1834, of Hungarian parents. His father was Director of the Mint in the Austrian empire, and the possessor of a celebrated private collection of works of art. He was educated at Vienna, and from 1848 to 1851 in England. He studied also in Italy and in Paris, but has been settled in England since 1862. He received the first Imperial Prize of Vienna in 1856. He was elected a member of the Academy of Florence in 1875, and an Associate of the Royal Academy of London in 1878. Mr. Boehm executed a colossal statue of the Queen for Windsor Castle in 1869; also a monument of the Duke of Kent in St. George's Chapel, and bronze statuettes of the Prince of Wales and all the Royal Family (for the Queen); also a colossal statue at Bedford of John Bunyan, 1872; and another of the Duchess of Bedford for the Park, Woburn Abbey, in gilded bronze, 1874; a statue of Sir John Burgoyne in Waterloo-place; a colossal equestrian statue of the Prince of Wales for Bombay, 1877; a statue of Thomas Carlyle; a monument at Deene to Lord Cardigan; a monument at Aldershot Church to Sir Yorke Scarlett; a colossal figure of an angel in marble for the Marquis of Northampton for Castle Ashby, and a horse group in bronze for Eaton; also a colossal equestrian statue of Lord Napier of Magdala at Calcutta, Lord Lawrence in Waterloo-place, and the new Duke of Wellington memorial for Hyde Park Corner. Sir Edgar was elected member of the Academy of Rome in 1880. The Government gave him the commission to execute the statue of Lord Beaconsfield for Westminster Abbey, and

the effigy of Dean Duncombe for York he did from Mr. Street's last designs. The reredos in marble for Newmarket Church and the monument of General Gordon in St. Paul's Cathedral are from his hand. Sir Edgar Boehm designed the medallion of the Queen for the Jubilee, and this served as the model for the new coinage. In 1881 he was elected Sculptor in Ordinary to the Queen, and he has delivered lectures on sculpture at the Royal Academy. This sculptor continues his animal studies, having lately executed a portrait of the Duke of Portland's celebrated racehorse St. Simon, the horse Cremorne for Mr. Savile, a colossal "Lion and Lioness" for Lord Leicester, and other similar works; also a life-size "Bull, with his Leader," which, after being shown at the Royal Academy, was purchased by the Committee of the Melbourne Exhibition. In Jubilee year Sir Edgar executed about six or eight statues of the Queen, and has just finished a colossal statue of the late Prince Consort for Windsor Park. He was created a baronet last year, and is at present engaged upon a fountain with mythological subjects for the Duke of Bedford, an equestrian group for Baron Rothschild, and an equestrian statue of Lord Napier of Magdala, to be placed between the United Service Club and the Athenæum, in Waterloo-place, S.W. His portrait is by Messrs. Elliott and Fry, of Gloucester-terrace, S.W.

Mr. W. B. Richmond, A.R.A., was born in 1842. He made a portrait of his brother in water colour when he was nine years old, and he "lived in an atmosphere of art," several distinguished painters frequenting the student's home. The study of poetry and music was seriously undertaken at this time. In 1856 he became a probationer at the Royal Academy, and he was thrown early into contact with John Leech, Rossetti, William Morris, Swinburne and others. His first picture was "Enid and Geraint," after which came "The Reconciliation of David and Saul." In 1859 he painted "Boaz and Ruth," the proceeds of the sale of which paid for a first trip into Italy. Portraits of children after this won for him some reputation; but he says that "finding he would be immersed in portraiture," he left for Italy again in 1865, where he painted frescoes as essays, and completed "The Triumph of Bacchus," exhibited in the Royal Academy in 1869. Afterwards a lengthened stay in Algiers enabled the artist to study colour out of doors of Arabs, negroes, &c. Portraits followed of Mr. Gladstone, of Lady Frederick Cavendish, and of Lady Halifax, on his return to London, as well as a colossal "Prometheus." The decoration of the walls of Lythe Hill, in fresco, was next carried out, which work was followed by a large fresco at Liverpool, 40ft. by 20ft. The design was modelled in wax first, and contained sixty-four figures. It represented "The Triumph of Commerce over Barbarism." In 1878 Mr. Richmond made his first effort on a large scale in sculpture, modelling his "Runner," not in clay, but in tow and plaster; but he says he would not advise anyone to repeat that labour. This figure was shown in 1879 at the Grosvenor Gallery. "The Arcadian Shepherd" was exhibited last year at the Royal Academy. His photograph was done by Mr. Moffatt, of Edinburgh.

## THE BASILICAN CHURCH OF BRIKWORTH, NORTHAMPTONSHIRE.

By FREDERICK GEORGE LEE, D.D., F.S.A.

BRIKWORTH, with a population of about 1,200, lies about seven miles north of Northampton, and twelve from Peterborough, thus not very easily accessible or attainable. The name of the place is set forth as "Bricklesworth" in the *Saxon Chronicle*. In "Doomsday Book" it is called "Bricklesworth." In the "Record of the Taxation of Pope Nicholas" (in which the taxation for the rectory is put at £21 6s. 8d., and for the vicarage £4 13s. 4d.) the name is first written "Bricklesworth," and later on "Bricklesworth." The name as at present spelled, Brixworth, stands in the *Valor Ecclesiasticus*.

The living is a "discharged vicarage," as it is technically termed, in the diocese of Peterborough, and was formerly in the gift of the Chancellor of the Cathedral Church of Salisbury.

\* This is said to signify a locality or habitation noted for its springs. There is, as I was informed, scarcely a place in the whole parish in which a spring is not to be found, and often on the very surface of the land.

All Saints Brissworth Northamptonshire

but now is in the patronage of the bishop of the diocese. The changes in detail as regards its patronage were thus effected:—In the 13th century the advowson was bestowed upon Salisbury Cathedral, the chancellor thereof holding it as his prebend. On the death of Dr. Hugh Percy, Bishop of Carlisle, in February, 1856, when certain of the cathedral properties were considerably manipulated, it passed to the Ecclesiastical Commissioners, who subsequently disposed of the Prebendal estate to Mr. Jones-Lloyd, afterwards Lord Overstone, upon whose death, the then lessees receiving due compensation, the patronage became vested in the Bishop of Peterborough.

Its parish church, dedicated to God in honour of All Saints, is a building of almost unique antiquity and interest, being one of the very few remaining English churches erected on the Basilican type and plan. A considerable portion of the building, together with all the foundations, many of which remain buried, though during the last fifty years they have been carefully examined by competent judges, are certainly of Roman materials and workmanship. The bricks, the arches, the plan, all the lower part of tower portion of the superstructure, the peculiar and unmistakable quoins, the westernmost turret, the lower half of the tower walls with its internal windows, belong no doubt to the period of the Roman occupation here\*; for these reasons, therefore, this building demands special consideration.

Answers to the "Why?" and "Wherefore?" shall now be set forth:—

The *Basilica*, or hall of justice,† in its most ancient and simplest form, was a rectangular

\* It is believed that our Roman conquerors had a station here of some importance. Adjoining the churchyard may still be clearly traced the remains of a camp, near which, as I am informed, several coins of Antoninus Pius and Carausius have been found, together with a few cinerary urns and bronze ornaments.

† See Parker's "Glossary of Architecture," Vol. I. pp. 65, 66 (Oxford: 1859), in which the term "*Basilica*" is shown to have been anciently applied to a tomb, as also to "the small chapels appended to churches." It is still likewise given "to some of the old churches of Rome by way of honorary distinction."

building, apportioned in its almost universal ground-plan into three equal squares; two with no divisions, conjoined at one end, and thus the larger; the other distinguished from the two by some kind of division—arch or raised platform. In front of the larger and lengthier division there was usually an *atrium* or porch; while, at the extreme end of the smaller division, there was often a semicircular apse, or (as it was of old technically termed) *concha*, so-called from its resemblance to the inner portion of a shell.

This tripartite division is found in some of the earliest heathen temples—e.g., that of Pæstum, the temples of Theseus, Jupiter, Æsculapius, and in those of Jupiter Stator and of Neptune at Rome. The Tabernacle, Temple, and synagogues of the Jews are one and all of a similar ground-plan.

Here, in such basilicas, of old, were held the courts of justice in civil matters, and sometimes religious services and public rites of a religious character. The semicircular apse would thus have contained the *bema* or tribunal, raised by a platform above the rest of the edifice, where the chair or throne of the judge would stand. The rectangular portion nearest to this apse would be apportioned to the use of the advocates and their clients, while the large part beyond and below would be indiscriminately filled by the public.

Subservient to this main structure were often erected lateral chambers, on either side of the part just described, for advocates, officers, the preservation of records, &c.

There can be little doubt that this type of building is of remarkable antiquity,\* going back to the very earliest ages, when, as is certain, both regal and sacerdotal functions were united in one person, and were often at the same time delegated to a class of officials representing both

\* Nothing is stated in the text above without direct and distinct authority. To secure brevity, however, references are not set forth, because, so far as the author is aware, there is little difference of opinion existing as to the leading facts, features, and principles enunciated.

monarch and priest, both king and judge. Virgil has: *Rex Anius atque sacerdos*.

Thus, when Christianity had triumphantly overrun the Roman empire, these halls of justice were found, in every particular, suitable for Divine worship. In such architectural ground-plan (independent of other features) the Temple, the Synagogue, and the Basilica possessed a common idea and scheme. The *bema* served for the bishop's official chair or *sedes* (hence, subsequently, his see); the advocates' official chamber served for vestries or side chapels, or for the table of the prothesis; the altar was placed in front of the *concha*, near which the officials stood for sacrifice and prayer, while the hall itself afforded abundant space for the worshippers, those not yet admitted to the full privilege of worship having to be content with the *atrium*, or porch.

Additions for convenience sake were, of course, subsequently made to such halls of justice by porches, peristyles, constructional galleries, *triforia*, internal balconies, domes, and towers. Often a crypt had been constructed under the *concha*, which was occasionally used as a temporary place of confinement. When the *Basilica* was formally and specially devoted to Christian worship, and its walls anointed and consecrated with prayer and ceremony, this crypt was sometimes used as a burial-place.\*

There are numerous Christian churches in Italy, Sicily, Dalmatia, Bosnia, and elsewhere of a purely Basilican type, both in ground-plan and elevation: none perhaps more engrossingly interesting than the old church of Torcello, near Venice, now far too uncared-for and partly ruinous, but full of singular beauty and appropriateness in its internal arrangements, and

\* The following churches, in plan and certain details, are more or less of a similar character:—Earls Barton, Northants; Sompting, Sussex; Dunham Magna, Norfolk; Barnack, Northants; Caversfield, Iver, and Lavenham, Bucks; St. Michael's, Oxford, Northleigh, Oxon; the destroyed church of Tettesworth, Oxon (on the old coach-road from London to Oxford); Beestone St. Lawrence, Elmham, and Newton, Norfolk; and Tintagel, Cornwall.

remarkably curious. The parish church of Murano is of the same type, though later. So, too, is the ancient church of St. Ambrose, at Milan, with its western court-yard and cloisters. The author studied these buildings for many days, taking several drawings and notes of their most remarkable features, in the month of November, 1877, and these are before him now, illustrating Basilican features (both in their simplicity and development) of notable interest.

The ground-plan of Brixworth Church, after restoration\* and as at present existing, proves the church to have been erected upon the most ancient and earliest Basilican type. It has a nave (so to write) divided into two parts of one and two-thirds, of 30ft. and 60ft. respectively, and exactly 30ft. in width—an example of size recognised and admitted as of the highest antiquity. A square atrium, recessed from the outer west wall of the nave on each side to the extent of 9ft., stands in the centre of that part of the building, having in turn a circular central tower-let, or turret (erected circa A.D. 870), for staircase to its west. At the east end, the *concha*, or apse, is semicircular in form within, though polygonal without, and externally supported by six shallow and flat buttresses. The nave is 90ft. long by 30ft. wide.

Anciently, as existing foundations prove, the present chancel was surrounded by an ambulatory, the outward wall of which was exactly parallel with the existing wall of the chancel. The original floor of this last was found to be perfectly level with the floor of the nave. But in this case, though crypts were common to many ancient basilicas, there was certainly no crypt.

The walls of the nave consist of four bays (as it were), the arches being semicircular, built with large flat bricks or Roman tiles, of a bright red colour, resting upon square impost of the same material, these placed again upon square piers of tiles and stones intermingled. No Norman woodwork† remains.

Above, on either side, between the openings of the lower arches, are three clerestory windows, of the same type as those below, but in every respect smaller. These contain far more stones

mortar made use of having itself hardened most effectually.

Here it should be noted that the lower portion of the original walls are no less than 4ft. thick—in some parts even more—while the upper part or clerestory narrows somewhat by several inches, but still retains its massive and solid character.

The rectangular tower at the west end is of the same kind of work, with arches of a like construction of Roman bricks. Higher up, within the tower, on its south side, as also on the west side, are three very early conjoined arches, having Saxon balusters between them in stone, added, no doubt, circa A.D. 870, when the round tower was added on and the west window necessarily closed up. Those on the western end of the nave have been sadly over-restored.

The original north and south aisles were no doubt co-eval with the nave, as was also the eastern apse. But the aisles of the old hall of justice have been removed.

The south chapel, of Early English work, was erected by Sir John de Verdun, some time Lord of the Manor, whose broken memorial effigy under an arched recess still remains, though it has been barbarously treated. The chapel has a three-light east window. Its roof, and, indeed, all the roofs, are modern. The north door, likewise a modern addition, is most awkwardly placed towards the east end near the sanctuary of the chapel. Any other position would have been better. The west end of the chapel would have suited it best.

The choir is very simple and very severe.

Two stone slabs remain in the nave, one with an inscription in Norman-French to the memory of Adam de Taunton, some-time vicar; the other in remembrance of Simon Curteis, about the same period. Each originally had brasses, but these are gone; while the inscriptions themselves are every year becoming more and more illegible. A late altar tomb of fair design, over the remains of Lord Inverary, is in the south chapel. Here traces of wall-colouring—conventional flowers, with alternately two blackbirds or ravens placed back to back—were discovered in 1849; but

of antiquity. And I likewise quite allow that, unless judicious repairs are from time to time carried out, such archaeological works of interest might be altogether lost to us. It is, however, said, by all whom I have consulted, that the restoration, made about thirty years ago, under the Rev. Mr. Watkins, Vicar, was careful, judicious, and effective. None can deny this much, though they may reasonably enough desire to have inspected the church before such restoration was undertaken.

#### THE LATE CITY ARCHITECT OF GLASGOW.

MR. JOHN CARRICK, the city architect of Glasgow, died at his residence in Park-quadrant, Glasgow, on Friday, aged 70 years, from influenza.

Mr. Carrick was, says the *Glasgow Herald*, one of the oldest officials connected with the Corporation, and the value and importance of the work he did for the city over a period of close upon half a century it is impossible to over-estimate. He was the efficient instrument in carrying out every scheme of public improvement undertaken in Glasgow throughout all these years. His knowledge of municipal matters was exact and extensive, and to this exceptional experience he added rare clearness of view and soundness of judgment. Everything which he undertook was done thoroughly. Mr. Carrick served his apprenticeship with the late Mr. John Bryce, architect, brother of the better-known David Bryce, of Edinburgh. Afterwards he was assistant to the late Mr. Herbertson, and he also spent a short time in England and in foreign travel. Returning to Glasgow, he began business in partnership with a Mr. Brown, under the firm of Brown and Carrick, but the co-partnership lasted only a few years, Mr. Brown retiring on falling heir to an estate. In 1844 Mr. Carrick entered the service of the Corporation, succeeding the late Mr. Hume in the office then known as superintendent of streets. When the City Improvement Scheme was projected, Mr. Carrick was one of its most cordial supporters, and the duty of selecting the areas to be dealt with, and of determining the method in which they were to be operated upon, were largely entrusted to him. In course of a few years, he saw a large portion of the central district, hitherto a danger and disgrace to the city, completely transformed in character and appearance. Other improvements executed or projected about this time were the formation of new squares at Bridgeton Cross and Gorbals Cross; the opening up of a fine approach to the Cathedral from the south by way of John Knox-street; the covering in of the Molendinar Burn, and the formation of a street along its course; the construction of the Alexandra Parade, and the laying out of the lands of Oatlands and Overnewton for the erection of workmen's houses. Mr. Carrick was also the architect of the workmen's dwellings in the Saltmarket, and of the model lodging-houses erected by the Improvement Trustees. To Mr. Carrick, too, fell the duty of preparing the designs for four police-stations and for the pavilion fever and smallpox hospitals at Belvedere. He also remodelled the City Hall. The question of the disposal of sewage necessarily received a large share of Mr. Carrick's attention, and the entire existing sewerage system was laid down according to his plans and under his personal supervision. Tramway routes were also laid out under his direction. The acquisition of parks by the city was another subject in which he took a keen interest. He was a member of the Glasgow Institute of Architects, a Fellow of the Royal Institute of British Architects, and a member of the Institution of Civil Engineers.

A Tudor room in Hampton Court Palace has just been cleared of its modern fittings and added to the public suite of apartments. It is known as Wolsey's Private Chapel, and is approached from the Mantegna Gallery. The interior walls, to a height of about 7ft., are panelled with oak drapery panels. Above the panelling and extending round three sides of the room is a series of pictures in oil, painted on oak panel, illustrating "The Last Supper," "The Betrayal," "The Procession to Calvary," and the "Resurrection." These have been restored under the superintendence of Sir J. C. Robinson, her Majesty's Surveyor of Pictures. The ceiling is of a geometrical design, richly ornamented with Tudor emblems.

Windows in tower.

than bricks, indicating apparently that the original Roman brickwork had been exhausted when, in reconstruction for sacred purposes, this part of the building had been reached. Here the brickwork is very broken and fragmentary, while the mortar used in building them—as I am informed—was seen to be less ancient than some of that of the older sort still adhering to them, when the latest restoration enabled a careful examination of the work in detail to be undertaken.

The stones made use of, evidently taken from the neighbouring beds, belong to the lias formation. This stone, of a sandy kind, impregnated with iron, is of a bluish tint, and hardens very much on exposure to the weather. The corners of the building are found to contain large blocks of granite, with the well-known long-and-short method of construction, the

\* For the restoration of the church several munificent gifts were offered—e.g., the family of the late vicar, Joceline Watkins, and others, gave £220; Sir Charles Isham, Bart., £150; Earl Spencer, K.G., £100; R. L. Bevan, £60. Inclusive of the above, no less than a total of £2,500 was spent prior to the church's reopening on July 11th, 1866. It is now in an excellent state, though somewhat devoid of due ornamentation.

† There remains some Norman woodwork of very high antiquity in the upper chapel of the old church of Comp-ton, near Godalming, in Surrey, which is quite worthy of inspection.

these were found to be incapable of restoration, and so were entirely obliterated. No drawings were taken of them, which might easily have been done prior to the last restoration.

Professor Willis, of Cambridge, the late Rev. D. T. Knight, M.A., of Weston Favell; and the late Mr. Parker, C.B., of Oxford, held that the round tower at the west end, appended to the square tower, was erected about, or soon after, the year 870 or 871, this latter being the first year of King Alfred the Great. At that period the Northmen overran the country, and it is clear that this tower was built, and pierced by very small windows, for the use of archers, in order to serve as a place of defence. When this addition was carried out, the chief entrance of the original square tower was necessarily blocked up, though another entrance of the same type (considerably smaller) appears then to have been made for access to the addition.

To those interested in architecture and archaeology, who have not yet had the privilege of examining foreign churches of the Basilican type, I would venture to recommend a visit of inspection to one of the most interesting in our own country—that of All Saints, Brixworth. I grant that the alterations and restorations of the present century—by no means undertaken too soon—have necessarily robbed it of some features

## Building Intelligence.

**BEVERLEY.**—New offices for the East Riding County Council are about to be erected at Beverley. The buildings, which will be situated in Cross-street, on the site of the old Mechanics' Institute, provide a suite of offices on the ground floor for the clerk to the Council, and large strong-room for the county records; also four offices for officials. The entrance is through a stone doorway and portico into a spacious corridor, which leads to the staircase hall. The staircase is to be constructed of oak. On the right side of the corridor on entering is a large committee-room, with bay window. The Council chamber on the first floor, will be 56ft. by 36ft., and semi-circular in arrangement. It will be broken up by deeply-recessed bay windows and fireplaces. The fittings are to be of oak, and the ceiling and walls will be enriched with panels and pilasters. On each side of the landing will be members' rooms, and there will be a large committee room on the same floor. The public gallery will be on the second floor, and admission to it will be gained by a side entrance from Register-square. The buildings are to be of red brick with stone dressings, and the style selected is English Renaissance. The estimated cost is £4,500. Messrs. Smith and Brodrick, Hull and Goole, are the architects.

**EDINBURGH.**—On Monday a meeting of the landward heritors of St. Cuthbert's parish was held, for the purpose of considering a report by Messrs. Cunningham, Blyth, and Westland, C.E., in reference to the stability of the foundations available for the proposed extension of the church towards the east. Messrs. Cunningham, Blyth, and Westland's report was to the effect that it would be advisable to dig down, but that such digging down would interfere with certain of the graves, and the meeting adopted a resolution sanctioning the kirk-session, at their own expense, to make such excavations in the east part of the burying-ground as were necessary to ascertain if solid ground were there available for satisfactory foundations, and, further, authorising the kirk-session to proceed with the building, provided, after the excavations, the stability of the plans was vouched for by some "eminent builder" to be employed by the heritors at the expense of the kirk-session. Dissent was intimated on the ground that the proposed extensions would interfere with the graveyard.

**JESMOND, NEWCASTLE-ON-TYNE.**—The new High School for girls in Tankerville-terrace, Jesmond, was opened on Saturday by Miss Helen Gladstone. The buildings have been erected in the Queen Anne style, from designs by Messrs. Oliver and Leeson, of Newcastle. All the teaching department proper is on the first-floor level. Centrally situated is the large assembly hall, with an open-timbered Jacobean roof. Surrounding it upon three sides are corridors, giving access to a range of six class rooms, the chemical laboratory, and the art department. There are two staircases, one at either end of the main corridor. Upon the ground floor are the junior and senior children's cloak-rooms, assistant-mistresses' common room and cloak-room, porter's office, lady superintendent's room, dining hall, and kitchen department, with the caretaker's living rooms. Beneath the large assembly hall is the gymnasium. In the rear is the playground. The buildings are carried out in Sherburn red bricks, with red terracotta mouldings, and red Corncockle stone dressings. The roofs are slated. Accommodation is provided for about 250 pupils. The works have been carried out by Messrs. Haswell and Waugh, as general contractors, at a cost of about £5,000. Mr. Robinson, and lately Mr. Armstrong, acted as clerk of works.

**LINCOLN.**—The drill-hall which Mr. Jos. Ruston is having built for the Lincoln Rifle Volunteers will be opened on Saturday, 24th inst., by the Right Hon. E. Stanhope, Secretary of State for War. The new hall has a front facing Broadgate, and extends back to Free School-lane. The drill-hall is 135ft. by 50ft., having a floor of wood blocks laid in pitch upon a concrete foundation, walls of red brick, and an iron-framed roof, with skylight extending almost from end to end on the north side. The main entrance to the drill-hall is from Broadgate, by means of oak folding doors. On the right of the main entrance is an officers' room, and on the

left are the adjutant's and his orderly's rooms. Immediately over these is the men's room, which runs the width of the whole frontage of the building, and is capable of being divided by a revolving partition. There is also on this floor a gallery looking into the drill-hall. The staircase leading from the second floor to these upper places is wide, and receives plenty of light from the main hall. Along the right wall of the drill-hall are doorways leading to the caretaker's abode, the gymnasium, and the store-room for clothes. Above the last-named is the sergeants' room, and the same staircase leads also to the band-room. On the left of the drill-hall are the magazine and the armoury, with workshop adjoining. Underground is a double Morris-tube range with a centre passage for marksmen, and a room at the firing point 35ft. by 15ft. The building is to be heated with hot air, the heating chambers being underground. Messrs. Goddard and Son are the architects, Messrs. H. S. and W. Close the builders, and Mr. Simpson is the clerk of works.

**LONDON SCHOOL BOARD.**—At the last meeting of this board it was reported that a recent examination of the Buckingham-terrace Board School, Chelsea, showed that serious defects existed in the drainage. The Chairman drew attention to a serious discovery which had been made in the Works Department as to a wholesale destruction of documents relating to the construction of schools some years since. Facts had been brought to the knowledge of the Board with regard to the building of the Kilburn-lane Schools which had led to the Board taking a legal action for redress against the builders, and in the usual legal preliminaries it was found that documents relating to these schools were no longer under the control of the Board. It was then ascertained that one of the officials, the head of a room in the architect's department, had been in the habit of systematically destroying the weekly reports of the clerks of works, in connection with the erection of new schools, six to nine months after the completion of the schools. The official in question claimed that the destruction was carried on openly and for the purpose of providing much-needed room, and he alleged that the late architect and other officials of the Board were cognisant of it. He admitted an error of judgment; but the matter was too serious a one to be treated in this light, and he moved that the official should be called upon to resign. An amendment that the official should be informed that to destroy the papers as stated was a grave error of judgment, and that a repetition of such conduct would be incompatible with further service under the Board, was, however, carried by 32 to 10.

**SOUTH MORNINGSIDES.**—St. Matthew's Established Church, South Morning-side, Edinburgh, was opened for public worship on Friday. It has been built from plans prepared by Mr. Hippolyte J. Blanc, of Edinburgh. Erected on a prominent site on the Braid estate, the building is carried out in the Early Decorated style. Provision has been made for an extension at the south-east end of the site, and the church, when finally completed, will provide accommodation for 1,000 persons. A tower and spire, rising to a height of 180ft., will ultimately be placed at the north-west angle. The masonry throughout is of red stone. Internally the plaster has been treated with colour, to remove the usual raw finish of white plaster and secure a harmony of effect with the stone dressings. In the spandrels between the arches the plaster has been enriched with diaper ornament in low relief, and the arched ceiling of wood is also relieved with ornament. The glass is clear throughout, relieved with faint ornamental outlines. The cost is about £6,000.

The International Exhibition of Electrical Engineering, General Inventions, and Industries at Edinburgh was opened on the 1st inst. by the Duke of Edinburgh. It has been built from designs by Mr. Allan W. Carter, C.E., who has adopted in the treatment of the façades features from styles so diverse as the French Renaissance and Japanese.

On Saturday afternoon a chapel, which has been added to Bath College, was opened by the bishop of the diocese. The building is Greek in character, with details to correspond with the fronts of the college and head master's residence, which connects it. It is built on the old playground, and consists of a nave, with seats for 260 persons, and a chancel accommodating a choir of 48. The seats are of pitch-pine. The chapel has cost £2,400.

## Engineering Notes.

**THE TOWER BRIDGE.**—At the last Court of Common Council a letter was read from Mr. J. Wolfe Barry, the engineer, in which he said the time fixed with Messrs. Arrol and Co. and Messrs. Perry and Co. for the completion of their contracts for the Tower Bridge was July, 1891, and Sir W. Arrol expressed his confidence at being able to adhere to the contract date, but it might probably be the end of 1891 or the beginning of 1892 before the bridge was finished. The approaches on both sides of the river were far advanced, with the exception of the paving, which would be done at the same time as the bridge. The hydraulic machinery was nearly completed, and would all be ready in time. The slow progress made with the foundations was owing to the necessity for making arrangements for carrying on the river traffic while the bridge was being erected.

## ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

**LIVERPOOL ARCHITECTURAL SOCIETY.**—The closing address for the present session was delivered on Monday evening by Mr. T. Mellard Reade, who has been re-elected as President. He remarked that that hardy annual, "the Architects' Registration Bill," was again budding forth. It commanded, he said, enthusiastic support from a small, but apparently compact, body of architects, but hitherto had failed to enlist the profession in its favour. The Institute at present represented the views of the majority of architects, and so long as their representative body opposed the Bill it was unlikely to pass into law. He was personally averse to sudden changes, but eventually it might, he admitted, be desirable to support such a measure. The call lately made for compulsory examination was another phase of the same desire for legislative aid in securing reforms, and he would also advise its promoters to wait awhile and see the effect of the present voluntary examinations. As to competitions, he felt that the increasing readiness to enter the field for rewards utterly inadequate as a remuneration when won tended to degrade the profession. All the evils of competitions were due to this undignified eagerness of architects to submit plans on any and every occasion. Having alluded with satisfaction to the success of the student classes recently organised by the Association, Mr. Reade proceeded to deal with the subject of "Plainness and Picturesqueness" in detail.

**NORTHERN ARCHITECTURAL ASSOCIATION STUDENTS' SKETCHING CLUB.**—At a meeting of associates and students interested in the formation of a sketching club in connection with the Northern Architectural Association, held on March 25th, it was resolved:—"That it is desirable to form a club, having for its object the frequent meeting together of the younger members of the profession for the purpose of sketching and measuring buildings of architectural interest in the district," and, as a result, the above-mentioned club has been called into existence. The first meeting was held at Durham Castle on April 20th, and on Saturday last the members met at Seaton Delaval Hall, and it is proposed to continue the meetings fortnightly. The committee of the club is formed of three members: Messrs. R. B. Dick, Edmund Rich, and Charles S. Errington, hon. sec.

The Princess Louise opened, on Tuesday, the Arts and Crafts Exhibition at Torquay, and laid the memorial-stone of the new pier and harbour works, which are to be carried out for the general improvement of the town as a yachting station, at a cost of about £30,000.

Monkleigh Church, near Torrington, Devonshire, has just had an important addition to its chancel-fittings in the form of an elaborately carved and decorated oak Communion table in the Late Decorated style. The front is divided into five panels, the central one being largest; the construction of its tracery forming a cross embellished with the Agnus Dei on a gold ground, and surrounded by rays. The side panels have traceried heads with carved spandrels and with sacred monograms in gold inclosed in decorated vesicas. An embroidered super-frontal has also been supplied. The whole of the work was intrusted to Messrs. Jones and Willis, of Birmingham and London.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

## NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII, XLVI, XLIX, L., LI, LIII, LVI, and LVII may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—W. and G. F. R. Co.—D. C. C.—W. E. R. and Co.—G. and Co.—B. C. B. I.—W. H. H.—C. of W.—G. W. R. Co.

## Correspondence.

## THE YORK COURTS OF JUSTICE.

To the Editor of the BUILDING NEWS.

SIR,—My attention has just been drawn to the paragraph relating to the Courts of Justice, York, in your issue of the 25th of April.

This report may lead to erroneous impressions in the public mind, and in justice to myself I have to ask you to make the following corrections:—

The statement of the Lord Mayor as to the rise of ten per cent. in prices does not apply to the original contract (which is £3 less than the amount stipulated), but to additional work estimated for since the contract was signed.

The statement that concrete was substituted in place of lime is badly expressed. Concrete was estimated for, composed of lias lime; but owing to the uncertain nature of the ground, I deemed it advisable to recommend the committee to adopt cement concrete, thereby entailing an additional expenditure of £261 9s. 1d.

I think it is only right to amplify your list by the following works, added to the contract, making up the grand total.

Additional plate glass, marble mosaic in entrance hall and corridors, tile dadoes and scagliola marble columns and pilasters, tower and dormers in oak instead of pine, facing bricks 2½ in. instead of 3 in. thick, additional price for clock, bells, &c., tiles on lavatory walls, main entrance doors in oak instead of pine, &c.

Trusting you will find room for this in your next issue—I am, &c., HUGH A. MATEAR.  
Liverpool and London.

## SETS OF QUANTITIES.

SIR,—Upon comparing the sets of quantities now being published, on the London system, with those of the North, I cannot help thinking

This column shows on what part of building the dimensions are intended.	Numbers.	Dimensions.	Squaring.	Deductions.			This represents the Bill of Quantities ready for lithographing.
				Numbers.	Dimensions.	Squaring.	
A. and W. ....	3/	55 0 17 0	935 0	3/	3 0 3 6	31 6	Yds. ft. Sup. 341 1

		4 0 8 3	33 0				
			391 5				
< B >	<	C	>	<	D	>	E

The following is the usual procedure by the surveyor using this system. Firstly, He writes a true specification for the item he is about to measure in column A. Secondly, The parts of building where the item is required, column B, following with the dimensions in C, and deductions in D.

This really is all the surveyor need do, having previously, when writing the description, stated how the item to be charged, as, for instance, yards, feet superficial of 1½ brick, &c.; each sheet as completed is given to assistant who square, cast, and extend. The columns A and E represent the bill for lithographing.

the latter are far superior in every respect. I take the liberty to forward one sheet, on the paper used for the draft, with explanatory notes. I have used the North system for upwards of fifteen years for works varying from £3,000 to £30,000.—I am, &c.

GEO. T. HOWELL, Architect and Surveyor.  
31, Cock-lane, London, E.C., May 5.

## PROVISIONAL AMOUNTS IN QUANTITIES.

SIR,—As "Twice Charged" asks me to give information on this subject, I can only state that I have never known a case of "surveyor's provisions," and, as before stated, I will not believe the surveyors do anything of the kind.

It is very easy to write in a building paper that surveyors do all sorts of things. Anonymous scribbles can stab in the dark; but if "Twice Charged" really knows of cases, why does he not name them, and, above all, give us his full name and address, that we may know who it is that throws mud in the hope that some will stick?

I think that persons should not anonymously attack others on mere hearsay evidence; there should be a clear case stated, with ample proof.

What would "Twice Charged" think if I were to make some statements about builders and their managers based upon the doings of some fourth-rate contractor, and then try to persuade your readers that there were no honest builders?

In conclusion, I may ask, Why is "Twice Charged" putting himself forward to protect the much-injured client?—I am, &c.,

26, Budge-row, E.C. HENRY LOVEGROVE.

SIR,—"Twice Charged" has his finger in a crack in a faultless system, and is trying to make a big hole of it. Provisional quantities inserted by a surveyor are rare, and in the few cases where they are inserted, it is done to meet an emergency, and is perfectly justifiable. I defy any surveyor taking out the length of lead pipes to an addition to a house, say, 100 miles from his office, to do so absolutely correctly. There is a rush to get the job done, time does not admit of an inspection of the site, the length of pipe is calculated as near as possible; but to meet a possible extra, a provisional length is inserted, which, together with the usual architect's provision, is omitted in nine cases out of ten by the architect at the settling up of the job without the surveyor being called in at all.

The large provisions of 200yd. cube of concrete, &c., must be taken with a provisional amount of

salt (to be deducted at the completion of letters), to say nothing of the other amount mentioned by "Twice Charged." It must have been a very big job to justify such insertions and a very incompetent surveyor afraid of quantities, and a very sleepy architect, too.

To charge a large body of men with insertions to swell the commission, is a gross palpable falsehood, and not worth answering. If "Twice Charged" were a surveyor, he would think less of our getting commission on a mortar provision; for, surely, something must make for work which does not pay, and on which, actually works to reduce his commission—for instance, in the not infrequent case of reducing estimate when the tenders are too high; or, when after the bills are all but written, a cheap material is substituted for another, which has been measured in a different way, such as zinc lead, distempers for paper. Quite lately I had a letter from an architect after the bills were ready for lithography, substituting stain for a varnish for painting for various rooms. Here we have work measured twice and only once charged for. This omitting one item and substituting another after the work is done is most puzzling work, and requires great care.

How often does the surveyor write specifications, supply tracings, find out construction errors, and make most valuable suggestions?

"Twice Charged" may be sure that when surveyor gets a double commission on a provisional amount, the seeming injustice disappears when consideration is taken of the frequent case of work being measured twice and not paid for. Let him think of another instance, not infrequent when an architect sends a rearrangement of, say the kitchen offices, or adds another bedroom to a building after the quantities are nearly prepared.—I am, &c.,

TWICE WORKED, ONCE PAID.

SIR,—The question of the use of the term "prime cost" versus "value" as applied to the amounts does not receive much enlightenment at the hands of "A Disgusted Surveyor." There is no argument for the use of "net prime cost" that because the builder gets a long discount on certain classes of goods (though nothing like so much as stated) that therefore he ought to be jockeyed out of it as much as possible by the mere blind of adding "the profit to be added" on the stated amount.

Mr. "D. S." must be a very "overgrown schoolgirl" indeed—probably a barely "fledged one" (to use his own similes)—if

inks that in these cutting days of competitions builder trying to get the job would put any profit on these amounts as invited; any builder who would soon find himself out-distanced by his competitors. In the first place, there is the uncertainty attaching to the very use of the words "prime cost," whether accompanied by the rider "profit to be added" or not; in the second place, the custom has prevailed so long of considering "prime cost" to be the "list price," or p.c. to the client, that any builder would naturally hesitate before adding any further profit to such prices; and in the third place, it is usual among the large majority of architects, to whom these matters generally have to be referred, to allow the list prices to stand even after "net p.c." and "profit to be added" have been stated in the quantities, for, as it has so frequently been pointed out to them, it is the profit in the whole job which has to be considered, not that on particular items.

The profits on modern building contracts, instead of being "rapaciously greedy," as they seem to exist in the mazy ideas of a "D. S.," would more often than not appear to disinterested observers as though the builder had unselfishly executed the work for the client at its actual cost, and surveyors with any knowledge of prices at all know that such is the case.

Supposing the profits on certain classes of goods to range rather high, can a "D. S." deny that the fixing items on the same goods are often, by stress of competition, priced far below their actual value in view of these long discounts? Where, then, is the "rapacious greediness" he so enlarges upon? Again, when a provisional amount of rods of brickwork, or cube fir, is inserted, the term "net p.c." cannot be made to apply. A builder may make 50 per cent. on such items for all that a surveyor cares, and yet not be open to the charge of rapacity; but when the case is a stove or kitchener, the builder is not to be trusted to supply them without divulging his profit to the surveyor—i.e., the client's representative.

What builders maintain is that neither architects nor surveyors have any right to go behind the list prices, for the simple reason that they are the client's representatives, and, as such, have no right to abuse their position in taking advantage of the knowledge of trade customs which they gradually acquire to take a mean advantage of the builder on certain classes of goods. It is nothing less than "sweating," disguise it as you will—an attempt to obtain goods for their clients at a lower price than they can buy them themselves, and as such cannot be too strongly protested against by all parties engaged in trade.

Surely a "D. S." is aware that builders do not live entirely by building contracts. Perhaps he will feel more disgusted still when he is informed that it is no unfrequent job for a builder to have to supply and set kitcheners, stoves, or mantel-pieces, provide and hang wall-papers, and also do small, plain building jobs without the intervention of either an architect or surveyor; and yet this sapient "D. S." would have your readers believe that our clients have been little less than swindled because we show them "fancy catalogues" for their guidance, and then execute the work at charges based on the prices therein.

The sneer of interested motives comes with a very bad grace from one who is trying to defend the charges of his own profession, and had much better not been advanced. Nothing is gained by vituperation. What is wanted is some solid argument as to why the term "prime cost," with its twofold meaning, should be used instead of "value," which expresses far better what the amount ought to be. Some reasonable argument as to why such a term should be seen in an account, for, after all, a bill of quantities is an account of work required—some solid reason why surveyors ought to go behind the list prices; these are the questions at issue, not the charges of surveyors.

A "D. S." may not swallow the arguments I brought forward in the opening letter of this discussion, but he cannot deny that the present system is somewhat anomalous, and he has not attempted to refute the theory of these provisional amounts as there stated. I will advance yet another theory, and that is, the term "prime cost" is essentially a trading term, invented solely by those engaged in the occupation of buying and selling at a profit, for the purpose of distinguishing between the first cost and the cost after adding all the incidental expenses connected with the goods; used as such it has a definite meaning, in any other capacity it is out of place.

To those, therefore, who have nothing to do with the actual buying (i.e., paying) and selling, the term has no meaning. To put the case in its most absurd light, imagine a person going to a merchant and saying, "I want such and such an article, of which your *strict prime cost* was so and so—of course I must pay your profit if you want any—but still the amount I have stated is to be your actual prime cost." Yet this is the sort of thing which is being done every day by architects and surveyors, only they write it instead of going to the shop and saying it.

In conclusion, I should like to say that I have no sympathy with "Twice Charged" and "Another Builder's Manager," and I am sure builders generally do not sympathise with such "washing of dirty linen in public"; the responsibilities of quantity surveyors are such that they deserve all they earn, and if it were not for the opportunities which occur in most contracts of being able to charge three times on some items, the percentage charge on the whole job would doubtless have to be raised; but in saying this I still think "D. S." has no right to complain if "full fledged" contractors make reprisals for the harsh grinding-down treatment they sometimes receive, if not from him, from others in the same profession.—I am, &c.,

A BUILDER'S MANAGER.

SIR,—As "A Disgusted Surveyor" appears to have got rather mixed in reading the letters on the above subject, will you please allow me to say in answer that the case I referred to was not a provisional amount, but the whole of a roof-covering of a large building?

I can also refer him to several sets of quantities upon which 3 per cent. has been charged and paid.—I am, &c.,

ANOTHER BUILDER'S MANAGER.

## Intercommunication.

### QUESTIONS.

[10276].—**Speaking-Tubes.**—Will some one who has had experience in the matter be good enough to tell me how the following difficulty can be got over? There are several independent  $\frac{1}{2}$  in. compo. tubes of moderate lengths between various rooms. In any room anyone listening at the tube can hear a conversation in ordinary tones going on in the room with which the tube communicates, though this end is closely plugged. One of the tubes, by way of experiment, has been cut away for 2ft., indiarubber pipe substituted, but of no avail.—TUBE.

[10277].—**Oak Shingle.**—I have to cover a spire with oak shingling. Would some reader kindly give me particulars how to carry out same, stating the sizes and thicknesses, and whether lapped as slate, and how best secured, &c.?—E. X. D.

### REPLIES.

[10273].—**Fire Regulations.**—There are no regulations in the county of London affecting the doors of churches and chapels; such places would be death-traps in the event of a panic. Theatres and music-halls must be carried out in accordance with the regulations of the County Council.—H. LOVEGROVE.

### CHIPS.

New dormitories and dining-rooms have been erected at Stratford for the Great Eastern Railway Company, and special attention has been paid to the ventilation; the extraction of the vitiated air being effected by the latest improved form of Messrs. Robert Boyle and Son's self-acting air-pump ventilator.

According to the Administration of the Fire Brigade of Paris, there were in that capital in 1889 one thousand and fifty-nine fires, destroying property valued at more than four and a-half millions of francs. Thirty-six of the fires occurred in the Exhibition buildings.

A strike in connection with the building trade at Cardiff is threatened, the employers having conceded an advance in wages, but declined to give way on the question of hours of labour.

The dissolution of partnership between W. R. Green, H. C. Walker, C. Day, and J. B. Nicholson, trading under the style of R. Waymouth and Co., Roberts-place, Falmouth-road, Southwark, and elsewhere, engineers, is announced in Friday's *Gazette*, so far as regards W. R. Green.

In connection with the London Society for the Extension of University Teaching, Mr. Arnold B. Mitchell, M.A., is delivering at Gresham College on Saturday afternoons a series of lectures on English Architecture. The object of the course is to give students such a practical knowledge of the subject as will enable them to date buildings belonging to any period of English Gothic architecture. Mr. J. J. Baddeley, C.C., occupied the chair at the first lecture, which was given on Saturday last.

### LEGAL INTELLIGENCE.

**CONTRACTORS IN ARBITRATION.**—At the Royal Hotel, Southampton, on Tuesday week, before Mr. S. W. Durkin, manager of the Southampton Gasworks, acting as arbitrator, the case of J. W. Roe and Co. v. Edward Cockey and Sons, Limited, was commenced. An action had been entered in the High Court and referred to arbitration. Plaintiff is a builder and contractor, of Southampton, and sought to recover from the defendant Company, who are engineers and contractors, of Frome, Somerset, the sum of £287 18s. 5d., balance due for work done and materials supplied. The gross amount of the claim was £601 5s. 5d., and from this was deducted £300 for cash received, and £13 7s. contra account. Defendants put in a counter-claim, in which, except as to £46 4s. 11d., paid into Court, they disputed the claim. The defendants contracted for the erection of gasworks for the Wilton Corporation in 1888, and employed the plaintiff as contractor for the building of a gas-holder tank. They alleged that by reason of plaintiff's carelessness and breach of contract they were compelled to complete the work, and expended a sum of £141 13s. 6d. in labour and materials, and that, further, they had incurred a penalty of £100, which sum had been deducted by the Corporation of Wilton. On Wednesday, when the case was closed, plaintiff gave evidence at length, and among other witnesses were Mr. J. Lemon, J.P., and Mr. W. B. G. Bennett, borough surveyor of Southampton, as experts. The Arbitrator announced his intention of making his award on June 1st.

**ALLEGED CONTRAVENTION OF THE BUILDING ACT.**—Charles Shepherd, builder, of Bermondsey, and formerly Chairman of the Building Committee of the late Metropolitan Board of Works, appeared at the Mansion House, before Alderman Evans, last Friday, to a summons issued by Mr. M'Lachlan, district surveyor of the Ludgate Hill district, alleging that in certain alterations he had made in the premises of Messrs. Samuels, at 57, Ludgate Hill, he had contravened the provisions of the Metropolitan Building Act in the erection of a certain roof upon the party-wall at a greater angle than forty-seven degrees to the horizon, the premises being used for the purpose of trade and manufactures. The summons also alleged that notice had been given to the defendant to remove the erection complained of, and that no notice had been taken of such notice by him. Mr. Selway, solicitor for the defendant, took a preliminary objection to the summons, contending that inasmuch as the work on the premises was completed in December last, even supposing he had infringed the law, he had no right to go upon the premises, as he would be liable to an action of trespass. He cited the case of "Boulton v. the Vestry of St. George's, Hanover-square," in support of his argument. The Alderman over-ruled the objection. Mr. M'Lachlan stated that a kerb roof should have been erected with two slopes instead of one. He admitted, in cross-examination, that similar roofs to the one erected by defendant had been passed by his predecessors in office, and that such roofs were common all over the City, and no complaints had been made with regard to them. Mr. Selway contended that the premises in question were used, not exclusively for the purposes of trade, but were part of a dwelling-house. The Alderman adopted his view and dismissed the summons, but refused costs to defendant.

A Local Government Board inquiry has been held at Littlehampton by Mr. J. T. Harrison, M.I.C.E., one of the inspectors, with reference to an application of the Littlehampton Local Board for borrowing £600 for works of water supply. Evidence was given by the surveyor, Mr. H. Howard, who also submitted plans and specification of the proposed works. There was no opposition to the scheme.

The British and Colonial Explosives Company, Limited, have commenced the erection of works at Perran, on the north coast of Cornwall, about 10 miles from Truro. There will be about 40 separate buildings, the largest being the nitric acid factory, 250ft. long by 40ft. wide. The danger buildings are separated from each other by immense earthworks. The present contract amounts to about £10,000, and houses for manager and workpeople will probably be added, the site being isolated. The contractor is Mr. A. Carkeek, of Redruth, and the architect Mr. James Hicks, Vice President, S.A.

In the Queen's Bench Division on Saturday, before Mr. Justice Wills and a common jury, an architect's draughtsman at Poole, named Sparks, was awarded £150 and damages for the loss of an eye by a shot fired by the defendant while rabbit-shooting. For plaintiff it was proved that, in addition to the personal injury and disfigurement, pain and loss of time, his salary had been reduced from 35s. to 25s. per week. The defendant will appeal to a higher Court on the ground that he displayed no negligence.

## Our Office Table.

THE erection of the new Public Library in Bethnal Green will probably now be soon commenced. Sir Thomas Fowell Buxton announced, at the last meeting, that Mr. J. Passmore Edwards, the proprietor of the *BUILDING NEWS*, the *Weekly Times* and *Echo*, the *Echo*, the *English Mechanic*, and other well-known papers, had promised £20,000 towards the project, quite unconditionally, and not, as is stated in some of the papers, contingently on any other sum being raised by public subscription. The matter is being warmly taken up locally. The Committee had already about £4,000 in hand, and it is hoped the building will be speedily finished for use.

THE report of the progress of the Ordnance Survey up to the end of last year, just presented to Parliament in the form of a Blue Book, states that plans of 23 towns were published during the year 1889. Plans of all towns in England and Wales have now been published. There have been published during the year 5,467 miles on the 1-2500 scale, and all England and Wales, with the exception of Lancashire and Yorkshire, have been surveyed on that scale. These were to have been completed by the end of March last. All the counties have been published on the 6in. scale, with the exception of Devon, Salop, and Wilts. The map of England and Wales on a scale of four miles to an inch is in the hands of the engravers, and the outline edition is in a forward state. The book also contains particulars of the work done in Scotland and Ireland. The cost of the Cadastral Survey was estimated in 1878 as about £1,900,000. The expenditure up to the end of 1889 was £1,697,078, leaving £202,322 to complete the survey from the beginning of this year.

AFTER holding a dozen sittings, and hearing a great mass of professional evidence for and against, the Select Committee of the House of Commons on the Central London Electric Railway Bill decided on Tuesday that the preamble had been proved, on the understanding, among other conditions, that a compensation clause should be inserted in the Bill similar to the one in the Midland Railway Bill, 1881; that stringent clauses should be inserted affording every opportunity to the engineers of the Corporation of London and of the County Council to inspect the works during their progress, lest any possible damage should be done to the sewers; and that until the City and Southwark Subway (of which, as well as of the proposed line, Mr. Greathead is the engineer) had been opened and used by the travelling public for a certain time no prospectus should be issued or capital raised by the Central London Company. The committee will meet again on Tuesday next for the discussion of clauses.

THE New York Chapter of the American Institute of Architects, at their last meeting, agreed to a protest, couched in dignified language, against a measure now before the Assembly, entitled "An Act for Fixing the Salary of the Commissioner of the Capitol." By this Bill it is proposed to appoint the present superintending architect of the new Capitol Building at Albany, Mr. Perry, architect to the State, at a salary of 10,000 dols., and to give him charge of all building projects for the State. They point out that the result of the Bill would be to throw the design and construction of all State buildings into the hands of one man, selected, as a rule, for reasons other than the highest æsthetic and constructional ability, and that, while such a measure would deprive the people of the State of New York of the services of the best members of the architectural profession, and provide an insufficient substitute, it would at the same time deprive the architects of the State of the natural rewards of eminence in their profession. It would further repeat the evils surrounding the constitution of the office of the supervising architect of the Treasury in Washington, as admitted in the official report for 1875. The scheme of an official architect is, the memorialists point out, more expensive to the taxpayers than if the State engaged the services of the best architects at the usual rates of remuneration. They suggest that the appointment of an architectural commission or advisory board, consisting of three architects and two State officials, would secure the best architectural results. The suggestion is a novel one in the

States, though following the practice in France, and it will be interesting to see how it is received.

MR. THOMAS WALSH, a well-known architect of St. Louis, died recently in that city at the age of sixty-five. Mr. Walsh was an Irishman, from Kilkenny. He emigrated to America in 1852, and soon settled in St. Louis, where he built up a prosperous business. He designed the Custom House, the Insane Asylum, the Poor-house, the Polytechnic School, the first University Building, the Four Courts, St. Xavier's Church, and many other important structures in that city. He leaves only one son, Mr. Robert Walsh, also an architect.

## MEETINGS FOR THE ENSUING WEEK.

TUESDAY.—Society of Architects. "Public Elementary Schools," by E. Tidman, St. James's Hall, Piccadilly. 7.30 p.m.  
Institution of Civil Engineers. Discussion on "The Screw Propeller." Paper on "The Kewick Water Power Electric Light Station," by W. P. J. Fawcens and E. W. Cowan. 8 p.m.  
WEDNESDAY.—Society of Arts. "Professor Elihu Thomson's Electro-Magnetic Induction Experiments," by Dr. J. A. Fleming. 8 p.m.  
THURSDAY.—Architectural Association Lyric Club. Concert at Mona Hotel (Ladies' Night). 7.30 p.m.  
Society of Arts. "Design Applied to Wood-carving," No. 3, by Lewis F. Day. 8 p.m.  
FRIDAY.—Architectural Association. Business Meeting to consider Report of Education Committee. 7.45 p.m.  
SATURDAY.—Municipal Engineers' Association. District Meeting at Hereford. 11.30 a.m.

Architectural Association, 9, Conduit-street, W.—May 16. Last Ordinary Meeting of Session. 7.30 p.m. Election of officers. Special Business Meeting (7.45 p.m.) for Members only, "To Consider Report of Special Committee on Education, &c."

FRED. R. FARROW. } Hon. Secs.  
ERNEST S. GALE. }

The foundation-stone of a Working Men's Institute at Lostwithiel was laid on the 30th ult. The building is being erected at a cost of £800, from plans by Mr. A. E. Skentlebury, Messrs. Bassett and Brown being the contractors.

New church schools at High Brooms, Tunbridge Wells, were opened on Wednesday week. They are built of brick, with terracotta dressings and gabled roofs of red tiles, and comprise two school-rooms, each 45ft. by 21ft., and two classrooms. Mr. Elphick was the architect, and Mr. C. J. Gallard, of Southborough, the builder.

At the Manchester Consistory Court on Friday a faculty was granted for the restoration of St. Philip's Church, Bradford-road, Manchester, at an estimated cost of £1,000. The works will include reseating, provision of new pulpit and font, opening out of two windows in sanctuary, and decoration.

The Belgian Government has bought for the Brussels Museum, at the price of 80,000fr., the celebrated picture by Rubens representing four heads of negroes, which was formerly in the Demidoff Gallery.

The Schools and Chambers Committee of the Newcastle City Council have instructed Mr. Sherbrooke, of that city, to prepare plans and estimates for a proposed new Home for Incurables at the Moor Lodge.

A design by Mr. George Washington Browne, of Edinburgh, has been adopted for the rebuilding of the Y.M.C.A. premises at Kirkcaldy, as a memorial to the late Provost Swan. The proposed outlay, exclusive of site, which is given, is about £3,000.

The next two meetings of the Royal Society of Antiquarians of Ireland, till recently known as the Royal Historical and Archaeological Association of Ireland, will be held in the Town Hall, Kilkenny, on Tuesday, the 20th inst., and at Athlone on the 8th July.

A series of alterations and improvements have just been completed at the offices of the Gas-Light Company in Waterloo-place, Edinburgh, for the Joint Gas Commissioners, from designs of Mr. P. L. Henderson, architect, of that city.

Memorial stones of a Bible Christian chapel were laid at St. Austell on Friday, adjoining the present chapel, which will be converted into schools. Mr. F. C. Jury, of St. Austell, is the architect, and Messrs. W. J. Blamey and S. Hunkin are the contractors.

It is proposed to erect a new United Methodist Free Church in Newport, Mon. Plans are being prepared by Mr. Alfred Swash, M.S.A., of Friars' Chambers, Newport.

## Trade News.

### WAGES MOVEMENTS.

YORK.—The bricklayers' labourers' of this city are on strike for an advance of 4d. per hour—from 4½d. to 5½d. They have refused to accept an offer made by the Master Builders' Association of 5d. per hour.

### CHIPS.

Mr. Harvey will exhibit next Thursday, at seven o'clock, at the City and Guilds of London Institute, the model made by the Class of Masonry of a groined vault over the crossing of semicircular arches of unequal spans. Everybody is invited to come and see the model. To architectural students, Mr. Harvey will offer to give gratuitously a few lessons on this vault, in order to prepare them for the Masonry competition.

The Late Norman font in Brushford Church, on the Exe, has just been restored by Mr. Harry Hems, of Exeter, under the direction of Mr. C. H. Samson, of Taunton. A large new central shaft and four detached angle columns, all of Purbeck marble, have been provided, and also a new base of red Corsehill sandstone.

Messrs. Hosken, Trevethic, Polkinghorne, and Co., Limited, millers, corn, wool, and manure merchants, the firms having recently been amalgamated with a capital of £250,000, are about to erect central offices at Hayle, Cornwall, from plans by Mr. James Hicks, of Redruth.

Lord Justice Fry granted on Monday a writ of sequestration against the Corporation of Wolverhampton for disobeying an injunction restraining them from polluting Pendeford Brook with sewage, but suspended its operation for six months.

The bronze equestrian statue of the late Prince Consort, which has been presented to the Queen by the women and girls of the United Kingdom as a Jubilee offering, was completed on Monday on Smith's Lawn, Windsor, and is ready for inauguration by Her Majesty on Monday next. It is the work of Sir Edgar J. Boehm, R.A., and stands on a pedestal of Aberdeen granite, provided by Messrs. Alexander Macdonald and Co., of Aberdeen.

The personal estate of the late Mr. Thomas Andrew Walker, of 15, Great George-street, the contractor for the Manchester Ship Canal, the Barry Dock, and the Severn Tunnel, who died at Chepstow on the 25th November last, aged 61 years, has been sworn of the gross value of £982,243, and of the net value of £551,694.

A choir vestry is about to be added to Holy Trinity Church, Wakefield, from plans by Messrs. Simpson and Richardson, of that city.

Mr. Maclure, M.P., has received a donation of £2,500 from Mr. James Jardine, late high sheriff of Cheshire, for the restoration of the south porch of the Manchester Cathedral. The north porch has just been rebuilt by the generosity of three donors at a cost of £5,600.

A stained-glass window has just been placed in the Beach Mission Chapel, Broughton Ferry, N.B., as a memorial. The subject is Christ bearing the Cross, and Messrs. Powell and Sons, London, were the artists.

Mr. J. T. Harrison, M.I.C.E., held an inquiry at the local board offices, Walker-on-Tyne, on behalf of the Local Government Board, as to the application by the board for sanction to borrow £5,600 for the purpose of completing a recreation-ground, and for works of private improvement.

In consequence of the reduction of work, owing to the Flintshire County Council having taken over the supervision of main roads, the Holywell district highway board have reduced the salary of their surveyor from £150 to £100 per annum.

The Camlochie Institute, Great Eastern-road, Glasgow, was opened on Friday. It is Late Renaissance in style, cost £4,000, and contains a large and small hall, seated for 700 and 200 persons respectively.

The Wilton Town Council, acting as the urban sanitary authority, have decided to provide a new cemetery for the town. Mr. Fred Bath, F.R.I.B.A., F.S.I., of Salisbury, has been appointed architect for the work.

A "ladies' night" concert and exhibition of drawings will be given by the members of the A. A. Lyric Club at 9, Conduit-street, W., on Thursday, the 22nd inst.

Holloway's Pills improve the appetite, strengthen the digestion, regulate the liver, and act as gentle aperients. Their pills are suited to all ages, and their inventor's fame has resounded through all the quarters of the globe. Wherever sickness exists, this medicine has made its way to be everywhere and justly appreciated.

## CONTRACT PROVISIONS.

REFERENCE was lately made in these columns to the practice of inserting "provisional sums" into specifications and bills of quantities for works or goods of a special description over which the architect or his client wishes to exercise some control. As we pointed out, there are two sides to the question: the owner or his architect is justified in considering that the amounts in money provided shall be entirely appropriated to the goods for which they are intended, without deduction; and the contractor is not unreasonable in thinking that he ought to charge a profit on the same if the amount is expended. We discussed these two views of the question, and it is needless to say anything about them now. But there is another kind of "provision" found in quantities often with the consent of the architect, to which one or two correspondents have lately directed attention. These provisions take the form of "quantities," and are intended to cover any extra material or labour that may be required in the carrying out of the building or contract. Thus, for instance, it is common to insert so many cube yards for excavation in foundations over and above the quantity actually required according to the plans and sections, and so many yards "cube of concrete" or brickwork. In timber or stone it is often useful to introduce such a provision, allowing for, say, "100ft. cube fir framed," and taking care to state "as provision" after it. Now, there is nothing wrong or objectionable in sometimes introducing an extra quantity of material or of labour when the architect or surveyor has no means of finding out the precise quantity required. For example, in the excavation for foundations it may be a judicious course to adopt, as in many situations it is quite impossible to say at what depth the footings will have to go, or what quantity of yielding material will have to be excavated. On the other hand, it can be argued "Why make a guess? If the labour or material is uncertain, let it be charged as an 'extra.' Put down the calculated quantity, and let anything beyond be measured and valued." There are, however, good reasons sometimes for adopting the provisional item, and, in any case, the circumstances of the work will determine which is the more desirable course to follow. Yet it is well to bear in mind that the system of introducing provisions, whether of amounts or quantities, is one capable of abuse, and great care is necessary in inserting and adjusting them. In carefully-prepared bills these items are placed either at the commencement or at the end of the trade, and, for the general contractor, all provisional sums ought to be placed together, so that they may not be lost sight of or confused with the ordinary items. Then, of course, at the completion of the work the provisional quantity must be adjusted; that is, a fair calculation should be made as to the quantity actually used, the remainder, if any, being accreted.

A correspondent, "Twice Charged," has dealt, with a certain acerbity of tone, but with unmistakable clearness of perception as to where the shoe pinches the client, with the weak point of this system. He describes the reprehensible practice adopted by some quantity surveyors of inserting quantities of a provisional kind, and charging their commission of 2 per cent. on the amounts they produce, as if they were bona fide

quantities for actual work, and afterwards of charging another 2 per cent. for the same items in the bill of omissions at the adjustment of accounts. Thus the surveyor charges a double commission on quantities that do not actually appear in the building, and the employer is none the wiser. If there are extras against which the sums are deducted, the employer has still to pay 2 per cent. commission to the surveyor. In the first place, the sums put down for the provisional quantities swell the amount of the tender and the surveyor's commission. A "Builder's Manager" corroborates the statements of "Twice Charged" as to the existence of the practice, and brings a case forward as having come within his knowledge in which 2½ per cent. was charged three times—first for the commission on quantities, secondly on the bill of deduction, and thirdly on the measurement of the work. We cannot here call in question these statements, for we happen to know that the practice referred to is not uncommon among certain members of the profession. The surveyor's provisions are inserted, as many of our readers are aware, to protect the surveyor against mistakes or omissions. We will not suppose that they are introduced from any other questionable motive, such as that of increasing his commission. Mr. Henry Lovegrove and "A Disgusted Surveyor" both write on the subject, and show that something can be said on the other side, and we commend their letters to the reader. We quite agree that 2 per cent. commission charged on omissions is more than can be justified—1½ per cent. is more usual. The latter writer adopts the *Tu quoque* argument. He retorts on the contractor in his effort to make the employer believe he has paid the catalogue price for goods, as if that price was equivalent to the net prime cost. But there is a difference between inserting a provisional quantity and inserting a lump sum of money. The former are put in for the presumed purpose of protecting the surveyor. We will not go so far as to say with our correspondent, "to swell the amount of his commission," as our knowledge of the professional surveyors of reputation is, that they are too high-minded and independent to do that sort of thing; while the provisional sum of money is to give the architect or his client a means of selecting any special article. The sum of money so put down is expended or not, as the case may be, and the surveyor has only to add it to the sum of other worked-out items.

When, as "A Disgusted Surveyor" says, the surveyor makes it clear that the contractor is to add his profit to the sum or prime cost of any article inserted, there can be no question whatever as to what it means. It is not our object to take up the cudgels for either the surveyor or builder, as there are respectable members of both businesses who would repudiate any attempt to extort percentages from the employer. We are aware that contractors of doubtful reputation are found guilty of accepting commissions and discounts from manufacturers, and the same may be alleged against surveyors, and even architects; but this is no argument that, because some do these things, there are no honest builders and surveyors. Our object rather should be to ventilate the question of provisional items, and to dispassionately ascertain whether the system is desirable or otherwise. This is the point we wish to arrive at. The letters we have published represent fairly the two interested parties. "Twice Worked, Once Paid" very truly asks whether it is possible for a surveyor, in taking out quantities for certain things, like lead pipe or excavation, without knowing the site, to do so correctly?—a provisional length or quantity is inserted to meet a possible extra. Of course these provisional amounts, like the architect's

provisional sums, are supposed to be deducted if omitted, or not expended. The surveyor's intervention need not be required, as the architect deducts the sum or the quantity; and the same writer argues that it is rather ungenerous to grumble at a surveyor receiving commission on a money provision when he, for instance, is engaged to reduce quantities when tenders are too high, or alterations are suggested by him for reducing the amount, to say nothing of assisting architects in writing specifications, supplying tracings, and sundry other services rendered during the preparation of the contract, and for which he receives little or nothing.

"A Builder's Manager" says: "The responsibilities of quantity surveyors are such that they deserve all they earn, and if it were not for the opportunities which occur in most contracts of being able to charge three times on some items, the percentage charge on the whole would doubtless have to be raised." The surveyor may be well deserving; but he would not like to admit the principle of this argument, however ingenious, as we do not think it justifiable on such a ground as this to charge a commission twice or three times on a certain item. The same writer contends that neither architects nor surveyors have any right to go behind the list prices, for the reason that they are the client's representatives. He says, further, "that the term (prime cost) is a trading term invented solely by those engaged in the occupation of buying and selling at a profit, for the purpose of distinguishing between the first cost and the cost after adding all the incidental expenses connected with the goods. To those who have nothing to do with buying—i.e., paying and selling, the term has no meaning." But all this reasoning is beside the question raised by our correspondents—Whether it is right for a surveyor to insert provisional quantities, and to charge his percentage upon them to the employer, first on putting them in, and again in settling the accounts? The opinions expressed are conflicting. One surveyor says the practice alleged by our first correspondent is not known to him, and he will not believe that surveyors do anything of the kind; two other surveyors came forward not only to prove that provisional quantities are taken, but to justify them; and two builders' managers corroborate the practice, though they vary in their opinions as to the justifiability of the proceeding. Like many other things, the practice is one that admits of abuse. If a surveyor inserts an item to cover any contingency that he cannot properly estimate or measure, there cannot be any reason why he should not do so provided he does not omit to allow for the amount in the settling up of the work, and that he does not charge twice his commission. To insert provisional items in any other manner is certainly not justified, and is manifestly unfair towards the employer. That there is an inducement to provide such-and-such an extra amount of material and labour to make quantities as complete as possible is evident, and at the same time we can imagine a percentage being charged twice on it through no intention, but simply by neglect. The surveyor, or architect, engaged to measure up or adjust the accounts charges his commission on both extras and omissions, overlooking the items of provision. There may be no intention to do anything wrong; but yet the circumstance leads to one—it is certainly an abuse. We will not here allude to the grosser form of abuse that one or two correspondents have suggested—namely, that the amounts are inserted to swell the surveyor's commission—as we do not believe the practice would be tolerated by any responsible surveyor or architect, and, if it exists, the practice is only carried on by a few of the less reputable among the profession.

## THE PICTURES AT THE ROYAL ACADEMY.

[CONCLUDING NOTICE.]

**K**EELEY HALSWELLE, so consummate and subtle a master of atmosphere and mirror-reflecting lakes, has one of the few pictures worth looking at in Gallery VII. Of course, there is the rainbow, the silvery light and reflection, the prismatic hues—these are characteristics of Mr. Halswelle's landscapes, but they are always truthful and pleasing pictures. B. W. Leader's "Silent Evening Hour" (672) and Dudley Hardy's "Dock Strike" are in forcible contrast—one tranquil and full of repose and warmth of colour, the other exciting, animated, and murky. But we pass on to John MacWhirter's "Mount Etna, from the Greek Theatre, Taormina," the bay with its foreground of ruins, full of light, though less successful than the other pictures of this painter. Henry S. Tuke's fine picture, "Euchre" (709)—a group of sailors on the deck of a ship playing cards—is in a low key of colour; the composition and expression of the players admirable. In the next gallery commonplace incidents and work are in the ascendant. L. Malempie's "Venetian Fruit Seller" (735) is a dainty figure subject; the blue skirt, yellow scarf, and bare arms of the bright-eyed maiden, with well-shaped ankles, are points of colour and beauty, brilliant and sparkling with Venetian light. Gwilt Jolley's "Not Forgotten" is touching—an old man tending a grave, over which he is strewing rose leaves. Everything wears the aspect of spring—light-green grass and foliage, and the open sunlight. "Seeking Sanctuary," by Ralph Hedley—a terror-stricken man at the portal of a church, one hand on the massive handle endeavouring to gain admission, the other holding a dagger—has dramatic interest, and the details of the wrought hinge work and Norman archway are correct. "The Haunt of Coot and Hern," by Charles G. Morris (749), is a delightful study of wild marsh and colour; but near it we have a very doubtful example of pictorial skill—"Tulip Culture," by G. Hitchcock (750), formal lines of coloured tulips in a garden. No. 751, "The Music of the Eager Pack," is a wretched idea, a ferocious pack of hounds tracking their victim—a picture worthy the parlour of a country inn. S. Melton Fisher's "La Sposa" and Chevalier Tayler's "The Last Blessing" depict two very momentous incidents in human life. The first is a bridal preparation, the group of female friends evidently enjoying the appearance of the young bride, the handling and treatment in Mr. Fisher's best style. The last is the interior of a cottage, a young man lies in *articulo mortis*, propped up on a pillow, and is receiving the last benediction of the Church. The dark figure of the priest in cassock and amice, holding the crucifix, is conspicuously set off by the light of the window. The sorrowing mother rests her head against the sick man, but the unmeaning expression of the father or brother, with his hands clasped, kneeling, looking at the priest, is one more of wonder and surprise than betokening any feeling. The details of the room are well painted, especially the window, the accessories of toilet table, and medicine bottles. A very large and sunny landscape, "A Ford on the Wye" (780), by H. W. B. Davis, a shallow river with its background of hills, and cattle crossing, has scarcely the claim to so large a canvas. Next to it (759) is an overvarnished picture, heavy and dark. No. 760, "An Orchard, Kent," fresh in its spring-like green, is by R. W. A. Rouse. We cannot imagine how such a commonplace picture as that of 794, "A Rifle Match," could have been hung, and we may ask whether it is a caricature. Those represented with their rifles cannot be flattered: the faces are painfully ill-drawn. "An Incident of the

Restoration" (793), by Charles W. Bartlett, has a touch of irony, not unmixed with humour, in it. The Puritans are walking and conversing together down the pitched street of an old town, apparently turning a deaf ear to the jesting of the party of merry-makers outside a village inn, who are laughing and joking as they pass by. The two extreme elements of the Restoration are thus brought forcibly out, and the arrangement, grouping, and colour are successful. E. Blair Leighton's incident from Boccaccio, "How Lisa Loved the King" (774), is poetical, refined in composition and colour. Lisa, a beautiful girl, lies ill on a couch; her parents sit beside her on an open terrace, while the favourite musician of the King of Sicily is playing and singing to her at her request. There is a simple dignity and grace in the attitude and expression of Lisa and her father, mother, and attendant musician. Walter Urwick's large evening landscape, with hop-pickers, is full of sunlight and haze, and the colouring rich. Gallery IX, devoted to pictures of small size, has fewer works of merit than usual. Terrick Williams's "For Michaelmas" has nice feeling and colour; "A Frosty Morning," by Frank Whitehead, is cleverly handled, the effect of frost and atmosphere being suggested to the eye. Delicate tones are seen in Edward Holmes's "Marshy Land" (966); "Friends and Foes" (937), by Ernest A. Waterlow, is a fresh-coloured landscape, the sea, craft, cottage roofs nestling under hills, and the geese natural and forcible in colour. The "Thistlefinches" (951), by Bryan Hook, is a clever and subtle study of a green bank near the sea. The landscape of Mary Raphael Jones (906), a village green, is charming in its scheme of colour treatment, its grey sky, and broad handling. These are only a few of those we noted and which are worth attention in this gallery, but space forbids us to linger. A sensational picture in the next gallery is Lady Butler's "Evicted," a hilly landscape desolate and wild, the solitary figure, a woman, homeless and in sight of the ruins of her cottage, looking up as if in despair, while the police force are seen returning—a thrilling incident of the Irish tenantry, recorded in its simple and painful reality. The large central picture by Arthur Hacker, "Væ Victis! Sack of Morocco by the Almohades" (1005), is a picture of power. Bodies of dead women—others in despair—are prostrate over the marble floor; the ruthless despoilers have made havoc of the treasures and the palace. Forcible and dramatic the work undoubtedly is—the light is certainly cleverly thrown over the scene of devastation; but for the beauty and motive of the theme we cannot say much. F. Hamilton Jackson's "Apparition of St. Agnes" (1025) is nice in colour and in the arrangement of the figures. Phil R. Morris's "Poor Jack" is touching in its pathos and colour. James Hayllar's "Local News" (1027), as descriptive of a village incident and a study of character painting, is excellent. Notice the old man conversing with the younger, the little boy reading a newspaper, the old woman and young mother having a quiet gossip—all outside the prim cottage. The large canvas by William Logsdail, "The Ninth of November," a view of the Lord Mayor's procession opposite the Bank and Royal Exchange, is an important record of civic state. Here we have the gorgeous and cumbrous state carriages drawn by the richly-harnessed horses, preceded by the footmen in state liveries. The crowd, kept back by the portly civic custodian of the peace, who is in good temper, is painted with much care and attention to the details of a London group of sightseers in which the mob element is mixed. The blue tones of the Bank and Exchange are, perhaps, a little too blue, even for a wet day; the background selected is, at least, well chosen and dignified. Henrietta Rae's scene from "Hamlet," where

Ophelia says, "There's rue for you" (1041), is a very successful and characteristic embodiment of the incident after Laertes and the King's interview. The colouring is rich, the girlish figure of Ophelia graceful, and the background accessories well arranged. Ernest Normand's "Vashti Deposed" (1049), from Tennyson's "Princess," is a large and richly-painted subject—a dark, beautiful woman reposing on her couch, a black slave at her feet. The clenched fist indicates the anger of the deposed beauty, who turns her dark eyes towards the king, Ahasuerus, in a revengeful manner.

Solomon J. Solomon's "Hippolyta" (1063) is powerful in the conception and colour. The queen of the Amazons is seated on horseback, and Hercules is wrenching the girdle from her which had been given her by her father. The myth says that Hercules slew her, and it is this moment which the painter has chosen. The beautiful features of the queen whose head is falling back on her frightened steed, the indication of movement, and the modelling of figures and horses make this a masterly work. Upon the ground are the bodies of slain Amazons. The fine landscape of Yeend King, "Autumn's Wooing" (1098), with its fresh green foliage and water, is a work of undoubted merit, perhaps a little too verdant for autumn. Opposite to it hangs another landscape of considerable power and ability, a wild moorland tract with sheep, over which rainy clouds gather, while in another part of the sky the sun breaks through and illumines the partially clouded landscape. The handling is strong, and the tones and gradations pleasing. Alfred East's sunny landscape and river through pastures, near Yardley Woods (1104), is another charming study of bright autumnal tints and haze, and to these we may add Walter Osborne's charming subject, "The Ferry" (1113), an old country woman and her son, waiting for the boat which is to take them across the narrow river. The small craft make a busy scene. True sentiment breathes in the work, and the colour and tone are subdued and in perfect harmony, the foreground figures being the only bit of bright colour in the picture. We cannot admire Henry S. Tuke's "Perseus and Andromeda." David Murray's "Young Wheat" is too large a canvas for so simple a subject; it has luminosity and perspective. Of course by far the best picture here, which takes a high place in the Academy for its truth, pathos, and conscientious handling, is Stanhope A. Forbes' sale-room scene, "By Order of the Court" (1146). Perched on a table, hammer in hand, the village auctioneer is receiving bids for a timepiece which a man holds up to a mixed assemblage of people. A gentleman in black stands opposite who is evidently about to bid, and a woman seated holds up her hand. A round table has all kinds of articles on it—old china, candlesticks; on the floor articles for cooking, crockery, and a few books. But it is the expression on the faces of the visitors, from the lady who is seated opposite the auctioneer, to the old man to the left and the gossips behind who are chatting near the window; the two old gentlemen, one of whom whispers something to the other, and the dejected ladies of the family who have evidently come to watch the sale, that enlist our attention and sympathy. The light from the window behind is reflected on the polished table; the faces receive the reflection. The dark, sombre dresses and the low key of colour have been cleverly introduced as a foil to the counteranances. It was easy to make such a scene commonplace. Mr. Forbes has stamped every face with reality and earnestness, and we can read the thoughts and feelings of the visitors. W. Dendy Sadler (1034) has a delightfully-painted subject in his usual vein of humour, "The Hunting Morn," where three or four scarlet-coated gentlemen

are enjoying their breakfast in a comfortable inn parlour; one old gentleman in the corner, with a clerical cravat, appears rather uneasy amongst his boon companions. G. P. Jacomb-Hood paints a weird subject, "The Witches' Dance," the greys and neutrals in the colouring of which are appropriate to the strangeness of the scene, but hardly witchlike are some of the faces. One other picture, by C. Napier Hemy, deserves mention, "The Rescue"—a gallant crew going to the rescue of a drowning man who is clinging to the bottom of a lifeboat. A buoy has been thrown to the man, but there is a heavy rolling sea between. Handling and colour are alike successful. Stuart Lloyd's "Dittisham on the Dart" is a charming river scene, reposeful and radiant with softened mellow tones.

Though they suffer from comparison with the oil, the water-colours this year are above the average in merit. A coast with waves and sandy beach, in which still water lies, has been rendered by George Cockram with his accustomed skill and delicacy. "Where the Sky dips down to Sea and Sand" expresses very aptly the idea sought to be rendered. 1174 is clever; 1188, by Leopold Rivers, has some nice quiet colouring—the cottages by roadside illumined by a setting sun make a very pleasant picture. E. J. Gregory's "Fanny Bunter" (1186) is a delightful figure study—a symphony in colour and treatment; the screen is a nice background. Kate Hayllar, as usual, gives us a piece of still life, charming in its drawing and colour (1190); next a clever drawing of the central lantern tower of Ely, by R. Phené Spiers, may be noticed. Woodland and water, soft and mellow in tone, foreground of birch, are pleasingly rendered with a true sentiment by Reginald Jones (1200), "When the Brightness of the Day is on the Wane." In a stronger key of colour is the rocky coast, with its boulders and deep blue sea, "The Little Orme's Head" (1213), by J. Finnie. Edith Barrow's "Azaleas" is chaste and delicate, the beaten copper bowl making a nice contrast with the delicate bloom. As a study of colour and stratified rocks, Ernest E. Briggs's "Old Quarry" of limestone is clever, the grey tones and water well rendered. R. Fowler's "Leech Gatherer" (1232), a rendering from Wordsworth, is powerfully drawn and in strong colour, the treatment and touch pre-Raphaelite in the delineation of the marsh pools and weeds. "Our Lady of Roses" is delicate in its scheme of colour and decoration, and is by A. Macallan Swan. Henry G. Massey's "Bad News" is clever. An elderly woman is reading a letter in her clean little parlour or kitchen, while her daughter looks over her shoulder. The drawing and sentiment are both strong. Arthur G. Bell (1236) has a clever drawing of Yarmouth Market-place. Geo. Cockram's "Afternoon Light on the Sea" (1240) is a beautiful piece of silvery sea and limpid beach, the lights and clouds and reflection on the still water in sandy pools delightfully luminous and delicate. No. 1262, "A Dutch Homestead," is a charming study of cottage and atmosphere, the cattle well drawn. Arthur Croft's "Evening Mists," Valley of the Rhone, is softly painted; Leopold Rivers's "Cromer" is broad, the tranquil sea and sky forming a light ground to the dark purple hues of the landscape. Nos. 1372 and 1359, "The Last of the Ebb" and "An Evening Tide," by Harry E. James and Alfred W. Browne, are both clever seascapes. L. Raven Hill has a vigorous sketch of two young ladies preparing their dresses for a fancy dress ball in their bedroom—strong in colour and drawing. W. Follen Bishop's woodland is masterly, the roseate hues of sun in distant wood and hillside glade clever, with the foreground of bracken. No. 1312, "Robin Hood's Bay," by John Sowden, is also a masterly view of coast.

FIG. 4.

## SHADOWS.—I.

THE science of putting in shadows in geometrical drawings, little known or employed in England, is extensively practised on the Continent and in America, where the architectural training is conducted after French methods. In fact, a geometrical drawing of any kind would not be considered finished unless the shadows, carefully found by rules, were conscientiously indicated. The result of this practice is to do away with to a very great extent the perspective drawing, considered indispensable in England. A geometrical elevation with the shadows indicated and tinted supplies in a way the place of the perspective; the different projecting or receding planes of the building, &c., being as thoroughly shown by the shadows thrown as if the distances were marked thereon.

Let us begin with the first few simple rules for determining the shadows thrown by a projection to a vertical or horizontal plane, as the case may be, proceeding afterwards to the more complex shadows thrown by advancing or receding planes. The student who is acquainted with the rules of descriptive geometry will find absolutely no difficulty in understanding the system of shadows, it being no more than an application of these rules for the intersection of different planes. But although the knowledge of descriptive geometry facilitates the drawing of geometrical shadows, the study of the former is not absolutely necessary in order to understand the ordinary rules for the shadows which would be generally used in elevations.

The rays of light which cast the shadows are always supposed to shine on the object or building at a fixed angle of  $45^\circ$  to the horizontal and vertical planes. If we employ a source of light such as that of a lamp or candle at no great distance from the object, we find that the shadows are cast at all possible angles, thus leading to great complexity in the drawing. But in the case of the source of light being at an immense distance, as that of the sun, the difference of the angles of the rays of light on projecting objects is imperceptible and supposed to be *nil*. The angle of  $45^\circ$  is employed because by the property of this angle the shadow thrown by a projection to a vertical or horizontal plane is always equal to the amount of projection from these planes. Thus, in Fig. 1, supposing the distance,  $x$ , to be the shadow thrown by the projection,  $x$ , the angle being at  $45^\circ$ , the distance  $x$  is equal to the side or projection  $x$ . It is possible that shadows

thrown at any other fixed angle would produce an equal effect as far as the drawing is concerned; but this effect would be, so to say, false, on account of the inequality of the shadows thrown and the projection supposed.

**Reflections.**—Reflections are the rays of light projected or sent back from planes brightly lighted to the other parts of the building more or less in shadow. Shadows can receive light by reflection only from the earth or other lighted body. Thus a shadow which, near the cornice of a building, is dark, becomes gradually lighter as it descends and receives the light reflected by the earth. We will notice this effect further on in treating a bay of a façade. In tinting shadows another effect must be taken into account, and this is the effect given by distance.

The shadows thrown on an object nearest the observer appear much darker than those on a body further off, and these again darker than those of still more distant objects. This effect is due to the vapour contained in the air separating the different objects from the observer, diminishing greatly the effect and depth of the shadows. Thus when tinting an elevation, care must be taken to diminish the depth and tone of the shadows in proportion to the distances that each part of the building recedes from the "avant corps."

It is understood that we are to imagine rays of light to arrive at an angle of  $45^\circ$  with the vertical and horizontal planes. To explain this in the cube ABCDEFGH (Fig. 2), the line GE represents the light falling at an angle of  $45^\circ$  with the horizontal plane, and DE the angle of  $45^\circ$  with the vertical plane. The intersection of the planes of these two lines is AE, which forms the diagonal of the cube. Thus the light falling in the direction AE is at the same time at an angle of  $45^\circ$  with the horizontal and vertical planes. It is in the direction AE that the light is always supposed to arrive.

This understood, let us proceed to find the shadow thrown by a block of stone projecting from a vertical plane or wall (Fig. 3). We have in ABCD the elevation, and in *abef* the plan of the projecting block. Let us imagine a cube having its side equal to the project *fb* of the block from the wall, and let this be in elevation BGHE, and in plan *bghf*. Draw the diagonals BH and *bh* of the two squares. Now BH and *bh* represent the lines GE and DE of the cube (Fig. 2), and these two latter represent the diagonal AE, the direction the

light is supposed to fall. Thus BH and  $bh$  (Fig. 3) will represent the rays of light falling on points B and  $b$  at any angle of  $45^\circ$  to the horizontal and vertical planes. Thus we see that the shadow of a point descends vertically and horizontally to a distance equal to the amount of projection of this point from the vertical plane which receives the shadow. Now in the plan (Fig. 3) the light falling on the points  $a$  and  $b$  at an angle of  $45^\circ$  will throw shadows on the wall planes as far as  $m$  and  $n$ , the shadow  $fh$  being equal to the amount of projection  $f b$ . In the elevation shadows will be thrown by B and C at an angle of  $45^\circ$  to the horizontal plane. Now we see by the plan that the shadow of point  $b$  is stopped by the wall plane at  $n$ ; therefore by projecting the point upwards we get H, the corresponding point where the shadow is stopped in the elevation, and by projecting point  $m$  we get M, the shadow of point D; this point, being of the same distance from the wall plane as point B, is naturally stopped at N on the line  $hH$ ; then by drawing the horizontal line, MN, we complete the shadow thrown by the block ABCD.

Thus we see that by drawing the shadow lines at  $45^\circ$  in both elevation and plan, and projecting the intersections of the latter with the wall plane, we determine the shadow in the elevation.

Let us now add to the simple block a cavetto and quarter round, as in Fig. 4, and establish the shadow thrown by the ensemble. Let us draw the tangent A to the quarter round, the tangent will touch the moulding at the point A. Draw the horizontal line AB, separating the part in the light from that in shadow. The tangent touches the block at point P; thus the point A throws its shadow as far as P; by drawing the horizontal line PR in ABPR we have the shadow thrown by the moulding on the block. To determine that thrown by the whole body on the wall, we proceed as in the last figure, and find the shadows of the points CDS and T and  $c d s$ . These shadows meet the wall at  $e f$  and  $g$  in plan; by projecting these points we establish EF and G in elevation.

We remark that the mouldings from B to R being themselves in the shade cannot throw a shadow; the shadow of point R is at K for the same reason as that of B is at H (Fig. 3). A horizontal drawn from K determines the shadow of point B in H, KH being parallel and equal to XB. Thus in GHKFE we have the shadows of the points SBRDC or the shadow thrown by the whole block.

ARTHUR L. VYE PARMINTER.

Palais des Beaux Arts, Lille.

### CARPENTRY AND JOINERY.—XXX.

FINISHING OF WINDOWS.—(Continued.)

AND now before taking up windows finished with shutters, as an intermediate step framed jamb-linings would come in. The lines of the inside of sash frame and rough walls would be laid down on the board upon which the plan of finishing is drawn; allowance would then

be made for plaster, and if the architraves are to stand out some distance beyond the line of the plaster that would have to be attended to (this is sometimes necessary in light walls in order to have a proportionate framing in the jamb-lining.)

The next step would be the amount of splay or inclination; 3in. to the foot is usual.

Fig. 206 gives a plan of such a jamb-lining as is being described. It will be seen that it is framed, and that the general design is similar to a plain jamb-lining. In regard to how it is framed, from floor to soffit is in one continuous length.

Fig. 207 gives an elevation of a framed jamb-lining as seen when the spectator is looking full at it—that is, when he is standing parallel to and in front of it. On the left hand is seen the sash in elevation, as the workman is guided by it in setting out the jamb-lining. The heavily-lined portion is intended to represent the groove in the casings and sill for the jamb-lining, soffit,

Fig 207

as shown in Fig. 207, is placed with its centre just opposite the centre of the meeting-rail, and here again a *reed* occurs, and in the centre of this rail, showing on each side of it a narrow rail. The top rail will, of course, be in line with the under side of the groove, or an allowance of 3in. above it may be made if let into the soffit. This jamb-lining is shown for a level soffit, which usually is the case when the window reaches well up to the ceiling, and there is room only for the top architrave and plaster cornice with a slight intervening space, so that cornice and architrave may be distinct. Of course, it will be readily seen that to elevate (splay) the soffit would require, say, 3in. or more—in other words, the frame would require either to be set 3in. lower, or it would have to be that amount shorter, or else a higher ceiling. The design of the framed jamb-lining may be altered from the above; one alternative design would be to have a square panel opposite the meeting-rail of the sash instead of the broad rail, and rails 2 1/2in. broad above and below this panel. To preserve uniformity, the soffit and back would require each to have a small panel in the centre. Another design would be to divide the portion of the jamb-lining corresponding with the shutter (that is, between the groove in the sill and that in the top casing of the frame) into three or four equal panels. Now, as the mortising and tenoning of framing has been fully explained previously, it is not necessary to again enter upon it, as no new principle is involved. The grooving or ploughing for the panels is usually 1/4in. or 1/2in. deep. Haunching requires to be left on the top rail, but need not be on the bottom rail, seeing that the stiles reach to the floor and the rail does not. Fig. 207 is self-explanatory otherwise. The framing of the soffit for these jamb-linings presents very little difficulty to the joiner who has attained a moderate degree of skill.

Fig. 208 gives an illustration of half the plan

Fig 208

1 1/2 Scale

of the soffit when it is level. The breadth of the front and back rails will be obtained from the plan of the jamb-lining (see Fig. 206). It will be noted that since the soffit is level and the jamb-linings splayed, the rails will be narrower than the stiles of the jamb-lining. The splay of the outer cross rails of the soffit will be the same as the jamb-lining, and for the purpose of setting them out, set a bevel to the splay of the jamb-linings in plan. The proper method of setting all out is to lay the front and back rails in their respective positions on the drawing-board where the plan of the window-finishing has been laid down, marking on their edges for the cross rails. The centre rail will, of course, be square to the front and back rails, but the outer cross rails, as has been stated, will be inclined at the same angle as the jambs, and, of course, the bevel will be used instead of the square to draw the shoulder lines by.

Sometimes it is the practice to lay the rails front and back in their respective positions on the plan of the window, face side uppermost, and on the top of these in their positions the cross rails, and then, by the aid of a simple apparatus shown in Fig. 209 with a *drawpoint* (its chisel end), draw the various working lines on the cross rails, and with a pencil mark the cross rails upon the front and back ones, the pencil being guided along the edges of the cross rail whilst the lines are being drawn on the face of the longitudinal rails. Then on the front and back rails make due allowance for the grooves in

and capping of window-back. The floor-line is the first to notice and fix on the rod or drawing-board, then the top of the groove in the sill, and this will give the under edge of the rail in the jamb-lining corresponding to what would be the bottom of the shutter, if such there were. Between this and the top rail of what would be the *elbow*, usually a bead occurs, and, as is shown, the bead extends along the rail only, and does not cross the stiles. The height to the top of the plinth from the floor line will determine the height of the bottom rail, which rail usually shows 3in. above the plinth or skirting; a portion of the rail should be beneath the top line of plinth so as to serve for nailing the plinth to; the plinth is also nailed to the stiles of the back and a piece fitted into the bottom rail, and reaching to the floor to which this piece may be side-nailed. The bead opposite to the groove in the sill, and which, by the way, is worked in the solid, the rail being a broad one corresponding to two narrow rails, and the bead above referred being in its centre. This bead is usually a 1/4in. or 3/4in. one. Strictly speaking, this is not a bead, but a *reed*. The rail in the jamb-lining above this one,

the cross rails for panelling, and also haunching; but this is not very necessary except the outer cross rails have been made so broad as that there will be no horns outside of them. It may be remarked that the outer cross rail should show the same breadth (measured square out from the jamb-lining) as the top rail of the jamb-lining, usually 3in. In Fig. 208 an attempt is made to show that the mortises through the front and back rails for the splayed cross rails are square through these rails, which will be found more convenient in wedging up, &c., as the workman will readily find out, but, of course, this presents a little more difficulty in setting out. It will be seen in the rail next the frame that the inner line of the mortise is just at the intersection of

Fig 209

H Scale

the grooves of cross and longitudinal rail, and the length of the mortise will be guided by where the rail runs out. In the rail nearest the spectator, and furthest from the window, where the groove cuts the outer edge of the rail, will be the point to square in for the inner line of the mortise, and the breadth of the splayed rail will again determine the length of the mortise. Of course, if no horns are on the front and back rails, then haunching must be allowed. Fig. 209 is an illustration of a very simple apparatus, being made of pine 2in. by 1in. or  $\frac{3}{4}$ in., and the length is determined by the breadth of the splayed rails. It looks just like a little stool with two feet, the feet being dovetailed into the long piece, or they may be trenched in and nailed. The method of using it is to have the timber of the soffit laid in order as previously stated, the cross rails upon the top of the longitudinal rails, and let all the timber have its face side uppermost, in order to have the lines on that side; then taking the splayed rail to begin with, when it is in position according to the plan laid down in the drawing. Place the apparatus shown in Fig. 209 across the splayed rail with the two feet hard against the longitudinal rail, then with the chisel end of a drawpoint draw the line for the shoulder, proceed in the same manner to line all the others.

It will be found that the apparatus requires to be lightly, yet firmly, held, so as to keep it from shifting, and prevent the rails from shifting also.

Fig 210

All splayed work can be set out in this way when it occurs in the form of doors or framing. It will be readily seen that the feet of this small stool must be less in length than twice the thickness of timber used for the framing.

Of course, it is not intended that the use of a bevel in setting out splayed work should be done away with; but it will be very often found that when the pieces of timber required have been laid in order on the plan of the proposed framing that it is much easier to line it out with the aid of the apparatus described than with a bevel. Much of the joiner-work for ships is set out in this way, and it is well known that ship-work is nearly all bevelled work.

Fig. 210 gives an isometric illustration to show the manner in which the rails are placed, one on the top of the other, and also how the apparatus illustrated in Fig. 209 is placed when in use for drawing shoulder lines in bevelled work.

#### FIELD'S NEW "1889 PATENT" SELF-ACTING SIPHON.

FOR the purpose of flushing town sewers and house drains, Mr. Rogers Field's new patented self-acting siphon claims the attention of all engineers and architects. This is no nominally new patent, but the result of careful investigation and experiment. We have had our attention drawn to the new siphon, which is being manufactured and supplied by Messrs. Bowes Scott and Western, the sole licensees, Broadway Chambers, Westminster, S.W., and, from an inspection of its operation, can say confidently that it is a great improvement on the old form of Field's annular siphon, which has attained a well-deserved reputation. The older form was found, when not very accurately set, to give uncertain results in its action, and to be slower. The first trickle of water down the conical-shaped lip did not invariably displace the air in the longer limb, but took a curved path impinging on the surface of tube. The new "1889 patent" obviates this risk for dribbles of water; the action is certain with the smallest trickle of liquid, so that the primary object of a siphon for flushing purposes is secured, as we shall explain by-and-by. It can also be more easily fixed, without requiring that most perfect adjustment of level of the upper

end of the limb. A flushing siphon to be of any practicable use should be capable of being put into action by an extremely small flow of water—a mere dribble, in fact; so that although the tap may be partially clogged, yet the action of the flush may be certain so as to avoid the waste of water by running away slowly into the drains. It is the sudden rush of water down the drains that is required to clear them. Mr. Rogers Field's new automatic siphon guarantees this action. The large tank may be fed by the constant flow from a small tap or drinking-fountain which takes a day or two to fill; but directly the level of water rises to the top of the longer limb, the contents are immediately emptied. The siphon is built into the tank, the longer limb dipping into water about  $\frac{1}{4}$ in. in a flushing chamber, which is kept at a proper level by a weir. The shorter limb of siphon is formed by an annular covering, dome-shaped at top, and the water rises in the annular space thus formed to the top of the longer limb. A few drops at first enter and expel the air in it, when a vacuum being partially formed, the siphon is brought into action, and the contents of tank discharged.

Considerable thought and ingenuity have been shown by Mr. Rogers Field in perfecting his siphon, especially in the adaptation of the adjuster to dispel the air in the discharge pipe at the onset. The old truncated cone inserted in the pipe at the upper end was found to be inadequate under certain conditions of setting. The first drops, as we have said, were found to take a circuitous course, and after trickling down the inside of cone to impinge on the inner surface of the pipe, rendering the action slow and uncertain. By the newly-invented adjuster, of which we give a section, the series of perforations, 1, 2, 3, &c., have the desired effect. The drops descending the cone pass through the perforations, and, meeting the drops at the inside of the lower edge of cone, cause them to drop perpendicularly downwards instead of impinging on the inner

surface of pipe. Thus the drops inside and outside of the cone *a* and *b* meet, and a resultant motion, *c*, is given to the water in the pipe, which produces the desired vacuum. The level of the water at once rises within the bell, expelling the air till a perfect vacuum is formed, bringing the siphon into full action, and the contents of the tank are rapidly emptied. By small notches at the bottom edge of discharge pipe which enters the flushing chamber, facility is also offered to the speedy outrush by allowing the air-bubbles free escape.

This valuable improvement gives a fillip at the commencement of the action of the siphon just when it is wanted, and is further secured by making the rim of cone or adjuster at its upper edge a trifle lower (see section) where the drops first enter to dispel the air, the greater rush of water after the vacuum has been formed finding an outlet on the side of cone opposite the perforations. These latter are also so ingeniously arranged that the first trickle of water must escape through them. They are pierced round half the cone, the other being cut away to form a large opening (see section). It does not matter if the first tricklings down the cone all go through the perforations, as the bottom edge of it will always be wet and allow the drops to fall plumb. Another point we noticed is the shape of the dome or outer casing; Mr. Field has greatly improved its shape. By reducing the diameter of the upper part, a better concentration of pressure is produced at the moment when the water attains the top of the inner pipe.

For the disposal of sewage from large institutions like workhouses, hospitals, and schools, the self-acting siphon is admirably adapted, as the liquid can be discharged at intervals over any land that may be available for surface irrigation. A galvanised iron flushing cistern with the "1889 patent annular siphon" is sufficient to flush house-drains, as the smallest dropping can be utilised.

#### CONSTRUCTIONAL DETAILS OF THE PARIS EXHIBITION.—VI.

By BANISTER FLETCHER, JUN., A.R.I.B.A.

THE "PALAIS DES BEAUX ARTS" AND "PALAIS DES ARTS LIBERAUX."

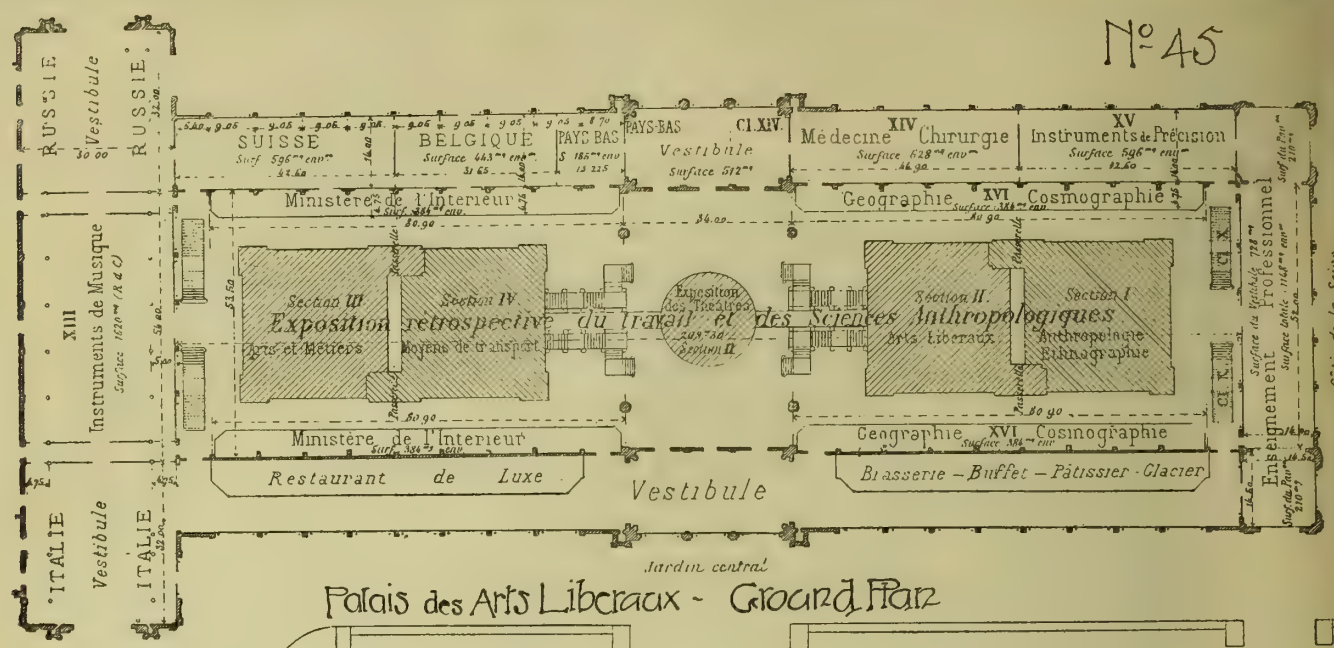

THESE two palaces are joined to the wings of the "Expositions Diverses," by means of the Galleries Rapp and Desaix respectively, and follow their central axis towards the Seine.

Before describing them in detail, it may be as well to give you the result of an interview I had with M. Formigé, the accomplished architect of these buildings. Amongst other things, he said that the great difference between the Exhibition of 1878 and the present buildings lay in the fact that in the Exhibition of 1878 the iron framing to the terracotta was hidden as much as possible, and the terracotta shown, whereas in the present Exhibition the ironwork, which is, as it was in '78, the framework, is everywhere plainly shown; even the cross-bracing of the standards is visible, and the terracotta work is placed behind it, showing by its position that it is not constructional, but only ornamental—he thought this a great advance.

He explained the construction of the great square standards carrying the outer aisles of the two palaces, the square standard being riveted up on three sides; the terracotta panels are then slid in on the fourth side. The tiling to the Fine Arts and Liberal Arts domes is of exceedingly elaborate construction, and M. Formigé explained the difficulty there was in keeping the water out, the tiles not lapping one another. A sketch of these is given further on. The ceilings of the galleries are built in rolled iron joists, and formed with brick arches and plastered underneath.

In examining the plan we find that it consists of a great central nave, 738ft. long by 175ft. 6in. wide, covered in one span, with side galleries the whole length on each side of the nave, about 50ft. wide, in two heights. These galleries are connected on their northern end by a vestibule 46ft. wide, at the junction of which there are square angle pavilions. At the southern end are the Galleries Rapp and Desaix. In the centre of the nave rises the central dome, which is carried on four lattice-work standards 105ft. apart. The exterior of the Liberal Arts dome is similar to the Fine Arts dome, but differs to some extent interiorly, which will be explained further on.

There are entrances to the building on each side of dome, that giving on the centre garden being more decorated than that on the outer side; the same arrangement is followed in the Fine Art building. These entrances are of the same width as the space inclosed by the standards supporting the domes, but are divided into three by terracotta piers. The Palais leads at its southern end by several doorways into the Galerie Desaix, and

great trusses, it is interesting to note the method of raising them into position. It was done by means of "scaffoldings" on wheels, which meet from one end to the other of the "Palais." The different scaffolding used for the "Arts Libéraux" and the Beaux-Arts are given (Nos. 47 and 48 from *Le Génie Civil*). The scaffolding for the "Arts Libéraux" was of necessity different, because of the projecting galleries. It

a clear span of 163ft. 3in., and a clear height of 92ft. 6in., and are spaced 59ft. 6in. from centre to centre. The principals, as M. Contamin, the engineer, explained, are articulated at three points: at the top and above the foundations on each side; and the trusses, although they do not appear to spring directly from the ground, do so to a certain extent, because the standards are riveted to really form part of the truss.

The vertical portion of the truss is 49ft. 2in. high, above which starts the curve of the intrados, which is formed by portions of two ellipses, the minor axes of which do not coincide with the axis or centre line of the roof itself; from which it follows that the roof is slightly pointed in the centre (see No. 49). The back of the principal goes up vertically to a height of 67ft. 3in., which is the height of the longitudinal gutters; from these gutters start the interior curve of the roof with a radius of 300ft.

On each side of the central articulation there are six purlins, the two uppermost of which are placed 5ft. 7in. apart, and carry the outside gallery, which is to be used for examination and repairs, then follow two groups of purlins in pairs, 5ft. 7in. apart, and then a single one at the bottom. The purlins are connected by intermediate rafters, to which are framed the cruciform bars.

#### CHIPS.

The parish church of St. Cuthbert, Edinburgh, rebuilt in 1773 on the site of one of the most ancient churches in Scotland, was occupied on Sunday for the last time prior to its reconstruction and restoration.

The memorial stones of a new church and school for the Swedenborgians of Haslingden, near Accrington, were laid on Saturday. The school-room, which will be on the ground floor, will hold 350 persons, and over it will be the church, which is arranged to seat about 300. Mr. Arthur Hindle, Haslingden, is the architect, and the building, which is Early English in design, will cost £2,700.

A chapel is to be erected from the designs of Messrs. Paley and Austin, architects, of Lancaster, in connection with Sedburgh Grammar School.

The Royal borough of Dumbarton was *en fête* on Saturday on the occasion of the public presentation of Knoxland-square, and a bandstand within it, to the town by the Denny family, and the laying of the foundation-stone of the William Denny Memorial Institute, now in course of erection at a cost of £5,000.

A large pavilion is about to be built in the Queen's Park, Longton, Staffordshire, at a cost of £5,000, from plans by Mr. John Taylor, architect. The building is of iron and glass, supported on a brick and stone base. The pavilion comprises, on the semi-basement floor, one large room, with annexe; gentlemen's and ladies' lavatories, two kitchens, and four large storerooms. On the ground floor there are a central hall and two ante-rooms and lavatories.

#### Palais des Arts libéraux.

Diagrams of Roof scaffolding.

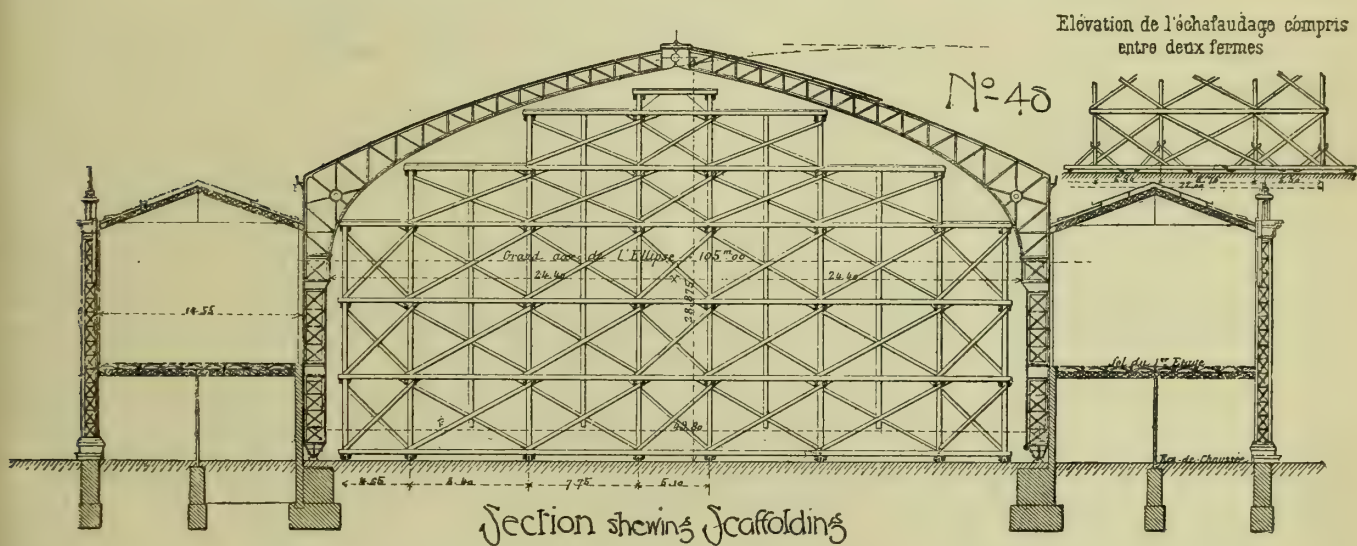

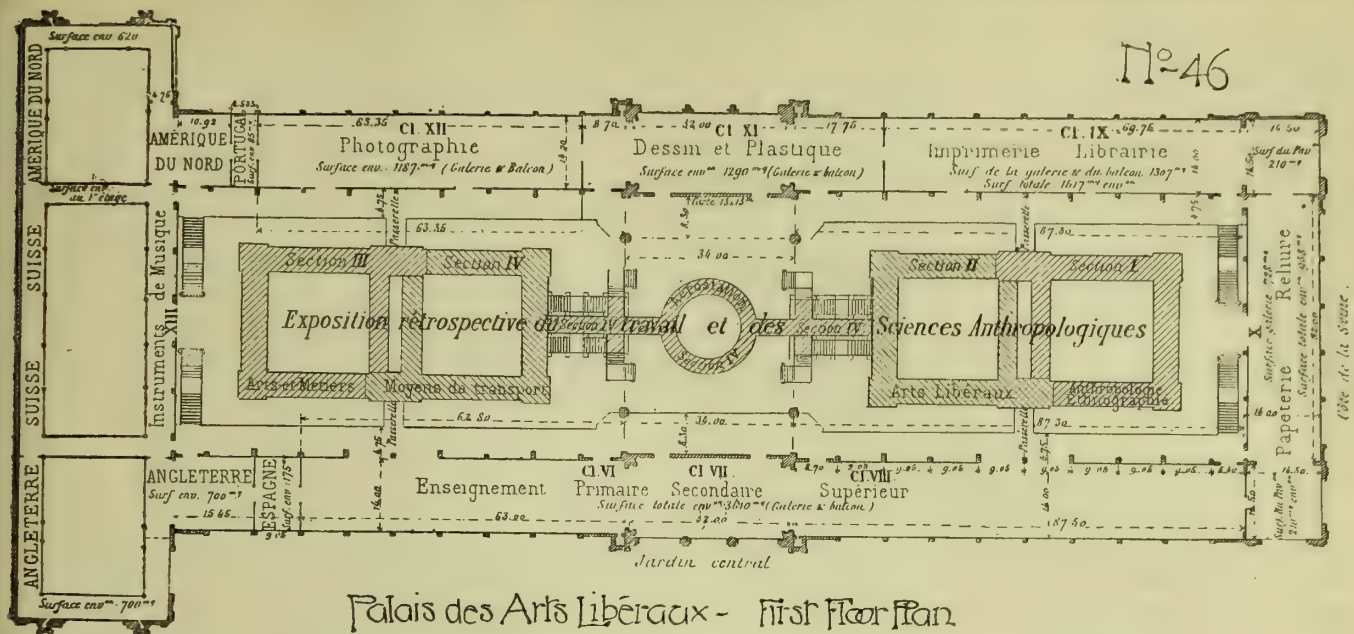

there is thus communication by the Palais des Expositions Diverses to the Palais des Machines at the back. Two staircases at each end of the building (carried on iron frames) lead to the galleries on the first floor, and also to the upper part of the Exposition Rétrospective du Travail, which, as seen by the two plans which follow, occupy the centre of the Palais, and are in two stories, the upper one being level with the side galleries.

Before proceeding to the description of the

is carried on sixteen cast-iron wheels of about 3ft. diameter. The "Beaux-Arts" scaffolding weighs 200 tons, and is mounted on thirty-two cast-iron wheels of about 1ft. 7in. diameter; the standards 55ft. 9in. high are raised first on the steel rollers and held in position, afterwards the two divisions of the spandrel, and the remaining part of the roof in six parts, by means of winches of wood, these parts not exceeding 8 tons in weight.

The roof principals of the nave (No. 49) have

CONTEMPORARY BRITISH ARCHITECTS.—"BEQUEATH'D BY BLEEDING SIRE TO SON."—"PARTING."—NEW BUILDINGS FOR HERTFORD COLLEGE, OXFORD.—"PEVERY," SHROPSHIRE.—PALAIS DE BLOIS, FRANCE.—RESIDENCE AT SURBITON.—HILL'S MANSION, SHREWSBURY.

## Our Illustrations.

CONTEMPORARY BRITISH ARCHITECTS.

(See description on p. 706.)

SCULPTURE: "BEQUEATH'D BY BLEEDING SIRE TO SON."—"PARTING."

The first group, by Mr. G. A. Lawson, was exhibited at the Royal Academy, and illustrates the above words of Byron. "Parting" is the Royal Academy Gold Medal group submitted in the recent prize competition, and to which the highest prize was given. The author of this highly-dramatic piece of sculpture is Mr. W. Goscombe John, of Elizabeth-street, Eaton-square, S.W. The blind old man is nursing the dying form of his only boy, his leading light and his stay. Both illustrations are from photographs supplied by the artists.

## HERTFORD COLLEGE, OXFORD.

ABOUT the year 1282 Elias de Hertford converted into a hall for students certain premises in Oxford, which were thereafter known by the name of Hertford, Hert, or Hart Hall. In 1740 Dr. Richard Newton, then Principal of Hart Hall, obtained a charter of incorporation for the Society, under the title of "The Principal and Fellows of Hertford College, in the University of Oxford"; but, the endowments proving insufficient, the college was in consequence dissolved in 1805. A part of the property of the dissolved college was transferred to the University, and the Hertford scholarship was endowed therefrom. The remainder was transferred to Magdalen Hall, which had previously existed in an ancient building close to Magdalen College. This building was in course of time required by Magdalen College, and Magdalen Hall was consequently removed to the site and buildings of Hertford College in 1822. In 1874 Magdalen Hall was dissolved and incorporated afresh as Hertford College, and the new foundation was richly endowed by the munificence of a member of the University. The old buildings soon proved insufficient for the increased number of students, and it became necessary to think of some mode of enlargement. Mr. T. G. Jackson was consulted as to the best way of meeting the requirements of the college, a task which the confined nature of the site, closely hemmed in by streets and other colleges, made somewhat difficult. The new buildings, which have been erected from his designs, consist of a large block facing the Bodleian Library, containing a new kitchen and a complete set of offices in a basement which, for want of space, is carried partly under the quadrangle. On the ground floor is a new gateway and porter's lodge, a bursary, a buttery, and a new study for the principal. The upper floor is occupied almost entirely by a new college hall, which is handsomely panelled with oak, and furnished in the usual collegiate style. Attached to this is a serving room, communicating by lifts

with the kitchen in the basement and the buttery on the ground floor. Above this is a lecture-room. A wide stair winding round a massive pier runs from top to bottom of the building, and the spiral lines of the ascent are marked on the outside by raking cornices and strings, and by the form of the arched windows. This is shown in the illustration which we reproduce to-day from the drawing in the Royal Academy. The north side of the quadrangle, which was occupied by the old kitchen and offices, has also been rebuilt, and now contains twelve good sets of rooms for Fellows and students. The work just completed includes also the restoration of the block adjoining the new hall southwards, which had been used as rooms, to its original use as a house for the principal, and several improvements have been made in order to fit it better to that purpose. The contractors were Messrs. Symm and Co., of Oxford, for the first block, and Mr. Halliday, of Stamford, for the rest. The carving was executed by Messrs. Farmer and Brindley, and Mr. E. Long was the clerk of works.

## "PEVERY," SHROPSHIRE.

This house is in course of erection for Sir Offley Wakeman, Bart., on a beautiful site near Baschurch. The walls are built of a fine local red redstone of good colour, and the roofs are covered with Westmoreland green slates; the terrace walls shown in the view are being built with the house, and the gardens are in process of being laid out by Mr. H. E. Milner; the works also include stabling, lodges, and kitchen-garden. The general contractor for the work is Mr. John Bentley, of Waltham Cross, Essex; and the clerk of works is Mr. Unwin. The garden terrace is to the south, and the principal entrance to the north.

## STAIRCASE ENTRANCE, PALAIS DE BLOIS.

ALTHOUGH we have given many drawings at various times of this famous chateau, this particular view, which we publish to-day, has not appeared before, and for the first time we give a plan of the building. The first Duke of Orleans, of the house of Valois, erected the buildings near the observatory; but besides these no other works of the period remain, either of this prince or of his successor, Charles. It is, however, to the third duke, Louis, and son of Charles, when he ascended the throne under the title of Louis XII., that we owe the *Corps de Logis*, or that portion of the palace represented by the darker parts of the plan. This *Corps de Logis* is a beautiful piece of architectural design, and our view to-day shows the base of one of the staircase towers, situated to the right on entering the quadrangle, as seen from under the arcade, the elaborated pillars of which form so important a feature in the picture. On the blank wall to the right on the opposite side of the arcade there was once painted a *Danse Macabre*, or Dance of Death. The kitchen has a single column in the centre to receive the vaulting, and by the side of this, entered from the portal archway, is a guard chamber. The use of some of the other ground-floor apartments seems uncertain. The king's bedchamber and sitting-room are on the first floor. The principal apartments have been renovated; but no remains of the original decorations exist. The Porcupine represents an order founded by Louis, first Duke of Orleans, who thereby sought to convince his rival, the Duke of Burgundy, that he would be found armed at all parts. The motto was "Cominus et Eminus"—from far and near—having reference to the fabulous power attributed to the porcupine to dart out its quills. Italian influence is evident in the carving of this building, and it is thought that the better wrought parts of the work were executed by some of those artists whom Philip de Commines informs us Charles VIII. brought from Italy to decorate the Chateau of Amboise. The acanthus leaf gracefully treated is frequently introduced, and the arabesques on the columns or piers of the arcade are typical of this character of workmanship, though they are not so good as the carved panels over the entrance-door, where the sculpture, and even the mouldings, are suggestive of Italian design. The *Basse Cour* in front of the *Corps de Logis* was formerly surrounded by inferior offices of the Palace, some hotels of the courtiers, and a large Conventual church, in which many royal personages had their obsequies celebrated before final transit to the Church of St. Denis. Louis XII. rebuilt the Chapel of St. Calais and incorporated

in its erection the remains of the former one before alluded to. From the part which remains of the chapel, it appears to have been of some length, and was terminated by an apse. The arms of Louis and his queen enrich the vaulting. The whole of the space now called the *Place des Jesuits* was at one time occupied by the gardens of the palace. We are indebted to Clutton's "Domestic Architecture of France" for the plan and particulars given in these notes. He published a view of the upper part of the main staircase, a sketch somewhat similar to ours of to-day, though by no means showing so much, and a capital study, with figures from the hand of the late Wm. Burges, representing the entrance gateway. The exterior of the greater staircase tower was illustrated by us on September 13th, last year. Other illustrations of the Chateau de Blois will be found in the BUILDING NEWS for June 25th and December 3rd, 1875; November 30th, 1883; November 20th, 1885; January 14th, 1887; March 22nd, 1889; May 3rd, 1889; measured details July 5th, 1889; and September 13th, 1889.

## RESIDENCE AT SURBITON, SURREY.

This house is now in course of erection within 10 minutes' walk of Surbiton Station. It is built of red bricks with Broseley tile roof, the upper floor being finished rough-cast. The exterior woodwork is principally of teak, merely oiled, whilst shutters are appended to the bedroom windows in front, which face due south. There are eight bedrooms, bath-room, housemaids' and linen closets, &c., on the upper floors, and the trimmings of staircase and best rooms are being executed from special designs prepared by the architect, Mr. J. Nixon Horsfield, 20, Market-place, Kingston-on-Thames.

## ROCHESTER SKETCHES.

THE central sketch represents the picturesque brick mansion called Restoration House, where Charles II. passed a night when on his way to London from Dover, in 1660, at his restoration to the throne. Amongst the surrounding views is one of Rochester Castle, which stands where a spur from the downs overlooks a sharp bend of the Medway on its inner side, guarding the spot where, at least since the days of the Romans, there has been a ferry or a bridge across the river. The outer walls of the castle are much dilapidated, but the keep is still comparatively uninjured, one of the stateliest and most perfect remnants of Domestic military architecture in Britain, unsurpassed by any, equalled only by Richmond. It rises to a height of about 100ft., its plan being a square, with a side of rather more than 70ft. The walls average four yards in thickness, and are pierced with round-headed windows, those on the inner side being more enriched than is usual in a structure of this kind. Some Norman fireplaces still remain. This present keep is assigned, with much probability, to Bishop Gundulf, the architect of the Cathedral, and of the White Tower of London. It has an interesting history, having been besieged more than once—the first time prior to the erection of the present keep, when Odo of Bayeux, Earl of Kent, was attacked there by William II., who took it after much difficulty. It was overcome by Louis of France, when he invaded England during the troublous days which closed the reign of King John, and was again attacked by Simon de Montfort in 1264. On this occasion, however, though the outer defences were won, the keep still held out, and after seven days' close siege the earl abandoned the attempt; but it was less fortunate when assailed by Wat Tyler. The remaining sketches show the picturesque remains of the old City gates, and a view up Bull-lane, with its quaint gables and undulating sky-lines, untouched at present by the sacrilegious hand of modern restorer or jerry-builder.—LEONARD MARTIN.

Sir J. R. Mowbray, M.P., as chairman of the Ecclesiastical Commissioners, will formally open at South Shields on Wednesday, the 25th June, two new parks. They cover an area of thirty-two acres on the south side of the pier promenade, and have been transformed by the Corporation during a long series of years from unsightly sand and ballast heaps into picturesque pleasure grounds. The works were designed and carried out under the superintendence of Mr. Matthew Hall, C.E., the borough surveyor, the North Park having been laid out by Mr. Burns, and the South Park by Mr. Peebles, landscape gardeners. The total outlay has been over £22,000.

## WAYSIDE NOTES.

THERE is a wise old saw that declares two heads to be better than one; and if ever there was a striking instance of its truth, it is to be found in the result of the Worcester competition. Among the authors of the six sets of designs that the assessor, Mr. Waterhouse, has selected for the final competition, I fail to discover the name of any gentleman competing in a single-handed manner. In all cases firms of architects have been successful, and young architects who competed single-handed will not fail to have noted the circumstance as worthy of regard. They will think less favourably of "one-man" work, and incline towards the co-operative system with a more willing heart.

I suppose there are few young architects who have entered into partnership, or some system of co-operative working, before they have failed on the single-handed tack. It is natural to imagine one is going to "set the Thames on fire" and carry off all the competitions as soon as the brass plate is fixed, or other legendary information vouchsafed to persons passing by the offices where our friend has settled down, to wait for the practice that may or may not come in the course of time. There are many young men who, had they the wisdom to know that this peculiar conceit is common to all humanity, and that mortification of the flesh is the only hope, would succeed where now they fail: instead of wasting years in futile endeavours to make a practice, they would accept a junior partnership or work on mutual terms with some old friend. But they wish to do all and be known to have done all—a very honourable desire, certainly, though at war with the results of experience and with known facts. Did they but seek the benefits of co-operation, and agree to work with others, they would find the path less thorny. There are always ways open to young men who have had ordinary opportunities of making friends in the earlier period of their careers. If they cannot get a junior partnership, they can get someone to share offices and participate in certain ventures, such as competitions. This latter system has been very much in favour of late years, and deservedly so, for it gives many of the advantages of partnership without its disadvantages; and if, as years go on, it be found mutually desirable to enter into proper partnership, the parties have had a time of probation—a wooing or a courting—that will insure a felicitous alliance. I venture these suggestions because nowadays co-operation, even on a small scale, is almost a necessary condition of success in business, and the incident of the Worcester competition is surely an index of the times, and not to be passed over as insignificant.

Certain individuals are born with an exceptional aptitude for "getting on," and such will find paddling their own canoe to be the best. As a general rule, however, a partnership can be made a more paying concern than the business of solitary practitioners. From an artistic point of view, partnerships are objectionable, and knowing the why and wherefore of this objection keeps the young architect, who fancies himself a William de Wykeham, or Christopher Wren, or both of these worthies rolled into one, from accepting positions which would doubtless advance his worldly position, but in his imagination obliterate his individuality. We all like to know who designed a certain building. It does not satisfy us to know that Messrs. Brown, Jones, and Robinson designed it. We then commence to speculate as to how much of the work Mr. Jones did, and whether there is a fair share of Brown and Robinson incorporated in the elevation. We cannot satisfy our artistic cravings. If we knew that Mr. Brown, say, conceived the whole design, we feel interest in the work; but there is something—difficult though it may be to express it in words—that repels us in the idea of a piece of architecture being the result of the efforts of Brown + Jones + Robinson.

New competitions announcements have been scarce lately, and the advertisement of the proposed Fleetwood Market hardly recompenses the confirmed architectural competitor, who lives but to compete. It is to be presumed that the market buildings will be fairly extensive, and that a sum of twenty pounds will be very scant remuneration. It is the old complaint—a beggarly £20 is offered for "plans, specifications, and estimates"

for and in consideration of a work which, from the nature of the buildings, must involve a serious amount of labour to the profession. In this case, moreover, the inaugurators do not bind themselves even to award the £20! Isn't this sort of thing getting a trifle beyond a joking stage? It is now a common affair enough for appeals for competition designs to be drawn up as though made to a gang of thieves. I wish that something could be done on similar lines to the action taken to insure the appointment of assessors to prevent this. It must be evident to all that the agreement among a large number of architects not to compete unless an assessor be appointed has been productive of most beneficial results. The majority of competition advertisements now appear with announcements to the effect that an assessor will be engaged to award the premiums. If similar measures to those which have brought about this marked reform could be taken to indirectly compel inaugurators to arrange competitions with a morsel of respect for the position of architects, I have no doubt but that it would be possible to defeat the ends of those persons, whose sole aim is to obtain a maximum of work from, with a minimum of pay to, the architectural profession. It is false to say that the state of things is referable to the competition of the times, &c., *ad nauseam*. The fault is with ourselves, and is only to be remedied by combined action.

Nothing like moving with the times! I have an idea, prompted by a visit to the Architectural room at the Royal Academy, whereby I hope to make that fortune for which I have long sought. Suppose next year I appended to a series of sketches on the R.A. walls, "Houses in this style £500; ditto ditto with back-stairs and less jerry-building, £550; schools as shown, £7 0s. 10<sup>1</sup>/<sub>2</sub>d. per head; churches, as drawn, £3,500, including architect's commission; cathedrals upon application!" Why not? I fail to see a vast chasm between a drawing of a "house costing £650" and what I propose.

I go to the yearly exhibition at Burlington House with a set purpose of enjoying the pictures and drawings, and when one puts oneself into an appreciative frame of mind there is a fund of enjoyment to be got out of even the Architectural room. A good show like the present one is interesting from two points of view—(1) regarding the architectural taste of the day, and (2) with respect to draughtsmanship. One of the most striking facts to be noticed in connection with the former is that only in one case is severe Classicism evidenced, and that is in regard to the Mappin Art Gallery; and the most noticeable feature of the draughtsmanship is one that I was glad to see you pointed out in your first notice of the exhibition, and that is a less amount of Yankee smartness, and, as a substitute, honestly-prepared drawings evidencing care and painstaking, in lieu of flick-and-dot and splash-and-dash. As regards the style of buildings illustrated, it might be imagined that Classic architecture is, at the present time, very much at a discount; but it should be remembered that a Gothic architect has been intrusted with the hanging of the architectural drawings. This, of course, greatly influences the nature of the whole exhibition. Mr. Pearson doubtless strove to be impartial as to style; but it would be impossible to entirely prevent style from influencing the selection. For my own part, I would rather the selection were plainly characterised by the taste of the architect intrusted with the hanging of the drawings; for it would add a special interest year by year over and above that of the drawings themselves.

In the course of an exceedingly instructive paper on "Public Elementary Schools," read before the Society of Architects on Tuesday evening, Mr. E. Tidman stated that it would be welcome news to many to know that the system whereby the Education Department's architect had to be fee'd by the architect submitting school plans had been abolished. The system was objectionable on every score, and the profession will be relieved to learn that it has thus been swept away. It never gave satisfaction, and caused much unpleasantness.

A museum of architecture is to be established at King's College. It is not stated whether it is to consist of models of light-and-air cases, and examples of schedules of dilapidations and bills

of quantities; but we shall shortly be hearing, I suppose. In any case, I fear much good is improbable. The dead-and-alive state of things at the Tufon-street Institution should be enough to frighten anyone from establishing another architectural museum. If a King's College student wants to study architecture, he can find plenty of examples of different classes of work within a short walk of Somerset House. Pictures and casts are of little educational value when compared with actual buildings; and in constructional matters, any earnest student, with his eyes open and wits about him, can learn more in an hour's walk through London streets than a day in a museum of examples. Models are mere toys. The best thing that could be done with the proposed museum would be to cram it full of the very finest photographs obtainable, of buildings from all parts of the world, arranged with regard to style and date. This would be in accord with a precept of Mr. Ruskin, which I call to mind, to the effect that if a student loves architecture he will study much from photographs of it. A well-collected, well-arranged exhibition of this nature would be the best kind of architectural "museum." It would not only be useful for educational purposes in connection with the college lectures, but would be interesting, and instructive, and useful for reference to all architects and students. Photography has reached a high pitch of excellence, and it is the best medium for the illustration of works of architecture. An architectural museum, I would repeat, is something which cannot exist, except in the city thoroughfares and country roadways. My advice to the promoters of the proposed "museum" at King's College is to rely upon photographs, and in so doing they have ample scope for the formation of a most interesting and valuable collection, which could be so arranged as to greatly facilitate the student's acquiring a clear knowledge of architectural history, which, after all, is the main thing required to be taught to probationers for an architect's calling. GOTH.

## CHIPS.

St. Edmond's Church, Exeter, was reopened on Sunday after being closed nearly six months for the removal of the old plaster ceiling, and a handsome wood one has been erected resting on carved stone corbels from the plans of Mr. F. J. Commin, architect; the carving was by Mr. E. T. Rogers; Messrs. Tree and Bolley were the builders, all of Exeter.

The Public Loan Commissioners have, on the recommendation of their consulting engineer, granted £13,000 of the £14,000 applied for by the Thurso River and Harbour Trust. Contracts will be advertised for as soon as the specifications have been prepared.

At "Tivoli" Theatre and Restaurant, London, in the theatre (and, we think, in some of the private rooms) "Anaglypta" has been used rather extensively by C. Dresser, Ph.D., &c., and H. René Rainger, artist.

The four-dial illuminated clock and a peal of tubular bells, which have been erected in the tower of the parish church, Blackley, at a cost of £700, were formally opened on Saturday. The clock, which has been erected by Messrs. J. Smith and Sons, of Derby, has four dials, each 5ft. 6in. diam., made of opal glass. The hours will be struck and the Cambridge quarters played on a series of metal tubes in suspension, manufactured by Messrs. Harrington, Latham, and Co., of Coventry. A stained-glass window, designed by Mr. J. Lowe, of St. Ann's-square, Manchester, has been erected in the south-east side of the chancel of the same church, the subject of which is "Aaron the High Priest."

The 15th-century church of St. Petrock, at Lydford, which includes all Dartmoor in its parish, is being restored and enlarged from plans by Mr. S. Hooper, of Hatherleigh. A north aisle is being added, and the roofs are being renewed. Mr. Harry Hems, of Exeter, is carrying out the carving.

In the course of the excavations now proceeding at Llandaff Cathedral for a new path from the Deanery to the cathedral the workmen in the employ of the contractor came upon a part of an ancient sword. The weapon is a contel-lache, of the early sixteenth century, and, although no marks can be discerned, is probably of Venetian workmanship. Its length over all is at present 14in., of which there is 9<sup>1</sup>/<sub>2</sub>in. of blade remaining outside the garde. The handle is of steel, welded into one solid piece, the cross-bar being plain, and having the strap-shaped contre-garde welded into one of its arms. The whole of the parts of the handle are thickly plated with silver, which has been damaged by the rusting of the under-lying iron and steel work.

Ground Plan of 3 Bed Rooms over

## CONTEMPORARY BRITISH ARCHITECTS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

**T**HIS, the eleventh sheet of portraits of living architects, commences with Mr. John Taylor, F.R.I.B.A., who entered the office of Her Majesty's Works in 1859, as first assistant to the Surveyor for Royal Palaces, Public Buildings, &c., in the London District, and to which post he succeeded in 1866. The following are amongst the numerous works which have been carried out under his direction—viz., additions to Marlborough House, including the raising of the main building and wings; the erection of the Bow-street Police-court, Offices, and Station, and the Marylebone and Dalston Police-courts and Offices; the erection of the "White" wing and the Mausoleum Room of the British Museum; the construction of the new entrance, staircase, and exhibition rooms at the National Gallery; several works of restoration at the Tower of London. The new Bankruptcy Courts and Offices now in progress in Carey-street, Lincoln's-Inn-Fields, are also being carried out under his supervision, and from his designs. In addition to the above, he has executed many important works of a miscellaneous character, which include the exhibition fittings of the Natural History Museum at South Kensington at a cost of about £125,000 (sketch drawings of some of those of a structural character having been prepared by the architect of the building, Mr. Waterhouse, R.A.); the embankment of the gardens on the south side of the Houses of Parliament at a cost of about £25,000; the fitting of St. Paul's Cathedral for the "Thanksgiving Service" in 1872, and of Westminster Abbey for the "Jubilee Service" in 1887; the works at Hyde Park Corner, including the removal and rebuilding of the Wellington Arch, &c. His portrait is by Mr. Deneulain, of the Strand.

Mr. John Douglas, of Chester, was a pupil of Mr. E. G. Paley, of Lancaster. He began practice in 1860, his first important work being the rebuilding of the south front of Vale Royal Abbey for Lord Delamere, who afterwards gave him the memorial church of St. John's, Over, Cheshire, and other works. He has been much employed in Ecclesiastical and domestic work in Cheshire and other counties. Barrow Court, near Chester, is one of his works. He has built the following parish churches:—Aldford, Tattenhall, Dodleston, Pulford, Hartford, Altcar, Warburton, Colwyn Bay, Criccieth, and the churches in conjunction with his partner, Mr. Fordham, at Barmouth and Haydock. He has also restored the parish churches of Bangor Monachorum, Northop, Holt Llanaimon, Llanfechain, Cilcain, Bettws Gweifil Goch, Weaverham, Whitegate, and the fine old churches of Malpas and Tilston, St. Peters, and portions of St. John's Priory Church, Chester. His domestic work, besides grammar and other schools, includes the Grosvenor Club and County Offices, Chester, and consists of various buildings on the estates of several noblemen, notably the Eaton and Halkyn of the Duke of Westminster. He has also built the following mansions:—Appleton Hall, Oakmere Hall, Bronwyfawrygfair, Stratton Park, Shotwick Park, Elford House, Rowden Abbey, Llanerch Parma, the Gelli Malpas, Plas Mynach, Cornist Pabo Hall; additions to the Plas Tan-y-Bwlch, Jodrell and Glossop Halls, Halkyn and Hawarden Castles, and recently, in conjunction with his partner, Abbeystead, for the Earl of Sefton. He has built the memorial fountains at Whitchurch and Ruthin. The portrait of Mr. Douglas was taken by Mr. Watmough Webster, of Chester.

Mr. R. Rowand Anderson, LL.D., Edinburgh University, and F.R.S.E. His principal works are the New Medical Schools, Edinburgh University; the National Portrait Gallery and Museum of Antiquities, Edinburgh; the Central Station Hotel, Caledonian Railway, Glasgow; the Conservative Club, Princes-street, Edinburgh; Mount Stuart House, Bute, for the Marquis of Bute; and smaller houses in many other places. The Estate Offices in Greenock, for Sir Michael Shaw Stewart, Bart.; the Catholic Apostolic Church, Edinburgh; Roman Catholic Church at Galston; Episcopal churches at Edinburgh, Forfar, Cupar, Kelso, Helensburgh, Dunbarton, Culross, St. Andrew's, Stirling; Colinton, Dunfermline, &c.; the parish church at Govan, one of the most important of the new Presbyterian churches lately erected in Scotland. Considerable restoration works at

Iona, Jedburgh; Douglas, Lanarkshire; St. Vigean, Arbroath; St. Mary's, Hawick; Duddingston, Midlothian; the National Memorial to the late Duke of Buccleuch, High-street, Edinburgh; and a very elaborate monument in St. Giles's, Edinburgh, to the Marquis of Montrose, who was beheaded in the reign of Charles II. Large Board Schools at Stockbridge, Fountainbridge, and Causwayside, Edinburgh; and others at Kirkcaldy and Leslie, and the Norman Memorial Hall, Dysart. Dr. Anderson is now engaged in restoring Dunblane Cathedral, and the chapel of King's College, Aberdeen University, and in the erection of the Great Hall of the University of Edinburgh, the gift of Mr. W. M'Ewan, M.P. Dr. Anderson was one of the six architects selected to compete for the Imperial Institute. In 1878 he published a well-known folio of "Examples of the Municipal, Commercial, and Street Architecture of France and Italy." The portrait given herewith is by Mr. Marshall Wane, of Edinburgh.

Mr. John Burnet, the senior partner of the well-known firm of Messrs. John Burnet, Son, and Campbell, of Glasgow, has carried out several works of the first importance, and we subjoin a list of some of them. In Scotland his name as an architect is very familiar. He is a Fellow of the Royal Institute of British Architects. We give the following without particular regard to the order of their cost or scale:—In Glasgow, the Western Infirmary, the Clydesdale Bank, the Union Bank, the National Savings Bank; Glasgow Stock Exchange; the Merchants' House, Glasgow; and Woodlands Church, in the same city. Auchendennen House, Dumbartonshire; Arden House and Kilmahen House, in the same county; Kierallon House, Islay; Newfield House, Ayrshire; Balmaghie House, Kirkcudbrightshire. Mr. Burnet's portrait is the work of Mr. Stuart, of Buchanan-street, Glasgow.

Mr. Henry Tanner, A.R.I.B.A., the architect of the General Post-Office, was born in 1849. He was appointed a surveyor in the employ of the Office of Works in 1882, and since then has designed new post-offices at Bradford, Halifax, Wigan, Liverpool (Eastern District), York, Boston, Wisbech, Aylesbury, Newport (Monmouth), London (Eastern District), North Shields, South Shields, Newcastle-on-Tyne (extensions), Birmingham Head Post Office, Smethwick, Bilston, London General Post Office North; Savings Bank, Knightrider-street, E.C.; Parcel Office, Mount Pleasant, and at Sheffield; many new sorting offices round London, besides many extensions and other works; new Inland Revenue Office, Newcastle; Custom House at Swansea, and the Probate Registry at York. Other new post-offices from his designs have been built at Leicester, Watford, St. Alban's, Barrow-in-Furness, Douglas, and Warwick. Telegraphic factories and stores are about to be erected on Mount Pleasant, besides new Parcel Office at Manchester. Mr. Tanner's portrait is from the studio of Mr. Abel Lewis, of Douglas.

Mr. James Cubitt, a member of the family of that name, which furnished a former President and a vice-president to the Institution of Civil Engineers, was articled to Mr. J. C. Gilbert, of Nottingham, and commenced practice in London about 1864. Amongst his principal works is Union Chapel, Islington, the design for which was selected in limited competition, Mr. Waterhouse, R.A., acting as assessor. This chapel, opened in 1877, was completed a few months since by the building of the tower. Mr. Cubitt was also the architect of the Church of the Redeemer, Edgbaston; of the Congregational Church, Trumpington-street, Cambridge; the Welsh Presbyterian Church, Charing Cross-road; Westgate-road Chapel, Newcastle; Osborne-road Chapel, Jesmond; the Countess of Huntingdon's Chapel, Swansea; the Dulwich Grove Congregational Church; Union Chapel, West Bournemouth, lately begun; and, in conjunction with Mr. J. M. Brydon, he designed and superintended the Congregational Church, Castletown-road, West Kensington. Amongst his other buildings are the Morley Hall, Hackney; St. John's College, Loughton; the Loughton Board Schools; Mr. Spurgeon's almshouses, Newington, and part of the buildings at the Stockwell Orphanage; Haddon Hall, Bermondsey; and schools at Leytonstone, Lewisham, Dulwich, Urmston (near Manchester), and many other places. Mr. Cubitt published about 1870 a volume on "Church Design for Congregations," a great part of which had previously

appeared in the BUILDING NEWS. His other contributions to our columns from 1863 onwards include papers on the "The Conduct of Competitions," "The Workman's Share in Architecture," "The Avenue and the Central Area," "Notes on Tower Design," and numerous articles on architectural details and practice. Elsewhere he has published remarks (illustrated) on Late Gothic lead work, and on similar subjects; and in the *Contemporary Review* some time since an article on "Wren's Work and its Lessons." The photograph we reproduce is by Messrs. Debenham and Gould, of Bournemouth.

## THE SOCIETY OF ARCHITECTS.

**A** MEETING of this Society was held on Tuesday evening, at St. James's Hall, Piccadilly, Mr. W. H. Seth-Smith, past-president, in the chair. Messrs. George Buckley, Tower-chambers, Halifax; James William Dunford (architect to the Salvation Army), Pembroke-road, Walthamstow; and Charles Archer Pigott, Archer Lodge, Charles road, St. Leonard's-on-Sea, were elected as members. Mr. Edward Tidman, Member of Council, read a paper, entitled:—

## PUBLIC ELEMENTARY SCHOOLS.

The lecturer explained that, as he proposed principally to deal with the subject from the point of view of the Education Department, the rules and regulations issued by them for planning and fitting-up public elementary schools would be the basis from which his remarks would be built up. Some of the requirements of the Department which Mr. Tidman regarded as being, on the whole, fairly full and explicit were quoted, and the author proceeded to consider the planning. Having ascertained the number of children—boys, girls, and infants separately—which it was desired the schools should accommodate, the schoolrooms and classrooms would then have to be arranged in the following manner:—For the schoolrooms, accommodation should be provided for the required number seated at desks and benches—as floor space or cubic contents does not count in schoolrooms—and since the width must be 18ft., 20ft., and 22ft., the length must be provided to suit these widths, allowing three long desks deep of 20ft. or under, and five rows of dual desks of 22ft. wide. No groups of long desks must be more than 12ft., and 1ft. 6in. gangway must be provided within such group and next walls, the minimum space for each scholar being 18in. in long desks and 1ft. 8in. in dual desks, with 1ft. 4in. gangway between each group. The doors and fireplaces must be placed so that the whole of one side of the school is left free for groups of benches and desks; and classrooms should be provided for as many classes as there are in the schoolroom. These classrooms should not exceed 600 super feet, and are calculated at 10sq.ft. per each child, with a minimum of 18ft. by 15ft., and no classroom should be a passage-room from one part of the building to another, nor from the schoolrooms to the playground or yard, if it can possibly be avoided. Corridors connecting the class and school rooms should also be avoided. This can, as a rule, be best done by placing the classrooms at the end of the schoolroom, and much of the time lost by the straggling or disconnected positions of the rooms avoided. Classrooms may also be practically formed by dividing one long room by sliding partitions; but where this is used, care must be taken that thorough ventilation is not cut off. As to the number of floors, the author is much in favour of having only the ground-floor for all. As a rule, additional land is cheaper than high buildings, and the wear and tear, inconvenience, and danger of stairs are avoided; the schoolrooms can be kept more lofty, and thereby better ventilated, and with a purer atmosphere than when there is one floor over another, with in many cases windows at one side and one end of the room, and the walls may be kept to the minimum of 14ft. Of course, in London and large towns one-story buildings cannot always be carried out; but it is much better where it can, and he did not approve of more than two floors under any circumstances. Four elevations at least of the proposed school must be prepared on the same scale as the plans, of which one of each floor, in addition to a block plan, is required by the Department; also sections of the various floors and roofs, window-heads, ceilings, and the mode of ventilation. In preparing the elevation, care should be taken not to make it too elaborate or

costly. It is generally best to complete the plan before the elevation is considered. Long windows with a plain stone head brick-arch over, with keystone and stone sill, will generally be found effective, if stock bricks are used for the elevation, and red and blue bricks for the quoins, plinth, eaves, and stringcourses. The steps should be of granite, and a long length of ordinary 12in. by 6in. granite curb will be found cheap and efficient. The window-sills should be of hard York or Portland stone, as should all dressings within reach of the scholars. The plinth and other facing bricks should be very hard burnt; the ordinary red rubbers are quite unfit for plinths, &c., as the children in a year or two disfigure them by rubbing to sharpen their slate pencils; therefore hard stone or blue bricks are best for all dressings within reach, with ordinary Bath stone heads and facings when this stone will stand the weather. Where stone is the usual building material these remarks do not apply. Where red bricks are the usual facing materials, it would still be well to use granite for steps, and blue or other hard bricks or stone for plinths, &c. The window-sills should be about 4ft. from the floor, and the head as near as possible to the ceiling. All external walls must be of 14in. work if of brick, if of stone, at least 20in., and must have a damp course just above the ground line. No damp course is more effective than a double course of slate, laid to cross the joints and in neat cement; in some localities other impervious material may be used, such as glazed perforated bricks, &c., but on the whole, slate is most indestructible and satisfactory. All internal fence walls must also have a damp course, and the whole area of the schools have 6in. of concrete under ground-floor and air-bricks to ventilate joints. As the whole area applies to under walls, it would appear that although concrete is not mentioned separately as necessary under walls, yet that it is provided in this rule; but it will often be found that the local by-laws require 12in. concrete under walls. Some districts do not require concrete under the ground-floor of public buildings, amongst others Walthamstow, and as a school is described as a public building, this requirement cannot be enforced, although the authorities endeavour to do so, and often no depth is given for concrete, which is required to be of "sufficient" depth—a very unsatisfactory description. The height of schoolrooms is regulated by the area; if ceiled at wall plate must be 12ft., if over 360 super. square feet 13ft., and over 600 then 14ft. from floor to ceiling. If ceiled at the rafters and collar beam it must be not less than 11ft. to wall plate and 14ft. to ceiling from floor level. Roofs open to apex are not approved, as the ventilation and warmth of the school cannot be so well managed with an open roof. All roofs should be high pitched, that the water may get away quickly, and to give as much air space in school as possible. The silica wool will be found a good non-conductor on which to bed the slates, which should be strong and fixed with two copper nails with good lap. The Department requires that there shall be separate entrances for each department, and more than one to each is desirable, and should never be through a cloak-room, at any rate so far as the principal entrances are concerned. Cloak-rooms are usually considered of little importance. In many old schools the entrance porch is thought sufficient, three or four children having their coats, cloaks, and hats on one peg. This is not only bad from a sanitary point of view, but it causes confusion and inconvenience to the children when leaving. The Department requires all gangways in cloak-rooms to be 4ft. wide at least, and well lighted from the end, and that a separate numbered peg be provided for each child, placed 12in. apart, two rows tier deep fixed alternately, and not one below the other. Plenty of light and air are very essential, and although it is not imperative to have a fireplace in the cloak-room, there should be some means of drying the clothes on wet days. A good firm umbrella stand and tray is also an essential. A ½in. wrought-iron tube fixed with stays, T's, and flanges, strong and cheap, with a short inclined deal tray in 6ft. lengths to take the drip, makes a convenient fitting to remove for emptying and cleaning purposes. The cloak-rooms should be so arranged that they can be locked up during the time the children are in school to prevent the clothes being stolen, and the doors should have strong diamond-pattern galvanised-wire upper panels for securing ventilation and facility of super-

vision by the teachers. Many schools are now designed with an assembly hall, where the whole of the children are collected for prayers, drill, and instruction by the head master or mistress. The greatest drawback to carrying out this arrangement has been that hitherto no grant of money has been sanctioned by the Department for the erection of this hall, as it is not considered in the accommodation of the school; but by the new Code provision is made that a grant will be sanctioned of not more than £600 towards the cost of a central hall, and the difficulty of funds will now be got over if the Code passes as drawn. Mr. Tidman said he was not in favour of this hall, which is useless, except for a very few minutes each day, for school purposes; it certainly could be made available for public meetings, elections, concerts, &c., but for educational purposes is somewhat of a white elephant. In mixed schools a class may be, however, taught in this hall. The lighting of schools, next to convenient planning and plenty of air space, is of importance. The instructions are very clear:—Light should be admitted from the left of the scholar, and greatly influences the planning. Right light is next best, and failing this, from the roof or very high windows. Nothing but large clear glass should be used; in the lower panes, fluted clear glass may be used. Skylights are always objectionable, and plans are often thrown out where they are needlessly introduced. The form of window frames the lecturer had found most useful is a 4½in. by 4in. solid frame, rebated out at the back to take the weights, the top sash being made to slide down the depth of second division of frame, avoiding the inconvenience from rain, of pivot hung sashes, and their interference with blinds, &c. He had specially designed these frames for schools erected by himself to get over the difficulty with blinds, which is always the case with any other form of frame, except a double hung frame, which it would practically be impossible to make 12ft., a height to which this special frame is made. Staircases are best avoided where possible; but where required no winders should be allowed, the steps should be 12in. to 14in. broad, 6in. high, and in short flights, and any doors should open outwards. The author claimed to have been exceedingly fortunate in getting good ventilation without draught by the windows just described, the fireplaces, and the roof ventilators. The system is perfectly under control, and can be shut down in very cold weather; but he had never had any complaint of down draught even through the very coldest weather. He did not approve of any form of patent ventilators; nothing is better than a simple opening under control. Where there is not a block of sufficient importance to engage the constant services, if a care is taken to attend to a proper hot air system, tortoise stoves will be found most economical and efficient; for the babies' room open fires are a necessity. Lavatory basins, with a good supply of water and trapped wastes, are required, with flushed slate enamelled urinals, with combination "Unitas" or other good sanitary closets for the teachers. There has been a very great improvement in school desks of late years, and those now made leave little to be desired. Perhaps the best way to get good desks is to select four or five makers of repute, get samples from each and place them side by side: the construction, convenience, and general finish will be at once apparent. The dual desks are now much used, and the Department prefer them as a rule, and their adoption considerably increases the seating accommodation, as five rows are allowed as against three and four of long desks. Pitch-pine should always be selected. He need not dwell upon the other furnishings: the manufacturers' lists are well illustrated, and they nearly all supply a similar constructed desk of the various patterns, for master, mistress, and pupil teachers. School managers and boards, as a rule, like to select the desks, and a provisional sum based on the number and cost is sufficient to insert in the specification, as desks are always best procured from special manufacturers and not made by the builder. Dual desks cost from 14s. to 20s. each, and long desks about 3s. 6d. to 4s. per foot run, in pitch pine. All desks should be graduated to suit the various ages of the children. Play-grounds should be well paved, have good open sheds for wet days and for shade, and be fitted with some simple apparatus as climbing poles, horizontal bars, &c. In infants' schools the accommodation is calculated at 8sq.ft. to each child, and the width may be 24ft. There should

always be a babies' room, and it should have an open fire. Many school boards and managers now require a separate cookery room; this should be separate from or may be over a school room, be about 400 super-ft. in area, well ventilated, fitted with tables, 2ft. 6in. wide, and arranged in U shape, so that 24 girls can face the mistress at practice, and seats provided for not more than 72. There should be an ordinary cottage range and gas stove, and a small scullery fitted with copper, dresser, sink, &c., similar to an ordinary house. Masters' residences, and also those for mistresses, should not be placed close to the school for obvious reasons. There, however, should be a caretaker on the premises in all large schools, who should be made responsible for the cleaning, latrine flushing, &c. The cost of schools varies very much in different localities, and also in the same neighbourhood. A few years ago a very good infants' school was built by the author at £3 10s. per child, and recently another has been erected for over 800 which will cost about £4 per child, including a cookery-room; there were, however, some old buildings on the site which the builder valued at some £450, which would make the cost about £4 10s.; but there were exceptional circumstances in both these cases, and one-story buildings should be built in a substantial manner for £7 or £8 per child. Furnishing is included in these figures; but not land. The Department are prepared to recommend the Public Works Loan Commission to advance £10 per child, although they do not approve extravagant plans. More than this may be obtained, if desired, in the open market. All are aware that the plans have to be submitted to the Education Department for their approval, and they are examined by and reported upon by their consulting architect. Some time ago a circular was issued to school boards that efficiency and economy in school buildings is greatly promoted by means of suggestions made by the consulting architect; but as this was no part of his duties as consulting architect, and occupied a great part of his private time, a scale of fees was drawn up for such consultation; these fees varied from £3 3s. for schools for 250 children, £5 5s. for those holding over 500. Many architects, including myself, Mr. Tidman continued, took exception to this arrangement for many reasons, as it might be construed, and has been stated, that plans submitted to the consulting architect would not be passed unless he was paid, and that it was almost in the form of a bribe. It also suggested the idea that the architect designing the school was not competent to prepare a scheme without the assistance of the consulting architect, and this being the case the clients might reasonably say that the architect should pay this fee out of his (not now too liberal) commission. There are other reasons why it was objectionable that will suggest themselves to you. It is pleasing to note that in conversation one of the officials of the Department the other day stated that the circular was withdrawn, and no fees were now demanded or paid. This will probably prove welcome information to many. There are many rules of the Department that are not printed in the instructions with regard to the position of windows, distance from cross walls, scheme of the school block, position of cloak-rooms, with respect to class and school rooms, and other matters that some detailed instruction should be issued upon. Whilst the details of each room may be all that could be desired, yet the grouping and surroundings are often fatal to the plans, and what in one building is passed without comment forms a vital objection in another, and hence a more comprehensive and detailed circular of instructions is called for.

The CHAIRMAN observed that the class of buildings dealt with in Mr. Tidman's practical paper was the one in the architect's practice least fettered by precedents. The establishment of the School Board system had resulted, in the Metropolis, in the erection of buildings in an entirely new style, he thought of very effective as well as distinctive appearance. All who had drawn out the three classes of desks on diagrams knew that the dual form was the most useful in relation to cost; the single desk was even better, but the expense prohibited its use, except in very large schools. There were many objections to sliding partitions between classrooms. The cloakrooms could be placed between each pair of classrooms with advantage. He differed entirely from the lecturer in his objections to the central-hall system. A central hall provided a dignified feature to the group archi-

turecturally, was relatively inexpensive in proportion to its dimensions, and was greatly approved by teachers, as it afforded a place of assembly for prayers, examinations, and drills. Mr. Tidman's scheme of ventilation was very ingenious. As Professor Carnelly and Sir H. Roscoe had shown, schools ventilated by mechanical means possessed far purer atmospheres than those ventilated by natural means. He was glad to hear that the rule permitting the architect to the Education Department to offer advice on payment of certain fees, had been withdrawn, for although all professional men knew that the present occupant of that post would not do anything that was dishonourable, the general public, who were less well informed, were apt to form hasty and unfair conclusions.

Mr. ELLIS MARSLAND, in moving a vote of thanks to Mr. Tidman, said he concurred with the Chairman that the central hall was a valuable and useful feature in a school. The best arrangement for a school was to have a central hall with classrooms on either side, a large window at one end, and at the other the staircases leading to first-floor rooms, with cloak-rooms beneath. It was a mistake to provide steps of granite, as they wore to a polished surface. York paving was the best material for the purpose, as it retained a rough foothold to the last.

Mr. R. CRUWYS seconded the vote of thanks, which was supported by Mr. W. Allport and Mr. Alexander, all the speakers advocating the adoption of the central hall in school plans.

Mr. TIDMAN, in his reply, remarked that, although architects and teachers probably preferred the central hall if they could get it, he still thought, from the ratepayers' point of view, it was too costly a feature in proportion to the practical use made of it.

#### BRICKS AND BRICKMAKING MACHINERY.

By M. POWIS BALE, M.Inst.M.E.; A.M.Inst.C.E.  
Author of "Woodworking Machinery," "A Handbook for Steam Users," &c.

##### DRYING SHEDS AND CHAMBERS.

**A**LTHOUGH drying sheds or chambers are used in many places in this country where the best class of bricks is turned out by the plastic process, their use is not nearly so general here as it is in America, where it is almost universal. These chambers are heated by steam, hot water, direct heat, and radiated heat. In permanent works the use of drying sheds can certainly be recommended, as it permits of making being pursued for a considerable portion of the year, and preserves the bricks from damage by storms and frost. In America ordinary drying floors, which necessitate considerable labour in handling the bricks, have given place to smaller drying chambers. In this case the bricks after moulding are placed on pallets, which are piled in tiers on iron trucks and run on rails into an inclosed heated chamber, where they are allowed to remain some twenty-four hours, when they are passed on to the burning kilns. There is a considerable difference of opinion as to the best method of drying; the advocates of steam claim that more uniform results can be obtained from steam than from direct heat, and that draughts, &c., can be more readily regulated. If direct heat be used, great care must be taken in regulating it, as some clays will crack and warp considerably under its action if of too high a temperature. A plan of radiating the heat through a brick or metal floor has been introduced considerably in America, and it is claimed for this arrangement that the heat can be so graduated that either tender or refractory clays can be successfully dried, and without damage to the bricks. There is no doubt that heat can be produced cheaper from fuel direct than through the medium of steam, which, in addition, requires a steam-boiler to be constantly going, the heat from which it is difficult to graduate, although it is never so intense as that from direct heat.

A combination of a drying-floor and tunnel system is also in use, in which steam-heating coils, covered by a perforated-iron floor, are employed. It is claimed for this arrangement that the perforation of the iron floor distributes the heat evenly, and obviates the cracking of the bricks. It has been found, however, that some clays will crack on hot iron plates, and concrete or hollow brick floors are preferred by many.

Ward, in his paper on "Brickmaking," recommends hollow brick floors in preference to iron or stone flags, as the moisture does not come through the joints so readily; he also says that a site should be chosen rising longitudinally, to allow the condensed water to drain away. A layer of concrete 3in. thick should be spread over the site. Flues measuring 6in. wide by 4½in. high are formed along the floor by laying rows of bricks on edges 9in. from centre to centre. The bricks are laid with open joints at the ends that steam may percolate freely everywhere under the floor. Paving bricks or tiles 1½in. by 2in. thick are used to bridge over the flues. A bed of neat cement covers the whole, and on this is laid the final paving-course of hard brick 2in. thick. This forms a hard-wearing surface, while the cement keeps the damp from rising, and does not appear to crack. The exhaust steam from the engine is taken between the sheds in a main-pipe, from which cross branches, controlled by throttle-valves, are led at intervals of about 40ft. These branches have holes opposite each flue, and should any section of the floor not be in use, the steam can be turned off. Live steam can be turned into these pipes when the engine is not at work.

In drying bricks, whatever system be employed, it is important that the drying is not too rapid, and that the heat is readily under control, or the outside of the brick will dry and contract much faster than the inside; the shrinkage would, therefore, be uneven, and the brick warp and crack. With the direct-heat system, if the heat is too great and the drying too rapid, the brick is partially baked, and its form spoilt. What is required is a steady heat, which will permit of a fairly even evaporation of the moisture all through the clay, and a little extra time spent in this way is more than recouped by the improved quality of the bricks, with greater freedom from "wasters." With the object of graduating the heat, drying-sheds are often divided into a series of chambers, separated from each other by iron doors, and with a tramway running through the whole of them. The soft bricks are placed on trucks, and gradually pass in rotation through each chamber. Under one end of the building a furnace is arranged, and hot air of increasing degrees of temperature is introduced successively into the series of chambers.

In one system of steam-drying an exhaust fan is employed to draw the moisture-laden air from the drying-chamber, and force it through a cylinder condenser back to the chamber. The condenser extracts the moisture from the air, which, liquefied, is discharged by a waste-pipe, whilst the air, which is now dry, is passed back to the chamber, and being heated by the radiation from the steam-pipes, is again in a condition to take up further moisture from the bricks. This operation is again and again repeated, till the drying is completed.

Whether the air used for drying is heated by steam, hot water, or fire, it will dry much more rapidly if kept in motion than if allowed to remain stagnant, although some may suppose it would thus be enabled to absorb a greater amount of moisture; the reverse, however, is the fact. It has been sufficiently proved that rapid drying is best effected by drawing considerable quantities of heated air through the chamber at a tolerable degree of velocity at the same time, the chamber being arranged with sufficient ventilation to allow of an easy escape of the moistened air. The air can be drawn through the chamber by means of an exhaust fan, or forced through it by means of a blowing fan; but the former arrangement is generally to be preferred. As a guide, I append a table showing the amount of water a cubic foot of air will absorb at different degrees of temperature (Hood):—

32° Fahr.	will absorb	2 grains of water.
60°	"	6
90°	"	16
97°	"	20
160°	"	160
212°	"	240

It will be seen from this table that the absorbent power of the air is largely increased as the temperature is raised, and that at 212° of heat 1 c.ft. of air will absorb over ½oz. of water. No rule can be given as to the best heat for brick-drying, as this will depend largely on the nature of the clay and the amount of water it contains, some clays being capable of standing a great deal more heat than others without damaging. The heat best suited to the nature of the clay can, therefore, only be correctly ascer-

tained by experiment. Seagrave, in writing on artificial drying, remarks:—"Rapid drying is best effected by drawing or driving large volumes of highly-heated air in rapid motion through the chamber or other mechanical appliance containing the material to be dried, with due arrangements for liberal ventilation. Upon the ability to heat and maintain a given temperature of the air in high velocity effective and economic drying power depends. Rapid motion and free exit of the moistened air should not be impeded for the purpose or with the view of effecting its more complete saturation before leaving the drying-chamber, inasmuch as air in brisk motion at any temperature, and independently of saturation, plays an important part in mechanically carrying off vapour; thus the exit should be so regulated as to keep the drying-room free from ready-formed vapour. It is frequently supposed that a given degree of heat is all that is required, and ventilation is regarded as a secondary or even unimportant consideration, whereas the reverse should be regarded—ventilation being far more important than the degree of heat maintained in the room. There is, however, no reason why both should not be attained for efficient work. At low temperatures absorption of moisture, to the extent of complete saturation, is slow; therefore rapid drying at low temperatures can only be effected by large volumes in brisk motion, as in the case of natural open-air drying with a brisk wind. At high temperatures absorption is more rapid, and saturation more easily effected. With brisk motion of air at moderately high temperatures, say 150° to 170°, very rapid drying results, from a high degree of absorption as well as by the vapour being carried off as quickly as it is formed. Perfect ventilation cannot be too highly estimated, either when dealing with low or high temperatures. With liberal ventilation, air at a temperature of 60° to 70° will prove more effective in drying than 80° to 90° in a partially stagnant condition. Unless the draught or ventilation is sufficient to remove the saturated vapour as fast as it is formed, the drying effect is proportionately retarded.

Should a fan be employed, it is important that it is fixed so that the hot air is drawn as equally as may be through all the tiers of brick, so that they may dry evenly. The writer has found a fan blade speed of about 100ft. per second at the points of the blade suitable for most drying purposes. It will be found convenient to have an outer casing of the fan divided right through the centre just above the exhaust pipe, so that the upper half of the casing may be readily lifted off without disturbing the bearings, and the accumulated dust and dirt removed. The horizontal joint of the fan should, in all cases, be carefully planed and made perfectly air-tight. If pipes are employed, they should be as free from bends as possible, and never of less diameter than the inlet of the fan.

#### ARCHITECTS' REGISTRATION IN NEW YORK.

**T**HE text of the Bill now before the New York Legislature, providing for a Board to license architects practising in that State, has just come to hand. As a whole, it is clearly drawn, and seems capable of being worked smoothly, with the exception of Clause 2 in Section 5, to which we shall allude hereafter. It provides that the State Board of Architects shall consist of seven members, of whom two shall be selected by the Governor of the State from four to be nominated by the Western New York Association of Architects, and two others from four nominated by the New York Chapter of the American Institute of Architects, and one each by the Faculties of Architecture at Columbia College and Cornell University. The members are to sit for one or two years respectively, and are to serve without compensation or reimbursement. This board, five of whom will form a quorum, are to publicly examine applicants for leave to promulgate architecture, and are to grant licenses to such as pass, and also to publish the names and addresses of successful applicants in at least two architectural journals. The total fees for examination are twenty dollars—about \$4— to a successful, and five dollars to an unsuccessful, candidate, and a file is to be kept in the office of the Secretary of State of all licensed architects, provision being made for recording any change of address. Licenses may be revoked for "gross negligence, recklessness, or dishonest practices," after formal hearing of the charge by the Board,

sitting as a court of record, having full powers to compel attendance and testimony, but no license is to be revoked except by the unanimous vote of the Board. The important section is No. 5, making it a misdemeanour to practise as an architect without a license. It reads thus:—

If a person shall pursue the practice of architecture in this State, or shall engage in this State in the business of preparing plans, specifications, and preliminary data for the erection or alteration of buildings, or shall advertise or put out any sign or card designating himself as an architect having an office or doing business within this State, without a license therefor in accordance with the provisions of this act, he shall be guilty of a misdemeanor, and upon conviction, shall be fined not less than 50dol., nor more than 5,000dol. But nothing herein contained shall be construed to prohibit any person in this State from acting as architect of his own building, or as architect for any person employing him with full knowledge on the part of such employer that the person so employed is not a licensed architect in accordance with this act; nor to prohibit architects residing in other States, and not having an office or carrying on a general business in this State, from competing for a special building, or from visiting the State for such purpose in person; nor to prohibit students or employees of licensed architects from acting for or upon the authority of such licensed architects.

The last clause is the weakest one in the Bill, and will need amendment to prevent unlicensed outsiders from carrying out all the duties of professional men.

## PRACTICAL ARCHITECTURE WITH DETAILED ESTIMATES.—LXV.

By HENRY LOVEGROVE, F.S.I., Surveyor.

ESTIMATE FOR A VILLAGE ELEMENTARY SCHOOL.—  
ABSTRACTS (CONTINUED).

JOINER AND IRONMONGER.

If the floors open to 1-16in., they are to be taken up and relaid.

All floor boards to be stacked on the site one month after signing contract.

### FRAMES, &C.

Cube. Fir wrought all round and framed.

9 8	Do. and twice beaded.	
18 10	18 10 Do. framed rebated and beaded.	
9 8	9 8 9 9 Do. and do. do. moulded.

## CHIPS.

The London and North-Western Railway Company have withdrawn the Bill for the extension of Euston Station by bringing it out to Euston-road.

A memorial tablet in terracotta of the late Mr. Samuel Morley was unveiled in the Waterloo-road porch of the Morley Memorial Hall, adjoining the Victoria Hall, on Wednesday. Mr. George Tinworth modelled the work, which represents Mr. Morley among his students.

Alterations have been made to the torpedo works of Messrs. Thornycroft and Co., Chiswick, and special attention has been paid to the ventilation, which is now carried out on the Boyle system.

The newly formed County Council for the Isle of Wight have adopted a design by Mr. Percy Stone, architect, of London, for the county seal.

The Duke of Westminster opened on Saturday the new public baths and washhouses in the Buckingham Palace-road, which have been erected at a cost of £28,200. The building consists of two swimming baths, the larger being 90 ft. long by 30 ft. wide, and capable of holding 84,300 gallons, 76 private baths, and a public laundry, the whole of which are lighted by electricity. They have been built for the Commissioners of Baths and Washhouses for St. George's, Hanover-square, from the designs of Messrs. Lee and Smith, chosen in competition, and were illustrated in our issue of September 7, 1888. Messrs. J. Mowlem and Co. were the contractors.

## Building Intelligence.

**CHELSEA.**—Holy Trinity Church, in Sloane-square, Upper Chelsea, was opened on Tuesday. It consists of a wide and lofty nave of five bays, with aisles on each side. Beyond that on the north side is the morning chapel, covered in by a series of barrel roofs running north and south. A continuation of this chapel eastwards forms the organ-chamber and vestries. The chancel, which is of the same width as the nave, is separated from it by a low screen of green marble. The chancel floor is paved with black and white marble. The stained oak choir-stalls are elaborately carved, and have angels and other figures of cast brass inserted in the panels. The stall elbows are also ornamented with angels. These figures were modelled by Mr. F. W. Pomeroy. More steps lead up to the altar, which has a carving by Mr. Harry Bates. The body of the pulpit is of white marble with coloured panels, supported on columns of alabaster and red marble, and approached by a flight of alabaster steps. At the west end of the nave is a gallery. The bowl and shaft of the font are of Mexican onyx with steps of golden-veined marble. The church is lighted with the electric light, on the incandescent system, and the lights are inclosed in wrought-iron lanterns, which are surrounded by filigree work of wrought iron gilded, and are suspended from the ridge of the vaulting. Externally the whole effect is centred in the west front. The most striking feature is the west window, of flowing tracery, on each side of which are two turrets. The architect is Mr. J. D. Sedding, and the builders Messrs. Higgs and Hill, of Crown Works, South Lambeth-road, S.W. The oak chancel stalls have been executed by Messrs. C. Trask and Son, of Norton, Ilminster, Somerset, and the marble work generally by Messrs. Farmer and Brindley. The cost of the church has so far been £22,000, and will be £40,000 when the entire scheme is carried out.

**DAWLISH.**—New premises are now in course of erection for the Devon and Cornwall Banking Company at the foot of Teignmouth Hill. The main plinth and ground floor pilasters are of bunch-faced dark Chudleigh limestone, the plinth chamfer blocks and main pilasters are of Barton light limestone. The whole of the dressings are of Ham Hill stone, and the terminal vases of buff terracotta from the Tamar Works. Mr. Hy. Webber, of Paignton, is the contractor; Mr. G. Soudon Bridgman, M.S.A., of Torquay and Paignton, is the architect.

**DENTON.**—The church at Denton, in the diocese of Durham, which was only built in 1830 on the site of an ancient church, is now being demolished, and a new and more substantial fabric erected in its place in the Early English style. It is to consist of nave, chancel, south porch, vestry at west end, and organ-chamber on the south side of chancel. The walls are to be faced with random blockers from Houghton Bank, and lined with buff pressed bricks from Normanby, the internal jamb and arches being of stone. The pulpit, choir fittings, reredos, and chancel screen are all to be of Austrian oak, the rest of the woodwork being of pitch pine. The gangways and chancel are to be paved with mosaic tiles, the rest of the floors being laid with wood blocks. The windows are to be glazed with cathedral-tinted glass, having coloured roundels and margins. The warming is to be by hot water, and the lighting by coronæ. The architect is Mr. J. P. Pritchett, of Darlington.

**EDINBURGH.**—After being closed for a month for rearrangement, the Scottish National Portrait Gallery was reopened to the public on Monday. Externally the Gallery has now been finished. The two wings and the balustrade surmounting the walls have been completed, and nothing remains to be done save the carving of the corbels under the niches. Between the first and second windows to the west of the central doorway, the Board of Manufactures have inserted a moulded panel, on which will be carved in sunk letters the following inscription:—"Dedicated to the Illustration of Scottish History, this edifice, the gift to his native country of John Ritchie Findlay, was erected Anno Domino 1890, by the Honourable the Board of Trustees for Manufactures. R. Rowand Anderson, LL.D., Architect." Internally great progress has been made with the fitting up of the eastern half of the

building for the accommodation of the Scottish Antiquarian Society's collection. Several additional works of art are now hung in the Gallery. Among these are a cabinet portrait of Dr. John Brown, the author of "Rab and His Friends," executed by Mr. George Reid, R.S.A., in 1881, a year before Dr. Brown's death; and a cabinet painting by the late Andrew Geddes, A.R.A., containing portraits of Daniel Terry, the actor (who, like the younger Mathews and Henry Irving, was trained as an architect), and his wife. This work has been obtained on loan from the National Gallery in London. Other additions include crayon drawings of Horatio McCulloch, the landscape painter, by Sir Daniel M'Nee, and of Professor Joseph Black, a silhouette of Alexander Wilson, the ornithologist and poet, a portrait study of Lord Jeffrey, by John Fairman, and a kit-cat portrait in profile of Lord Clyde, by Jones Barber. A bust has been added of Sir John Leslie, Professor of Mathematics, and afterwards of Natural Philosophy, in Edinburgh University. It was carved by Mr. John Rhind. A bust in marble of the late Mr. Charles M'Laren, executed by Mr. John Hutchison, R.S.A., after the late Mr. Brodie's work, and another also in marble of Professor Aytoun, by Mr. John Rhind, after Mr. Patrick Park's bust in the University, has also been presented.

KIRKSTALL, LEEDS.—The Wilkinson Memorial Schools, which have just been erected in connection with St. Stephen's Church, Kirkstall, were formally opened on Friday. The new schools cost £1,700, and accommodate girls and infants. The infants' schoolroom is 50ft. 3in. long by 26ft. 6in. broad. The infants' classroom is 26ft. 6in. by 20ft., and there is a girls' classroom of similar dimensions. All these rooms are 22ft. 3in. high. The infants' school is entered through a large porch, which also does duty as a lavatory and cloak-room. The building is faced with broached sandstone, and has lancet-headed windows arranged in triplets. It has also dormer windows, the ceiling level. The roof is covered with stone slates from Idle. The floor of the new school is 13ft. above the level of the adjoining street, and this has afforded an opportunity of providing a covered playground under the whole, the arcade walls being lined with white glazed bricks and the floor concreted. The whole of the works have been carried out by Messrs. Eddison Brothers, Kirkstall, to the designs of Messrs. Smith and Tweedale, South-parade, Leeds.

PERTH.—Caledonian-road Board School is about to be built at a cost of £14,000, and will accommodate 1,250 pupils, including infant department, in addition to which there are cooking, chemistry, drawing rooms, &c. The plan has been arranged on the central-hall principle. On the ground floor the infant department comprises a large schoolroom, with classroom at each end, separated by sliding glazed partitions. The classrooms have throughout an average accommodation for 65, but are arranged in pairs with sliding glass partitions. The staircase is placed in the middle of the central hall, with separate flights for the different sexes. Headmaster's, headmistress's, male and female assistants', and pupil-teachers' rooms are provided. The heating is to be accomplished by means of hot-water pipes carried round the outside walls of the rooms. Each room has a separate outlet grating for vitiated air, and a flue carried to central roof. The stone used is of a warm red colour from Corncockle Quarry. The style is a simple rendering of Flemish Renaissance. The building is designed by Mr. Andrew Heiton, F.R.I.B.A., and the contractors are:—Masons, Fraser and Morton; joiners, Pullar and Falconer; slater, James Buchan; and plumber and heating, James MacLeish.

The Royal Cornwall Gazette says: The new institute buildings at Blackwater, Mithian, are being proceeded with rapidly. Hopes are entertained that the donor (Mr. Passmore Edwards) will be induced to perform the opening ceremony.

Colfe's Grammar School, Lewisham-hill, was opened on Tuesday. The new buildings have been erected from the designs of Messrs. Giles and Gough, and will cost between £6,000 and £7,000. They will accommodate 200 boys, and are planned with a view to convenient extension in the future if needed. They comprise a large main hall with five separate classrooms (three of which can be thrown into the main hall), masters' rooms, laboratory, and other accommodation, and a gymnasium shortly to be erected.

#### COMPETITIONS.

BROMLEY.—The Bromley School Board recently invited a limited number of architects to compete for their new schools at Raglan-road for 700 children. On the award of their referee, Mr. R. Norman Shaw, R.A., the design of Mr. Charles Bell, F.R.I.B.A., of 3, Salters' Hall-court, E.C., has been adopted, and the works will be commenced at once.

WHITECHAPEL.—A free library is to be erected at Whitechapel at a cost of about £4,000, a sum, however, somewhat inadequate to the amount of accommodation required, judging from the conditions issued to competitors. Plans have this week been sent in by about eight or ten firms invited to compete. Among those who have submitted designs are Messrs. E. W. Mountford, John Johnson, J. M. Brydon, Smith and Potts, and Sulman and Hennings.

#### ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The third annual meeting of this society was held at the School of Art last Tuesday night. The report of the secretary and the treasurer's statement of accounts were read, and showed that the society now consisted of 44 fellows, 24 associates, and six students, and that the balance in hand is £55. The meeting next proceeded to ballot for the election of officers and council for the coming year, Messrs. W. C. Fenton and C. Gibson acting as scrutineers. The following were elected for the season 1890-91:—President, Mr. F. Fowler; vice-president, Mr. C. J. Innocent; treasurer, Mr. J. B. Mitchell-Withers; hon. secretary, Mr. C. Hadfield; council, Messrs. T. J. Flockton, E. M. Gibbs, W. F. Hemsoll, W. H. Lancashire, and W. C. Fenton.

#### CHIPS.

The memorial stone of a new school which is being built by the Manchester School Board in Johnson-street, Bradford, was laid last week. The school, which will accommodate 1,000 children, will have two floors, 500 boys occupying the upper and 500 girls the ground floor. A peculiar feature in connection with the school is that no playground will be attached to the building, but by arrangement with the Corporation the children will have the use of a public recreation ground which is now being laid out immediately to the rear of the school. The builders are Messrs. Robert Neill and Son, Strangeways, Manchester, and the cost will be about £9,300.

The first stone of the church of the Convent of Our Blessed Lady of Good Counsel and St. Augustine was laid at Hayward's Heath by the Bishop of Southwark. Among those present were the architect of the convent and new church, Mr. Edward Goldie, of Kensington, and the builder, Mr. Goddard, of Dorking.

A memorial to the late Hon. F. J. Tollemache, M.P., is about to be erected at the north end of St. Peter's-hill, Grantham. The pedestal will be polished grey Aberdeen granite, 11ft. high, and the figure surmounting it will be of bronze, and 10ft. in height. Mr. G. Simmonds, of St. John's Wood, N.W., is the sculptor.

The pastoral staff to be presented to the Bishop of London will cost about £720 instead of the £350 originally proposed to be expended upon it. The designer is Sir Arthur W. Blomfield, A.R.A., and Mr. Gilbert, A.R.A., will execute the crook, the tabernacle, and the figure work. It is proposed that the staff shall remain permanently at St. Paul's.

Mr. Ira Hendy, of St. Columb, has been elected surveyor to the West Powder highway board.

The local board of Newtown, Mon., received the resignation of Mr. John Owen, their surveyor, who is emigrating to America, and, on the motion of the chairman, decided to send a written resolution expressing their confidence, regret, and good wishes.

The town council of Burton-on-Trent at their last meeting appointed Mr. J. E. Swindlehurst, Assoc.M.I.C.E., engineer and surveyor to the Rawtenstall local board district, and late deputy borough engineer of Barrow-in-Furness, their borough engineer and surveyor. There were 107 candidates.

The parish churches of All Saints and St. Nicholas, Cardiff, have just been provided with handsomely-carved oak eagle lecterns in the Norman and semi-Norman styles respectively, the order in both cases being entrusted to Messrs. Jones and Willis, of Birmingham, London, and Liverpool.

#### TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

#### TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

#### ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

#### SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

#### NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII., XLVI., XLIX., L., LI., LIII., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—W. I. C.—J. G.—S. and Co.—J. G. and Co.—S. R. and Co.—G. and Co.—J. C. and Son.—W. H. and J. S.

## Correspondence.

### "UNIVERSAL PROVIDERS'" ARCHITECTURE.

To the Editor of the BUILDING NEWS.

SIR,—I have just seen some house-plans with the name and address, as architect, of a great general store-keeper who undertakes seemingly work of all kinds, and, in fact, thanks to the absence of Registration of architects, he acts also in this capacity, taking the bread out of the mouths of those who, in the ordinary course of things, for every good reason ought to be employed to do architectural work. I need hardly say that the work shown by the drawings to which I refer was thoroughly bad, even as a sample of practical building, to say nothing about good taste or design; indeed, the whole thing—plan, elevation, and section—is so bad that I need not waste your space by describing it.

I may add that a w.c. was contrived to enter out of the ladies' sitting-room! Of course, in a free country, people can have accommodation of this kind in the centre of their dining-room if they choose; but I do think you are right in advocating such measures of reform as shall prevent publicans, universal providers, and other unqualified people from undertaking building operations like this—not only to the disadvantage of professional architects, but to the loss and sanitary risk of the public. Pray, persevere in your good work.—I am, &c.,

F.R.I.B.A.

(Not a Member of the Society).

#### PROVISIONS IN QUANTITIES.

SIR,—“When rogues fall out, honest people come by their own.” Any attempt to apply this old saw to the correspondence on “Provisions in Quantities” would probably be considered by

"A Builder's Manager" and "A Disgusted Surveyor" as "vituperation," which they bandy to and fro without strict regard to its significance. Still there is not much to choose in the other horn of the dilemma, taking Carlyle's division of humanity into rogues and fools, which the correspondence seems to support, although, perhaps, reversing the preponderance that he suggests.

A rapid glance at the different communications may help to winnow the corn from the chaff, and aid in checking a very lax code of morality.

"A Builder's Manager" opened the ball by a very shallow and fallacious attempt to show that "prime cost" and "nett" do not mean prime cost and nett as understood by every one but builders and their managers and architects that are willing to be hoodwinked; or that prime cost, instead of being what the builders pay, should be what they wish to be paid, and that nett should be the actual cost plus the ever-varying discount of trade catalogues of from 5 or 10 to 50 per cent. or more. Then 500 sovereigns "imply £500 worth of goods," not that 500 sovereigns should be paid for the goods, which is puerile trifling, and implies that truth and honesty are at a very large discount—but it is to be hoped not with a very large class of builders or managers if with any of large business and good standing. The Manager's ordinary rule of logic is somewhat extraordinary when equally applied to arbitrary prices, only checked by a builder's view of what profit he would wish to get, and prices checked by competition with others for the job. The architect need not know the prime cost of the latter; but he certainly should take good care to know the real prime cost of the former, if he intends to fulfil his duty to his client; and he as certainly should not submit to the insult of being told that when he writes prime cost or nett he intends it to have two meanings—one for honest men, the other for Carlyle's minority.

Following your article on the subject, "Twice Charged" takes up the running, but on a loop line for very nasty traffic, that if tolerated is liable to increase and fructify, and which his exposure may tend to check. That his complaint as to "surveyors' provisions" was needed is very clearly proved by the two angry replies that it elicited, which are both ill-tempered and illogical. Mr. Lovegrove answers by queries beside the mark, and a plea of character, and "no benefit"; but he is probably right, that the matter is not large yet. "A Disgusted Surveyor" twits "Twice Charged" with inconsistency very erroneously, and pleads justification and moderation of charge that implies the foot of the ladder. No doubt some surveyors properly charge a less rate for omissions taken from the quantities and not remeasured when the amount is large. It is also true that drawings and specifications may fail to define work so that a surveyor can take it accurately; but a surveyor is only accountable for what is defined. "Stabbed in the back" and "cowardly fashion" are bosh, and the complaint of *nom de plume* comes badly from "A Disgusted Surveyor." "Builder's Manager" (a second Richmond probably) shows that "surveyors' provisions" are not ideal, or their charges trifling. "Twice Charged" parried and countered Mr. Lovegrove's silly query, and offered him a worse choice than Hobson's, asked for information, and left "A Disgusted Surveyor" to deal with "Builder's Manager," if he could; and in this he was anticipated, for "A Disgusted Surveyor," after a fling at "blackening characters," carries the war into the enemy's camp, leaving his own deserted and exposed; but he gives one "Builder's Manager" a very plain Roland for the other's Oliver as to "net prime cost" and "coloured catalogues," which he paints in true, if repulsive, colours. That should teach architects who may have had any doubt on the matter to ignore trade lists, and to avoid, as far as possible, those who issue or produce them, and to insist on the full sum provided being actually expended for their clients, or deducted from the contractor as far as not expended, with a proportionate share of the added profit. It is lax dealing in such matters that may be considered only generous liberality that prompts and encourages claims that are scarcely disguised swindling. "A Disgusted Surveyor" can see this clearly, but cannot see that charging fees on the same work three times over should not be set off against loss of fees in other cases.

Mr. Lovegrove toes the line again, and again

misses the mark, as to the information asked from him, which certainly was not to repeat what he said before; but to explain any cause for surveyors' provisions, or, if there was none, to condemn the practice; for it is offensive to deny it in the teeth of the statements made, and the plea in abatement by "A Disgusted Surveyor," and it is hard to conceive how Mr. Lovegrove cannot know of it, even if he does not practise it, or to account for his ill-temper as to "anonymous scribbles" and "stab in the dark," if he has not been touched on a sore spot. He should remember that all do not desire a cheap advertisement of their names and addresses unnecessarily, and that some, at least, desire to uphold what is just without the spur of personal interest. He is, however, probably right with "Twice Worked, Once Paid," as to the practices complained of being confined chiefly to a certain class of builders and surveyors; but that is no reason why they should not be exposed and condemned, and certainly no reason for over-charging for one thing because something else is not paid for.

"A Builder's Manager"—the real original one, I think—tackles "A Disgusted Surveyor" with a will, but is himself disgusted at a builder being asked to add profit to a provisional amount, and appears quite unconscious of the unblushing dishonesty that he advocates, and that, as he asserts, some architects permit and practise. He reiterates his blunder as to a builder's prices or profits for works checked by competition being the same as prices paid for, or profits on, provisional works without competition, and which he pretends to think that it is derogatory for an architect "to go behind the back" of a builder about, whatever that means. Possibly it is a verbal equivalent for the old story of putting a lock on the milk-can. And to do him justice, he is rather opposed to any limitation all round, for bad as "A Disgusted Surveyor" is, he does not agree with "Twice Charged" or (another) "Builder's Manager" in washing even surveyors' dirty linen (much less builders') in public. He is evidently for live and let live (at the client's expense) and honour amongst thieves. But the other "Builder's Manager" briefly points out quite correctly that "A Disgusted Surveyor" has become confused by the two Builder's Managers and the blending of right and wrong.

But, Sir, it rests with architects to root out or encourage this fungus growth of moral delinquency. Whenever a surveyor's provision appears it can only be caused by neglect on the part of the architect by not properly defining the work, or neglect, or worse, on the part of the surveyor, in not properly taking what was properly defined, in the interest of dishonest builders. And, certainly, an architect who entertains a juggling question as to his meaning in specifying nett or prime cost, belongs to either of Carlyle's divisions of humanity. If a builder had a nett price quoted to him, would he look for a further discount? An architect who includes a provisional amount is bound in honour to see that his client is only charged the actual price paid by the builder, with such profit as he added in his tender.

M. M.

Sir,—I thank "A Builder's Manager" for his generous remarks at the close of his letter in your columns last week. I promise him in return not to "vituperate" any more.

Certainly another "Builder's Manager's" letter which followed was surely not complete. Why did he not state that the roof in question was in "yards cube" in the said quantities? As to why it was taken "Provisional," a possible explanation is that the architect was doubtful as to whether a roof would be required or no! I wish "A B. M." would remember that "all is not gold that glitters;" likewise surveyors are made up nowadays of all sorts—old and effete, or young and pushing builders' clerks, who, when got rid of by contractors, usually start as surveyors; and architects, when they wish to get rid of a clerk who has no knowledge of art, always promise him, as a sop, their quantities; and architects, again, who find their families increasing and their "jobs" not so numerous, always begin to argue that the architect is the only man who can properly "take out" quantities, and they plunge into it accordingly, and "leave out" quantities also accordingly.

Your readers, I have no doubt, will remember the able instances collected by a surveyor, I think, in your columns some five or six years ago, and they went to prove that the commission

charged by the above gentry was always in inverse proportion to the accuracy of the quantities and the amount of paper in the said bills.

With your kind permission, I will now proceed to examine the misty arguments of "A B. M." or "value versus prime cost." I notice that he does not try to explain away the "catalogue" question, neither does he give us the historic origin of this gigantic swindle with their red-ink slips. It is, without doubt, the foundation of the whole matter. I ask, Why do not these catalogues for chimney-pieces, stoves, and wall-papers show on their faces the true value of the things sold?—and it is odd that these are the catalogues which most frequently come before a client and his architect to choose from. "B. M." carefully explains that "prime cost means in trade the first cost before adding incidental expenses, and, used as such, it has a definite meaning." Precisely so, and that is exactly what a surveyor means when he states that a range is to cost £20 prime cost, and the contractor is requested to add his profit. What has it to do with the argument or with the client if the contractor chooses to ignore the latter request, because he fears one of the competing contractors may not add a profit, and thereby get the job? Why does not "B. M." instead of arguing that black is white, prevail on the trade to understand that, when a thing is described as "prime cost," it simply means what the contractor pays for it in cash, and that the contractor's profit is to be added to it.

"B. M." is quite right in thinking that a surveyor would not care if 50 per cent. were added; neither would the client, if the particular tender happened to be lowest. If the contractor were the manufacturer of the range or the wall-papers he would, no doubt, have a right to mulct the client in any profit he chose, or could get; but he is not. Therefore, what right has the contractor to a difference in value caused by lessened cost of production?

I will suppose a case. A merchant takes a moneyed man into partnership, extends his premises, buys new and improved machinery, and, to do a larger business, sends out a circular that, instead of, say, 25 per cent. discount off first prices, he will give 35 per cent. In the name of all that is honest, what right has the contractor to this difference in value? Again, a store merchant. The price of iron goes down, and men agree to accept a lower wage. Again, a circular is issued that prices will allow a larger discount. This also is schemed, according to "B. M.," entirely in the interests of the contractor, and the whole should go into his pocket.

When "B. M." prices the brickwork in a surveyor's Bricklayer's bill, how does he do it? Does he not take the current price of stocks, and add cartage, lime, sand, labour, and then his profit? Or does he hunt back to find out the price of bricks when one of our "winters" happened to occur in the "summer-time," and then, because bricks were much dearer, does he argue that he is being "jockeyed" out of a profit because those concerned will not pay the price?

I do not agree with "B. M." that there is anything anomalous in the way most surveyors treat this question; the only anomaly is in the special pleading which contractors indulge in over this simple matter. Apologising for the length of this letter—I am, &c.,

A DISGUSTED SURVEYOR.

#### SCULPTURE AT THE ROYAL ACADEMY.

Sir,—Nos. 2046—2050 in the lecture-room, represent "a series of five niche figures in marble forming part of a reredos erected in St. Mary's Church, Aberavon, in memory of Mr. Llewellyn, of Baglan Hall, by Henry H. Armstead, R.A.,"—so reads the catalogue. An elevation of the reredos in question—one of Early character—may be found in the Architectural room just under Sir Arthur W. Blomfield A.R.A.'s careful pencil sketch of his proposed interior treatment of St. Saviour's, Southwark. It is designed and exhibited by Messrs. Kempson and Fowler, architects, of Llandaff.

I have read Mr. Harry Furness's clever skit "Royal Academy Antics," but I was scarcely prepared, upon going into the Sculpture department, to find anything approaching to these five statuettes in marble. Although they are draped up behind, so that the best possible effect may be obtained, they are so utterly unlike any architectural figures I ever saw in my life before, that

I venture to call attention to them. Is such work really what London experts call excellent? Pausing for a reply, I am, &c.,  
A VISITOR FROM THE COUNTRY.

## Intercommunication.

### QUESTIONS.

[10278].—**Force of Gravity.**—A difference of opinion arose the other day between two men in an office in which I am employed, concerning a gymnastic display, which took place some years ago at the Crystal Palace, during which display a member of the German Gymnasium ascended, hand-over-hand, to the roof of the structure by means of a rope suspended from the centre transept roof—the ascent occupied a quarter of an hour; and the contention of one of the men was, that, supposing the descent took the same time, and was performed in exactly the same way—viz., by the arms, and not the arms and legs of the performer combined, the physical strength exerted in each case would be identical. Going on to a more mechanical illustration, one of the men held that a pin in a shackle in a line or chain employed in raising a weight, would have to be stronger than if the tackle was exclusively used in lowering an exactly similar weight, assuming that the motion of the weight up and down was rapid, or even fairly appreciable. The question is, it seems, this—viz., Whether exertion required to overcome the force of gravity in moving a given weight in an upward direction, is the same as that required to regulate the speed of a similar weight (in its obedience to the law of gravitation) travelling earthward!—A. F. CUTLER.

[10279].—**Italian Oak.**—In the Honours grade of the City and Guilds examination in carpentry and joinery, held on May 30, No. 1 question is as follows:—"Give particulars of the following oaks, stating for what purposes they are best adapted, and how you would distinguish them:—'Dantzie,' 'Italian,' 'White,' 'Riga.'" I should be glad to know through the medium of your valuable paper for what purpose "Italian" oak is used, having failed to discover any particulars from works on this branch of building.—H. J. P.

[10280].—**Provisional Amounts.**—Whereas an amount is included in quantities stating that the work is to be executed by a specialist (who has tendered for same), and stating that the amount is to be paid to him by contractor on architect's certificate, can the contractor fairly claim from specialist a trade discount? This has been attempted, and, I believe, acceded to in more than one instance in my experience.—FAIRBANK.

### REPLIES.

[10274].—**Hot-Water Apparatus.**—As there has not been a reply to "Canadian Architect's" query, perhaps I may aid him. The connection or feed-pipe from the expansion tank, or supply cistern, should be to the return pipe or boiler, and not to the flow-pipe, unless the expansion tank is for hot water; but if a cold-water feed cistern, the pipe from it should dip or siphon under the flow-pipe or the boiler before its connection with either, to prevent the hot water ascending to the expansion or feed cistern. And it would be well to have a draw-off cock (or screw-plug if the pipes are iron) at the bottom of dip or siphon to let off sediment, and to empty the pipes if below the boiler, which is only done when a cold-water pipe from the supply cistern passes near the boiler for other purposes. The reason for not connecting the feed-pipe with the flow-pipe is that the water entering by the feed-pipe, being, of course, colder than the water in the flow-pipe ascending from the boiler, would check the circulation and descend to the boiler. Whereas if connected with the return-pipe, it would unite with the current returning to the boiler, and rather increase than check it; but if connected with the boiler, the water would get quickly heated, and scarcely affect the circulation.—M. M.

[10276].—**Speaking-Tubes.**—Perhaps the tubes are plugged with a whistle. If a whistle is not required at that end of the tube, I would recommend your correspondent to plug with a cork, and see that the mouth-piece is well screwed up.—C. F. M.

A deputation waited on Monday on Mr. Chaplin as to the formation of a School of Forestry. It was stated that, with the exception of Spain, there was no other nation in Europe which was without a School of Forestry. Mr. Chaplin said it was not in the power of the Agricultural Department to establish a School of Forestry; but he would put the matter before the Government.

A stained-glass window and a marble and stone reredos are being prepared for setting-up as memorials at the east end of the chancel of the new parish church of St. Michael, Aberystwith, now building, from the designs and under the direction of Messrs. Nicholson and Low, architects, Hereford. The window at the east end of the morning chapel is also to be filled with memorial stained glass.

The memorial stones of a new mission church for the parish of St. George's, Birmingham, were laid on Monday. The building is being erected in William-street North, between Hospital-street and Summer-lane. It will consist of a hall 50ft. by 30ft., which will accommodate 250 worshippers, and two classrooms at the back, each 24ft. by 18ft., with a basement containing hot-water apparatus, &c. The front will be of brick and terracotta. The architects are Messrs. Dunn and Hipkiss, and the builder is Mr. John Webb, of Villa Cross, Birmingham.

### LEGAL INTELLIGENCE.

**REPAIRS UNDER THE BUILDING ACT—IMPORTANT DECISION.**—(Divisional Court, Queen's Bench. Banister Fletcher, district surveyor, v. Briant and Son).—An important judgment on what has been a vexed question for years, defining what are exempted repairs, was given by the Lord Chief Justice and Mr. Justice Grantham on May 2nd. The case was an appeal from the decision of Mr. Biron in the Lambeth Police-court, reported in our issue of November 1st, 1889. Mr. McCall appeared for the appellant, and Mr. Willis, Q.C., and Mr. Bernard Coleridge for the respondent. The works in question were done at 8, Crampton-street, Newington Butts, and were stated by the magistrate to consist of "taking down and rebuilding the upper portion of two chimney-stacks and the upper portion of an external wall which inclosed the upper part of the said building. The length of the portion of the wall so taken down and rebuilt was about 22ft., and its depth or height about 5ft. 6in.; one of the chimney-stacks containing three flues, and the other two flues. The said work was done entirely by way of necessary repairs, and the wall and chimneys were not altered in height or width, and the work done was by way of substitution merely of new material for old, and I held that the work did not affect the construction of any external or party-wall within the exception of section 9, and that notice need not be given."—Mr. McCall argued that all alterations are under the regulation of the Act, and referred to the various sections.—The Lord Chief Justice: Has not the magistrate ruled you out of Court? The work done was entirely by way of necessary repairs.—Mr. Justice Grantham: The 10th section says: Notwithstanding that, if it is beyond an extent exceeding one-half of such building, then, although it is for repairs, it is to be considered as new work.—Mr. McCall contended that would be rebuilding, and referred to the sections regulating the construction of flues. He also referred to length to the case of "Badger v. Denn," and argued that this case was different. The wall might have been improperly bonded, or even built without cement or mortar. Could such not be a work contemplated by a provision of the Act?—The Lord Chief Justice: When that arises I will tell you, or, at least, I will give you my opinion.—In giving judgment the Lord Chief Justice said: The learned magistrate has stated the case perfectly fairly and in good sense, and quite independently of the authority of Lord Campbell, to which I defer most entirely, and has upon the words of the Act of Parliament stated Mr. McCall out of court. The words are substantially that an alteration or addition done for necessary repair, not affecting the construction of an external or party-wall, is not within the Act. I do not mean those are the words, but that is what the section comes to. I must say that to say the works here done shall be brought within the section would be doing gross violence to the Act, and introducing a most unreasonable and vexatious power of interference which might be used bona-fide, but most vexatiously, against builders who are doing small repairs, which everybody ought to be allowed to do if they do not really affect the character of the house, without interference from a public authority. These Acts are passed for the general benefit of the public, and I am the last man to narrow their construction. But where a man simply puts a few new bricks for a few old ones, and does not in any manner alter the character of his house, it would be monstrous to say he must give all these notices and invite interference where none is wanted. I think the magistrate is perfectly right, and his decision must be affirmed.—Mr. Justice Grantham: I am of the same opinion. To give full effect to the contention of Mr. McCall would be to say if the owner of a house takes one brick out which is rotten and puts in a new one, if it is in an external wall, he must give notice to the surveyor before the work is done, and go through all the formalities exactly as if he were going to build a new house. It cannot be contended that was the object of the Legislature. I think the magistrate was right.—The appeal was dismissed with costs.—Mr. McCall thought the district surveyor should not pay costs.—Mr. Willis said it was to get fees these proceedings were taken.—Lord Chief Justice: There is no reason why you should not have your costs.

**IN RE T. QUINN.**—The debtor, Thomas Quinn, M.P. for Kilkenny, has been engaged in extensive building operations in Islington and other parts of London. He petitioned the Court in January last, the liabilities being returned in the statement of affairs at £75,948, of which £9,079 only will probably rank, with assets estimated at £919. An application was to have been heard on Monday for the approval of resolutions passed by the creditors accepting a composition of 5s. in the pound, payable by two instalments, the first forthwith, and the second six months after approval; but, on the debtor's application, an adjournment for a week was granted.

**RE W. J. FEARY, JUN.**—Under a receiving order recently made in the case of William James

Feary, the younger, of No. 251, Goswell-road, builder and contractor, a statement of affairs has now been furnished showing total liabilities £22,801, of which £20,850 are fully secured, and no available assets.—The debtor states that he commenced business in 1883 with a capital of about £100, and he attributes his failure primarily to the loss by non-fulfilment of an agreement for a mortgage loan; also to depreciation in the value of house properties, and to his expenses having been in excess of his profits.

**WANTED, THE BUILDING OWNER OF A CHURCH.**—The "owner" of All Saints' Church, Lower Marsh, Lambeth, was summoned to Southwark Police-court, on Monday, by Mr. Roberts, of the Solicitors Department of the London County Council, to show cause why an order should not be made against him to take down the loose and defective portions of the tower and spire, which had been certified by the district surveyor to be a dangerous structure within the meaning of the statute.—The Rev. Dr. Lee, the incumbent of All Saints', asked for a postponement of the case, on the ground that he was engaged before a select committee of the House of Lords to support a petition against the London and South-Western Railway Company, whose works had interfered with the security of the spire.—Mr. Roberts said Dr. Lee's presence was not absolutely required at the hearing of the summons.—Dr. Lee said his only anxiety was that he should not be made personally responsible for the cost of the repairs.—Mr. Roberts said the late Metropolitan Board repaired the church some six years ago, and attempted to recover the expenses from Dr. Lee; but the Court of Appeal held that they could not do so; and, in face of that decision, the County Council had no intention of asking the incumbent to pay the expenses.—Mr. Slade made an order for the execution of the necessary repairs on the "owner."

**ALLEGED INFRINGEMENT OF THE METROPOLITAN BUILDING ACT.**—At the Mansion House, on Monday, Mr. William Shepperd, builder and contractor, of 101, Bermondsey New-road, appeared before Sir R. N. Fowler to answer a summons at the instance of Mr. Hugh McClachlan, western district surveyor of the London County Council, charging him with having failed to comply with a notice with respect to the erection of party-walls at 65-67, Ludgate-hill. Mr. Sydney appeared for the defendant, and Mr. Reynolds, who appeared in support of the summons, in briefly stating the facts, said the contention on the part of the defendant appeared to be that the district surveyor had misread the section of the Act dealing with party-walls, and therefore they had to come to a magistrate for a decision. In November last Mr. Shepperd gave notice that he had replaced the old roof of the premises for a new one, and, consequently notice was served upon him to erect two party-walls, which were intended to form a safeguard in case of fire. This notice had not been complied with, the defendant differing in opinion with Mr. McClachlan as to the meaning of the Act. Mr. Sydney said the question was whether these walls should or should not be raised, and if so, were they party-walls? He contended they were not, and, in support of his argument, he cited the judgments of Mr. Justice Mellish and Mr. Justice James in the Bristol case, "Weston v. Arnold," which he submitted entirely governed the present summons. Mr. Reynolds interposed; but the Alderman held that Mr. Shepperd was quite right in quoting from two very eminent judges upon a point of law which he, the Alderman, thought ought to go to the High Court. Upon the summons, however, he had made up his mind: it would be dismissed. Mr. Sydney applied for costs. He said Mr. Shepperd had been put to great trouble and annoyance by this and the other summons heard last week in respect to the same matter. A guinea costs was allowed.

**MANDATORY ORDERS IN LIGHT AND AIR CASES.**—**LAWRENCE V. HORTON.**—(Chancery Division. Before Mr. Justice Chitty.)—This was a case which raised the question as to the circumstances under which the Court will grant a mandatory injunction for the removal of a building completed or almost completed before complaint made or writ issued. The plaintiffs were owners in fee of a shop, 25, Queen-street, Wolverhampton, and four cottages at the back. On the west side of the plaintiffs' premises was a yard about 32ft. long and about 12ft. wide. On the opposite side of the yard, facing the back windows of No. 25 and the cottages, where the yard narrowed down to about 6ft., stood a warehouse belonging to the defendants. No. 25 was let to a milliner, and two of the rooms were used as a show-room and a work-room. The cottages were let to weekly tenants. In March, 1889, the defendants pulled down their warehouse and commenced a new and loftier building on the same site. On May 23, 1889, when the new building was up to the third story, plaintiffs objected to it on the ground of its interference with their ancient lights. On May 24 the defendants abandoned an intended fourth story, levelled up the existing brick-work, and put on the roof. The plaintiffs claimed a mandatory order requiring the defendants to

remove so much of the new building as exceeded the height of the old one. The defendants paid £50 into Court. Mr. Whitehorse, Q.C., and Mr. Underhill, for the plaintiffs, submitted that the plaintiffs were entitled to the relief claimed, notwithstanding the completion of the building ("Smith v. Smith.") Mr. Romer, Q.C., and Mr. Wurtzburg, for the defendants, submitted that it was not the practice of the Court to grant a mandatory order in the case of a completed building except under very special circumstances, or where there had been fraud or trick. Nothing of that kind was alleged here, and damages would be an ample compensation. Mr. Justice Chitty said that no hard-and-fast rule could be laid down as to when a mandatory injunction would be granted and when not. It was clear, however, that a man could not be allowed to run up a building so as to interfere with another man's lights, and then by way of defence say that he had finished the building by the time the writ was issued. If the building was not finished when the writ was issued the plaintiffs were entitled to have it pulled down; and the fact that the building had reached a certain height by the time complaint was made and before the writ was issued did not entitle the defendants to say that they might, at any rate, keep their building at that height and that no order could be made to pull it down. In his opinion it was indisputable that serious damage had been inflicted on the work-room and show-room. It was the defendants' duty to have stopped the work as soon as they knew of the plaintiffs' objection, and it was impossible they should be allowed to obtain any advantage by running up the building before the plaintiffs could come to the Court. A mandatory order must be granted, following the form in "Yates v. Jack," and the defendants must pay the costs of the action. The operation of the order would be suspended for three months. The £50 paid into Court by the defendants would be returned to them.

#### STAINED GLASS.

**CHRIST CHURCH, BATH.**—Six three-light memorial windows were dedicated in this church on Ascension-day. The first one nearest the east end contains three pictures of Our Lord as the Good Shepherd, and in the tracery above are angels rejoicing. The second window illustrates three scenes from the parable of the Good Samaritan, while the tracery is filled with foliage ornament and scrolls bearing the texts of the Eight Beatitudes—all these subjects being set in rich 15th-century ornament. The other four three-light windows illustrate the Te Deum of angels, apostles, prophets, and martyrs. In the first is St. Michael, with angels in acts of praise and adoration; in the second SS. Peter, James, and John; in the third Isaiah, Daniel, and Jeremiah; and in the last SS. Stephen, John the Baptist, and Paul. The work has been designed and executed by Mr. Alfred O. Hemming, 47, Margaret-street, Cavendish-square, W.

#### CHIPS.

"The Funeral of the First-born," by the late Frank Holl, R.A., has been presented to the Dundee Picture Gallery by an anonymous donor.

The annual meeting of the Association of Municipal and Sanitary Engineers and Surveyors will be held in Liverpool on Thursday, Friday, and Saturday, the 26th, 27th, and 28th of June.

By the death of Miss Annie Walters, the sum of £1,000, left under the will of her late brother, Edward Walters, architect of the Free Trade Hall at Manchester, becomes payable to Owens College.

At a general assembly of Academicians and Associates held last evening at the Royal Academy of Arts, Mr. Hubert Herkomer, A.R.A., was elected an Academician. Mr. Herkomer, whose advancement is well deserved, was elected an Associate of the Academy in 1879.

The Joule Memorial Committee have appointed Mr. Alfred Gilbert, A.R.A., as the sculptor of the marble statue to be erected in Manchester, in commemoration of the distinguished scientist.

About 200 builders' labourers at Cork went out on strike on Monday. Three of the employers gave the 2s. demanded, and the men in these cases resumed work.

The new North Sea Wall and Marine Promenade at Scarborough has been completed, and will be opened by Prince Albert Victor in the latter part of June.

Mr. Thomas Trewwhitt Wharrier died on Sunday at his residence, Byker-terrace, Walker-on-Tyne. Deceased was for over twenty years surveyor to the Walker Local Board, which position he resigned a few years ago, and immediately after his resignation he was elected a member of that board. He was 66 years of age.

A new temperance hall was opened at Drighlington, near Bradford, on Saturday. It is of red brick with stone dressings, and the contractors were Messrs. Pawson, of Morley.

## Our Office Table.

THE arrangements for holding the third annual congress of the Association for the Promotion of Art, which will be held in Birmingham in November next, are being completed. The congress will be opened on Tuesday, November 4, by the presidential address to the members. The Wednesday, Thursday, and Friday following will be devoted to the meetings of the sections for the reading of papers, to be followed by discussions, and, after the first general meeting on the Saturday, the usual excursion to places of interest will take place. An afternoon reception will be given by the Royal Birmingham Society of Artists on the Thursday, and the Mayor will give a reception on one of the evenings. The Town Hall will be lent by the corporation as head-quarters, and Mr. Whitworth Wallis will act as hon. secretary.

THE Wells collection of pictures by Landseer were dispersed by auction at Christie's on Saturday, and fetched high prices, the sum of £43,000 being realised for the thirty works. The highest prices were obtained for the picture of fighting stags, known as "None but the Brave Deserve the Fair," which sold for £4,000; that of a young stag and hind, which fetched £4,042 10s.; and "Not Caught Yet," a fox looking at the trap, which went for £3,150. The National Gallery collection will be enriched by two of the works sold, the picture of Landseer at work modelling his colossal lion in the studio of Baron Marchetti having been allowed to be purchased for that purpose by Mr. William Agnew, without opposition, at fifty guineas, while M. Rochefort bought for presentation to the same gallery Sir Francis Grant's characteristic portrait of Landseer, the price paid being 120 guineas. At the same sale the highest price yet publicly given for a work by Turner was realised for his "Sheerness," which was bought by Lord Wantage for £7,450.

At the examinations of Plumbers for Registration, held at the Guilds' Institute on Saturday, there was a very satisfactory attendance of candidates, not only from London and the suburbs, but from Kent, Essex, Oxfordshire, Hertfordshire, Suffolk, Cambridgeshire, Salop, Berkshire, and Staffordshire. The examinations were such as to test the qualifications of the applicants in both the practical and theoretical branches of their craft, each applicant being required to execute a given amount of manual work, such as joint-making, pipe-bending, lead-laying, &c., besides answering a number of questions relating to the properties and qualities of the various materials used by plumbers, external and internal construction, sanitary arrangements, and water supply. One-fourth of the masters and two-thirds of the operatives succeeded in passing the full examinations.

#### MEETINGS FOR THE ENSUING WEEK.

**SATURDAY (TO-MORROW).**—St. Paul's Ecclesiological Society. Visit to the church of St. Peter ad Vincula and Chapel of St. John in the Tower. 3.30 p.m.

**MONDAY.**—Royal Institute of British Architects. "German Technical Museums," by Frank Granger. 8 p.m.

**TUESDAY.**—Society of Arts. "The Industrial Arts of Japan," by Lazenby Liberty. 8 p.m. Institution of Civil Engineers. "The Keswick Water Power Electric Light Station," by Fawcett and Cowan. 8 p.m.

**WEDNESDAY.**—Society of Arts. "The Mannesmann Process for Making Seamless Tubes," by J. G. Gordon. 8 p.m.

**THURSDAY.**—Architectural Association Lyric Club. (Ladies' Night). Concert and Exhibition of Drawings. 9, Conduit-street, W.

The Ladies' Night concert and exhibition of drawings arranged by the Architectural Association Lyric Club, has been postponed from Thursday in this week to Thursday next, the 22nd inst., and will be given in the galleries of the Nineteenth Century Art Society at 9, Conduit-street, W.

The name of Richard Arthur Bullivant, of Shadwell and Leeds, architect, appears in Tuesday's list of adjudications in bankruptcy in the *London Gazette*.

Two blocks of schools are being built for the Hanley School-board in Cauldron-road and the Grove respectively, from plans by Mr. E. E. Scrivener, of that town. The contracts have been taken for the former school by Mr. T. Godwin, also of Hanley, at £2,700, and for the latter by Mr. N. Bennett, of Burslem, at £2,550.

## Trade News.

#### WAGES MOVEMENTS.

**ACCRINGTON.**—The joiners resumed work on Monday morning at the advanced rate of wages. The bricklayers were also at work at the increased rate, but the labourers with the bulk of the masons are still out.

**ASHTON-UNDER-LYNE.**—The strike of stone-masons at Ashton-under-Lynde district, after lasting a week, terminated on Monday, the advance of a halfpenny per hour demanded, making 8½d., having been conceded.

**WEST BROMWICH.**—The strike in the carpenters' and joiners' trades has ended, the men having accepted the employers' offer of an immediate advance of ½d. per hour.

**YORK.**—The master-builders of this city have acceded to the demand of the carpenters and joiners for an advance in wages of ½d. per hour, and a threatened strike has thus been averted. The advance will come into operation on the 1st of June.

**Holloway's Ointment.**—This cooling Ointment perseveringly rubbed upon the skin, is the most reliable remedy for overcoming all diseases of the throat and chest. Quinsy, relaxed tonsils, sore throat, swollen glands, ordinary catarrh, and bronchitis may be arrested as soon as discovered, and every symptom banished by Holloway's simple and effective treatment.

## ELECTRIC LIGHTING.

### COMPLETE INSTALLATIONS OR WIRING ONLY {ESTIMATES GIVEN.

**STRODE & CO.** 48, Osnaburgh-st., N.W., and 67, St. Paul's Churchyard, E.C. **LONDON.**  
New Branch Showrooms:—188, PICCADILLY, W.  
Telephone No. 3958.

## BILLS OF QUANTITIES & PLANS.

**T. PETTITT and CO.** Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—**T. PETTITT and CO.** Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

## DOULTING FREESTONE.

**THE CHELYNCH STONE.**—The Stone from these Quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

**THE BRAMLEDITCH STONE** is of the same crystalline nature as the Chelynych Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to **CHARLES TRASK and SONS**, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

## HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material. Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—

**THE HAM HILL STONE COMPANY**  
NORTON, STOKE-UNDER-HAM, SOMERSET.  
London Agent:—

## RESTRICTIONS OF MODERN ARCHITECTURE.

THE restrictions imposed in the design of buildings in town leave the architect very few resources. Being compelled on account of space to keep to the line of adjacent premises, he is not able to produce any play in the outline of the façade. The flat wall with its windows is the result. As regards the arrangements of his stories, the number of stories restrict their individual heights, and necessitate tiers of windows at certain levels. Projections are not permitted, and deeply-set windows are out of the question if room is to be obtained. Little variety is possible under these restrictions. The architect may vary the style: the character of his windows may be altered to a certain extent, but still he has to work within very prescribed limits. In the choice of materials he has a resource, but these are limited to brick, stone, terracotta, and iron, their available modes of treatment have an end, and do not admit of new forms *ad infinitum*. So the architect's design cannot have the freedom and flexibility of other forms of art—painting or decoration for example—in which the invention and imagination of the artist can have the fullest liberty and license. It is this want of modes which the designer, eager to break through the restraints of convention and tradition, is in quest of. The architect of small inventive powers is restricted to the ordinary types and styles; but the true artist in the profession, who can see behind and beyond them, has a far wider range of ideas open to him. He, in fact, like the poet or the word-painter, can indulge in a wider range of thought and expression. He can step beyond the bounds of that kind of respectable mediocrity and correctness which the public call "good," and indulge in rhapsodies which look strange and even ugly to the ordinary taste for *en regle* composition, like the New Police Offices on the Embankment, or the design for a house which transgresses the canons of traditional taste. We do not excuse the audacious design which only aims at upsetting all recognised principles. The real artist manages to keep within these; but he sees possibilities which the mechanically-trained architect does not perceive. Looking to the outline and proportions of his masses, he can afford to break through stereotyped arrangements and details which belong to style, to treat his materials *de novo*, and to bring his knowledge of architecture to his aid. There is a freshness in all he does, which gradually commends itself to the eye, though at first it seems strange. Here his elevation may present a plain surface of wall—there it may be relieved by blank arcading, or superficial ornament; in another place there is bold and open fenestration—his detail is confined to features, such as a door, or window, or gable, to which he wishes to draw attention. The ordinary and conventional design for an elevation is an evenly-distributed scheme of apertures and ornamentation, as we see in most of the Classic and Gothic buildings.

The architecture of Florence presents us with examples of distribution of windows, even in Classic design, which display more range of artistic freedom than we are accustomed to see. Bramante, in the Guadagni Palace, has shown a fine example. Here we have beneath the bold cornice the open colonnade, admirably suited for artistic and climatic reasons; below it is a series of semicircular-headed

windows of plain design. Below this comes a sgraffito frieze over a series of windows, almost identical with the former, with sculptured wreaths in the spandrels. The ground story is excessively plain, and is pierced by six small, square-shaped openings with a central doorway. Many buildings of the style of the Empire in France show a treatment of façade in which the regulation formula has been departed from. In America we see that the architects have been following the French style of the Empire. Even in the arrangement of a columnar façade the columns are grouped, as in Mr. R. W. Gibson's bold design for the United States Trust Company's building, New York. The style is a modification of Romanesque, which is becoming very popular. Breadth, surface ornament, as in the flatly-treated frieze of entablature and in the capitals of grouped shafts of the first and second stories, adaptability to the material, are conspicuous. The late H. H. Richardson developed a style based on Byzantine types, in which considerable departure from stereotyped features is to be noticed—broad wall surfaces, bold archways, and good outline. The Richardsonian style, like that which the late Sir Alex. Thomson, of Glasgow, made his own, in which Greek forms and flat, incised ornament are prominent, are developments of the artistic mind working with materials of localities. Many of these designs, when first seen, provoked criticism and ridicule; but they are now regarded as marked national developments. What, for example, could have been more in harmony with the material than the principal entrance to the City Hall, Albany, by the former architect? The circular recessed arches resting on grouped shafts are enriched by bold ovolo mouldings, having flat interlaced Byzantine foliage on them in which the acanthus form appears; one of the members is a bead and reel, and the shafts have capitals of Byzantine type, with the same class of flat carving. Many charming specimens of the same style applied to street architecture by Richardson exhibit the freedom with which the historic types can be used for everyday purposes. Some of the masonry and shingle buildings in the States show that old types are capable of artistic handling by re-incorporation into buildings. The most signal instances of success are where the architect has not attempted to do too much, but has developed his design simply from plan, and has expended his details and ornament sparingly wherever there is an opportunity for them, not forcing them a little here and there, as the wont of too many.

Our own street architecture affords very few examples of the artistic architect's work. The temptation has been too strong for display. The commercial premises are built for show; new hotels, offices, and clubs are designed to attract, the consequence of which is that the fronts are full of windows and the spaces between crowded with pilasters, ornament, or carving. How much of sameness and common-place, for example, overpower us in Northumberland-avenue! Hotel and club-house jostle one another for precedence, but from end to end there are the stereotyped façades, based on Italian or Flemish Renaissance models—clever some of them—with good features here and there; but on the whole exceedingly flat, tiring, and monotonous. A design for the new buildings for the Metropolitan Life Assurance Society by Mr. Aston Webb, F.R.I.B.A., and Mr. Ingress Bell, F.R.I.B.A., may be instanced as an effort in the right direction. We cannot call it of any particular style—the wide term Renaissance may cover it; the details are more essentially Classic than Gothic, there is a little infusion of Elizabethan in the carved panels on the faces of the projecting corner semi-octagon. The plain wall surfaces between the window tiers form horizontal bands which relieve

the lines of closely connected fenestration on each story. The angle-shafts carry flat arches beneath the window-heads, and on the outer edge of the pier-jambes, and the short corbelled pilasters which spring from the piers, the pleasing range of windows beneath the cornice, divided by shafts, are some of the points of freshness which mark this original treatment. There is refined taste in every detail notwithstanding.

What we have to point out in these and like designs, which avoid the temptation of following the Renaissance, or the Gothic, or any other set style, is that the architect is free in the choice of material. But it is only the gift of the few to be able to design a building without following the traditional modes of expression, to design in the true spirit of the Gothic or Renaissance architecture, but without being tied to forms. In the street architecture of London and in large towns the limitation and restrictions are, as we have said, so great, that the architect is driven to select some more or less hackneyed formula; he must have rows of windows all, or more or less, alike, certain height of stories, shop fronts, modes of treating roofs and cornices. Adjoining properties have to be consulted; cornices and string-courses cannot be allowed to stop abruptly against the adjoining houses, or in line with a row of windows; the shop-front cornice and fascia must have a stop of some form, either in the shape of the conventional truss or be returned. Many of these objectionable conventionalisms could be dispensed with by doing away with the straight frontage line, and by requiring a certain proportion of each frontage to be set back. Of course, the consequence of a building-line in a street is to make every one come out to the full extent, and to produce a row of buildings all in one plane. The results that follow are prejudicial to architecture. The street becomes either a monotonous row of windows with continuous lines of cornices, supposing the whole is taken by one person, or we get a succession of abrupt vertical slices or elevations of different patterns. Strongly-marked horizontal lines, such as cornices and strings, are more consistent with length of building façade than with narrow frontages; yet we frequently see the anomaly of a mere strip of several stories high divided into parts by cornices and strings, stopping abruptly on either side. We cannot call this a sensible or an architectural treatment. It is just as if a long façade were cut into sections or parts, and one part thrust or wedged-in between two adjacent buildings. On the other hand, the narrow façade is better adapted to the vertical treatment of composition in which the piers are emphasised, and the windows joined vertically by pilasters, or vertical members predominate. The Flemish Renaissance is therefore in consonance with streets composed of narrow façades. Recent buildings in Oxford-street, and in many of the newer thoroughfares are consequently more in keeping than the old Classic elevation with its horizontal lines and rows of windows. But there is evidently a tendency to overdo the vertical division, to overcrowd pilasters, pinnacles, gables, and to produce a fussy, restless appearance. As the houses are in one plane, they are wanting in the picturesque effect found in the old streets and market-places of Bruges, Ghent, or Ypres. The want of this element of variety in plan can only be compensated for by an irregular distribution of details and apertures. Only the true art architect has been able to grasp the idea and supply the corrective. He breaks up the plane surface of his building by attention to points instead of lines. The elevation of a flat surface is intensified in flatness by rigid lines of windows and members, but by breaks in their continuity the effect of

variety is given in perspective. To sum up these remarks we may enunciate the following propositions:—1. Straight lines and plane surfaces are accentuated by the employment of (a) horizontal members and features, and (b) by the even distribution of fenestration and ornament. 2. Therefore, to produce variety and architectural effect it is necessary to break up the lines and surfaces either by recessions and projections so as to give play to the horizontal members, or to accentuate the architectural features and ornament on certain portions of the façade. 3. Horizontal members and rows of windows produce the most desirable effects in long façades broken by projections; but when the fronts are narrow and high, as in street houses, the vertical features and members are more effective, and avoid the abrupt junctions of one house with another, also the recourse to clumsy methods of stopping horizontal members like cornices so common in streets, where the horizontal features of Classic architecture prevail.

#### REPAIRS UNDER THE BUILDING ACTS.

THE ruling of the Lord Chief Justice in the recent case of "Fletcher v. Briant and Son," which we gave last week in our Legal Intelligence, is too important to pass unnoticed. The case was an appeal from the decision of Mr. Biron, in the Lambeth Police-court. The magistrate held that the work of taking down and rebuilding the upper portion of two chimney-stacks and the upper portion of an external wall, by way of necessary repair, did not affect the construction of any external or party-wall within the section of the Act. The Lord Chief Justice confirmed this decision. The words of the Act are substantially, that an alteration or addition done for necessary repair, not affecting the construction of an external or party-wall, is not within the Act. Commenting on these words, the Lord Chief Justice repudiated the idea that such a work of reinstatement of new material for old could be included under the Act. It would be introducing "a most unreasonable and vexatious power of interference, which might be used *bonâ fide*, but most vexatiously, against builders who are doing small repairs, which everybody ought to be allowed to do if they do not really affect the character of the house, without interference from a public authority."

We have very often observed that repairs and slight alterations to buildings are made the pretext for interference on the part of district surveyors. We cannot complain of this interference if undertaken from a right motive, as if they were not to make personal inquiries, a great deal of objectionable alterations might be made to premises, which would render them unsuitable for safe occupation, as in the case of a row of private houses converted into shops, with sleeping accommodation over, without any of the proper safeguards against the spread of fire. But sometimes the provisions of the Act are extended in a manner that may be objectionable, the effect of which is to prevent repairs of a very necessary kind being carried into execution. The decision of the Lord Chief Justice and Mr. Justice Grantham is intended to apply to such a vexatious interference, and to limit the real meaning of the section of the Act. In the case referred to, the upper portions of two chimney-stacks and an external wall were taken down by the defendants and rebuilt, the length of the wall so rebuilt being 22ft., and its height about 5ft. 6in. One stack contained three flues, and the other two flues. There was no alteration in the height or length, and the work done was one of substitution of new material for old. Section ix. of the Metropolitan Building Act expressly excludes such necessary repair in

these words: "Any alteration, addition, or other work made or done for any purpose except that of necessary repair not affecting the construction of any external or party-wall in, to, or upon any old building, or in, to, or upon any new building after the roof has been covered in, shall to the extent of such alteration, addition, or work, be subject to the regulations of this Act." The words "except that of necessary repair" are an important reservation, which ought fairly to be respected in the interests of all tenants and property owners. The clause was, of course, framed with the object of preventing any structural alteration or addition to a building without permission, which would or might evade the intentions of the Building Act; but it was never intended to be applied to every case of simple repair. The 10th section defines the extent (one-half) beyond which any building is deemed to be the erection of a new building subject to the regulations of the Act. Many buildings require periodical repairs. Chimney-stacks, for instance, become twisted or shaky, the mortar joints decay, and the stack often bends considerably. Surely the term necessary repair is intended to cover the rebuilding of such a stack, provided no alteration in its size be made. Gable walls and external walls for a similar reason may have so far decayed as to become dangerous, and it is reasonable to substitute new for old brickwork, and to take down such a part of the wall and rebuild it, without being liable to give notice. These rebuildings may be considered to be substantial repairs, though they do not affect the construction in the least. No alteration is implied in such repair as that of substituting new bricks and mortar for the old and decayed portions of the wall. It was on this ground that the magistrate's decision was affirmed. Mr. Justice Grantham was of the same opinion, and said that if the owner of a house took out a brick in an external wall which is rotten, and put in a new one, it was absurd to contend that notice should be given to the surveyor. The appeal was dismissed with costs.

If the provision of the Act is held to maintain the plaintiff's construction, and to bring such a trifling rebuilding under the regulations of the Act, a serious injury would be done to owners of property. Every small repair would be liable, and notice would have to be given of it. The consequence of such a contention would be to stop all repairs and to render the condition of old houses less safe than they are now. Would it not also be the policy of the owner to keep his property in a very objectionable condition, knowing that he could not be called upon to do anything unless the premises were in a positively dangerous condition? He could evade the law by not doing anything. Thus, a too strict interpretation of the Act, like a two-edged sword, would be fatal to its operation. Owners of houses and other buildings would hesitate before giving notice to the district surveyor about any repair or alteration, rather than put the machinery of the Act into operation, invite unnecessary interference, and incur fees. We happen to know a case where the wall of the building, a corner one, through a trifling settlement, was slightly out of plumb, though perfectly safe; the owner applied to the officer of the late Metropolitan Board to allow him to undertake a trifling work; but instead of complying, the district surveyor was sent to make an inspection, which ended in a costly and unnecessary order being made to rebuild. Other instances of enforced rebuilding might be mentioned on equally slight grounds. Surveyors are eager to show their authority, especially when the smallest opposition is offered, and the provisions of the Act, if needs be, are extended beyond the line to which they were originally

intended to go. The decision to which we have referred is a timely protest against the idea that all alterations are under the regulations of the Act, and the vexatious interference of officials who, anxious to make all comply with the Legislature, are apt to occasionally overstrain the meaning intended to be conveyed. The formalities required are apt to deter many from undertaking repairs and alterations which cannot affect the construction of buildings, but are simply the reinsertion of new materials and workmanship.

#### ARCHITECTURAL BRICKWORK.—XXXIV.

##### ORNAMENTAL ARCHES.

SOMETIMES for ornamental arches bricks are moulded which have geometrical or other devices cast upon them. The result is to form a band of enrichment round the arch which resembles carving. Sketch 1 represents an arch in which these kinds of pattern bricks are introduced under the label moulding; Fig. 2 shows different patterns of diaper on the flat surface. The zigzag or chevron, billet moulding, and other Gothic ornaments, are sometimes introduced at the angle of the arch bricks, and produce a rich effect. But surface ornamentation can be overdone; the best plan is to introduce it on a part of the face, as in the examples we give, Figs. 1 and 2, so as to allow a plain face to intervene between one course or band and the next. Few kinds of enrichment are more suitable than the chevron or billet for arches; a plain leaf or geometrical form, such as in Fig. 2, is more effective than very elaborate patterns. These moulded and enriched arch bricks are made from 9in. to about 12in. or 14in. long, the shape being regulated by the curvature of the arch. There is an objection to the use of moulded arch bricks, however, that may be noticed. They would have to be manufactured for every form of arch, as every arch would require bricks of a different mould to suit its curvature and thickness, and this increases the expense and causes delay. On this account few arches are built with purpose-made moulded bricks. The ordinary building brick can be adapted by cutting and rubbing to most arches.

##### WHERE MOULDED AND ORNAMENTAL BRICK CAN BE USED.

There are, however, special circumstances under which the use of moulded arch bricks may be used with advantage, as in a number of arches of a decorative character of the same radius and span, as in an arcade. The cost and labour of cutting and rubbing will here be saved. Again, the ornamental moulded brick affords a comparatively cheap substitute for carved work, when many similar arches are required. Another advantage in using moulded arch bricks is that for external work they are harder and more durable than the soft rubbers, which are often of an inferior quality. Not only is the cutting saved, but the surface skin of the brick as burned is left untouched, which is most desirable for weather-exposed work. The colour also of the bricks as burned is more pleasing and varied in tint.

##### EXAMPLES OF APPLICATION.

The value of the brick impressed with ornament is its suitability for plain arches, as, for example, the voussoirs under an ordinary label moulding as in sketch 1. The label brick is required to give character to the arch. Nothing looks commoner or in worse taste than these ornamental arch bricks set flat with the wall without a label moulding, as we often see over the windows and doors in new houses and tenements. The ornament looks out of place in such a situation. We strongly object to the whole of the brick face being covered by ornament, which should be confined to a part only of

the depth. A very effective arch, suitable for a Gothic arcade, may be formed of two members, or arch rings, one within the other, the outer one in the same plane as the wall over. This outer arch can be built of bricks having a flat diaper as a trefoil in the centre of each voussoir, which thus forms a continuous band of ornament imitating carving. A similar band of diapers can be formed in the lower ring in the angle made by it with the soffit of the outer ring. Bricks of this kind are manufactured by Mr. James Brown, of Cannon-street. The object of the ornamental arch brick should be to confine the flat ornament to lines or bands in the plain face of the brick. When it covers the voussoir the idea of an arch is lost, and the appearance of strength and compression ignored. The arch certainly is not the place for ornament of this character, and we prefer the moulded voussoir for ordinary work.

#### ITALIAN ARCHES.

The Italian architects are masters of brick detail, and their arches to their Gothic buildings are particularly worth notice, especially the moulded arches, of which we have already given an example from the Cathedral of Monza. Sketches 3 and 4 represent another very beautiful and elaborate group of mouldings and enrichment round a circular window in the Broletto at Brescia, which is illustrated in Fergusson's "Handbook." It will be noticed the bricks are of different sizes and depths, the largest being the ovolo and cavetto forming the deep-shadowed member

in the inner portion of the arch. As before observed, the radiating joints are not continued through the whole series, but break joint at the principal divisions. The band of half-circles, quatrefoiled, is introduced with much effect under the outer label member, and in the same surface or plane as the wall. This kind of flat ornament is always more agreeable when introduced as bands below projecting members or between mouldings; the latter are more suitable as a relief at the intrados or lower portion of the arch.

#### THE SYMBOLISM AND ICONOGRAPHY OF EARLY AND MEDIEVAL CHRISTIAN ART.—XII.

By GEORGE ASHDOWN AUDSLEY, F.R.I.B.A.  
(Author of "Handbook of Christian Symbolism," and several works on Architecture and Art.)

IN the preceding article we alluded to the arched member which is so frequently seen spanning the field of the Aureole, and which the Italian artists commonly represented as part of the frame or structure of the attribute. We have now a few words to say with reference to the probable origin and intention of this feature. There can be little doubt, we venture to think, that it was originally introduced to represent the "bow in the cloud," or the rainbow, in allusion to the vision of Ezekiel:—"And above the firmament that was over their heads was the likeness of a throne, as the appearance of a

sapphire stone: and upon the likeness of the throne was the likeness as the appearance of a man above upon it. And I saw as the colour of amber, as the appearance of fire round about within it, from the appearance of his loins even upward, and from the appearance of his loins even downward, I saw as it were the

FIG. 34.

appearance of fire, and it had brightness round about. As the appearance of the bow that is in the cloud in the day of rain, so was the appearance of the brightness round about. This was the appearance of the likeness of the glory of the Lord." We have given this passage in full, for it has an important bearing on the subject under discussion; and was doubtless closely studied, in letter and spirit, by the Mediæval artists in rendering the Aureole and Glory.

In some examples more than one bow are

FIG. 35.

introduced. On this point, Didron remarks: "When God is represented sitting within an Aureole, His feet are frequently placed upon the rainbow; a second rainbow supports His back, and a third forms a pillow for His head. This is a fine conception, especially when the field of the Aureole is blue, studded with golden stars, and the border of a greyish colour and undulating like clouds. The two rainbows of the head and back are often suppressed, for the Deity needs no support; in this case the rainbow of the feet

FIG. 36.

is in some instances replaced by a carpet of gold, starred with silver." In Fig. 30 the rainbow is omitted, and the figure is depicted standing upon small clouds. The glory of heaven, expressed by concentric arches of light or rainbows, is beautifully rendered in a miniature of the "Triumph of the Lamb," in an *Evangelium* illuminated for Charles the Bald. Here, however, the arches or bows of light span the upper half of the subject, and are outside the circular Aureole which surrounds the Lamb of God.

The careful examination and comparison of a considerable number of examples disposes us to question whether it was invariably the artist's intention to represent the "bow in the cloud" by this arched feature of the Aureole; but that such was his intention in many cases is clearly shown by his treatment of it, in both form and colour. In the circular Aureole shown in Fig. 36, from the "Imperial Dalmatic," the arched feature, on which Christ is seated, seems evidently intended for a rainbow; whilst the two narrow arched lines which cross the field of the Aureole given in Fig. 37, from a late Greek painting, do not clearly indicate any such origin. Here the arched features serve as a seat and a footstool.

The form of Aureole of which we are now going to speak appears to have grown out of the desire to provide an appropriate seat for the figure invested, and at the same time to adapt the general outline to the seated figure. A characteristic example of this peculiar treatment is furnished by the central panel of the golden cover of the *Evangelium* just alluded to, an outline drawing of which is given in Fig. 34.

In this example two circular portions are introduced, the lower one slightly overlapping the upper and larger one. The idea of a seat is clearly conveyed by the ends of a cushion being indicated where the circles meet. Another circular form of small size serves as a footstool. Aureoles of this description have most certainly a very material character, far removed from the original idea of luminous clouds or radiance. Didron gives two illustrations of compound Aureoles very similar to that of Fig. 34. In one, the lower portion is circular, whilst the upper

part is lenticular in form, and the cushion appears at the junction. This Aureole invests a figure of Christ. It is from a fresco of the 11th century in the church of Montoire (Loire-et-Cher). In the other example, from a 10th-century miniature, the Virgin Mary is seated on a lower portion of irregular outline (probably intended to be circular), whilst the upper part is nearly a perfect oval.

In Fig. 35, which is taken from the sculptured tympanum of the portal of the church of St. Trophime, at Arles, a work of the 12th century, an oval Aureole is seen, but with a treatment of the arched member which seems to convey the idea of the compound Aureole just described. The arched portion which spans the field in this instance can hardly be construed into the likeness of a rainbow; indeed, the sculptor has, by his system of ornamentation, done his best to inform the observer that the arched seat for the figure is a part of the framework or border of the Aureole. In this respect it resembles the Aureoles represented in Figs. 5 and 31. In Fig. 35 the portraiture of the Deity is crowned, but is not invested with the Nimbus, furnishing a noteworthy and comparatively early example of the use of the Aureole alone investing the figure of the Deity. Had this been a work of late art one would not have wondered at the omission. In the case of the portraitures of the Saviour and the Virgin Mary, in Orcagna's celebrated fresco of the Last Judgment, in the Campo Santo, at Pisa, fine lenticular Aureoles appear; but instead of their heads being invested with the usual circular Nimbus, they have a bright radiance extending from them beyond the margins of the Aureoles. A drawing of the Virgin Mary from this fresco will be given in our next article.

It has been already remarked that the artists of the Middle Ages adopted the double or compound Aureole with the view of adapting the general outline or shape of its field to the proportions and forms of seated figures. Now, we will also observe that, with the same view, they have introduced several modifications of the lenticular and oval Aureoles for standing figures. One instance

of this latter treatment may be described here. In the tenth century manuscript of Saint-Sever, preserved in the Royal Library, at Paris, there is a miniature in which the Deity appears in a Glory. Here the main portion of the Aureole is reduced in size, length being secured by the addition of lobes at top and bottom. The upper lobe receives the large tri-radiated Nimbus, whilst the lower one surrounds the feet of the figure. Outside the margin of the Aureole are several layers of fleecy clouds, which extend its effulgence outward in gradations of intensity. The singularly self-supporting effect imparted to the Aureole by this treatment, and the idea of dignified motion—the coming of the Son of Man in the clouds of heaven with power and great glory—which is conveyed to the mind by the attitude of the figure and the disposition of its surroundings, render this miniature worthy of careful study.

The forms which appear to be best suited for a throned or seated figure, with outstretched arms, are the circle and quatrefoil, and both these have been frequently used by Byzantine artists and those working under Byzantine influence. One of the most beautiful and interesting examples of the circular Aureole known to us is that which adorns the magnificent dalmatic, known as the Imperial Dalmatic of Pope Leo III., preserved in the treasury of the Cathedral of St. Peter, at Rome, a most elaborate specimen of embroidery of Byzantine origin, attributed to the 12th century. We give, in Fig. 36, a drawing of an important part of the embroidery of this dalmatic, in which the Aureole alluded to appears. The Aureole, it will be observed, is a large and plain circular disc, spanned in its lower portion by a rainbow—evidently "the bow that is in the cloud in the day of rain" is here intended—and having, issuing from its field near the edge, the symbols of the four Evangelists carrying the books of their Gospels. Seated upon the rainbow, and with its feet resting upon the two winged wheels "full of eyes, round about" which the Byzantine artists have derived from the vision of Ezekiel, is a beautiful portraiture of Christ. The right arm is outstretched, and the left hand rests upon a large open book. The head is invested with a large circular, tri-radiated Nimbus, on the rays of which are inscribed the Greek letters  $\Theta$ ,  $\Omega$ ,  $\Lambda$ . Adjoining the Nimbus, on the field of the Aureole, are inscribed the Greek monograms of our Saviour's name,  $\text{IC}$ ,  $\text{XC}$ . Around the Aureole proper is the region of heaven, studded with the sun, moon, and many stars; above the Aureole stands the cross of Calvary, with the crown of thorns, the spear, and the sponge—emblems of the Passion; and on each side and nearly surrounding the Aureole are representations of the choirs of angels, the Blessed Virgin, and numerous saints. This, taken altogether, is a most interesting iconographic study, and probably one of the most beautiful illustrations of the Glory to be met with in the entire range of Mediæval art.

Another interesting and uncommon example of the Glory is to be seen in a late fresco in the church (Panagia Phaneroméni) of the great Convent of Salamis. An outline drawing of this is given in Fig. 37. Here the Aureole is circular, but far from plain in its treatment, being intersected with two quadrangular forms with curved sides, forming an eight-pointed star, and covered with numerous lines radiating from the centre. Two arched lines span its lower portion, serving as a seat and a footstool for the portraiture of our Lord. The Aureole appears as if borne by four cherubim. The figure is that of Christ coming in glory as the Supreme Judge. The head is invested with the Byzantine tri-radiated Nimbus; and the right hand is raised in the act of blessing, according to the form authorised by

FIG. 37.

FIG. 38.

the Greek Church. The intention of the artist is by no means clear with reference to the two quadrangular forms intersecting the field of the Aureole; but we may point out a treatment almost identical in the Nimbus of God the Father, in our illustration Fig. 21, in Article VII. It seems to be an extension of the idea, whatever it may be, of the quadrangular, hollow-sided Nimbus, as illustrated in Fig. 20 in the same article.

Cusped or foiled Aureoles are sometimes met with, although they are by no means so common as the lenticular, oval, and circular forms. A painting, of 12th-century date, in the crypt of the Cathedral of Auxerre, furnishes us with a good example of an Aureole in the form of an ordinary Gothic quatrefoil. A drawing of this is given in Fig. 38. The small portion outside the dotted line has been destroyed, but we have restored the part, without, however, attempting to insert the missing symbol of St. Mark, so as to show the general form entire. The quatrefoil Aureole is admirably suited for a throned figure, especially when accessories are introduced, as in the present instance. There is another and very fine example in the west rose window of the Cathedral of Chartres. In this instance the figure of Christ is represented seated, and with arms outstretched and extending into the lateral foils of the Aureole. His throne, head, and hands have, accordingly, each their special part of the field of the quatrefoil. In the Auxerre example, the form was probably adopted with the view of accommodating the two seven-branched candlesticks, and giving an opportunity for the addition, in an artistic manner, of the symbols of the Evangelists. These symbols appear in small circular Aureoles, partly hidden behind the cusps of the chief attribute. There is little doubt that in such Aureoles as appear in Figs. 36 and 38, the artists' intentions were to set forth the region of heaven, the immediate surroundings of the Deity, and the centre of His glory, rather than the effulgent cloud-like or material radiance which is expressed by the more common elongated Aureoles, moving unaided through space or borne by numerous angels.

We may now say a few words on a form of the Aureole, the signification of which has much exercised students of Christian Iconography. We allude to the form which displays on its field radiating bars, like the spokes of a wheel, and which was often used by the Byzantine artists of the 11th and 12th centuries. It rarely appears in Western art. This peculiar treatment of the Aureole is met with in representations of the Transfiguration. According to the *Byzantine Guide to Painting*, the Transfiguration is painted thus:—"A mountain with three peaks. Upon the

centre one Christ stands clothed in white garments; He blesses. *All round Him is a light with rays.* Upon the peak to the right stands Moses, holding the tables of the Law; upon the peak to the left stands the prophet Elias. Both regard Christ in a supplicating manner. Below Christ, Peter, James, and John appear in prostrate positions, with heads gazing upwards, and lost in ecstasy." In paintings executed according to these directions, the bright light which surrounds Christ is expressed by an Aureole of circular or lenticular outline, whilst the rays, usually eight in number, proceed from the centre of the Aureole and extend some distance beyond its margin.

Transfiguration, instead of standing on the central peak, Christ is lifted up in the Aureole. As Didron remarks, alluding to this treatment, "the figure of Christ is affixed to this wheel-like glory, and might be imagined to be nailed to an instrument of torture; for the martyrdom of St. George, who suffered death upon the wheel, is thus commonly represented. This singular treatment is rarely met with in Western art; it is, indeed, seen only in works which betray at least an indirect Byzantine influence; as for example in one of the three great windows in the west gable of Chartres Cathedral." This authority seems to favour the idea that the long

FIG. 39.

The idea to be conveyed by this form of Aureole is obscure. It may very probably have been intended to express the name, Jesus Christ, after the fashion of the old Greek monogram, in which the initials I, X, of the words 'Ιησους Χριστος, are united into a wheel-like device, as may be seen in the ornaments of the Church of St. Demetrius, at Thessalonica; here the *iota* (I) is formed into a Greek cross by the addition of a horizontal bar, a very commonly adopted expedient. In certain representations of the

radiating bars, which issue from the Aureole, have some symbolical connection with the five witnesses—Moses, Elias, St. Peter, St. John, and St. James; but we consider that the fact of there being eight instead of five rays or bars, and their assuming a strictly geometrical arrangement, clearly refutes the idea. Nor, indeed, is our own supposition, which only applies to groups of six or eight bars, always supported; for occasionally, though very rarely, more than eight are introduced;

but in such cases the wheel-like treatment is abandoned by the omission of the fellow or ring. In the Transfiguration depicted in the Cathedral of Monreale, near Palermo, the eight bars (straight lines of blue and white) are introduced. The three lower ones certainly reach and disappear behind the apostles, at the foot of the mount, the lateral bars passing behind Moses and Elias. This example, though apparently supporting Didron's idea that the rays are in some way related to the witnesses, does not overthrow our suggestion.

On the back of the "Imperial Dalmatic," already spoken of, is a most interesting representation of the Transfiguration, which, in the treatment of the Aureole, supports our opinion that the rays or radiating bars have no connection with anything beyond the attribute or the figure invested. We give an outline drawing of the figure of Christ, with the complete Aureole, in Fig. 39. The figures of the apostles are placed far away at the foot of the mount, and none of the rays even point in their direction. In this instance there appears to be no vertical ray to suggest the cross, or to carry out the idea of the monogram formed of the I and X. The lozenge-shaped field of this aureole is worthy of note.

In certain representations of the Transfiguration three vivid rays of light, unmistakable in their intention, descend towards the apostles in the foreground; but these have no connection with the Aureole. In an ivory carving of 12th-century workmanship the figure of our Lord has no Aureole; but three broad divergent rays issue from its sides and feet and flood the apostles, who seem to shrink from their overpowering brilliancy. And in another representation of the event, in a Russian bronze casting containing scenes from the life of Christ and the Virgin, the figure of our Lord is invested with a circular Aureole covered with stars and divergent lines; and, in addition, appear the three great rays descending on the apostles, who crouch towards the ground to hide their faces from the great glory. In neither of these examples have Moses and Elias any rays directed towards them.

(To be continued.)

#### CONTEMPORARY BRITISH ARCHITECTS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THIS sheet completes the first dozen plates of portraits of British Architects given in our pages this year. The series commenced in the opening number of the present volume. The first photograph reproduced to-day is of the late Mr. E. C. Ayton-Lee, F.R.I.B.A., whose death at the early age of forty-four we recorded only a few weeks since. One of his last acts was to send us this portrait. He was conspicuous as a figure draughtsman and bold delineator of detail, working with genuine enthusiasm for his art, and having the great advantage of material aid from his uncle, the late Mr. Octavius E. Coope, who recognised the great promise of his relative, and assisted him with his influence and patronage. Mr. E. C. Lee, as he was better known, came from the office of Col. R. W. Edis, F.S.A., and although not a pupil of the late Wm. Burges, A.R.A., was much influenced by that master. He was among the first promoters of the Architectural Association Sketch-book, and founded the Colour Decoration Class. He was President of the Architectural Association in 1880. He gained the Soane Medallion in 1869, and the Pugin Studentship in 1870. He was a member of the "Goths and Picts." In 1869 he became an Associate, and in 1881 a Fellow of the Institute. His last work of importance was St. Thomas's, Brentwood, and he did a lot of work in Essex. He twice built St. Mary's Church, Whitechapel; Mission Church at Collier-row, Romford; St. Paul's Church, Bentley, and another at West Greenwich. He restored churches at Hornchurch, Dagenham, and Ilford, and built St. Matthew's Mission House in West-

minster; schools at Barrow-in-Furness, others at Brentwood; a bank at Colchester; Berechurch Hall for Mr. O. E. Coope, M.P.; also Gower Walk Schools at Whitechapel; The Grange and cottages at South Weald, Essex; vicarages at Bentley and at Horsell, near Woking, and various houses in London, Bentley, and Shere. He was good at water-colour drawing, and had a love of the beauties of nature. He changed his name to Ayton-Lee in 1887. His portrait was taken by Mr. Bassano, of Bond-street, W.

Mr. Thos. Manly Deane, M.A., of Dublin, was a pupil of the late Wm. Burges, A.R.A., and was associated in his student days with Mr. Ayton-Lee. He won the Royal Academy Travelling Studentship in 1876, and studied in Italy for a year. He is a graduate of Trinity College, Dublin. For some years he has been a partner with his father, Mr. Thomas N. Deane, R.H.A., whose portrait we gave on Feb. 28 last. The firm have carried out the Museum of Science and Art and National Library, Dublin, which was won in competition; various branch offices through Ireland for the Provincial and Munster Banks have been erected by them; the Royal Exchange Insurance Office, Dublin; the Commercial Union Insurance Offices, Dublin; the town hall and markets, Bray, co. Wicklow; the rebuilding of Lough Crew House, co. Meath, for Mr. J. L. Napier, D.L.; the M'Arthur Hall, Belfast; and several country houses in various parts of Ireland. Messrs. Deane and Son's design submitted in competition for the Imperial Institute will long be remembered for its ability and the grandeur of the scheme. The Anthropological Museum and the Physiological Laboratory at Oxford are among their recent works, and also a house for Master Bruce, near Dublin; the Church of Ireland Training College, Dublin; and other works of more or less importance have been finished from their designs. Mr. Deane's portrait comes from the studio of Messrs. Werner and Son, of Dublin.

Mr. John F. Bentley was for some years with Mr. H. Clutton, and his work is well known. Much of his time has been spent on restorations and additions, and on work accessory to architecture, such as fittings and decoration, besides designing silver, brass, and ironwork. The work at Carlton Towers, York, named in the subjoined brief list of works, is perhaps as thorough and complete a piece of Gothic work as any done since the "revival." Mr. Bentley's portrait was produced by Mr. Deneulain, of the Strand. Some of the buildings mentioned among the following are enumerated in Eastlake's "History of the Gothic Revival" as notable examples:—Fittings, furniture, and decoration of the whole of the interior, Carlton Towers, Yorks; Buxstead Hall, Uckfield, Sussex; house, Sydenham; Sunnyside, Rockhills, Sydenham, Surrey; house, Ascot; Westminster Diocesan (St. Thomas), Seminary, Hammersmith; Cupper's Field, Yorkshire; Beaumont College, Old Windsor; Bramley Manor, Surrey; Convent and Chapel, Taunton; City of London Distillery; offices, Messrs. Sutton and Co.; St. Francis of Assisi Church, Notting-hill (baptistery and schools); St. Mary's Church, Chelsea; St. Mary of the Angels (chapels and baptistery), Bayswater; St. Mary's Church, Kensal; Corpus Christi Church, Brixton; Church of the Holy Rood, Waterford; and the Presbytery at Doncaster.

Mr. Hippolyte J. Blanc, F.I.A.Scot., was a pupil of the late David Rhind, is a Past President of the Edinburgh Architectural Association, having been elected in 1871 and again in 1886 and 1887, and one of the Vice-Presidents of the Royal Scottish Society of Arts, and President of the Edinburgh Photographic Society. For several years he held an appointment in H.M. Office of Works, Edinburgh. Among executed works are Christ Church, Episcopal Church, Mayfield Free Church, West Port Free Church, St. Margaret's Episcopal Chapel, St. Matthew's Church all in Edinburgh; and at present engaged upon designs for the reconstruction of St. Cuthbert's Church, Edinburgh. In the provinces: St. James's Church, Paisley; Broxburn U.P. Church and manse; West Kilbride U.P. Church; Woodend Free Church and manse; Kirkliston Free Church; Greenbank Church, Greenock; restoration of St. Duthus Church, Tain; Free St. Luke's; Broughty Ferry Free Middle Church, Perth; All Souls', Invergowrie; Lasswade Episcopal Church, and probably the most important church built in Scotland during the past ten years, the Coats Memorial Church, Paisley, being erected to the memory of the late Thomas Coats by the

members of his family. Of mansion houses, examples are at Ayr, Southdun, Wick, Broughty Ferry, and Ferguslie Park, Paisley, for Colonel Elen Coats. Of street architecture, there are the Edinburgh Café Co.'s new premises, properties at Paisley, Broughty Ferry, and residences on an extensive scale in South Bruntsfield-place; while among buildings for commercial purposes on a large scale are brewery establishment of Messrs. John Aitchison and Co., and brewery offices for Messrs. D. and J. M. Bernard, Gorgie. When, by the munificence of the late Mr. Wm. Nelson, an offer was made to the Government to defray the cost of dismantling the great hall of Edinburgh Castle, so long lost to view through re-appropriation, the works of restoration were intrusted to, and are now being carried out by Mr. Blanc, who has also recently restored the ancient tower known as the Argyle Tower, and which now forms so prominent a feature in the group of the castle buildings. In 1887 Mr. Blanc was joined in partnership by Mr. James Gordon, whose early death was reported at the beginning of last year. Mr. Blanc's photograph comes from the studio of Mr. W. Crooke, of Edinburgh.

Mr. Robert J. Johnson, F.S.A., F.R.I.B.A., after being articulated in the country, passed some time in Sir Gilbert Scott's office, being much engaged, amongst other matters, on the drawings for the Foreign Office in the Gothic style, which was abandoned in favour of the present building, and he subsequently travelled abroad, particularly in France. On his return, the "Specimens of Early French Architecture" was published, and he settled in Newcastle-upon-Tyne, where he has since carried on an extensive and varied practice, building and restoring many churches, and erecting important buildings of various descriptions. Amongst these are the restoration of the interesting Saxon churches at Monkwearmouth and Escombe, various works at Brinkburn Priory, St. Giles's Church at Durham, the costly fitting of the chapel at Castle Howard, works at Woolbeding in Sussex, and the great reredos, choir fittings, and other works in the church of St. Nicholas at Newcastle-on-Tyne, including its general arrangement as the cathedral for the new diocese. Of new churches, there are St. Anthony and St. Stephen at Newcastle; All Saints, Gosforth; All Saints, Skelton; North Gosforth, Wylam; St. James, Gateshead; Sherburn, Burnmoor, Bishop Auckland, Jarrow; St. Paul, Middlesbro; St. Hilda, Whitby, and many others; several large schools for the Newcastle School Board, and many other local Board schools, church schools, &c. The extensive buildings for the Durham College of Science at Newcastle; and the complete establishment of the North-Eastern County School at Barnard Castle. Banks for the principal private banking firms in Newcastle and elsewhere, and several insurance offices and other commercial buildings. Pendover, Kirkclevington, Upsall Hall, Blindburn, and other mansion houses, and numerous vicarages and smaller houses. Mr. Johnson has been diocesan surveyor for Durham and Northumberland since the passing of the Dilapidation Act in 1871. His photograph is the work of Mr. W. P. Glaisby, of York.

Mr. Edward Augustus Grüning, F.R.I.B.A., was articulated 1853-1858 to the late Professor Donaldson, and studied also at the Royal Academy and University College. After completion of his articles, he was engaged for some time on other matters, gaining experience in mercantile affairs in a leading merchant's office in the City, and in engineering in railway construction, having been also employed as clerk of works at Broadlands, on the estate of the late Lord Palmerston, K.G., and in the Inspector-General of Fortifications Department at the War Office. Elected an Associate of the R.I.B.A. in 1860, he became a Fellow in 1869, and served on the Council, 1873-1876, and again from 1885 to the present time; also as an active member of the Board of Examiners from the commencement of the obligatory examinations for associates. Established as an architect in Gresham House, Old Broad-street, in 1862. The following is a list of the principal buildings erected by him. Office buildings:—Bartholomew House, Bank, E.C. (including Alliance Bank); 144, Leadenhall-street; 113, Cannon-street (corner of St. Swithin's-lane); 31, Throgmorton-street; 14, Austinfriars; 11, Cophall-court, Throgmorton-street; 22 and 23, Change-alley; 11, Tokenhouse-yard; 1, Crown-court. Premises for private firms:—Colonial Bank, Demerara;

Messrs. F. Huth and Co., 12, Tokenhouse-yard; Messrs. Frühling and Goschen, 12, Austinfriars; London Banking Association, 57, Old Broad-street; new galleries and alterations, Messrs. Christie, Manson, and Woods, King-street, St. James, and two houses adjoining in Duke-street; many alterations, including the Council of Foreign Bondholders, in Moorgate-street, Standard Bank of South Africa, Clement's-lane, and the fitting up of many banking and merchant's offices. Hospitals:—German Hospital, Dalston (joint architect with the late Professor Donaldson); additions to out-patients' department, &c. (as sole architect), Seaside Convalescent Hospital, Seaford. Hotels:—Royal Hotel (De Keyser's), London, E.C.; Tilbury Hotel, Tilbury; Excise Coffee House, 56, Old Broad-street, and various alterations, &c. Warehouses, &c.:—Union Oil Mills, Rotherhithe; London Seed Crushing Co., East Greenwich; Sales, Pollard, Lloyd, and Co.'s tobacco factory, Farrington-road; Palm Kernel Mills, Limehouse; warehouse, New-street, E.C.; Tilbury Docks electric light engine-house, and various other works. Private houses:—4, Seamore-place, Park-lane; 28, Hertford-street, Park-lane; Alton House, Roehampton Park (alterations and additions, stables, lodge, conservatory, &c.); 10, Grosvenor-street, W., and stables; two houses on Hampstead Heath, "Beechwood" and "St. Mary's"; Tilbury Docks, officers' houses; twelve houses, The Terrace, Richmond; smaller houses, and many alterations and additions; stables, &c., in London and various parts of the country; also some few restorations of old churches and old country houses. Schools, &c.:—St. George's German and English Schools, Whitechapel; Anglo-German Schools, Bristol; German Gymnasium, near King's Cross. Mr. Gruning holds the appointment of honorary architect to the German Hospital at Dalston, is on the livery of the Goldsmiths' Company, and on Her Majesty's Commission of Lieutenancy for the City of London. The portrait is from a photograph by Mr. Thos. Fall, of Baker-street.

Mr. Paley was born at the vicarage of Easingwold, near York, in 1823, and became pupil to the late Mr. Edmund Sharpe, of Lancaster, in 1838, and subsequently partner in 1845. The firm carried out the rebuilding of the parish church of Wigan, new churches at Knowsley, Lever Bridge, Rusholme, and other smaller ones; new halls at Capernwray, in Lancaster, and Ince, near Chester; large additions to the County Lunatic Asylum and Castle at Lancaster, &c. From 1851 to 1868 Mr. Paley practised on his own account, and designed and carried out several new churches—viz., St. George's and St. James's, Barrow-in-Furness; St. Peter's Catholic Church (with presbytery, schools, and convent) at Lancaster; Poolstock, near Wigan; Ringley, Allithwaite (with parsonage house and schools), Aughton, St. Thomas's, Blackburn; Bradford (Holy Trinity), Bury, Bradshaw, Hoddesden, Higher Walton, Penwortham, Ince, Wrightington, Lowton, Walton, in Cumberland; Walney Island, Rossall School Chapel, Pennybridge, Blawith, Singleton, Quernmore, Woodlands, Over Darwen, Thwaites, Livesey, St. Mark's, Preston; Stockton Heath; new parish church, Bolton-le-Moors; Catholic churches at Garstang and Yealand Conyers, &c. Restoration and enlargements of the parish churches of Winwick, Cartmel, Lancaster, Burnley, Easingwold, Crayke, Ulverston, Kirkby Lonsdale, Poulton-le-Fylde, Penn, Caton, and others. At Lancaster, the Royal Albert Asylum, Wagon Works, new cemetery buildings, savings bank, Royal Grammar School, and several smaller buildings. At Barrow-in-Furness, large ship works and jute mill, schools, new bank, old railway-station, &c. For Furness Railway Company, stations and hotel at Furness Abbey, Grange, &c.; hotel at Grange; mansions at Abbots-wood (for Sir J. Ramsden), Wennington, Dalton, Newfield Halls, Browhead, Windermere, and numerous smaller buildings, schools, parsonage houses, &c. Mr. Paley became associated with Mr. H. J. Austin in 1868, and since that date the firm have designed and carried out above 40 new churches, many large and important—viz., Mossley Hill, Liverpool (with parsonage); Kirby (for Lord Sefton); the Saviour's and All Saints, at Bolton-le-Moors; St. Mary's, Bewick; Higher Broughton; and St. John's, Cheetham Hill, Manchester; St. Clement's, Salford; Millom, Bettws-y-Coed; parish church, Leigh; St.

Laurence, Morecambe; Atherton, Winmarleigh; Howe Bridge, Cross-Crake, St. Cuthbert's, Darwen; Walton, near Warrington; St. John's, Greenock; Halliwell, Daisy Hill, St. Anne's-by-the-Sea, Halton; St. Cross, Knutsford; Hutton-roof, Mansergh, Thornton, and Leck, nr. Kirkby Lonsdale; Largho, Scorton, Pilling, Westleigh Mill, St. Barnabas, Crewe; Parish Church of Dalton-in-Furness, Lower Ince, Mission Chapel at Scarborough, Grimsargh, Burnage, Finsthwaite, Torvor, Burton-in-Lonsdale, Cloughfold, &c. Restoration (and enlargement in some cases) of the parish churches of Bowness, Hever-sham, Lytham, Gt. and Little Ouseburn, Melsonby, Alderley, Broughton-in-Furness, Penn, Bolton-le-Sands, Daresbury Eskdale, Great Harwood, Halsall, Kirkstall, Malham, Llanwrst, Fleetwood, Melling, Orton, Ormskirk, Fawley, near Henley-on-Thames; Westham, and Wilmington, nr. Eastbourne; Sedbergh, Dent, Colne, Prestwich, and other smaller ones. Grammar schools at Sedbergh, Skipton, St. Bees, and Giggleswick. Mansions: new wing at Holker (for the Duke of Devonshire), new tower and enlargement of Underley Hall (for Lord Bective), Thurland Castle, new wing and terraces at Fawley Court (near Henley-on-Thames), Dane Ghyll, Oak Lea, Dunningwell, Chapel Ridding, Windermere; Walton Hall (new offices and enlargements, &c., for Sir Gilbert Greenall), new hall, with stables, lodges, &c., for Lord Winmarleigh. Banks at Barrow and Lancaster, for Lancaster Banking Co., and bank at Barrow, for Cumberland Union Banking Co. Stores: Jubilee Institute at Lancaster, &c. His photograph was produced by Mr. Silas Eastham, of Southport.

Mr. Hubert Austin is the youngest son of the late Rev. Thos. Austin, M.A., rector of Redmarshall, Durham, and was educated at Richmond School, Yorkshire. In 1860 he was articled for four years to his elder brother, the late Thos. Austin, of Newcastle-on-Tyne (afterwards Austin and Johnson). On the completion of his articles he passed the Voluntary Examination in Conduit-street in January, 1864, and entered the office of Sir Geo. Gilbert Scott, on whose staff he remained till he became associated with Mr. E. G. Paley, in 1867. He was Pugin student in 1866, and the first secretary of the Spring-gardens Sketch-Book. He gained the competition for Christ Church, Ashford, Kent, in 1865, which church was built from his designs by the kind permission of Sir Gilbert Scott. A list of works carried out by the firm since his partnership with Mr. E. G. Paley is stated above. The churches at Mossley Hill, near Liverpool, Bettws-y-Coed, St. Barnabas, Crewe, Cloughfold, and Crawshawbooth were gained in competition from designs by Mr. Austin. The first premium for mountain churches, given by the Carlisle Diocesan Church Extension Society in 1873, was also gained, out of 56 competitors, by the firm from Mr. Austin's designs. The portrait given was produced at the studio of Messrs. Davis and Sons, of Lancaster.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary meeting of the Institute was held on Monday evening, the president, Mr. A. Waterhouse, R.A., in the chair.

#### GERMAN TECHNICAL MUSEUMS.

A paper on this subject, illustrated by plans and drawings, was read by Mr. Frank Granger, M.A., holder of the Godwin Bursary for 1889. The lecturer remarked that the industrial art and trade museums of Germany had been suggested to a great extent by South Kensington Museum; but close inspection revealed essential differences. A common practice in Germany was to locate industrial art museums in school buildings, the great principle in these institutions being that they were regarded from the student's point of view, not from that of the collector of curios. It was advisable to group objects of one kind together, so that the characteristic methods of a group of artists, a district, or a period could be seen in combination at a glance; the division of rooms by partitions and screens, as in Berlin and Hamburg, greatly facilitated this. In planning a trade museum it would be well, on scientific as well as on practical grounds, to group together, 1st, the materials employed in the industries of construction; 2nd, the materials employed in the

textile and allied industries. All the buildings the lecturer visited were characterised by great simplicity of plan. The rooms were square or oblong, and arranged along corridors, and, generally speaking, there was an absence of *tours de force* in the planning. In some of the larger buildings the corridors overlooked interior courts. The rooms in which textile objects were exhibited should not have the sun upon them; and accommodation should be provided for storage in an easily accessible manner. A library and reading-room should be provided in connection with each museum, and it should not be necessary to pass through the museum to reach the library, near which lavatories should be provided. The museum authorities in Germany preferred wood to iron for the framing of glass cases for exhibits. Extracts from the author's detailed reports on particular museums were given, commencing with the museum at Hamburg, erected from the designs of Herr Zimmermann at a cost of £120,000. It formed a closed quadrilateral with two interior courts separated by a central block. The greatest length was 343ft., and the greatest width 247ft. The Industrial Art Museum, Berlin, was from the designs of Gropius and Schmieden, and was constructed with stone basement and brick superstructure, with tile and terracotta bands. The library was on the ground-floor to the right of the entrance. The Dresden Museum of Industrial Art was in the same building as the school; and, as at Hamburg, the museum occupied the ground-floor, and the school the upper stories. The Trade Museum at Chemnitz was the best example of its class Mr. Granger inspected. It occupied the second story of the building of the local "Handwerkerverein," the floor below being devoted to their library; and consisted of four rooms opening into one corridor, while the further corridor led to a fifth room and a small library. The Mining, the Agricultural, and the Hygienic Museums, Berlin, were described, and also the Art Museums at Leipsic and Hanover, the Trade Museums in the latter town, and the Mineralogical Museum of the Charlottenburg Technical High School. The last-named example was housed in a fine new building, the main block being 600ft. long by 170ft. deep from front to front, with two large projecting wings. It had five exterior courts; the basement of the exterior was faced with red sandstone, while the upper stories were in yellow sandstone with white sandstone dressings. The principal staircases were of unpolished red granite. In the grounds were a chemical laboratory, a technical testing institution, and an engine-house. The Dresden Polytechnicum covered an area of 13,700 square feet, the technological, engineering, architectural, telegraphic, and electro-technical collections being all arranged with a view to their use in instruction. Several miscellaneous matters noted during his tour were mentioned by the lecturer. The scaffolding of the new buildings were usually constructed of square timber, and carried up to the top soon after operations were commenced. The bricks used for the interior walling of the new shops and residential blocks were ordinarily the local yellow. Some of the fronts were being faced with brick; the majority, however, were still faced with stucco in the old fashion, the brickwork being carefully adjusted to the stucco detail. At the Academy of Art, Leipsic, the ventilation and heating were kept independent. The slates were secured by hooks at the bottom; no leverage was allowed to the wind, and even in exposed situations such roofs had stood for thirty years without suffering much damage. As an instance of German professional practice, Mr. Granger stated that in the case of the University Library and of the Academy of Art at Leipsic, the buildings were not being executed under the superintendence of their designers, but the library under another architect, the Academy under the Municipal Building Inspector. At the close a vote of thanks was accorded to the lecturer on the motion of Messrs. E. C. Robins and T. M. Rickman.

At the last meeting of the town council of Wolverhampton, the School of Art Committee presented a report giving the names of three gentlemen selected for the office of head-master of the school in succession to Mr. A. Gunn, resigned. They were Mr. A. C. Jahn, of South Kensington; Mr. W. H. Gates, assistant-master at the Wolverhampton School; and Mr. G. Ward, of Rochester. Mr. Jahn secured the highest number of votes, and he was appointed at a salary of £250 per year.

TRINITY HALL, CAMBRIDGE.—HOLY TRINITY CHURCH,  
WANSTEAD.—CRANBORNE MANOR HOUSE, DORSET.—  
CONTEMPORARY BRITISH ARCHITECTS.

## Our Illustrations.

NEW BUILDINGS, TRINITY HALL, CAMBRIDGE.

THIS is a new block of buildings, containing eighteen sets of undergraduates' chambers and Fellows' rooms. The materials are small, red, south country bricks, and yellow Ham Hill stone dressings. The roofs are covered with tiles of variegated colours from six different yards. The contractors are Messrs. Haigh and Thornton, of Liverpool, and the architects Messrs. Grayson and Ould. The Master's lodge is also being remodelled by the same architects, and an addition made to the college hall. The drawing illustrated is from the exhibition of the Royal Academy.

CHURCH OF THE HOLY TRINITY, WANSTEAD, ESSEX.

THE Church of The Holy Trinity, Hermon Hill, is now being built for the use of a rapidly increasing population, at George Lane, on the Great Eastern Railway. The plan of the church comprises a nave 102ft. long, 30ft. wide, and 55ft. high, with N. and S. aisles measuring altogether 62ft. across, with chancel, organ chamber, and vestries on the north side, tower and spire at the W. end of the N. aisle, and South porch. The nave is of five bays, of broad, massive arches on circular shafts, with pilasters and columns rising from the pillar capitals to the roof, and in each bay above are three low-pointed windows. The chancel is 40ft. by 24ft., apsidal ended, and is arcaded round the sanctuary with interlacing arches on marble columns, and marble roof shafts rising from the floor to the cornice. The three arches forming the eastern bay of the chancel contain a sculptured group of the Ascension. The altar is of large size, and is enriched with interlacing arches forming nine compartments, each of which contains a carved statuette, all in oak. The organ-chamber and vestries form a picturesque group on the north side of the chancel, and below them is the vault for the warming apparatus. A low stone wall, with metal cresting and gates, separates the nave from the chancel; and at the end is a large pulpit, enriched with carved interlacing arches, and on one side is a fine sculpture of our Lord in Majesty. Doorways for egress are provided at the east end of each aisle. The tower and spire stand at the west end of the north aisle, and will be a conspicuous feature when completed. The tower is 30ft. square outside the buttresses; the total height will be 170ft. The tower is of three stages, the lower one being again subdivided, and this forms one stage internally, making a handsomely-arcaded and groined porch. The style of the church is that which prevailed at the end of the 11th and the early part of the 12th century, and has been well and thoughtfully carried out, great variety being given to the mouldings and ornamentation. The nave of the church was built three years ago; the chancel and lower part of the tower are the gift of the Misses Butler, who have also contributed most liberally to the other parts of the work. Mr. S. B. Barton, of Newcastle-on-Tyne, is the

builder employed, and has carried out the work most satisfactorily under the direction of Mr. James Fowler, of Louth, architect.

CRANBORNE MANOR HOUSE, DORSET.—EXTRA  
MEDAL.

THE Manor House was the head lodge of Cranborne Chase, and in it were held the Hundred, Manorial, and Chase Courts. Of its erection there is no recorded date; but from time immemorial there has existed on the site a building mentioned in old records as "the Castle." In the Domesday Book the Manor is noted as having belonged to Queen Maud. It was subsequently held for a long period by the Earls of Gloucester, and eventually came to the Crown by King Edward IV., after which it was frequently granted to many great persons for life, until, in 1612, James I. presented it to Robert, Earl of Salisbury. It has remained in the possession of this family ever since, and is now the property of the present Marquis of Salisbury, to whose eldest son it gives the title of Viscount Cranborne. The house is ably described in the R.I.B.A. *Journal*, February 6th, 1890, by Mr. John P. Seddon, who visited it last year with members of the Committee of Architects of the Incorporated Church Building Society—when that body was hospitably received by Canon Cazenove, the present occupier—as follows:—"On a Norman foundation, and with sufficient remaining of that early period to indicate that its original plan was a remarkable and characteristic one, with half the ground story open and arcaded to form a covered approach, the main central block had been completed in the 13th century, and retains the beautiful corbelled parapets of that age, with additions of the Elizabethan period in the shape of projecting towers from the entrance façades, with parapets curiously copied from the earlier ones; with a cinque-cento architectural veneer on the opposite side with enriched pilaster buttresses, with a wing added by Inigo Jones, and a most picturesque and curious screen-wall, with gateway flanked by square lodges placed diagonally." There is an underground passage, now walled up, connecting the "larder" with the priory some few hundred yards to the eastward. The Chase and other Courts were held in the great hall, the prisoners being confined in the dungeons on the floor below. The arms over the N. porch are those of Sir Robert Cecil, K.G., first Earl of Salisbury. The building was for many years in a ruinous condition, but the whole has been well and thoroughly restored by the present Prime Minister.

J. E. MOWLEM.

CONTEMPORARY BRITISH ARCHITECTS.

(See description on p. 720.)

## CHIPS.

It is intended to fill the window in the gable of the north transept of Bristol Cathedral with stained glass as a memorial to Edward Colston. The work will be carried out from designs by Mr. J. L. Pearson, the architect to the Dean and Chapter, and towards the £1,000 required about one-third has already been promised.

Additions have been made to the Infectious Diseases Hospital, Portsmouth, and special attention has been paid to the ventilation, the extraction of the vitiated air being effected by Messrs. Robert Boyle and Son's latest improved patent self-acting air-pump ventilator, and fresh air admitted by their improved air inlets.

A full-sized statue of Edward the Confessor, the gift of the Queen, and another representing St. Edmund King and Martyr, given by the corporation of Winchester, have just been placed in two of the vacant niches in the screen of Winchester Cathedral. They are the work of Mr. Boulton.

Mr. E. Onslow Ford's statue of General Gordon, a model of which forms the chief feature of the exhibition of sculpture in the Octagon-room at the Academy this year, was unveiled by the Prince of Wales on Monday. It represents Gordon riding on a gaily-caparisoned camel, and wearing the uniform of an Egyptian general. Both statue and pedestal are of bronze, and on the latter is the single word "Gordon."

At the London Bankruptcy Court on Friday, Mr. Registrar Brougham adjourned the application for the approval of resolutions in the case of Thomas Quinn, M.P. for Kilkenny, and builder and contractor in Islington, till June 6th.

The Buildings (Sanitary Registration) Bill was withdrawn from the House of Commons on Wednesday night.

## COMPETITIONS.

MENCE SMITH STUDENTSHIP.—The Mence Smith Travelling Scholarship of £50, offered in competition by the Painters' Company for the best set of designs in decorative painting, and open to students of all Schools of Art within the Metropolitan area, has been awarded to Edward Gridal, aged 21, a student at the Regent-street Polytechnic School of Art.

OLDHAM.—The awards for designs for the new offices of the Oldham School Board have been made as follows:—1st premium, Mr. F. E. L. Harris, Chelmsford; 2nd, Messrs. Potts, Son, and Pickup, Manchester and Oldham; 3rd, Messrs. Smith, Woodhouse, and Willoughby, Manchester and Stockport. There were 31 competitive designs submitted.

WILLESDEN.—The competition for the new cemetery at Willesden has been settled, and the author of the chosen design is Mr. Charles W. Worlee, of 62, Welbeck-street, Cavendish-square, W., whose motto was "Terracotta." The scheme includes two chapels, a mortuary, and superintendent's lodge, provision being made for about 20,000 graves. The estimated cost of the buildings, &c., is £6,500. Great care seems to have been taken in this plan with the drainage, for which the site has a good natural fall.

## ARCHITECTURAL &amp; ARCHÆOLOGICAL SOCIETIES.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—At the final meeting of the session, held on May 14th, the president declared that the following gentlemen had been elected to the various offices named for session 1890-91: President, T. Naden; vice-president, W. H. Lloyd; hon. treasurer, C. E. Bateman; hon. librarian, H. Beck; hon. secretary, H. R. Lloyd, A.R.I.B.A.; hon. auditors, A. T. Powell, chartered accountant, and E. F. Titley. Council to consist of four members and three Associates. Members: W. H. Bidlake, M.A., A.R.I.B.A., W. Doubleday, W. Hale, F.R.I.B.A., and W. H. Kendrick. Associates: F. B. Andrews, A.R.I.B.A., G. T. Bassett, A.R.I.B.A., and H. R. Bewlay. A hearty vote of thanks was passed to the president for the services he had rendered to the association during the past session, and the thanks of the association was also voted to the retiring officers. It was announced that the services of Prof. R. H. Smith, M.I.M.E., Assoc. M.I.C.E., had been secured as lecturer on "Statics," and that a number of members had already given in their names for the lectures.

MANCHESTER SOCIETY OF ARCHITECTS.—An exhibition was held on Friday, the 9th inst., at the meeting room of the Manchester Society of Architects (Diocesan Chambers), of the drawings and descriptive report of a tour in Belgium and a portion of Northern France, made by Mr. Ph. E. Barker, A.R.I.B.A., who had been selected, in a preliminary competition, as the holder of the Society's Travelling Studentship for last year. The Studentship, of the value of 50 guineas, was given on the condition of the holder submitting satisfactory proofs of work done during a tour of three months, and the Council of the Society, at a meeting held on February 20th, passed a resolution expressive of their satisfaction with the results.

The foundation-stone of the new public buildings and library for Oldbury was laid on Monday. The site is at the corner of Freeth-street and Birmingham-street. Hitherto Oldbury has been without a free library, and the offices of the various officials of the Local Board have been distributed over the town. In the new buildings all the officials will be accommodated, and there will be commodious Board and committee rooms. The lending library and reading-room will be on the ground-floor. Messrs. Wood and Kendrick, West Bromwich, are the architects; and the building contract of £3,000 has been taken by Mr. J. Dallow, of Blackheath.

Among the birthday honours we note that Mr. Trueman Wood, the secretary of the Society of Arts, has been knighted, Mr. George Bullen, late Keeper of the Printed Books, British Museum, Mr. W. C. Roberts-Austen, Assayer to the Royal Mint, and Major-General C. S. Hutchinson, inspector of railways under the Board of Trade, are made C.B.'s, while Mr. James G. H. Glass, superintending engineer to the Public Works Department, Central Provinces of India, is created a C.I.E., and Mr. R. Knox MacBride, Director of Public Works for Ceylon, receives the C.M.G. decoration

## WAYSIDE NOTES.

THE scene of my daily labours being not more than one hundred miles from the parochial churches of St. Clement Danes and St. Mary-le-Strand, I frequently look forward with pleasurable anticipation to the time when the Strand Improvements Bill will become law, and its provisions duly carried into effect. I joyfully picture to myself the change that will come over the things that be. It causes me no small happiness to reflect that ere long the jostle and crush that at present characterise the district comprised in the area of the improvements that the County Council propose to effect will be conspicuous by their absence, that, moreover, there will be freedom in ambulatory action, and that comfort will accrue from the increased elbow-room. And I console myself not a little with the reflection that, all well, I shall at last, perchance, witness the demolition of the butcher's shop, whence, for so long, gory carcasses have projected over the narrow public footway.

No less do I delight to anticipate the architectural effects that will accrue from the destruction of the group of buildings that, for the want of a more definite term, have been called "the Holywell-street block." I conjure up visions of St. Mary-le-Strand standing out in dark purple outlines against the glowing red of the evening winter's sky. How greatly will the effect be improved, pleasing though it may be under the present circumstances in the days when the setting sun throws its bright rays down the length of the busy Strand! Then, too, I picture a new prospect of St. Clement Danes, with a more interesting view of its admirable spire, besides a glorious grouping of both churches, and yet another group where these old buildings will be backed by the broken outlines of Street's masterpiece! Those will be better days for the architectural features of East Strand, apart from the fact that 'buses, cabs, and other units of vehicular traffic will pass along more smoothly. May the question of betterments, then, and other debatable matters, be quickly settled by the Parliamentary Committee now in the thick of its labours, and the work of demolition begun in all earnestness.

So much attention has in times just past been bestowed upon St. Mary's that excellent St. Clement's has been cast into the background. It is to be supposed, with some readers, that had there been an equally determined attempt to have the latter church pulled down, it would have also been "discovered" as a building of remarkable interest and architectural beauty. In many respects it would have deserved the notice; in some it would deserve more commendation than St. Mary's. To my mind, the spire of St. Clement Danes has ever been an object of great beauty, appealing to my sympathies more strongly than does any feature of St. Mary's. The peculiar gracefulness of its upper stages, resulting, primarily, from the diverse and contrasted plans of the several stories or stages, must have been often noticed by the observant among the passers-by. The pleasing proportions, the bold mouldings, and the crisp "go" about the whole design are characteristics of this London campanile that compel the regard and esteem of the architect. It is a pity, I have thought, that the body of the church should be of such inferior architectural merit to that of its steeple; but it is at least honest, and if the roofs have little more character of outline than a straw-stack, the blemish and shortcoming are referable to the fact that the building had to be adapted to a curiously-shaped plot of ground.

I have been up and down the Lower Thames lately more than once, and have had opportunities of inspecting the condition of the works for the new Tower Bridge. One cannot take in a vast deal from the deck of a passing steamer, so my observations were but superficial. They, nevertheless, suffice to show the excellence of the work upon the substructure of the two proposed towers. It is pleasingly massive, and eminently soothing and grateful to the architectural senses in these days, when civic corporations debate as to the possibility of allowing 4½ in. party-walls, and when Mr. Buggins is daily adding to his numerous "pieces" by the building and selling of shoddy houses. Massiveness and solidity are always pleasing, and an inspection of these works at their present stage will prove interesting to all, and instructive to the students

who can gain access to them. In a short time now, I suppose, the towers will begin to develop more rapidly. Work on the foundations has seemed lengthy; but no one will be surprised at this who sees the nature of the undertaking, which is truly of no ordinary kind.

Having been interested in the value of riverside property below London Bridge, it has become evident to me that the completion of the new bridge will decidedly affect businesses carried on at wharves lying between the old means of river transit and the new. Mention any possible building site east of London Bridge, and the first thing a business man asks is whether it is above or below the new Tower Bridge. There would appear to be a general apprehension that the interference with the freedom of navigation to and from the western portion of the Pool will in some measure depreciate the value of waterside premises above the new bridge. As it is at present, there is not a vast waterway between the basements of the two proposed towers, not a greater distance, perhaps, than between the heads of the two harbour piers at Ramsgate. Although this may cause no practical congestion in river traffic whilst unspanned by the proposed bridges, the opening day of the new undertaking will certainly find the navigation to and from the Pool a very different thing to what it was in the old days, when the river was unobstructed. Barges, lighters, and small craft, and steamers of small tonnage with adjustable funnels and masts will be able to pass under the girder bridges leading from the river banks to the towers—so, at least, I presume; but large steamers finding themselves at one and the same time desirous to pass up or down the river will have to wait about a bit, and the delay will not tend to promote briskness or business. The bridge, however, is on a fair way to becoming an accomplished fact, and so it is no use talking of what its effects may be, unless, indeed, some intending buyers of wharves on the Pool should read this, when perhaps they may be inclined to give less for such property. Otherwise the only apology for this note is that the subject matter may be taken as a possible example of the newly-invented word, "worsement."

Things in connection with the City and South-west Subway progress favourably. The method of electrical locomotion—the means that will cause the trains to "electrocute," "electrate," "volt," "ohm," "mote," "trike," "squirm," or "chortle," &c., as individuals, blessed with more originality than sense, have variously suggested in the columns of the *Times*, has been under trial for some six months, and is said to promise success. Boilers of some thousand horse-power have been erected at the generating station at Stockwell, and the fittings of the electrical plant, and other details, is rapidly progressing. The trains, it is intended, shall be composed of three carriages and an electrical locomotive, and carry one hundred passengers at a speed of 15 miles per hour, including stoppages. The main conductor will be of copper, and laid along one side of the tunnel, and this will be connected at short intervals with the conductor from which the current will actually be taken. This latter will consist of a light iron rail between the rails of the permanent way, contact with the motor on the engine being made by means of metallic brushes. All things, therefore, being settled, it should not be a great while before the line is ready for traffic, when it will be seen whether the chief question will be satisfactorily answered, and the line made to "pay." Regarding the enormous concourse of humanity that daily passes to and fro over London Bridge, there can be little doubt on this score, providing the descent and ascent of the lifts at the stations do not prove tedious and wearying.

A correspondent kindly sends me the "particulars" and "instructions" to architects for the competition for new market buildings for the Fleetwood Improvement Commissioners, saying that he forwards them exactly as he received them, and that he considers that, "of all the vile productions of late years," the documents, taken in conjunction with the advertisement, to which I referred last week, "cap everything." I must confess they would be hard to beat. The plan of site is a beautiful production certainly! My correspondent requests that I may return "the

curiosity," which I will not fail to do; but had he not wanted them back, I might have been tempted to have them framed, or to present them to the trustees of the British Museum, who would doubtless have labelled them "Competition Particulars, Instructions to Architects, XIX. Century, temp. Queen Victoria." The "instructions," save the mark! are written, of course; but on paper such as a grocer wraps a pound of tea in. I suppose they would be called "instructions," because they don't instruct. The architect, presumably, is to arrive at a knowledge of the requirements of the commissioners by a sort of intuitive process. But the plan takes the mortar-mill. It is prepared upon similar tea-wrapping paper, but sheets of paper of sufficient size to take the whole plan were not at hand, so one half goes on one sheet and the other half on another sheet of paper. I cannot, however, do justice to the "curiosity," which should be a really marketable article among architects anxious to procure the very latest thing in competition particulars and instructions.

GOTH.

## CHIPS.

A stained-glass window and a marble and stone sculptured reredos are being prepared for setting up as memorials at the east end of the chancel of the new parish church of St. Michael, Aberystwyth, now building from the designs and under the direction of Messrs. Nicholson and Son, architects, Hereford. The window at the east end of the morning chapel is also to be filled with memorial stained glass.

Mr. Oscar Harrison, who has acted for several years as assistant to the borough surveyor of Stafford, has received the appointment of surveyor to the local board of Workop, at a commencing salary of £110 per annum. There were about ninety applicants for the post.

On Monday Colonel Luard, R.E., held an inquiry at the Town Hall, Newport, concerning the proposal of the corporation to borrow between £6,000 and £7,000 for street improvements.

An inquiry has been held by Mr. Thornhill Harrison, Engineer Inspector to the Local Government Board, on an application by the Local Board of Sutton, Surrey, for a loan of £26,000 for works of sewerage and sewage disposal on a plan designed by Mr. Anstie. The scheme was strongly supported by Mr. E. L. Jacob, medical officer of health.

The Thomas Coats Memorial Church at Paisley is in course of completion, and on Friday the vane was formally placed on the tower. Mr. Hippolyte J. Blanc, of Edinburgh, is the architect.

A stained-glass memorial window was unveiled in Ellison-street Presbyterian Church, Jarrow-on-Tyne, on Sunday. It occupies the east end of the church, illustrates the Parable of the Sower, and has been executed by Messrs. Atkinson Brothers, of Newcastle-on-Tyne.

A pavilion is being built on the side of the private cricket ground in Erridge Park, Tunbridge Wells. It is being built from the designs of Mr. J. Richardson, one of the estate foremen, under the superintendence of the Marquis of Abergavenny. Mr. H. Bond, of Frant, is the builder.

The Rugby Local Board have accepted from Mr. R. H. Wood, of that town, the gift of a house, four stories in height, with schoolroom, reading-room, bath, and five-court attached, standing in 2,000 square yards of land. It is presented as a home for an institute and museum.

The Abbey of Winchester has been purchased by the corporation, and the beautiful grounds, which are well wooded and intersected by a river, are to be converted into a public promenade.

Mr. Ernest Alfred Williams, F.S.A.Scot., architect, of 171, Queen Victoria-street, E.C., died on Saturday last at his parents' residence in Upper Norwood, at the early age of 27 years. Mr. Williams had only five days previously returned from a voyage to South Africa, undertaken with the hope of restoring him to health.

The family of the late Mr. W. Thompson Watkin, the well-known archaeologist and historian of "Roman Lancashire and Cheshire," have just received a grant of £200 from the Royal Bounty Fund.

A new organ chamber, containing an instrument built at a cost of £1,250 by Messrs. Henry Willis and Sons, of London, was opened at Broughton-place U.P. Church, Edinburgh, on Friday. The architect was Mr. G. Washington Browne, of Edinburgh.

The will of Mr. John Ridley Hunter, formerly of the firm of Messrs. W. and J. R. Hunter, timber merchants, Moorgate-street, has been proved, the personality exceeding £18,000.

# THE PROPOSED CHANGES AT THE ARCHITECTURAL ASSOCIATION.

THE closing ordinary meeting of the Architectural Association was held on Friday evening, and was largely attended. Mr. Leonard Stokes, the President, occupied the chair. A motion was made by Messrs. Price, Appleton, and Stannus to rescind the motion passed at the previous meeting for publishing the number of votes given in the election of the committee, but, after considerable discussion, the motion to rescind was defeated by 47 votes to 40. The following were announced to have been elected as officers and committee for 1890-1, the statement of the unanimous re-election of the President being greeted with prolonged applause. President: Leonard Stokes. Vice-Presidents: Frank T. Baggallay and H. O. Cresswell. Committee: Herbert D. Appleton (197 votes), T. E. Pryce (173), John Slater (153), A. Beresford Pite (141), Gerald C. Horsley (130), W. Burrell (128), Frank G. Hooper (128), G. Richards Julian (128), Owen Fleming (117), and E. W. Mountford (116) — the highest unsuccessful candidate received 114 votes, and the lowest 34. Hon. treasurer: Hampden W. Pratt. Hon. assistant treasurer: R. L. Cox. Hon. librarian: W. H. Town. Hon. assistant librarians: W. Stonhold and E. H. Freeman. Hon. secretaries: F. R. Farrow and E. S. Gale. Hon. auditors: Max Clarke and Campbell Jones.

The President announced that the A.A. Travelling Studentship had been awarded to Mr. Percy D. Smith, and the second prize had been given to S. Tugwell.

Messrs. J. Todd, R. H. Hunter, E. Cruickshank, H. Jefferies, A. G. Dutton, G. W. Haywood, T. Constanduros, H. G. Collins, T. D. Mitcheson, and H. C. Corlette having been elected as members, the meeting was made special for the consideration of the report of the committee on education, an epitome of which appeared in our issue of the 2nd inst., p. 618.

Mr. J. SLATER, B.A., past president, as chairman of the special committee, moved the adoption of the report, which he thought would be, if agreed to, epoch-making in the history of the Association. While the proposed changes were of a decidedly drastic character, they had not been propounded in an iconoclastic spirit. The inquiry was originated by the dissatisfaction felt by the students in one or two of the classes; but when the committee examined into the working of the Association, they found the field widened. The voluntary system had been strained of late years almost to the breaking point, and for the past ten years every President of the Association had declared in his opening address that some change must be made in the near future. That near future ought to be, the committee believed, the immediate present. Examination was not, after all, education, and if students were to enter examinations with any hope of passing them, there must be an organised system of preparation. When the Association was younger and smaller, and had only two classes, those of construction and design, it was easily managed on a voluntary basis. These two classes had now expanded into eighteen, attended by 300 students, and it was no longer possible for unpaid workers to cope with the task. Men could not be expected to give up time for teaching unless remuneration were offered. Again, their honorary secretaries were asked to make great sacrifices of time and money; indeed, the senior secretary had now to meet between £40 and £50 a-year out of his own pocket, and it was obvious that this could not always be maintained. This was not a novel departure, for already there were some regularly paid instructors and lecturers. While the curriculum proposed to adopt the Institute examinations as a basis, it would be by no means confined to those subjects. The architectural studio system which it has proposed to adopt had been very successful abroad, and one or two studios had been established of late years in London, with great benefit to those who availed themselves of these advantages. The studio plan was, therefore, an integral and cardinal feature of the committee's programme. At the same time, the curriculum sketched out was a tentative scheme, and went thoroughly on the basis of the old classes. A new feature was the establishment of day classes, and in this department the committee did not wish to enter into rivalry with existing institutions. As to the scale of fees, the committee came to the conclusion that

ten guineas was not too much to ask for the whole curriculum, and in no other profession could the necessary instruction be obtained on such inexpensive terms as these. For attendance at a casual lecture a fee of half-a-crown had been fixed as a minimum charge. The committee contemplated that at least 100 students might join in the aggregate, and if this number—only one-third the present attendance—joined, the elaborate scheme would be self-supporting. Another recommendation was the raising of the subscriptions of town members. He regretted that this proposal was not carried when it was mooted five years ago, and he did not believe they would have lost a dozen members by the change. At present members paid 33d. per week for all the privileges of the Association, and 7d. was not an excessive sum. In conclusion, he appealed for full and fair criticism; he believed that if the suggested alterations embodied in the report were adopted, a career was open before the Association of enlarged usefulness and widely-extended influence.

Mr. A. O. COLLARD seconded the adoption of the report, remarking that criticism of the scheme was what the committee wished for. As one of those who opposed the proposals of five years since, he now admitted that the subscription must be raised. It was intended, he explained, that the hon. secretaries would continue to be unpaid, but many of their duties would be delegated to paid assistants. The curriculum was, he claimed, an improvement of the R.I.B.A. examination plan, particularly in its weak point—the testing of drawing; and in particular the establishment of an architectural studio would tend to improve and raise the standard of examinations. It had been suggested that architects would be willing to meet part of the fees of their articulated pupils, and to afford them facilities for attending day classes, in consideration of the increased usefulness in the office of youths so trained.

Mr. COLE A. ADAMS, past president, thought all would agree in thanking the committee heartily for their report. The case on behalf of the change could not have been put more fully and fairly than had been done by Mr. Slater. As to the scheme generally, it was inevitable, but while he felt that the time had come for paid assistance, he would put in a plea for the continuance of the mutual system. Was it, he would ask, necessary or desirable that the Association should resolve itself into a college? It would be a mistake to eliminate the aid of members as voluntary workers. He could not understand the estimate in the report that a salary of £100 only would be sufficient for the director of the studio for the first year, for no man so clever and well-informed as the director would need to be could be secured for anything like that salary. He would throw out the suggestion that the assistance and counsel of many architects of high standing could be secured—with advantage to the students—as visitors, and this would prevent the extinction of the present enthusiasm. The great danger of all paid teaching was to become perfunctory in character, and against this they must guard. Referring to the proposal to raise the subscriptions, he said five years ago those who proposed that plan had a very definite programme—viz., that lecturers should be provided, and that transactions should be published; but these were defeated by a narrow majority. Since then his views had somewhat changed, and he feared the proposed increase would have a disastrous effect in driving out the senior members, who derived no benefit from the classes, but did not care to sever their connection with the body. He hoped it was not regarded by the committee as part and parcel of the scheme. As that evening only about a fifth of the members were present, he thought before the report was put for adoption a plébiscite by voting papers ought to be taken.

Mr. J. A. GORCH, past president, heartily welcomed and supported the report. He was pleased that the committee had grappled with the problem, and had brought forward so comprehensive and thorough a scheme, for half measures would be useless. As to the raising of the subscriptions, the matter now stood on a different footing to what it did five years ago, and the reasons in favour of increase were much greater. The change would only apply to town members. The establishment of day classes would be of great benefit to provincial men, for they could then apply themselves steadily to study. It was intended that students should continue their ordinary employment, the nine hours per week

allotted to study by the curriculum, in addition to fortnightly meetings of the Association and Institute and Saturday visits, left little leisure to students. He agreed with Mr. Cole Adams that it would be well to continue the voluntary system by enlisting the co-operation of eminent men as visitors to classes. All other instructors should be paid, partly by fixed salaries and partly by capitation grants.

Mr. S. BEALE thought with Mr. Gorch that the report should have laid more stress on the necessity for establishing day classes. The experiment of such classes ought to be tried concurrently with the introduction of the new programme.

The PRESIDENT explained that the only reason the committee did not press the point of the establishment of day classes was that it was felt to be premature to attempt to promulgate the whole programme at once.

Mr. HUGH STANNUS said the report would have been better received if it had been better edited. They were asked to adopt it as a whole, whereas it dealt with at least half a dozen proposals, the acceptance of one of which did not necessarily imply concurrence in the others. These points were the proposal of an ideal curriculum, the laying down of the principles that teachers should be paid, that those who profit by the classes should maintain them, that day-classes should be established, that a studio be organised, and, lastly, that the subscription be raised. He would appeal to Mr. Slater to withdraw his report, and move the adoption of these principles in some six sections. They could then be discussed in detail, and the real views of the members would be ascertained. At present he did not think members were prepared to vote on the subject. In reply to the President, Mr. Stannus said he would move, as an amendment, that the best thanks of the members be given to the committee for their report, and that it be remitted back to them with instructions to submit it again in sections.

Mr. GOTCH supported this; but Mr. F. T. BAGGALLAY contended that the report must hang together, and be accepted *en bloc* or entirely rejected.

Mr. WOODTHORPE agreed with Mr. Stannus. He objected to the proposal to raise the subscriptions, and thought ten guineas a year too large a sum to demand from young students. The Association was primarily intended to assist young men who could not afford to pay the ordinary college fees. He could not admit that the atelier system was a success in France. A man was not qualified to practise there till he was 33 or 34, and then State appointments had to be provided for him. He did not share Mr. Gorch's views as to the course being too severe; unless a young man was willing to work hard for considerably more than eight hours a day, he would not succeed. He deprecated taking a vote on the report after only one evening's discussion.

Mr. H. L. FLORENCE, past president, held that it was all-important that the old feeling and instinct of the Association should be maintained in the revolution now proposed. A mere educational studio of classes was not what was wanted. He was willing to accept the report in great part, but with security that the voluntary system should be continued. Day classes would not be so difficult to organise as some appeared to anticipate, for he believed many architects would not only allow pupils to join but be willing to pay all or a portion of the fees. As to the estimated expenditure, he was convinced that £900 a year would be found utterly inadequate, especially after the first two years. With the improved classes a great development of the library would be urgently needed, and also the provision of a proper reading-room, and as a nucleus of a fund for making such provision he was commissioned by a past president to offer a donation of one hundred guineas. (Applause.) He did not anticipate they need lose a serious proportion of members if the subscriptions were raised.

Mr. BERNARD DICKSEE seconded Mr. Stannus's amendment.

Mr. LEVERTON expressed fear that the raising of the subscriptions would reduce the membership. Mr. MAX CLARKE agreed with Mr. Stannus's proposal to discuss the report in sections; while Mr. E. J. TARVER begged the members not to send the report, which was the outcome of much thought and labour, back to the committee. Mr. F. T. BAGGALLAY also opposed the amendment.

The PRESIDENT explained that it was not pro-

posed to do away with the system of visitors; but that the earlier stages of instruction in the classes should be intrusted to paid lecturers and teachers, while the latter stages would be carried on nearly as at present.

Mr. SLATER appealed to Mr. Stannus not to press his amendment, and expressed his willingness that the report should be discussed in detail. Mr. Stannus, however, declined to withdraw.

It being now ten o'clock, Mr. C. H. BRODIE and Mr. FLEMING proposed the adjournment of the discussion, and, after an ineffectual appeal by Mr. Stannus that the amendment be voted upon forthwith, the motion for adjournment was carried. The discussion will be resumed on Friday, the 30th inst.

#### THE ARMOURERS' AND BRAZIERS' METALWORK EXHIBITION.

THIS City Company's Hall and Galleries in Coleman-street have during the week been usefully occupied with an exhibition of art brass-work and arms, including a great variety of objects both old and new, most of them on loan from private collections, and some in competition for the prizes offered by the promoters of the gathering. One good condition was inserted in the rules drawn up for the exhibition—viz., that the name of the craftsman and designer shall be given in each case for all modern contributions. We notice, however, in some cases, among the larger firms represented, that this condition was ignored, the name only of the manufacturers being stated. Another condition was that the objects shown must have been made during the past twelve months, and not previously exhibited or offered for sale. We seem to remember, notwithstanding this, some fairly familiar specimens. The various prizes seem to have been very judiciously awarded, and much of the students' work is of a high standard, judged rather from a technical standpoint, and not so much in respect to artistic merit of design. The honorary judges were Mr. Alfred Gilbert, A.R.A., and Mr. Herbert W. Singer. A prize of £10 was given to Messrs. Wm. Hopkins and Son for a set of saw-pierced iron cabinet furniture, and another prize of £3 for a lock and finger-plate in brass, designed and wrought in each case by Mr. Herbert Bennet. The skill displayed, particularly in the work of the former, is deserving of praise. Messrs. Hicks and Son received a second prize for their telescope floor-lamps, designed by Mr. Chas. J. Moreton. The slight relief in bronze of a figure of a jester, by Mr. C. E. L. Koester, took an extra prize as a spirited and well-drawn specimen of figure modelling. The Keswick School of Industrial Arts was well represented, the most ambitious being a gilt altar cross, designed by Mrs. Hardwicke Rawnsley. The Guild of Handicraft are responsible for some curious specimens of copper-work, coal-vases, sconces, and log-boxes; but the most singular of all is a big sconce or so-called picture-frame in copper repoussé, designed by Mr. Holman Hunt for his picture of "May Morning Ceremony, Magdalen College, Oxford." The square panel for the picture is surrounded by rays indicative of the rising sun. The craftsman was Mr. J. Williams. Mr. Samuel Cope is to be congratulated on the excellent character and taste displayed in his £10 prize. Finger-plates in brass (representing the use of armour), and another, No. 42, representing brazing. The drawing, both of the figures and the acanthus leaves intermingled with them, is first rate. Electric-lighting sconces and pendants naturally lend themselves for fresh treatments, and among these we note a trefoil arrangement by Mr. R. L. B. Rathbone, in copper and brass, having ground-glass domes for the lights and turrets over. Messrs. Strode and Co., the well-known iron-workers of 48, Osnaburgh-street, are strong in exhibits of this character, and win a first prize of £10 for a large hall lantern in wrought brass and copper, designed by Mr. Amor Fenn, and made by Mr. Henry Ross. To this work, as the best in the exhibition, the judges specially award a prize of £10 to the designer and £5 to the craftsman—£25 in all. This official statement must be highly gratifying to this leading firm and its assistants, and we are glad to note that all three parties concerned have been thus properly recognised. The lamp is circular on plan, with horn-like glass panels divided by elaborated metal bands, surmounted by a most delicately-wrought cornice with foliage and leafings to a scale well

according with the general proportions of the whole. Miss Georgie Cave France is clever in her lock-plate engraved with cupids and doves, decoratively treated. Mr. Shuttleworth-Brown takes a prize for a coffee-jug, which we admired amongst his other articles of domestic ware, though his kettle looks like a copy of a well-known and extravagant designer's goods. The vases in brass and copper by Messrs. Winfields, Limited, are equal to a second prize, but came too late. The hammered hollow ware is interesting, and so is the saw-pierced work, some of which is particularly delicate, as, for example, Mr. John Gorrill's photograph frames (122-124), to which a first prize was given. The cored castings are good, and so are the cire perdue castings by Mr. Conrad Dressler, whose bust in bronze seems worthy of a prize. The students' designs from the Birmingham School of Art reflect great credit on Mr. Taylor, the master there, and they have received several prizes. A large collection of Oriental and ancient metalwork and armour is shown in the other rooms from South Kensington Museum. The Exhibition closes on Saturday at 4 p.m.

#### CHIPS.

At a special meeting of the Surrey County Council held on Tuesday, it was decided to purchase a site for new county buildings at Kingston, at a cost of £3,450.

The Duke of Cambridge laid on Tuesday the corner-stone of the new front which is to be erected at the London Hospital, Mile-end-road. The disadvantage of the approach, the inadequacy of the receiving-room, the need of a new operating theatre, and the absence of conveniences for clinical teaching have long been felt. The principal features of the new buildings will be a covered approach, a new receiving-room, an operating theatre, a clinical theatre, and a chapel.

King's College, London, has just received the means of organising two new departments. The widow of Sir William Siemens, in fulfilment of the intentions of her husband, has given £5,000 for the establishment of an electrical laboratory, of which Dr. John Hopkinson will be the new professor, and Mr. Banister Fletcher, master of the Carpenters' Company, has subscribed liberally towards the formation of an architectural museum.

The opening on Wednesday week of two new recreation grounds in the borough of Croydon was made the occasion of a public demonstration. The open spaces were Wandale Park, situated in the west ward, comprising 20 acres of reclaimed marsh land, and about 12 acres of ground at Upper Norwood. The cost of acquiring and laying out the former was about £8,000, and the total expenditure with regard to the latter was £7,800.

A new line of railway, connecting the town of Woodstock with the Great Western system, was opened on Monday. The line, which is rather more than three miles in length, has been constructed by Messrs. Lucas and Aird, mainly at the cost of the Duke of Marlborough. It terminates close to one of the entrances to Blenheim Park. Woodstock-road Station will henceforth be known as Kidlington.

A Select Committee of the House of Commons has passed the preamble of the Bill by which it is proposed to erect a weir, lock, and footbridge across the Thames at St. Margaret's, just below Richmond.

The Board of Trade, having inspected the new line from Towcester, in Northamptonshire, to a junction with the Midland Railway near Olney, have sanctioned the opening thereof for passenger traffic.

The tenders have been let for a new Wesleyan chapel at Friendly, near Halifax, these amounting to £2,000. Mr. T. L. Patchett, of Halifax, is the architect.

A new pulpit and lectern, placed in St. Philip and James Church, Ilfracombe, were dedicated last week. The pulpit is Early Decorated in style, hexagonal on plan, and constructed of Derbyshire alabaster and nine varieties of Devonshire marble. Mr. H. Gardner, of Ilfracombe, was the architect, and Mr. H. T. Jenkins, of Torquay, executed the work.

At a meeting on Monday of the Devonport School Board, Messrs. Hine and Odgers, of Plymouth, were appointed architects for new schools to be built at Pennycomequick.

Justices Grantham and Charles have decided that, under the Local Government and Highway Acts, county councils are liable to pay the costs of maintenance, repair, and reasonable improvement of footways at the sides of main roads within urban districts, as well as of pitched crossings over those roads.

## Building Intelligence.

DARLINGTON.—On Saturday the chairman of the Darlington School Board laid the foundation stone of a new boys' school in Albert-road. The buildings will afford accommodation for 390 boys, and comprise a schoolroom 72ft. 6in. long, by 22ft. wide, master's room, lavatories, store room, &c. There will also be a large playground, with covered sheds. The buildings are of brick, with stone dressings; the roof will be of Welsh slate, and the timber used is to be Baltic fir. The flooring is to be of wood blocks laid on a 6in. bed of concrete. Ventilation will be obtained by means of the windows and inlet tubes, the foul air being carried off by exhaust ventilators in the roof. The schools are being erected to the designs of Mr. T. W. Robson, Paradise-terrace, Darlington, and the total cost of the contract for the buildings is £3,338. The contractors are—for brick, stone, and plastering work, Mr. George Marshall; carpentering and joinery, Mr. W. Jameson; plumbing, glazing, and gas-fitting, Mr. Emmerson Smith.

FENTON, STAFFORD.—The foundation-stone of the new parish church for Fenton was laid on Wednesday week. It replaces a red-brick building erected in 1856, and is being erected from designs by Mr. Charles Lynam, F.S.A., of Stoke-on-Trent. It will consist of a nave of six bays, with clerestory and aisles and north and south porches; a chancel with a chapel on the south side and clergy vestry on the north; also a north transept containing a choir vestry and an organ-chamber. Beneath the clergy vestry is the heating vault. A tower is designed for the west end of the nave, the foundations of which have been put in, but this feature is not included in the present contract. The floor space will accommodate about 1,000 worshippers. The walls throughout are of brickwork, with facings of the same material, except that the interior of the chancel is of ashlar stone. All the dressings are of Hollington or Wall Grange stone. The roofs are of timber, open-framed, and will be covered with lead or green slates. The floors will be laid with wood blocks, with passages of plain tiles. The chancel is to be inclosed by open oak screens and fitted with oak stalls, whilst chairs will be provided for the church generally. Much of the stonework from the eastern part of the former church will be reused. The style is English Decorated, and was dictated by the requirement of the reuse of certain prominent features from the former church. The present contracts with Messrs. H. and I. Inskip, of Longton, are for something less than £6,000.

LIVERPOOL.—On the 4th of May the Bishop of Liverpool opened a new high altar and reredos at St. James's Church, Marsh-lane, Liverpool, which was illustrated in the BUILDING NEWS in 1886. The new altar and reredos, with screens and alabaster rails, is carried round the chancel to a height of 25ft., the upper portion of the side walls above the arcading being lined with slabs of rouge fleuri marble, and there are medallions with paintings of the Evangelists, by Westlake, on gold grounds. A central composition on the east wall has two tiers of niches, and rises to the east window sill level. The window will later on be filled with stained glass, and complete the whole composition at a height of 50ft. The niches have a series of 12 figures in polished white alabaster—Our Lord in Majesty, St. Joseph, the Virgin Mary, SS. Peter and Paul, and others. The altar throne and tabernacle are of white polished alabaster and Irish and Derbyshire fossil marbles; and there is a relieve in the frontal, of the "Last Supper," and at either corner figures of adoring angels. The wall arcade is worked in polished light alabaster, with Kerry red shafts, and Connemara green-veined panels. These marbles have all been arranged on the old North Italian model as to tone and figure, and harmonise well with the red stone of the pillars, arches, vaulting ribs, and stonework of the church. Mr. Boulton, of Cheltenham, executed the figures, and Mr. C. Hadfield, F.R.I.B.A., of Sheffield, was the architect.

SHEFFIELD.—The plans for the additional postal offices, which are to be erected for the authorities in Pond-street, have been passed, and a commencement made with the work of getting the foundations ready. The new buildings, which will cover a space of about 50ft. by 120ft., are to consist of a basement, lower ground floor on a level with Pond-street, and another

ground floor on a level with Flat-street. The intention is to use the basement merely as a boiler-house and storage-room. The lower or Pond-street ground floor is to contain a loading shed for parcels, parcel sorting, and comptroller's rooms. The upper, or Flat-street ground floor, will comprise postmen's rooms, public parcel, private box, and other offices. The plans for the new building have been prepared by Mr. Henry Tanner, of H.M. Board of Works office, and the contract has been secured by Mr. S. Warburton, Miles Platting, and the work is now being carried out under the direction of Mr. F. Wilson, general foreman, the clerk of the works being Mr. R. Berry, from H.M. Board of Works.

WEDNESBURY.—The memorial stone of the Art Gallery was laid on Wednesday by the Mayor. The new building will stand on a site adjacent to the Town Hall. The style is the Renaissance, harmonising with the façade of the hall, and the materials used will be Stourbridge red bricks and terracotta dressings. The rooms for the caretaker and the heating apparatus are in the basement. To the ground floor access will be had by means of a vestibule and hall entrance, behind that being the grand staircase hall, with a flight of stone steps leading to the floor above. On each side of the vestibule will be an art or class room, 19ft. by 24ft.; and behind those, on each side of the staircase, will be ladies' cloak-rooms, and secretary's or committee-room; a corridor, extending the whole width of the building and forming the connection with the Town Hall, intervening before the museum, a lofty room—34ft. by 18ft.—is reached, at the back of the building. The Richards bequest will occupy the front of the first floor, a room, 50ft. by 24ft., and 19ft. to the flat of the coved ceiling; and in addition three other rooms on this floor will be set apart for works of art, one—15ft. by 23ft.—on each side of the staircase, and behind these, at the back, a room 50ft. by 18ft., a doorway from this room communicating with the gallery floor of the Town Hall. Messrs. Wood and Kendrick, of West Bromwich, are the architects, and the contract has been taken at £3,300 by Mr. H. Willecock, of Wolverhampton. £1,500 is also being spent on the alterations to the Town Hall.

#### CHIPS.

A convalescent cottage and nurses' home are about to be added to the hospital at Bromley, Kent, at an outlay of £2,000. Mr. John Ladds, of London, is the architect, and Mr. H. Heathfield, of Beckenham, is the contractor.

A mission school is to be built near Turner Land, Ashton-under-Lyne, from plans prepared by Mr. J. H. Burton, and at an estimated cost of £1,500.

A stained-glass window, designed by Messrs. Heaton, Butler, and Bayne, is being placed in the Salford Royal Hospital and Dispensary. The window will be formally unveiled by Lord Howard of Glossop to-morrow (Saturday).

In the course of some excavations for a new road on the Sea View estate at Broadstairs, a discovery of human skeletons and several vases or urns has been made. The vases, three of which were preserved intact, vary from 4in. to 6in. in height; they also vary in shape. The position where they were found is very near to the North Foreland Light-house. Several pieces of metal very deeply oxidised were also found, one of them having the appearance of a clasp.

A plaster model of Sir Edgar Boehm's equestrian statue of Lord Napier was placed on view yesterday (Thursday) in Waterloo-place, between the United Service and Athenæum Clubs, prior to a final decision as to the site being come to by the authorities. The model will remain on view for a few days.

Mr. W. Grant, of the borough engineer's office, Plymouth, has received an appointment as assistant in the borough engineer's office, Croydon, and Mr. G. Reginald Davey, late of the same office, has been appointed an assistant to the county surveyor of West Sussex. They were both pupils of Mr. Geo. D. Bellamy, M.Inst.C.E., borough and water engineer, Plymouth.

The Rugby Union Rural Sanitary Authority has called in Mr. J. E. Willcox, C.E., of Birmingham, to report and submit a scheme for the drainage of Wolston. Mr. Willcox is also engaged by the Evesham Rural Sanitary Authority to report as to the best means of providing a supply of water for North and Middle Littleton.

A new organ is being built by Messrs. Voules and Son, of Bristol, for the Mayor's Chapel on College Green, in that city. The chapel was recently reopened after restoration from Mr. J. L. Pearson's designs.

#### TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 392, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

#### TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

#### ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 6s.

#### SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

#### NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII, XLVI, XLIX, L, LI, LIII, LVI, and LVII may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—J. M.—E. H. L. and Sons.—A. and Co.—M. J. P.—W. H. R.—B. of S.—A. F. P. Co.

#### "BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Pisistratus," "Red Rover," "Wallaby," "Clansman," "Coombe," "Box."

"RED ROVER," "Coombe," and others.—(The drawings for cottages will be returned in a few days.)—George Peto. (The Parish Hall is the last subject to be given this session.)

### Correspondence.

#### THE A. A. AND THE INSTITUTE COUNCIL.

To the Editor of the BUILDING NEWS.

SIR,—In common probably with other members of the A. A., I have received a circular from a secretary of that body exhorting me to vote at the approaching election of the Institute Council for various persons whose names are therein duly set forth. Now, as there is nothing in this document to show whether it emanates officially from the Committee of the A. A., or whether it is only a little private electioneering device of our esteemed secretary (or vice-president, I forget which he now is), Mr. T. E. Pryce, and the "some others" to whom he alludes but does not mention, it would be interesting to learn the origin of it. If the latter surmise is correct, I have nothing special to say about it; but if it is to be taken as a duly authorised bull, or pastoral letter of the President and Committee of the A. A. to the faithful of the Association, issued especially to guide and direct them in their choice, then it would appear to be a merely somewhat barefaced attempt to interfere with the rights of private judgment at present possessed by the members.

The list of names given is, however, both curious and instructive. The present Associate-Members are left out in the cold, and in place of them two gentlemen are recommended whose principal distinguishing qualifications are that they are the sons of their fathers, and bear well-known names. Considering that one of the discarded is actually a member of the A. A.

Committee, and has, besides, done more probably than any other member of that body to obtain for Associates their present position, it seems little unkind! Of the other, I would only say that, apart from his acknowledged position and abilities, he represents a phase of the profession that should certainly find expression upon the Council. Sir, we have, and always have had enough and to spare of merely "pretty-picture makers" of men, who, wanting the ability to become artists in the ordinary acceptance of the word, yet affect to look down from their imaginative heights upon their ordinary every-day brethren. Neither—with all respect be it said—does architecture begin and end with the building of churches; so that the ecclesiastical copyist and Mediævalist element must be kept within bounds. What is wanted is such a body as the Council are—representative men.

It is depressing, but not surprising, that the few architects of real ability and originality who possess stand aloof from the various architectural bodies, and the squabbles engendered by them.—I am, &c.,

F. T. W. MILLER, A.R.I.B.A.

73, Queen Victoria-street, E.C.

#### THE GRAND SCHEME AT THE A.A.

SIR,—As an old fogey member of the A.A., should like to know what is the meaning of the little game which a certain clique are endeavouring to inaugurate at Conduit-street? The establishment of the Architectural Studio or private atelier may or may not be a good thing, and I enough pupils are forthcoming, probably it would pay the promoters very well. The A.A. should not, however, be converted into a high road for architectural "coaches," whereby only those who can afford to pay the fares demanded may travel with advantage. The old path of progress so prosperously continued by the founders of the A.A. and their successors, my contemporaries was that of mutual aid. Turn it into a forcing bed for professional crammers, and the society will be crushed out of all knowledge as it becomes the vantage ground of a mere set.—I am, &c.,

AN ODD FARTHING.

#### THE ARCHITECTURAL ASSOCIATION.

SIR,—I do not know what was done at the meeting on Friday last; but I fear that the A.A. is going to the dogs.

1. Stagnation; nobody found worthy of the office of president.
2. Returning to the old supper, in place of the more dignified dinner.
3. Raising subscriptions, and so losing about half the members.
4. Departing from the old system of mutual help, and turning the A.A. into a kind of college.—I am, &c.,

OBSERVER.

#### PROVISIONS IN QUANTITIES.

SIR,—I will not attempt to follow in detail the long letter in your last issue. Personal abuse is not argument.

Your readers will have perused the excellent leader on the subject, and I again state that the practice mentioned by "Builder's Manager" has never come to my knowledge, and it is scarcely necessary for me to inform your readers that I have never thought of doing such a thing myself.—I am, &c.,

26, Budge-row, E.C. HENRY LOVEGROVE.

SIR,—It is gratifying to read the lucid and interesting article respecting the above in your last issue, and likewise "M. M.'s" excellent general review of the correspondence on this subject, and the judicious manner in which he sifts the whole. It may, in time to come, dawn upon Mr. Lovegrove and others that neither of them has answered the question at issue, or given the desired information. Possibly they are unable, or unwilling, or both, or wish to avoid it altogether. Any way, their silence, whether from inability or unwillingness, appears to give a tacit confirmation to the opinions I previously expressed. The marvel is that a gentleman of Mr. Lovegrove's calibre should pen such effusions, and imagine that they in any way approach the nature of replies to my letters. I say this with all due deference and respect to Mr. L., but their freedom from anything even remotely connected with the point in question is so very palpable, whilst the innocent self-complacency of a "Disgusted Surveyor," so

ably illustrated by Mr. M., is perfectly charming. Possibly a surveyor may yet come to the surface who can give a straightforward reply—no quibbling or fencing off on to other matters foreign to the subject, but a genuine comprehensive answer to the point, which might aid in dispelling the doubts under which "surveyor's provisions" at present labour.—I am, &c.,  
TWICE CHARGED.

Sir,—After reading the remarks by "M. M." and "Disgusted Surveyor" in your last issue, one is irresistibly reminded of the old saying, "Codlin's the friend, not Short," and also of the adage, "Charity begins at home." If these gentlemen, in their conscientious scruples regarding their clients' interests, had begun at their own end of these amounts, we builders would have listened to what they had to say with more respect.

Without going into details, it is sufficient to point out that architects and quantity surveyors charge just as much for including, say, a £500 provision, as they do for designing £500 worth of work in the one case, and for "taking out" the same amount in the other. In the first case a short arithmetical sum represents the bulk of the work, and in the other case it consists of the clerical effort of writing the amount in the draft bill. "Oh! but," these gentlemen exclaim, "our charges are based on the whole transaction." The laborious work which it partly consists of makes up for the more easy portion." Just so, and we builders expect the same consideration. It is the profit on the whole which ought to be considered, and not that on particular items.

"M. M." makes an absurd blunder in supposing there is any distinction between the general prices and the provisional prices. Why, "Disgusted Surveyor" says he puts p.c. to the latter items so as to get a competition profit. Neither the client or builder recognise any distinction; it can therefore only be artificially created by the architect or surveyor. I am further charged with a fallacious attempt to prove that "prime cost" is not the actual amount a builder pays. My letters bear no such interpretation. I defined the proper meaning of the term and its proper use, receiving, as I fully expected, the retort that my definition was the surveyor's definition, and, further, that if a £20 kitchener was stated to be p.c., with profit to be added, what could possibly be plainer? I have stated all along that the builder's contention is that p.c., as so applied, is to him the client's p.c., i.e., what the client would pay if he bought the kitchener himself, and that if the catalogue or list prices of kitcheners, generally speaking, was subject to a liberal discount, no further profit need be added. The round sum itself shows that the p.c. in a trading sense is not meant, because it is impossible for anyone out of trade to know what the p.c. is likely to be a few weeks in advance, and even if they did, there would certainly be some odd shillings and pence to the sum. I suppose it will be admitted that it is really the client who invites builders to tender, and consequently the bills of quantities represent the work he wishes them to execute. Supposing, instead of the bills, he personally went to the builders, gave them the plans and asked them to include for a £20 kitchener when making out their estimate, would he personally tell them he meant their actual cash payment for it? I venture to say he would not, unless he meant to insult them. Builders therefore deny the right of a surveyor to mean any more by p.c. than the client would when stating an amount. These ardent p.c.-ists surely do not carry their notions of what is a fair profit to other trades, and in asking, say, for a pound of tea, state that they want it of such and such a p.c. price with a competition profit added.

The system of trying to give p.c. prices is decidedly wrong in principle, and I say "trying," because it will always, at the best, be a very will-o-the-wisp proceeding—just when you think you have got near it, trade organisation will upset the calculation. It is a far more straightforward proceeding to quote the value of the thing, whether the list prices are high or low: competition in some form or other will always keep the profits down. It is idle talk to say the builder would pocket the difference in value by a fall of prices. Surely it will be admitted that if the prices rose the builder's prices would rise also. Well, then, if the prices fall, surely competition can be trusted to cause their prices to fall also. All the charges of lax morality and

rapacious profits fall to the ground after the remarkable admission by "Disgusted Surveyor," that neither surveyors nor clients would care if 50 per cent. was made on provisional amounts, provided the particular tender happened to be lowest. It is quite unnecessary to go into the catalogue question with their red slips if that is the case. Apologising for again troubling you, —I am, &c.,  
A BUILDER'S MANAGER.

#### WHAT IS A "BUILDER"?

Sir,—Can any of your numerous readers answer the above simple question?

I am led to ask simply because I read in a local paper that a County Court judge expressed himself at a loss to know whether a lot of carpenters and bricklayers were engaged in their proper line of business when they commenced building operations. It is a singular thing that in the town to which the judge referred there is not a single "Builder" who was not at one time a mechanic of some kind—fourteen were carpenters, three bricklayers, three plasterers, one a plumber, and two wheelwrights.

Now many of these are now engaged in their "proper line of business." Is there any system of examination or form of certificate for a builder? Is building construction, sanitation, or elementary drawing a necessary part of their education? Surely, Sir, among the vast array of talented readers of your valuable paper there are some who can draw the line and enlighten an—  
IGNORANT INQUIRER.

### Intercommunication.

#### QUESTIONS.

[10281.]—**Bench-Mark.**—When the expression—"so many feet below bench-mark" is used, am I to understand that the distance is taken from the mark itself, or from the level of the ground at that point?—TRADDLES.

[10282.]—**Deposit on Copper Boiler.**—Some few months back I fixed a copper circulating boiler heated by gas (Bunsen burners). 60ft. of 2in. piping was run in from boiler, which the latter worked satisfactorily; but after a month's constant use a greenish white encrustation formed on bottom of boiler (outside) which threw off a very offensive and suffocating smell. This incrustation I scraped off down to the copper, and went on with boiler again; but the same deposit formed, and smell returned with it. Can any reader who may have had a similar experience tell me what this deposit really is? and can the copper be treated in any way, or any other means adopted to prevent the adhesion or formation of the deposit?—W. W. R.

[10283.]—**Weathercock.**—I have to fix accurately a weathercock to the four cardinal points. Will any kind reader inform me how I should proceed, and what I should allow for magnetic declination?—J. E. S.

[10284.]—**Shores.**—Will some one kindly answer the following query which was asked in one of the examinations by the Royal Institute? Sketch shores you would adopt to stop the lateral movement outwards of the blank side of a house 40ft. long. (a) 30ft. high, three stories; (b) 60ft. high, six stories. Give the distance apart of the shores, and figure the scantling of the timbers. (N.B.—There is supposed to be no other building within 40ft.)—GILBERT.

[10285.]—**Continental Cathedrals.**—I will be glad to know where, on the Continent, examples will be found of cathedrals presenting the feature of a lower and an upper church. I understand one or two examples exist in Germany, and I have heard of one in the south of France somewhere. In this country, Glasgow is the only example I believe.—C.

#### REPLIES.

[10279.]—**Italian Oak.**—I take it that by "Italian" oak is meant the fine Austrian butts that are shipped at Trieste, and are so largely used in this country at the present time. I happen to be cutting up 60 logs of it on my pit just now, straight, wide billets, 20ft. and upwards long; all entirely free from knots or shakes, and opening out clean, bright, and flashy. It is the best oak that I know.—HARRY HEMS, Exeter.

[10279.]—**Italian Oak.**—This oak, although placed in the list of questions framed by the City and Guilds examinations in Carpentry and Joinery, has nothing to do with these trades so far as this country is concerned. "H. J. P." will find the fullest published particulars in "Timber and Timber Trees," by Thomas Laslett (Macmillan and Co., 1875), pages 83 to 89. The botanical names of the trees producing this oak, as given in the above work, are not reliable. Loudon, in his standard work "Arboretum Britannicum" (p. 1844), gives the Italian oak as the *Quercus esculus*; but it is probable that *Q. Cerris*, and *Q. Pyrenaica* may constitute wood under this generic title. The oaks of Europe as a genus are deciduous, the wood brown and of medium hardness. When grown in the south they have a tendency to become evergreen, and to produce wood hard and horny in texture; when grown in the north they develop no peculiarities except that of mildness, being soft, and, when in a dry state, light in the wood. The Dantzic, Italian, and Riga oaks mentioned by "H. J. P." are, of course, European. Riga, being the most northern, is mild and soft in texture; Dantzic, somewhat more south, is harder wood. From this to the Italian oak is, as our geography implies, a considerable remove, and hence we obtain a wood marked by extreme hardness and density. We have not

the specific gravity of Riga oak, which would be somewhat less than Dantzic oak; but the following bears out the above remarks:—

Dantzic oak .....	835
(English about the same.) .....	
French .....	1029
Tuscan .....	1040
Spanish .....	1042
Modena .....	1109

African oak would be still higher in its specific gravity. Italian oak, so far as this country is concerned, is matter of history. When:—

"Hearts of oak were our ships," this timber had a prominent place, and was used in preference to most other oaks in the framework of ships. It was not purchased by our naval authorities after the year 1863, owing to the introduction of iron, but there was a considerable quantity in hand at the Royal Dockyards in 1875, and may be even now. Mr. Laslett, in his table, showing the uses of woods, has the following:—

Oak, British .....	All kinds of constructive work—naval, civil, and military engineering.
" Belgian .....	
" French .....	
" Piedmont .....	
" Turkey .....	
" American .....	Similar to British; but not so generally useful.
" White .....	
" Italian .....	

The White oak mentioned by "H. J. P." is an American product. The distinguishing feature between the oaks of Europe and America is, that the former are brown in colour, and the latter are red. It thus follows, that for wrought work of a good character, it is impossible to work the two together. The mode of distinguishing the European oaks, in the first place, is by the manner in which they are hewn or prepared for the markets. The high class, soft or mild oaks, are shipped in the half log or billet, or, in other words, in the wainscot form, for it is the form only that constitutes the title wainscot. This form is shipped from Riga, Memel, Odessa, Trieste, and Fiume. These ports occasionally ship the wood in the round or partially-squared log. The Dantzic is mostly in the squared log, but, occasionally in the partially-squared log, the latter being the form in which the Stettin and Italian oaks are shipped. To distinguish these oaks in panel specimens is not an easy matter. It requires a practised eye, and an experience of years; the tests are colour and texture. The Riga and Odessa oaks are uniformly brown and fine grained—fine in the "bark" or texture. The Memel is paler in colour and coarser in "bark" or texture. The Stettin is alike coarse, possessing a greenish tinge or colour. The Trieste and Fiume oaks (Austrian) are coarse in the "bark" or texture, large in figure, i.e., in the medullary plates or silver grain, which, at times, is white and lustrous. The colour is not pronounced in any direction; hence it can be used with any of the above oaks, to which it is superior in point of size.—W. STEVENSON, Hull.

#### WATER SUPPLY AND SANITARY MATTERS.

**DRAYCOTT SEWAGE FARM.**—The sewerage works and sewage farm are now completed at Draycott, near Derby. The sewage was turned on the farm last week, and everything appears to be acting very satisfactorily. This scheme may be regarded as a sample of what may be done in sewage disposal for a country district of 1,200 inhabitants. Members of local authorities, or others interested in sanitary work, may see the farm at any time. The land is six acres in extent, and it has been properly drained, levelled, steam scuffed, and laid out with carriers. The sewers are flushed automatically every 12 hours with brook water. The engineer to the works is Mr. W. H. Radford, C.E., of Nottingham, and the contractors are Messrs. Holmes Bros., of Nottingham.

**LYNDHURST.**—Active operations were commenced last week by the Lyndhurst Gas and Water Company, Limited, with a view to the completion of their scheme by next winter season. A well, lined with iron tubing, has been sunk on a site granted by H.M. Department of Woods and Forests, and a sufficient supply of potable water, free from contamination, has been obtained at a depth of 85ft. from the surface, the borehole passing through 60ft. of hard clay before reaching the Upper Bagshot Sands, from whence the supply is derived. The Company are considering the question of manufacturing gas made from crude petroleum. The constant system of water supply will be adopted, and a pressure always available for fire purposes capable of throwing a jet over any buildings in the village. The joint engineers are Mr. Reginald Bolton, C.E., and Mr. E. L. W. Haskett Smith, A.M.I.C.E., of 6, Queen Anne's Gate, London; and the London offices are at 11, Queen Victoria-street, E.C. Messrs. Scholfield and Lacey are the contractors.

Messrs. W. Lewis and Son, architects, of York, have just completed considerable improvements to Grantley Hall, and other work on the estate, for the Right Hon. Lord Grantley. Other work is in progress and contemplation to generally improve the estate, from the plans and designs of Messrs. Lewis and Son.

The Clethorpes Local Board have instructed Mr. W. H. Radford, C.E., of Nottingham, to prepare plans and obtain tenders for carrying their Beacontorpe outfall 150 yards farther out to sea, in consequence of the tidal increase of sand on the beach.

## STATUES, MEMORIALS, &amp;c.

**BRADFORD.**—A bronze memorial statue to the late Right Hon. W. E. Forster, for twenty-five years member for Bradford, was unveiled in Forster-square in that town on Saturday. The statue is by Mr. J. Havard Thomas, is 9ft. 7in. in height, and stands on a red granite pedestal 10ft. high. The attitude, as will be remembered by those who have seen the model for the statue in the present Academy Exhibition, is erect, with the head slightly turned towards the right hand, which is uplifted and outstretched, while the thumb of the left hand is inserted in the armpit of the waistcoat. The statue has been cast by Messrs. H. Young and Co., of the Enlston Ironworks, Chelsea.

## STAINED GLASS.

**CHESTER CATHEDRAL.**—A great improvement has just been effected in the north of the nave of Chester Cathedral. The harmony and beauty of the mosaics have hitherto been marred by the colours of the stained glass in the windows above them. This glass was removed from the eastern window of the Lady-chapel when the stonework was replaced in its ancient Early English form, and was distributed through the small windows in the north aisle. It has now given place to other glass, designed and executed by Messrs. Heaton, Butler, and Bayne, of London, under the supervision of Sir A. W. Blomfield, A.R.A. The general tone is silvery. The most western window, which is lighted from the chapel of the old Bishop's Palace, contains pattern foliage with emblems of holy baptism, the font being immediately below. The remaining five windows have each four openings, and the two middle lights in each case contain figures of angels with musical instruments, the whole series forming a celestial choir. The appearance of the mosaics has been improved, while the aisle has received fresh light, and the groining of the roof, one of the many gifts to the cathedral by the late Mr. Platt, now stands out distinctly in beauty of form and design.

## LEGAL INTELLIGENCE.

**IN RE W. BISSETT AND SONS.**—At the Sheffield Bankruptcy Court on Friday, before Judge Ellison, the affairs of William Bissett and Sons, builders and general contractors, of Sheffield and Birmingham, again occupied attention, the bankrupt, James Francis Bissett, who attended to the Birmingham branch of the business, applying for his discharge. The gross liabilities, according to the statement of affairs presented by J. F. Bissett, were £35,006, of which there was £34,439 to rank for dividend. The assets were estimated by the bankrupt to realise £7,326, from which there was deducted for preferential creditors £567, the deficiency being £27,680. Up to the present time the assets had realised £5,311, and the Official Receiver thought he might realise a further sum of £500. The separate liabilities of the bankrupt, James Francis Bissett, were £25 5s. 2d., and the assets £50, out of which £21 6s. 2d. for preferential creditors had to be paid. The bankrupt J. F. Bissett did not appear to have committed any misdemeanour under the Bankruptcy Act, 1883, or the Debtors' Act, 1869. The trade books, which had come into the Official Receiver's possession, appeared to have been well kept, but the last cash book and the private ledger had not been given up, the bankrupt, J. F. Bissett, alleging that the same were in the possession of his partners, and it was supposed they were taken away or destroyed. The Official Receiver stated that the father of the bankrupts died in February, 1888, when a balance-sheet was prepared, and it appeared there was a balance in favour of the firm of £7,525, the whole of which belonged to the father. No balance-sheet had since been made out. The bankrupts had since February, 1888, carried on the business on their own account with this balance of £7,525 standing against them, and their only asset was the reversionary interest under the father's will. This reversion was assigned by the bankrupts to creditors as security for a debt, and it therefore appeared to be doubtful as to the bankrupts ever having been solvent during the time they had carried on business. One of the chief causes of the bankruptcy had been the losses on contracts, but the primary one had been the extravagance of William Crellin Bissett and Lawrence Colgrave Bissett. The Official Receiver gave particulars as to the departure of William Crellin and Lawrence Colgrave Bissett, taking with them about £4,000. The Official Receiver considered the bankrupts were very blamable in not preparing a balance-sheet after their loss by fire in Wilkinson-street. The bankrupt, J. F. Bissett, had assisted him largely in realising and investigating the estate, and his conduct since the bankruptcy had been satisfactory. His Honour said no blame attached to J. F. Bissett, except that he knew his brothers were living extravagantly and drawing more money than they ought to do. He should therefore grant the discharge.

## Our Office Table.

THE voluminous report of M. Marius Vachon on English Industrial Museums and Schools of Art, published by the French Minister of Education on Wednesday, is of a flattering character; M. Vachon plainly avowing that our artists and artisans have alike made great progress during the present generation in art as applied to industry. It will be known to some that M. Vachon spent last June and July in England, making this the close of his tour of inspection through Europe. He says:—"In England the artistic industry of this century was, so to speak, entirely created by France. Our artists and artisans are no longer in request. English artists and artisans are insisted on. There is the ambition of making by them a national art and industry. England has plenty of resolution. This ambition is already being realised. In default of recent exhibitions, which have not been an accurate and complete expression of the present industrial and artistic movement, it is sufficient to visit the country, or even London alone, to be convinced of the rapid march of the new evolution."

THE proposal to carry out a photographic survey of Warwickshire has been warmly taken up by the amateur photographers of the county, and will, there is little doubt, be adopted. The general work of the survey will be directed by a council, to consist of representatives elected by the various photographic and scientific societies of Warwickshire, with co-optative members. The photographic, artistic, scientific, and literary societies of Warwickshire have elected representatives, who attended a general meeting held yesterday (Thursday) at St. Edmund's College, Edmund-street, Birmingham, when the directing council was elected. The county is to be divided into sections, and of that for Birmingham Mr. Jethro A. Cossins, architect, of that city, has been appointed the vice-chairman. No English county is more rich in historical associations and architectural works of every period in proportion to its area than Warwickshire, and the photographic record of its buildings and scenery will be of permanent and increasing value.

At the meeting on Saturday of the Montgomeryshire County Council, it was proposed by a committee that they give the county surveyor (Mr. W. N. Swettenham) three months' notice to terminate his engagement, on account of the differences of opinion that had been expressed and the difficulty that had arisen as to what the duties of the county surveyor were. It was explained that the county council had reduced the emoluments of the office from nearly £400 per annum to £300 and increased the work, and also wanted to make the engagement terminable by a three months' notice. These Mr. Swettenham objected to, and claimed compensation under the Local Government Act. In the end it was decided to give him six months' notice to quit, and to again offer him the position on the new terms.

The first meeting of the Registration Committee of the Council appointed by the Plumbers' Company for Devon and Cornwall was held in the Drake Chamber, Plymouth, on Monday. The chair was occupied by Mr. H. G. Luff, architect, Devonport. Thirty-two applications for registration were considered, and those received from Mr. W. G. Pearce, of Plymouth, and Mr. W. T. Steer, of Barnstaple, were passed by the committee, and were recommended to the Worshipful Company of Plumbers, London, for their certificate of registration. Many of the other applicants not having inclosed their indentures, the secretary was requested to write them asking that they may be forwarded before their application can be considered, and also to request Messrs. Burden, Stuart, Tardrew, Mardon, Lake, Cockram, Whitfield, Tilley, Hedges, Trick, and Waterman to attend to a practical examination to be held at Plymouth shortly.

**Indian Engineering** describes an important work of engineering skill, the new Nira Canal in the Poona District, a project due to the genius of General Fife, R.E., which has been carried out by Mr. J. E. Whiting, M.A., M.I.C.E. The district traversed has a very capricious rainfall, and the crops fail for years in succession. This canal commands an area for irrigation of 429 square miles, under the immediate command of 61 distributionaries. To maintain a supply in the canal after

October, when the river Nira becomes a mere streamlet, a reservoir is designed at Bhatghur, on the Yelwandi river, a tributary of the Nira; the dam is at the junction, and will be of concrete and masonry, 3,020ft. long, 127ft. high above foundations, and 103ft. above bed of river. The canal headworks consist of a weir, 2,273ft. long, the crest of which is 42ft. above bed of river, constructed of masonry and concrete, 26ft. wide at river-bed level, and 9ft. at crest. Two other subsidiary weirs are constructed. The main weir will discharge a flood of 158,000 cubic feet per second, with a depth over crest of 7.5ft., representing one-third of an inch rainfall over the whole catchment area of 700 square miles.

THE improvements being made in motive-power and rolling-stock equipment in America, such as locomotives and cars, are in advance of the track. Trains of heavy engines and elaborately-decorated carriages are allowed to run over a track of 56 to 70lb. rails, which are inadequate to the strain put upon them. Such is the gist of a paper, by Mr. Tratman, on railway and street traffic in the *Transactions of the American Society of Civil Engineers*. An improved rail section is advocated of greater weight per yard; a better mode of securing the rails to ties than by spiking them, improved rail-joint fastening; the advantages of steel ties for heavy traffic are recommended. The paper is illustrated by diagrams of American rail sections and suggested improvements in the construction of tracks. The English railroad system is superior in many respects: the rails are heavier, and are secured to the sleepers in a better manner. The American cars are furnished in a more sumptuous style, but out of all proportion to the actual requirements, while the expenditure on the track is reduced to a minimum.

## MEETINGS FOR THE ENSUING WEEK.

**SATURDAY (TO-MORROW).**—Architectural Association. Visit to Field and Queen Offices, Bream's-buildings, E.C. 3 p.m.  
**THURSDAY.**—Edinburgh Architectural Association. President's Valedictory Address. 8 p.m.  
**FRIDAY.**—Architectural Association. Special Business Meeting to consider Report of Committee. 7.30 p.m.  
**SATURDAY.**—Edinburgh Architectural Association. Annual Excursion to Dunfermline, Inverkeithing, and Pitreavie.

**Architectural Association, 9, Conduit-street, W.**—The Special Business Meeting, adjourned by resolution on May 16, will be resumed on May 30, at 7.30 p.m. The last Seasonal Visit will be made on May 24, at 3 p.m. to the Field and Queen New Printing Offices, Bream's-buildings, Chancery-lane, Messrs. Satchell and Edwards, architects.

FRED. R. FARROW. } Hon. Secs.  
ERNEST S. GALE. }

## CHIPS.

The inquiry about to be begun by the Corporation of London into the charges made for water in the City and elsewhere in the metropolis, and other matters incident to the question of the water supply, will be formally opened at Guildhall to-day (Friday), when, after arrangements as to procedure have been made, it will be adjourned over Whitsuntide.

The contracts for the Glasgow Caledonian Central Underground Railway were let on Wednesday; the main portion—viz., from Bridgeton Cross to Stobcross-street, will be made by Messrs. Chas. Brand and Son, at a cost of £650,000; that from Stobcross-street to Kelvinside, by Messrs. J. Young and Son, at £210,000; and that from Kelvinside to Maryhill, by Mr. A. H. Boyle, at £145,000.

The ceremony of opening the new vicarage house at Verwood, Dorset, was performed by the Bishop of Salisbury last week. The vicarage is of red brick, with facings of Bath stone, and contains a drawing-room 24ft. by 18ft.; a dining-room of the same dimensions, a study, and the usual domestic apartments. There are nine bedrooms, besides dressing-rooms, bath-rooms, &c. The entrance hall is laid with tessellated tiles, and measures 40ft. by 12ft. The vicarage is in the Gothic style, and was built by Mr. George Moore, from designs by Messrs. A. & C. Bradford-on-Avon, the cost of the building being £4,500. The principal features in the drawing-room and dining-room are the beautifully-carved mantels, which bear the arms of the Province of Canterbury and those of the See of Salisbury.

Mr. Millward Butterfield, architect, of Brackley House, Sevenoaks, died at Hastings on the 14th inst, aged 48 years. He had been an Associate of the Royal Institute of British Architects since 1882.

## Trade News.

### WAGES MOVEMENTS.

**BRADFORD.**—The whole of the plasterers in this district turned out on strike on Monday for an advance of  $\frac{1}{4}$ d. per hour.

**BARNSELY.**—The strike of carpenters and joiners, bricklayers, and masons at Barnsley shows no change. The men are still out, and the employers show no sign of giving way. The joiners ask 8d. per hour, the wage they had ten years ago. The masons offer  $7\frac{1}{2}$ d., and will not advance beyond that. The masons and bricklayers have already 8d. per hour, and ask 9d. They have been offered an advance of a farthing per hour, which they refuse to accept.

**CORK.**—The builders' labourers are still out and have not returned to work. The employers are determined not to concede the advance demanded, which they regard as unreasonable. A number of men employed by Mr. Samuel Hill, of this city, on some works in Waterford, and who left work a week before the Cork men, making a similar demand, returned to their employment on Monday last on the old terms, and it is likely the men in Cork will shortly follow their example.

**Holloway's Pills** completely cleanse the blood, expel all oppressive accumulations from the bowels, and purify both solids and fluids. With the blood perfect, and all poisons purged from the system, regularity must prevail throughout the body, aches and pains must cease, healthful energy must supplant weariness, and the shaky nerves must regain their wholesome tone.

### ELECTRIC LIGHTING.

**COMPLETE INSTALLATIONS  
OR WIRING ONLY** {ESTIMATE GIVEN.

**STRODE & CO.** 48, Osnaburgh-st., N.W., and  
67, St. Paul's Churchyard, E.C. LONDON.  
New Branch Showrooms:—189, PICCADILLY, W.  
Telephone No. 3998.

### DOULTING FREESTONE.

**THE CHELYNCH STONE.**—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

**THE BRAMBLEDITCH STONE** is of the same crystalline nature as the Chelynych Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to **CHARLES FRANK AND SONS**, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

### HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful COLOUR of this material. Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—

**THE HAM HILL STONE COMPANY**  
NORTON, STOKE-UNDER-HAM, SOMERSET.  
London Agent:—  
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

**GEO. FARMILOE & SONS,**  
Lead, Glass, Oil, Colour, and Varnish  
Merchants.

ALL LETTERS TO OFFICES AND WAREHOUSES:—

**34, ST. JOHN STREET, WEST SMITHFIELD,  
LONDON, E.C.**

Lead Works: Island Lead Mills, E.

Sanitary Appliances and Plumbers' Brass Work Factory:  
Eagle Court, Clerkenwell, E.C.

Stained Glass Works: 109, St. Martin's-lane, W.C.  
Wharf: Queen's Wharf, Wapping Wall, E.

### BILLS OF QUANTITIES & PLANS.

**T. PETTIT and CO.** Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices—**T. PETTIT and CO.**, Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

### CRAIGLEITH STONE.

UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear. VERY HARD, and NEVER WEARS SLIPPERY.

SOLE AGENTS for England,

**J. & A. CREW**, Cumberland Market, London, N.W.

**WM. OLIVER & SONS,**  
MAHOGANY, WAINSCOT, WALNUT,  
TEAK, VENEER, and FANCYWOOD  
MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

### TENDERS.

Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

**AUDENSHAW.**—For the pulling down and rebuilding of the Sun Inn, Hooley Hill. Mr. J. H. Burton, Warrington-street, Ashton-under-Lyne, architect:—

Pike, Z., Hooley Hill	£1,958	0	0
Brown, W. H. & H. C., Stockport	1,691	0	0

**MITHIAN, CORNWALL.**—For the restoration of the parish church of Mithian, near Truro. Messrs. St. Aubyn and Wadling, London, architects:—  
Julian, J., Truro (accepted).

**PADDINGTON.**—For alterations at 9, Bishop's-road, Paddington, for the Phoenix Brewery Co., Latimer-road, Notting Hill. Mr. R. A. Lewcock, 68, Bishopsgate-street Within, E.C., architect:—

Tyerman ... .. £517 0 0  
Smith ... .. 510 0 0  
Ivory ... .. 485 0 0  
Courtney and Fairbairn (accepted) 460 0 0  
Counter, cabinet, and pewtering:—  
Mathews, T. H. (accepted) ... .. 117 0 0  
Gasfitting:—  
Ungar (accepted) ... .. 44 16 0

**PLYMOUTH.**—For erection of chapel at the Little Sisters of the Poor Home at Penny-cross, near Plymouth. Mr. F. W. Tasker, London, architect. Quantities supplied:—

Lethbridge, A. R., and Son ... .. £2,155 0 0  
Finch, J. ... .. 2,080 0 0  
Partridge, J. ... .. 2,065 0 0  
Lapthorne and Goad ... .. 1,798 0 0  
Blowey, P. ... .. 1,760 0 0

**RICHARD'S CASTLE, SALOP.**—For the erection of the Foster Memorial Church. Mr. R. Norman Shaw, R.A., London, architect:—

Heath, Endon ... .. £9,990 ... £7,694  
Bowdler, Shrewsbury ... .. 9,670 ... 8,650  
Treasure, Shrewsbury ... .. 9,440 ... 8,244  
Collings, T., Tewkesbury ... .. 8,678 ... 8,032  
Thompson, J., Peterborough 8,590 ... 7,360\*  
\* Accepted.  
A.—If stone is found.

**SALFORD.**—For retort ironwork, for the gas committee of the Salford Corporation:—  
Clayton, Son, and Johnson ... .. £6,909 0 0  
(Recommended for acceptance.)

**SHREWSBURY.**—For the conversion of the Nisi Prius Court at the castle into a council chamber, for the Salop County Council. Mr. T. M. Lockwood, of Chester, architect:—

Morris, T. (accepted) ... .. £156 0 0

**SOUTHAMPTON.**—For improvements to the Common, for the town council:—  
Morgan, Isted, and Morgan, Southampton (accepted) £87  
(Three tenders received.)

*To Municipal Authorities, Engineers, and Surveyors.*

# JENNINGS' PATENT URINALS

FOR PUBLIC THOROUGHFARES AND RAILWAY STATIONS,

Have been adopted in all the principal European Cities. They are particularly adapted for public use, being simple in construction, strong, and most economical as regards the water supply.

## JENNINGS' STONEWARE DRAIN-PIPES

Have been specially selected and adopted, after severe tests, by the South Australian Government for the drainage of Adelaide. The Sockets and Pipes are made in one piece under great pressure by Steam Machinery from the finest selected Poole Clay taken from Beds on the works, and, by hydraulic testing, have been proved superior to any other pipes in the market. Prices and particulars can be obtained from

## THE FINISHING TRADES AND THEIR PROVISION.

A GREAT deal of the improvement and comfort found in modern buildings is to be ascribed to the goods supplied by the ironmonger. A glance down the list of items in a bill of ironmongery will suffice to show the number and variety of the articles used or supplied, from ordinary butts to the fittings and appliances of rooms. Though small and miscellaneous in their character, and scarcely of much consequence to the architecture, they yet help to make up the sum total of the finishing features, and to impart character to the design. Many architects are so strangely indifferent as to the form or design of a door-handle or finger-plate, that they are perfectly willing to leave these etceteras to the contractor or to the taste of the owner. This is a mistake from the art point of view. If we are to elevate our art industries and artistic manufactures, it ought not to be considered too trivial to devote attention to details of hardware, such as door furniture and fireplace grates. Certainly by ignoring such things the architect is playing into the hands of the trade, who are foisting upon us foreign goods and inferior design. He cannot expect to be looked up to as a worthy disciple of the Pugins and other pioneers of the Art Revival who thought it not too insignificant to design hinges and escutcheons, and even fire-irons. Can, indeed, our art manufactures be raised by leaving the selection of these articles to builders' foremen and ironmongers? Of what value are the collections at South Kensington if not to place before the student examples of the wrought iron and hammered metal-work of the 15th and 16th centuries of Nuremberg and elsewhere?—but it is of no use encouraging a taste for good design in our artists and manufacturers if all the work actually required in our buildings is to come from other countries. The architect is largely responsible for not patronising some industries, as he has it in his power to specify or order a very large proportion of the goods manufactured in this country—perhaps 70 per cent. of which are made for buildings. But, commercially, there is a strong reason why the architect should have control of the trades, like that of the ironmonger. First, because by non-interference the goods specified are ordered of firms who obtain foreign manufactures, and thus injure the English markets; and, second, because the articles are inferior imitations of designs, and the system directly encourages trade discounts and illicit commissions. We might fill pages with instances of "commissions," "discounts," and other trade customs which have been brought under our notice by some of the correspondents who have been discussing the subject of "Provisions in Quantities." What we say is that the system of specifying in contracts directly countenances the practices complained of, and encourages the custom of contractors taking the difference in value arising from lessened cost of production. In the case of ranges or grates, a large per cent. discount off first prices may be lost in this way to the contractor, and the owner obtain goods of so much less value. The system of trade discounts is fostered by the indirect ordering of goods of his description, and the middleman trader and his traveller profit at the expense of the manufacturer. Items of ironmongery have been too long exposed to trading of this kind;

the contractor who has given a low tender making it a source of profit. In an article in our contemporary, *Ironmongery*, this weakness has been pointed out. The builder has to affix prices to the bill. Instead of going to a respectable local ironmonger and submitting the specification to him for prices, he consults a traveller who has a variety of foreign-made articles at the lowest prices, and who gives long credit. It is needless to say very trashy goods are supplied in place of genuine wares, and what is worse, the architect has no check; he is not willing to give the attention which he should to details of this sort: the consequence is very inferior wrought butts, doors furniture, and fastenings are put in, which turn out a constant source of trouble and disappointment. For improved fastenings for sashes, such as those of Verity's lines and pulleys, mortise locks, and handles, &c., stays for opening skylights, as those made by James Hill, are substituted commonplace articles. The architect is much to blame for this remissness. All improvements of this kind are now known, or ought to be known, through advertisements; it ought not to be possible for any approved fastening or appliance to escape the attention of the architect, and it is his business to see that they are specified by name. Responsible firms of tradesmen ought to bring to his notice any new and improved article. One valuable means of instruction is the building exhibition, when it does indeed represent the wants of building, and does not descend into the bazaar; but this seems almost impossible from the way such exhibitions are promoted.

To mention a few of the things in this trade that concern the architectural finish of buildings, let us take door furniture. The commonest goods are often seen on doors that ought to have superior fittings. Something can be done to improve their shape and design. The old rim lock was once a feature on a door worth looking at; the old door knobs of brass of the 17th and 18th centuries were artistic in shape compared with the modern spheroidal-shaped door knob, and the black lacquered lock of iron without the slightest pretence to design. The architect has not seriously set the question before him whether the ordinary "rim" lock could not be made attractive instead of repulsive and clumsy? Some little improvement in brass furniture is to be found, it is true, in houses designed by a few leading architects in Queen Anne, in which the old style of brass knob pear-shaped and turned with corrugations has been introduced; but these goods are costly and are seldom noticed in ordinary houses and villas. Mechanical improvements, too, of great value have been made in the construction of locks and knobs, such as the self-adjusting spindle, the push-and-pull lock; but confining our remarks to forms of improved door furniture, we notice that, for the reason already hinted, this class of goods is not employed as it should be. The builder often selects the commoner qualities, and the architect passes them; therefore we find that foreign-made fittings continue to handicap improvements in design and manufacture. The cost of bringing out improved and artistically designed articles of this description is considerable, and can only recoup the manufacturer when he can insure that architects will specify and insist upon obtaining them. In stoves the same disinclination is felt. The retail dealer finds the common stoves pay better: he is able to supply them at a profit, and to allow a good trade discount, which is an inducement to the small contractor. To take a higher class of metal-work of an ornamental kind, such as gates, grilles, wrought iron work for churches, standards, brackets, door hinges, lecterns, gable crosses, the wholesale manufacturer who can supply everything per catalogue

at reduced prices, gets the lion's share of the trade. More artistic skill has been expended on ecclesiastical metal-work than on constructional ironwork, but original design is still rare; we find architects constantly selecting patterns that ill suit the style of building, because the cost of executing their own designs is too high. We should like to see a guild of metal-workers emulating the Mediaeval smith in turning out forged work; welding, chiselling, and manipulating the folial parts of a design, welding together the branches and twigs or leaves, and resorting to the traditional methods of the old smiths, instead of so much that is mechanical and spiritless. Architects who have any love for the art might then be inclined to give their aid in the work; but it may and will be agreed that such emulation and zeal will find little response in these days of contractorship, low tendering, and profit-squeezing-by-discount-taking. The profession must set their faces resolutely against the finishing trades of building being allowed to fall into hands which see no harm in extracting discounts and in encouraging inferior foreign manufactures. Painters, grainers, stained-glass and ceramic manufacturers, modellers paper-hangers, and all those who provide for the decoration of our walls, floors, ceilings, and furnish rooms, have a great deal more on their hands than they know how to do with satisfaction—all because the architect specifies a scheme of decoration which he does not take the trouble to formulate, or which he considers trivial things that can be left to the taste of the client or the decorator. We can well understand how the cry against profit-sharing may be urged in these trades; but we will rather dwell on the other aspects of the question—how the work is actually turned out under the usual contract system, and the injury inflicted on artists who have made the decoration of buildings a special study. In the first place, it may be mentioned that the business of decoration comprises a great deal more than is properly included under the term. The decorator is now intrusted with many artistic finishes which formerly belonged to the plasterer, modeller, carver, metal-worker, and glass-painter. This combination has been due to the development of the contract system and to the desire on the part of architects and contractors to include kindred trades under one responsibility. A great deal of labour in estimating and specifying has been thereby saved, besides much friction between the several trades; on the other hand, the separate trades have suffered. "Slop" shop work is now tolerated, as the master decorator has encouraged the labour of inferior artists, instead of those who have made themselves masters of their respective trades. The painter, for instance, is often turned from one kind of work to another, instead of being allowed to complete one thing. Modelling and carving are done by men who have not been specially trained, either by art teaching or experience, to the work. Many of the branches which the modeller and carver once undertook, and which gave them the prospect of becoming artists in the 16th, 17th, and 18th centuries, are now superseded by the substitution of papier-mâché, carton-pierre, fibrous plaster, "Anaglypta," "Lincrusta," and like appliances. These productions are brought to a degree of perfection which leaves very little to be desired, except one thing, and that is the taste and control of the architect. He may insure this supervision by providing specific sums for them in the specification and quantities, and selecting his own patterns and firms. As the prices depend so entirely on design and manufacture, it is impossible to insure success otherwise than by stating prices attached to certain selected patterns. But how seldom he troubles about the matter! And then, when special artistic skill is required, the

quotation of prices is misleading. The prices of leading firms vary of course with the class and situation of work. If a vestibule or hall is to be decorated, it is absurd to imagine that such a work can be priced from general drawings and quantities with any satisfaction. Those who tender in competition, being desirous of winning, will underprice this class of workmanship, because it is uncertain and indefinite in character and extent. A guess is made, but the guess turns out to be very inadequate. Detailed drawings of medallions, panels, arabesques are not even indicated on the general elevations, and have not been given in the quantities. These and the schemes of colouring ought to be made by the architect, and an idea of the cost obtained from a respectable firm. The sums may then be stated with some approach to accuracy in the quantities. But if the designs for decorations in the rough were submitted to artists for their suggestions and prices, the lowest offer being accepted, the decorative arts and crafts would assume an independent position instead of being as they are now, subsidiary to the building and other trades, under the general contract. The items of decoration, instead of being as now, the accommodating provisions in a contract—to be modified, cut down, or left out to suit the circumstances—would be considered necessary to the completion of the building in its entirety.

#### ADDITIONAL STORIES.

THOSE who are engaged in raising buildings or adding stories to them do so often without any consideration of the risks attaching to the operation. In towns the prospects of an extension of premises should be always present to the mind of those who build, and as this extension cannot take place laterally, and in few cases rearwards, it follows that building an additional story or two is the only method of enlarging the premises. But, for some reason or other, architects do not think of the probabilities; they design their elevation and build their walls without a remote idea of an addition to the height. When the owner or occupier thinks of adding a story, the difficulty of the matter comes into view; the walls are found insufficient to bear the additional weight, or it is found that thicker walls are necessary to comply with the section of the Building Acts referring to party structures. Many building owners, and those who advise them, however, do not allow these considerations to have any place in their proposals; they are prepared to add a story, and would for this purpose doubtless carry out their intentions if the district surveyor were not on the alert. Possibly the old party-walls are sufficient and thick enough; but in many cases the full height allowed by the schedule has been given them, so that the addition of another story makes it necessary to rebuild the party-walls. In the case of old buildings the condition of the party-walls is sometimes defective through age, or former alterations; the jambs in some cases have been moved, thereby weakening the wall; sometimes underpinning operations have weakened the foundations; excavations for drains may have been brought so close to the walls as to have caused settlements in the work, which would render it inexpedient to add weight to them. All these are reasons for examination and care on the part of district surveyors. A fractured wall is not fireproof. If flame broke out in a house having a wall of this kind with fissures, the safety of the adjacent premises would be seriously impaired, as a passage for flame and heat would be found through the broken bond. This is one of the dangers of unsound party-walls. There may be unnecessary demands made on building owners,

nevertheless. The wall may not require to be wholly rebuilt, if thick enough. A new roof, for example, may be substituted for an old one, and the surveyor may require the party-walls to be rebuilt; but suppose the walls on each side of the roof are the separate property of the owner and do not belong in common to the parties of the adjoining houses. In this case it seems to be unreasonable to call upon the owner to rebuild what is his own property and ceases to separate the buildings of the adjoining owners. The case heard at the Mansion House the other day, in which a builder was charged with having failed to comply with a notice to erect two party-walls, appears to be an instance. The summons in this case was dismissed. The contention was that the walls on either side of the roof were not party-walls, and this contention was that of the ruling of the Judge in "Weston v. Arnold." In that case a wall divided the property of one party from that of another to a few feet in height, and in so far they were joint owners, and the wall a party structure. Above the wall was affirmed to be a separate property or an external wall belonging to one of the owners; but in this case the owner had acquired a right to windows in the upper part, and the adjoining neighbour wished to raise his building, which would have darkened them. In the Metropolis the introduction of windows in such a position is not common, neither is it sanctioned by the Act, so that the argument does not exactly apply to party-walls in London. The question is whether it is expedient to compel the statutory party-walls to be carried up on both sides of a building when not walls of separation, or because a steeper roof is proposed to be erected?

An individual, therefore, who proposes to add a story or two, or to reconstruct an old roof, should be well advised as to his obligations. He has to comply with the schedule of thicknesses, and with the rights of the adjoining owner, according to the rules of the 85th section. Suppose, for example, he proposes to put a story on his house, by which it will not exceed, say, 60ft. in height, and the length of wall is 45ft., he must have two stories of 18in. wall, and the remainder in height must be 13½in. thick, which means the addition of 4½in. to the thickness of the wall above the first story to the top of the second story, and the addition of the same thickness to the topmost story. No objection can be made to the rules of the Act in theory. When a wall being raised becomes an external wall above the adjoining roof, it ought to be built of the same thickness, for appearance and stability; but when a trifling alteration only is made, it appears hard in practice to call upon the owner to rebuild. Party-wall legislation has, in some respects, retarded the raising of buildings. We do not desire uniformity of height in the London street architecture, and in this respect the regulations have acted beneficially; but the huge blank spaces of walls and chimney-stacks are beginning to be almost alarming in their extent and ugliness. Cast-iron stacks tied to the walls and supported by all sorts of ingenious metallic supports are painful enough to the aesthetic sense, and one is glad to see still the old bulky and irregular masses of brick chimneys with their uneven tops. The cast-iron and zinc pipes, square and round, raking at unpleasant angles, appear as makeshifts, and suggest the speedy rebuilding of the adjoining premises, and in this way a building raised above its neighbours invites them to follow the example.

Mr. Thomas Layton, F.S.A., of Kew, who has for many years past been occupied in forming a museum of the prehistoric antiquities of that district, has contributed on loan to the British Museum a case containing a series of bronze swords, spears, and axes, all found in the river Thames between Richmond and Battersea.

#### THE HYDROPATHIC ESTABLISHMENT AND ITS BATHS.—VII.

By R. OWEN ALLSOP, Architect.

(Author of "The Turkish Bath: Its Design and Construction.")

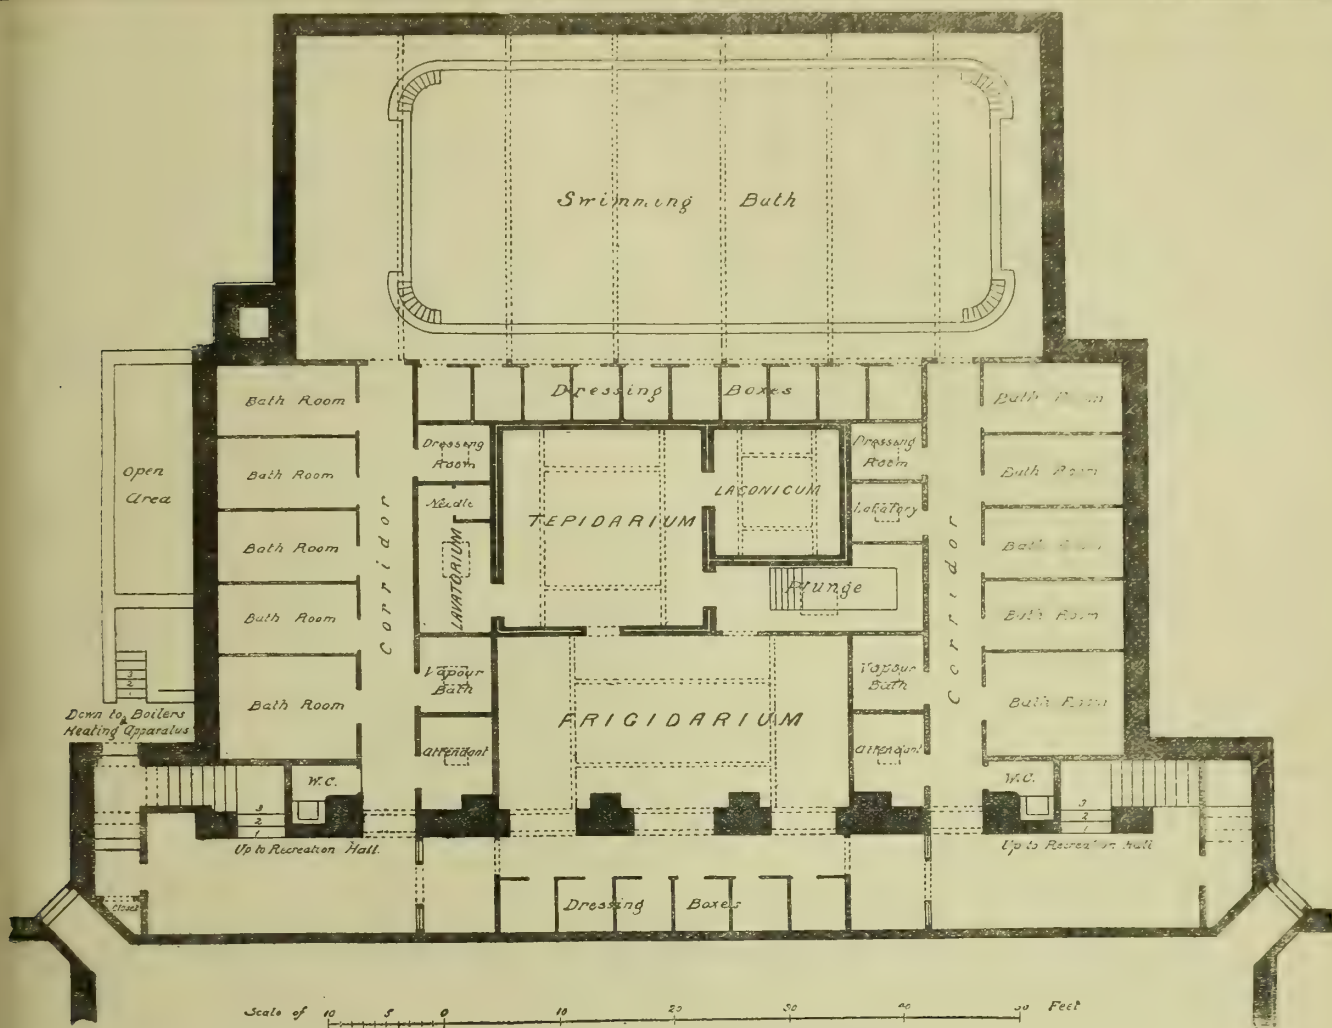

INDIVIDUAL opinion of the hydropathic practitioner modifies to a greater or less degree the nature of the bathing accommodation at the various establishments. In all cases, however, where the resident physician is properly qualified for the duties he undertakes, it will be found that the bath-houses are arranged in harmony with the ascertained principles of action of the system of hygienic medicine called "hydropathy." The bath are, or should be provided, with regard to their curative and remedial values, and thus differ from those of make-believe hydropathies, where they are merely allurements for visitors. Everything is done upon scientific principles; and although the course of treatment may vary at different establishments, it is, in all cases, based upon certain primary laws of hydropathic practice.

Hydropathy has been defined by Dr. B. W. Hunter, in an admirable article in the ninth edition of the "Encyclopædia Britannica," as a *treatment of disease by water, of which the active agents are heat and cold.* For an elucidation of the principles of hydropathy and a concise description and explanation of the action of various baths, the reader cannot be referred to a better work than this article by Dr. Hunter. It will form the basis of study of the medical value of baths and bathing—a study that all who have to do with baths, whether of the hydropathic establishment or of public or private bath-houses, should make, as it is impossible to properly plan any kind of bathing establishment whatsoever without a knowledge of principles underlying the method of treatment of disease by water. For it should be remembered that the slightest application of water to the body, or parts of the body, produces changes, however slight, unimportant and temporary, in the organic structure, and influences, for good or evil, the vital forces, according to the mode of administration, the duration of the application, and the temperature of the water. And although in the hands of the medical practitioner, the power of thus affecting the human frame is all turned to good account, so great is it that, when employed by persons ignorant of the true principles of hydropathy, or *thermo-therapeutics*, positive harm may be done, and life at times endangered.

If, then, it be duly recognised in hot certain and powerful a manner hydropathy acts upon the system, we shall be prevented from falling into yet one more error in the building of hydropathic establishments, and that error relates to the providing of baths without reference to their medical uses. Often we see bath-houses, not only arranged in so unpractical a manner that they are a source of constant inconvenience to the bath men and bathers, but so fitted as to prevent effective treatment. And not only in hydropathic establishments, for in the planning of public baths, baths for civic corporations, and those erected as speculations by private persons, unscientific planning is to be noticed. Evidences of this are to be found in the invariable structural alterations made now here, now there, in bath-houses, and the disuse of fittings and apartments ignorant and misplaced in the first instance.

It is a great thing to rid oneself of the notion that baths of all kinds are merely aids to cleanliness of the visible portions of the human economy. Every bath has some therapeutic property, and this over and above its mere cleansing powers. In medicinal parlance, it may be derivative, stimulative, sedative, alterative, or tonic, &c. The chief end of scientific bathing is to stimulate the functions of life, by assisting the wasting tissue and by aiding the recuperative action.

CRAIGLOCKHART HYDROPATHIC ESTABLISHMENT.—PLAN OF BATHS.

regenerative forces of nature. Hydropathy, more directly than any other system of medicine, aims at assisting the *vis medicatrix nature*.

In the various works of writers on hydropathy, such as those of Hunter, Gully, Johnson, and many others, more or less comprehensive lists of hydropathic baths are given; but in the article above referred to they are grouped according to their therapeutic uses. The author says: "The appliances and arrangements by means of which heat and cold are brought to bear on the economy are—(a) Packings, hot and cold, general and local, sweating and cooling; (b) hot-air and steam baths; (c) general baths, of hot water and cold; (d) sitz, spinal, head, and foot-baths; (e) bandages (or compresses) wet and dry; also (f) fomentations and poultices, hot and cold, sinapisms, stupes, rubbings, and water potations, hot and cold."

Every serious hydropathic establishment should be provided with such bath-rooms, heating appliances, and fittings as will enable treatment, embraced in the above list, to be administered to patients.

Of this list, (a) and (e) only affect the design of the building by necessitating the provision of the bath-house, of private dressing-rooms of such ample size as to admit of full-length couches whereon the packings, &c., may be administered, and the contiguity of a well-appointed douche-room with concluding tonic baths, such as the needle, shower, &c.

Class (b) now means a complete and perfect Turkish bath for the application of heat or heated air for sudorific purposes. The Turkish bath has taken the place of the temporised lamp baths used by the early postles of the "water cure" for inducing perspiration. Steam baths are whole or

partial. Of old, the vapour box was used; but now this apparatus shares with the Russian bath the duties of a sudorific chamber with a vaporous atmosphere. The former is a partial bath, while in the latter the bather is wholly surrounded by and breathes the steam-laden air. The Russian bath should be arranged off the shampooing-room of the Turkish bath; vapour boxes are best placed in a corner of the general douche room, or tonic bath-room, or placed in a chamber connected with this apartment, so that the bather may conclude with the needle or douche, &c., as the bathman may dictate.

Class (c) are the baths of the douche room—the needle, shower, wave, douche, ascending douche, spray, and the more complicated baths of this nature that ingenuity, which may be styled *misapplied*, has devised. They are used either as separate treatment, and as comprising distinct baths in themselves, or as tonic applications to conclude the processes of different baths, as packs, massage, sweatings, &c. The relation of the douche room to the other bath-rooms thus becomes a matter of very considerable importance. If not studied, great inconvenience will result from the neglect. A minimum of passages and corridors, and intervening doors, should connect the miscellaneous bath-rooms with the douche room, and the ways of intercommunication should be so heated and free from cold draughts that bathers may not be exposed to the risk of taking a chill.

Class (d) may be termed *local baths*, as distinct from those just described. Spinal and head baths must be included in the general douche room; but sitz baths may either be simple and movable and placed in the private dressing-rooms, or complicated with various fittings and fixed in a separate

chamber connected directly with the douche room.

Class f may mean simplicity or great elaboration. If the object of the treatments detailed under this head is to be effected with simple means, it will be necessary to perform dry massage in private rooms or dressing-rooms, and wet massage in the douche room or shampooing-room of the Turkish bath; but if all modern resources for cure are to be included in the bath-house, costly arrangements for massage dry and wet, for massage with douching (as the Aix-les-Bains), electric baths and electric beds, and "movement" rooms or Swedish gymnasia, must be made. The simpler treatments included in class (f) call for no comment: they are administered in patient's bedrooms, or the private dressing-rooms of the bath-house.

It may be said that the most able exponents of hydropathy—regarding that term as meaning a system of treatment comprising, in addition to bathing, every hygienic aid to cure, such as regulated living, dieting, exercise, &c.—are the least bigoted; that is to say, the true hydropathist avoids the *nostrum* principle, and seeks rather to derive help from every source. It is the quack and charlatan who avers that certain baths, &c., are sovereign remedies for every disease under the sun. Viewing hydropathy in this light, one may assert that the treatment of the allopathic physician is daily becoming more influenced by its principles. The old, hard-and-fast drug system is decaying, and giving place to a method of practice founded on a deeper and more accurate knowledge of the laws of health, and established facts of hygienic science. In a sense, it may be said that the allopathic and the hydro-

pathic practitioner are meeting on common ground; whereas, in the early days of the cold "water cure" bigotry was evidenced on both sides.

That hydropathy has more powerfully influenced the old system than the latter has modified hydropathy, is a very patent fact. Hydropathy and the progress of "hygienic medicine" has, to a greater or less degree, lured the allopathic physician from his favourite tenets, while the hydropathist has never been tempted to revert to drug medication. It may be said again, then, that while the allopathic practitioner has been lifted up, the exponent of hydropathic principles has had his mind expanded since the days of the first introduction of the "water cure." This expansion has influenced the design and arrangement of the hydropathic establishment. Formerly the appliances to be found in these institutions comprised little more than the wet-sheet pack, the compress or water bandage, and the cold sitz and colder douche. Now, the hydropathist has relaxed the old method and pursues a more gentle treatment, so that, with perseverance, he is enabled to regenerate the most enfeebled constitution. In addition to the baths of the early practitioner, he brings to his aid every variety of treatment based on sound principles, in accordance with ascertained physiological facts and the laws of hygienic science.

*Compactness of plan* is the chief desideratum in the bath-house of a hydropathic establishment, as in any other system of baths, public or private. *Intercommunication* is another point to be regarded, as without easy and convenient access from bath to bath and bath-room to bath-room, it becomes impossible to effectively carry out treatment involving a course of different baths. This is especially necessary where any peculiar treatment compels the bather to conclude with the tonic-baths of the douche-room.

In the preceding articles, the plans of the several establishments illustrated clearly show the arrangement of the baths attached to, or included in, the building. They embrace for the most part a similar scheme of baths, including all the ordinary and simple hydropathic expedients, each having a Turkish bath, douche-room appliances, vapour baths, and miscellaneous bathrooms and dressing-rooms. As a further illustration of the different ways of arranging bath-houses, another plan of an existing institution is given herewith. The baths at the Craiglockhart Hydropathic Establishment were designed by Messrs. Kinnear and Peddie, architects, of Edinburgh, who kindly supplied the plans. The baths are adjoining, but at a lower level than, the fine recreation hall, which extends below the plan, and is reached by staircases from both ladies' and gentlemen's baths, each of which has its separate corridor. A Turkish bath—used at certain times for ladies, and at other times for gentlemen—is placed compactly in the centre. On either side are grouped bathrooms that may be used as douche rooms, or for ordinary baths, and for sitz baths. The swimming-bath—a pleasant addition to a large establishment, but expensive to keep up, unless unusual supplies of water are at hand—is also so arranged as to be convenient for either sex at stated hours. Under the bathrooms, on the left-hand side of the plan, are the stokeries, boilers, heating apparatus, &c. This illustration is a good example of a set of baths with a single Turkish bath, which is invariably to be found in hydropathic establishments, in spite of the fact that the want of a separate ladies' bath is often seriously detrimental to effective treatment. Readiness, at all bathing hours of the day, of every kind of bath for both sexes, doubles the power for good of the resident physician.

(To be continued.)

## NOTES ON BUILDING PRICES.

By JOHN LEANING.

### INTRODUCTORY.

THE references in existing books to the principles of pricing are few and imperfect, and their discovery requires considerable search; much of the teaching they afford is obsolete and mixed with irrelevant particulars; such parts as are worth the knowing are familiar to most fairly-taught students of architecture or surveying. It has been the object in the following notes to eliminate as far as possible everything not directly bearing upon valuation. Upon the importance of the subject it is unnecessary to enlarge. The measuring surveyor who is not an expert in prices is but an imperfect product of professional education, and brings to his vocation less skill than his employers may properly expect of him. A knowledge of building values is an important element in the preparation of quantities, and materially assists the surveyor's judgment as to the order and manner in which items shall be presented so as best to facilitate the pricing. Judicious pricing is the latest acquired faculty of the surveyor, and the severest test of his capability; perhaps it is his most difficult task to deduce analogies in the application to a measured account of the prices of a schedule prepared by an ignorant man. Whatever may be the system of measurement adopted, the reasonable principles of pricing are everywhere similar, and this may be a reasonable excuse for the adoption of many London illustrations. There is always an advantage in learning one system thoroughly, if coherent and complete, even though it may be in some of its details imperfect. In it the student possesses a definite starting-point—a base for the development of a system in which his individuality will find more ample scope. The constants of labour are derived from various sources, and if the student adopts the advice here given he will be able, as his knowledge increases, to make many for himself. Their value as a condensed register of experience is great, and the principle of their application deserving of more attention than it has hitherto commanded. The instances given hereafter of sums for water, attendances, &c., are derived from genuine estimates, and are the work of practised estimators. That the study of the architect, the building surveyor, and the builder's clerk is in many respects similar excuses the inclusion of some information which would seem the exclusive concern of the latter.

*Builders' Price-Books.*—The natural resort of the inexperienced in pricing is a builders' price-book, and while one must admit the value of the great store of information they contain, it is beyond question that they abound in difficulties for the neophyte; the rates of profit vary on different things, some of the prices are list prices, some with a large trade discount, some with a small one. In some of the books this trade discount has been modified; in some it has not. Moreover, no explanation is ever given in a price-book of the way a particular price is arrived at. Modifications to meet a special case is consequently impossible; the difficulty is increased by such artless statements as "8d. to 1s. 3d." If the student buys all the current price-books, his last state is worse than the first, for he finds none of them alike, and even their diversities are not uniform in degree. A builder's price-book to be truly valuable should show the absolute cost of all materials and builders' work; but it should be remembered that no set of prices can be applied to any two buildings without some changes. Every work will possess some special features which will modify its value. There are various causes which contribute to increase the difficulty of framing a set of prices of universal application. Inefficient supervision by the contractor often enough makes the difference between a profit and a loss on a building; besides this, foolish and harassing interferences by the architect or his clerk of works, delay in furnishing details, and general indecision of superintendence, are all elements of value which no price-book can measure; but a builder will modify his profits in various degrees dependent upon the peculiarities of the circumstances.

*Good and Bad Work.*—The difference in value of good and bad workmanship is sometimes alleged, but often unreasonably, as reason for modification of price. Good work and high finish is mainly the result of a good system of business management, and a proper selection of

men; it does not necessarily involve a great outlay, and generally would be represented by very small percentage of the cost.

*Trade Discounts.*—So much has been said written about trade discounts of late that little need be said here on that subject except that the student must learn all about them and take them into consideration in the assessment of his prices. One may say in passing, that wholesale houses not connected with the building trades, with few exceptions, content themselves with giving discount of 2½ per cent. for cash, the house supplying building requisites vary in their practice, giving a discount of 10 to 50 or more per cent. in addition to the discount for cash. The evil effect upon a man's moral nature of association with horses or pigeons has been remarked often enough. Is there some similar occult influence in building operations?

*Use of Priced Bills and Pricing.*—Another resource of the student in prices is a collection of old priced bills of quantities; but these do not help him much. Comparison of the sets of quantities for the same building priced by different men will show a diversity for which it is sometimes very difficult to account. The occasion for pricing presents itself in various ways; the preparation of an estimate from a bill of quantities or from drawings and specification; the items of a measured account or of a day account the position of the man who prices is also varied—he is the surveyor appointed by the architect, in which case he is popularly supposed to administer justice between the building owner and the builder, but is not unfrequently special pleader for the former, or he is estimating clerk to a contractor or a surveyor employed by the builder. In either case pressure is often exerted to induce him to raise every plea in his employer's favour which ingenuity can devise. How far this may be legitimately carried is a question of the morality of advocacy upon which we need not here enter. In the pricing of an estimate, the experienced man has in his mind a store of approximations to the truth which he applies on all occasions. If it were not so, it would be necessary to calculate every price in detail, and it would not be possible in a large business to do the large quantity of work which estimating involves. Preparation for such work is another matter; the student must arrive at every price by careful calculation in detail, and he should beside this be always on the watch for parallel cases and generalisations. When pricing a bill, it will be advisable to write neatly on clean sheets of paper (not rough scraps which are liable to loss or destruction), the calculation used of cost of concrete, brickwork, timber, &c., and the rate of profit, not only as a check upon other calculations which they may affect in the same bill, but for future reference, and if necessity should arise, for the vindication of the judgment. To those familiar with office work it will be unnecessary to speak of the importance of dates. Every document should have written legibly on it the date of its production.

### MEANS OF PRESERVING AND ARRANGING INFORMATION.

The general neglect by the student of surveying of the obvious methods of acquiring thorough knowledge of prices (the most important part of his work) is patent to all experienced persons. A surveyor whose capabilities are only equal to the taking out of quantities is a mere clerk. Unfortunately, many building surveyors know little else. As the examination of the Surveyors' Institute increases in their stringency, prices will probably take a more important place in them, to the advantage of all concerned. Doubtless, the expert in price begins with a mind naturally formed for the study, and without that natural faculty probably none become eminent in that direction; but patience and assiduous attention will bring to any mind that adopts the study a familiarity with values far beyond the average, and in their company the confidence of clients or professional colleagues, with their consequent substantial pecuniary reward. Nor will this be all: it will give the student a faculty of generalisation and a power to trace analogies even more valuable than a memory of rates. Important means to this end are a collection of trade lists and the common-place book. The student should obtain trade lists of every raw material or manufacture article used in the building trade. When he receives a list he should write legibly on it the

ate of its receipt, the trade discount, and the discount for cash. The smaller lists (not books) should keep in a guard-book, which is most conveniently secured by a strap around it. It should be paged, indexed, and cross-indexed, thus: "Ashton and Green," slate merchants, should appear in A Ashton and Green, slate merchants, and in S, slate merchants, Ashton and Green. The bound books or thick pamphlets should each be marked with a number entered in an index, as last described, and kept in portfolios or on a shelf. The student should not merely procure these lists and arrange them: he should make himself familiar with their contents and thoroughly understand them, and he should settle by inquiry any doubts raised by their perusal. The estimator should also keep a book, in which he should enter all the rates of railway carriage. The collection of information as to materials, cost prices, railway rates, &c., is necessary to the man who would achieve distinction in the study of prices, and some method of arrangement for facile access is required. If one of these methods, the common-place book, it is impossible to overrate the importance. The larger number of those men who have become distinguished in any profession have adopted it. By no other means can such a store of professional knowledge be acquired, nor will it in any other way be so readily accessible. The experience of anyone will be sufficient to recall the recollection of long and tedious search (perhaps of days) for information cursorily read and almost forgotten which might have been by those means found in a few minutes. Much depends upon the system adopted. The leading principle is easy and clear reference. There are two kinds: one, the "index rerum," as it has been called, which contains references only to passages of interest. The other, the "common-place book" proper, mainly a collection of the passages themselves. Directions for the management of the "index rerum" are thus given by Dr. John Todd, author of "The Student's Manual":—1. When you meet with any subject of interest, note the subject, the book, the page, and any word distinguishing its qualities. The index should be your constant companion when you read. 2. Make your index according to subjects, as much as possible selecting that word which conveys the best idea of the subject. 3. Put, at the upper left-hand corner of the page, a capital letter as A, B, &c.; in the centre one of the first five vowels, as a, e, i, o, u. 4. Place the principal word in the margin under the first letter in that word, and the first vowel in it. For America, I turn to capital A and the vowel i, because A is the first letter and e the first vowel. A book with faint lines is best, and it should be ruled as below:—

A	a	A	e	B	a	B	e

Examples of the entries are as follows:—

A	e
America.	Supposed to be known in time of Homer. Thomas's "History of Printing," Vol. I. p. 20.
Atheism.	Of France, picture of. Schlegel's Lectures, Vol. II. p. 199.
B	a
Bradford.	Governor, Notices of. American Quarterly Review, Vol. II. p. 497.
B	o
Brougham.	Graphic and powerful description of. Post, Rhetorical Reader, p. 248.

The scale of apportionment of pages recommended by Todd is as follows:—

A 3	J 2	S 6
B 6	K 2	T 4
C 4	L 3	U 3
D 3	M 6	V 3
E 3	N 2	W 6
F 3	O 2	X 2
G 4	P 6	Y 2
H 4	Q 2	Z 2
I 3	R 4	

The foregoing will not be found an infallible guide; various circumstances will arise to modify the proportion—as a peculiar direction of study. A commonplace book may be constructed in a precisely similar form, except that instead of a mere reference to subject, volume, and page, we adopt subject, page, volume, extract, or it may be a mixture of both, or it may include newspaper cuttings and small original memoranda of which you may desire to preserve a record.

Q	"
Quantities.	I advise employers not to let the quantities be taken by anyone who can be made out to be their agent, nor to recognise them in any way except as after mentioned with reference to a schedule of extras. Sir Edmund Beckett, "A Book on Building," p. 32.
B	e
Bedrooms.	Decoration of, remarks on. "House Decoration," R. and A. Garret, p. 30. This might also appear as below.
D	e
Decoration.	Of bedrooms, remarks on. "House Decoration," R. and A. Garret, p. 30.

The reference word should express the leading idea, and should be selected with judgment. Another method of keeping a common-place book has been recommended by Mr. G. A. Sala, and is the method adopted by him. He says:—"Take a book, large or small, according to the size of your hand-writing, and take care that at the end of the book there shall be plenty of space for an index; begin at the beginning, and make your entries precisely as they occur to you in unsorted sequence. But after each entry place a little circle or oval, or parenthesis, thus—( ), and in a portion of these spaces put consecutive numbers. Here is the model for a page:—'The Prince of Wales wore the robes of the Garter at his marriage in St. George's Chapel, Windsor, all the other K.G.'s present wore their robes and collars. Mr. W. P. Frith, R.A., who was to paint a picture of the wedding for the Queen, stood close to the reredos to the right, looking from the organ-loft (1023).' 'Just before the liberation, in 1859, of Lombardy from the domination of Austria, the audiences in the Italian theatres used to give vent to their pent-up patriotism by shouting Viva Verdi; the initiated knew that this meant to signify Viva V. (for Victor), E. (for Emanuel), R. (for Re), D.I. (for D. Italia), (1024).' Now, all you have to do is, immediately you have made your entry, to index it, and if you will only spare the patience and perseverance to cross-index it. Thus, under letter W you will write, Wales, Prince of, married in robes of the Garter (1023), under G, Garter, robes of, worn by P.O.W. at his marriage (1023). Under F, W. P. Frith, R.A., present at marriage of P.O.W. (1023). Thus also Verdi Victor Emanuel and Italy will be indexed under their respective letters V and I, and be referable to at 1024. Write the figures in the circumscribed spaces in red ink. The corresponding ones in index may be in black.' Of commonplace books, as compared with his "Index Rerum," Dr. Todd says, alluding to Locke's system: "Neither that nor any other commonplace book which I have ever seen will either come into anything like extensive use or be of any essential advantage to the student and man of literary habits: they require too much time and too much labour. Everything that is saved must be copied out in full, and then noted also in the index. Few have the time, and fewer still the patience, to do this." This is not by any means a general opinion. We recall the somewhat hackneyed but pregnant sentence—"Reading maketh a full man, conference a ready

man, writing an exact man." For the third reason, irrespective of the value of the store of knowledge amassed, the commonplace book is to be strongly recommended. The foregoing are those for the arrangement of general professional information. For prices there is still one other method—the arrangement of the average price-book in trades. The student should have a book for each trade, and enter every price that comes in his way in its respective book. Every element which has affected the cost of work, all the information you can get as to the working of particular materials, relative values, when you can get them, and weights and measures which are new to you; and in every case date the item and state its derivation, as both source and date are important. The student should also seize upon every opportunity which may offer of observing and making notes of the time and material expended upon certain quantities of work. The most valuable will be those of larger bulk, as from these more reliable results may be deduced for the valuation of smaller quantities. Example: The notes of the production of a thousand yards of concrete will yield a more reasonable average than ten. This practice will, besides enriching his store of information, help the student to foster habits of observation and precision such as would be worth very much more trouble to acquire.

**Profit.**—Profit may be best defined as a percentage to be added to every item after its complete cost has been computed. The rate of profit must be decided upon in any system of prices, and although the general usage does not countenance it, some estimators hold that it is in the case of pricing a bill of quantities best added at the end of the bill. Ten per cent., besides establishment charges, is the least that should be attached, except in a very large work. Sometimes contracts are deliberately taken at a less profit than this; but it is much oftener unwittingly done. It may be safely assumed that work at a less rate than 10 per cent. clear is seldom worth the doing. Undoubtedly work has been taken without profit for such reasons as the keeping together in a period of depression a well organised business and a staff of efficient workmen; but such a case is an exceptional one, requiring exceptional treatment. Profit should be higher on work or material in small quantities. Nails and screws (of which many are inevitably wasted), and small quantities of such things as paint, putty, solder, colours, &c., are examples. The adjustment of profit in cases of variation is usually defined by a condition of the contract that extras or omissions shall be valued at the rates of the original contract or analogous ones; in such case there is no base of argument. In its absence it seems reasonable that the special circumstances should be considered. Several hundred similar doors may be produced by machinery at first, at a much lower rate than one or two later; and these should bear a larger price. On the whole, it may be admitted that the equitable assessment of profit requires mature judgment, and almost every case demands modifications not exactly referable to a fixed rule. A collateral issue is well expressed by Mr. Matheson in his "Aid Book for Engineers." He says: "There are certain engineering undertakings in which it is very difficult to frame a schedule which shall apply fairly to additions or omissions. A contractor may have to provide expensive plant, machinery, and apparatus, the extent or cost of which would be but slightly altered if the quantity of work were to be diminished or increased. Therefore, having these fixed expenses already provided for extra work, could be performed at less rates than those in the primary contract, while deductions in price for omissions should also be made at a less rate, because the contractor would only save the material and labour deducted, and not a like proportion of his apparatus and fixed charges."

**Establishment Charges.**—It is best to preserve a distinction between profit and establishment charges; these latter represent the outlay other than labour or material before any profit can be realised, and are most conveniently considered as a percentage to be added to the prime cost of every item. In a well-drawn bill of quantities, the preliminary bill contains a number of items which, in the opinion of some, might be properly included in that percentage—as sheds, scaffolding, screens, &c.; but as these vary with the requirements of each building, they are probably best dealt with separately. The remaining items for consideration are:—Interest on capital, rent of offices and yard, clerks' salaries, including

cost of measuring, or waiting on an appointed measurer, depreciation of plant and machinery. The whole of the prime cost of the building operations for a year being ascertained from the books, exclusive of foregoing items, and a similar calculation of a year's outlay on those items made separately, their comparison will show the proportion and consequent percentage which should be added to every item of prime cost. The judgment and experience of an assessor are often considerably tried to form a reliable opinion in a given case. The conduct of some businesses costs twice as much as some others equally efficient but less pretentious. Sometimes when the rate of percentage is in question the builder will permit the surveyor to inspect his books (in confidence), when he can satisfy himself as to the reasonableness or otherwise of the claim set up. In default of this permission, the builder may be requested to furnish a statement of the detail of his calculation. When no items of the kind are included in a preliminary bill, establishment charges are commonly computed at 5 per cent. Sometimes as much as 7½ per cent. is allowed. Occasionally they are classed in two categories—5 per cent. on work done at the building, 7½ per cent. on work done at the builder's shops. The necessity of defining these charges before signing a contract is admitted, as, after a schedule of prices has been agreed to and the work done, the contention has been raised that the prices were not intended to include establishment charges. Probably the best way is to mention them in the preamble of a schedule.

#### SUPPLY OF MATERIALS TO LONDON.

The sources from which materials may be most conveniently procured, and the means of placing them on the site, will always be an important one, and in this connection the extent of the proposed work must materially affect the decision. Taking sand as an example, for a large work it would be procured by the barge-load at the cheapest rate; for a small work, the reasonable alternative would be to obtain it from one of those merchants of building materials whose yards are, as a rule, on the banks of the Thames, the canals, or their basins. Similar conditions regulate the supply of stock bricks. Bricks of all kinds are brought to London in large quantities by railway, the merchants having depots at their termini. Whether a truck or barge load shall be ordered direct from the field, or the bricks bought by the thousand from the London merchant, will depend upon the size of the work. The price of the smaller quantities thus obtained will be about ten per cent. higher than the larger ones otherwise procured. It will often be possible to save all trouble of barging and unloading, and yet avoid much increase of cost, if a large order can be given to one of the London merchants. It is obvious that the possibility of the builder's barging for himself must operate to keep down the middleman's profits. Much of the sand and ballast used in London is dredged from the Thames. Not nearly so much is brought from above bridge as from below, although the former is more generally specified. The contractors may either charter a barge, and purchase the sand when dredged, landing it at one of the Thames draw wharfs, where the privilege of unloading will cost him 25s. per day, and he must find his own baskets, barrows, and planks, or he may arrange for a barge load at a price per yard, including barging, unloading, and filling into carts. Pit sand is also brought by barge. Contractors may, however, generally buy sand (unless he occupies a wharf) as cheaply of the keeper of a draw wharf, who generally keeps a stock, or will have it there to order, and will arrange for its cartage and delivery if desired. From some of the suburbs, as Fulham, Hammer-smith, Epping, Walthamstow, &c., pit sand is still carted to London, and in such cases the carts take away rubbish on their return journey. Sand is also brought by truck or barge from Croydon, Redhill, Sevenoaks, West Drayton, Southall, Ealing, Dawley, &c. The supply of stocks and malms for the metropolis is derived from Kent, Essex, and Middlesex—Sittingbourne, Teynham, Faversham, Southend, Acton, West Drayton, Ealing, Hayes, and Southall are some of the places. Bricks are still made in the more immediate neighbourhood of London, as at Edmonton, Norwood, &c.; but as these must be carted all the way, it will generally prove cheaper to use bricks from more distant places conveyed by rail or barge. The supply of lime is derived from

Dorking, Merstham, Halling, Lewes, and Petersfield. A stock is always kept at the merchant's yard in London, and the price quoted generally includes delivery in loads of two yards, and when the lime is ground the use of sacks. The lias lime used in London is for the most part brought from Barrow, Leicestershire, or Lyme Regis, Dorsetshire. Portland cement is brought from Northfleet, Rugby, Arlesley, &c. Most of the manufacturers at these places have London depots, and there is no advantage in purchasing at the works, as it would probably increase the cost. The price generally includes delivery within the usual limits, and use of casks or sacks. The stone used in the metropolis is almost uniformly brought by rail; some Portland and York, however, comes into the Thames. The timber used in London comes to the Surrey, Commercial, East India, and West India Docks.

#### THE RIVER THAMES.

It is probable that the wharves of the Thames have been less used for the introduction of materials since the great development of the railway system, the rates for railway carriage being reduced to their lowest point wherever shipping comes into competition with them. Besides this, a coasting vessel of average tonnage carrying a cargo for delivery above London Bridge must transfer it to lighters before it can be deposited at wharves up the river, and this involves additional expense. This consideration does not affect the traffic from the Medway or the estuary of the Thames, which is carried in smaller craft, and consequently large quantities of bricks, sand, cement, lime, ragstone, &c., are brought from Kent and Essex by water. Deals and timber are also conveniently brought by barge from the Surrey, East and West India, and other docks to the river wharves, and as some of these belong to the railway companies, access is thus afforded by their systems to all parts of the country. There is still, however, a large traffic in sea-borne materials, as granite, Portland stone, Yorkshire stone, bricks, lime, slates, stoves, ranges, and miscellaneous iron castings, iron joists and girders, rain-water pipes and gutters, &c. The draw wharves on the Thames are much used for the shooting of rubbish into barges. Exclusive of loading and unloading, the lighterage from the Surrey or India Docks to any wharf between London Bridge and Westminster costs:—

25 tons and over, per ton, Deals, 1s. 6d.

25 " " " Mahogany, 1s. 9d.

Bricks, Southend to any wharf between London Bridge and Westminster, 4s. per thousand, exclusive of loading and unloading. These charges would include all dues. The Thames Conservancy tolls do not much concern the contractor, as he generally makes his bargain with either merchant or lighterman at a price which includes them.

#### EARTHWORK SLIPS AND SUBSIDENCES.\*

AS a large number of public works are undertaken in which excavations and earthworks are concerned, any information and suggestions of a practical nature cannot fail to be of use to engineers and others engaged in dock construction, embankments, waterworks, and other like construction. Mr. John Newman, A.M.I.C.E., has written a volume on the subject that has hitherto only been treated of cursorily. The main causes of slips and subsidences in different soils are described, and preventive measures are discussed. Among the chief causes of slips of earth, of which our author enumerates no less than 31, we may mention want of uniformity of earth, particularly as regards percolation, cohesive power, and resistance to change by the action of water, &c., the temporary or permanent exposure of earth to the effects of atmosphere, rain, frost, &c., the tapping of springs, erosion of a slope, slopes honeycombed and disturbed by rodents, particularly in clay soils, marls, discharge of water from land drains, local percolation of water, vibration, over-weighting, unequal loading, and other artificial causes. We are disposed to think many of the causes are distinctions without differences. We should say that No. 1 cause, "Want of uniformity of the earth, particularly as regards percolation, cohesive power, and resistance to change by action of water, &c.,"

covers causes numbered 2, 5, 10, 11, 12, 13, 14, 15, 16; at all events, the heads assigned may be reduced to about a third of the number. We should have rather classed them under the following heads: Slips or subsidences arising from geological and physical causes; want of cohesion; differences of structure; action of water; atmospheric causes, such as disintegration caused by frost, rain, and snow; mechanical causes, such as over-weighting, vibration, want of support. No less than 39 heads of causes of slips and subsidences in embankments are mentioned. Surely there is no need to name so many, and the summing-up of the causes given by the author on p. 8 appears to meet all the requirements for investigation. It is rather tiring reading. The author proceeds to give a few suggestions of value respecting the stability of earth works. 1. Avoid cuttings or embankment in drift soil, or upon the side of a hill. 2. Avoid all damming-back of flow of natural drainage waters, or heaping of snow by the erection of an embankment in mountainous or hilly ground. 3. In excavations "on the side of a hill, observe the natural configuration of the ground, or the wettest part, and remember that the shape of cutting may not stand unless at the same inclination, or the toe of the slope is supported by massive retaining wall and extensive drainage and that any disturbance may cause it to require a flatter inclination." Other useful advice is given which the railway engineer and earthwork contractor may profit by. A chapter is devoted to the probabilities of a slip, and time of the most frequent occurrence. The author discusses the slips in different kinds of rock; igneous or unstratified rocks are less likely to slip than those liable to surface decomposition and disintegration such as some varieties of basalt and clay-slate limestone, sandstone attacked by frost. The crystalline rocks are not so exposed as those of clay composition. Chalk, as in the Needle Rocks will stand perpendicularly, if free from faults, to a great height, the slopes of repose are 1½ to 1, 1 to 1½ to 1. Marly chalk requires a slope of 1½ to 1 clean gravel, of uniform size, 1 to 1; compressed hard clean sand, the same slope; loose sand, 1 to 1; irregular bed of sand, gravel, clay, and rock, 1½ to 1; and this latter angle is that of ordinary loamy sand and clay loams. Shifting sand is never stable, though when drained, and the toe is secured by a retaining wall, it will stand at an inclination of from 3 to 1 to 4 to 1. Some notes are given on methods of drainage which would have been more useful if accompanied by diagrams. Speaking of the normal pressure of earth, Mr. Newman refers to the limit to the height of an embankment—the height to which it may be carried without exceeding the safe load that the natural ground will sustain. The limiting height in feet is obtained by dividing the safe load in tons per square foot upon the original ground by the weight in tons of a cubic foot of the deposited earth. Thus, the limit of height for embankments unaided by retaining walls, and the slope soiled and covered with grass is, for surface clay 20 to 30ft.; boulder clay, 25 to 30ft.; ordinary clay, 30 to 40ft.; in cuttings, 60 to 65ft.; chalk 30 to 40ft.; gravel and sand about 60ft.; ditto in cuttings, 80ft. Other chapters consider coefficients of friction, forms of slope, preservation of the foot of a slope, covering slopes, and variety of other questions; also canal, reservoir, and river embankments. The book contains a fund of useful information, but would have gained by a little more condensation.

#### BRICKS AND BRICKMAKING MACHINERY.

By M. POWIS BALE, M.Inst.M.E.; A.M.Inst.C.E. Author of "Woodworking Machinery," "A Handbook for Steam Users," &c.

#### BRICK-KILNS.

AFTER the bricks are made comes the extremely important matter of burning them and unless this is well and carefully done, all previous labour is thrown away. To deal with the construction and working of kilns at length would occupy much more space than I have at my disposal. I must, therefore, for the present limit my remarks thereon. The chief points to be desired in a kiln may be briefly summarised as follows:—

- (1) Uniformity in burning and colour of bricks
- (2) Economy in labour and fuel. (3) Easy regulation of the heat. (4) Moderate first cost and

\* Earthwork Slips and Subsidences upon Public Works. By JOHN NEWMAN, Assoc.M.Inst.C.E., &c. London: E. and F. N. Spon.

FIG. 20.

low cost of maintenance. A greater or less difficulty found in all kilns is that of securing uniformity of burning, and consequently uniformity in colour, hardness, and size of the bricks. To obtain this the kiln must be very carefully planned as regards size, draught, area of flues and chimneys, and number of furnaces. Then, again, the quantity of fuel used, the nature and shrinkage of the clay from which the bricks are made are very important matters. To secure uniformity in burning, the most advanced forms of kilns have been designed so that the heat can be regulated to a very considerable extent, chiefly by means of a system of air draughts, and directed to any desired part of the kiln. It is necessary, too, that the draught to the furnaces should be properly adapted to the nature of the fuel, &c., used; this is a point often lost sight of, but one of great importance in securing a constant and even heat. The furnaces and flues should, in all cases, be lined with firebricks, and when low cost is not important, it will pay well to line the whole kiln. Where drying sheds are in use, the flues can be arranged so that the waste heat can be afterwards utilised in them. The whole kiln should be well and substantially built, and the parts of the furnace which most rapidly burn out be made capable of being readily renewed. Kilns are built both round and rectangular, and with both up and down draught according to the direction in which the heat is conducted from the furnace. They are built also in chambers; this latter is the most modern and economical plan, and the one that will probably eventually be most generally pursued.

The want of uniformity in colour found in many bricks burnt in the same kiln has given rise to considerable difference of opinion as to the cause of this, and amongst other reasons given are (1), want of uniformity in the heat; (2), the admission of cold air on hot bricks, oxidising the iron, &c., in the clay; (3) the chemical constituents of the clay being unevenly distributed; and (4), owing to the steam discharged from the bricks whilst heated, producing with the carbonic acid of the fuel a chemical action, which showed itself after the bricks were burnt by discoloration. I am inclined to think the last is the chief reason, as it has been fairly well proved in practice that if the bricks are well fired, and all steam and moisture removed from them before they are brought under the action of the fire in the kiln, the colour is much better. This, doubtless, arises from the fact that by the removal of the moisture the smoke and dust in the kiln cannot so readily attach itself to the surface of the bricks, and so cause discoloration. For the effective removal of the moisture from the bricks, and to obtain a good colour, the author can recommend continuous-working chamber kilns in preference to any other with which he is acquainted. The originator of this form of the kiln was Hoffman, whose kilns have been largely introduced. They have, however, recently been considerably improved, and of these improvements we shall have something further to say.

Most of the bricks made in the London district, in which ashes, &c., are used, are burnt in "clamps" in the open without the aid of kilns, and this plan has some economical advantages, as the ashes contained in the bricks furnish part of the fuel for vitrifying or burning them. In addition to this, layers of ashes are placed between each course of bricks, graduating in

thickness from the bottom upwards. Flues or "live holes" are formed at intervals through the clamp, and filled in with wood, which is lighted from the outside, and the mouths of the flues closed. This fire lights the breeze between bricks, and gradually extends to the whole clamp, which continues burning for several weeks. To successfully burn a clamp of bricks requires very considerable skill and experience in the arrangement of the bricks, the thickness of the layers of breeze, &c., these often requiring modification, according to the nature of the clay, &c., which can only be learnt from practical experience.

The common kinds of kilns in use for brick-burning consist usually of a rectangular building or walls, the fires being arranged at the sides or ends of the buildings. The floor of the kiln is sunk somewhat below the surface of the ground, and the bricks are set in and drawn from the kiln through narrow doorways or openings at the side. These are arranged slightly above the surface of the ground, and they are bricked up when the bricks are being burnt. The fire-holes or furnaces are usually arched openings lined with firebrick. The kiln walls are made about 3ft. thick, the bricks being set in loam or fire-clay, mortar not being used on account of the lime contained in it, which would destroy the brickwork when heated. Lean-to roofs are usually erected on each side of the kiln to protect the fires and firemen.

Circular kilns are also in use; these are built with domed roofs with an outside wall to protect the fires. The fire-holes are narrow openings left in the kiln walls.

Many kilns of the ordinary forms in use are very wasteful of fuel, consuming as much as 10 or 12cwt. of coal for each thousand of bricks burnt. Both oil and gas have been used in lieu of coal for burning bricks with, we believe, considerable success. In America, crude oil as a fuel, in conjunction with a compressed-air burner, has been introduced, and it is claimed for this arrangement that the heat can be readily applied to any form of kiln, that it is absolutely under control, and can be easily graduated from the gentle heat necessary at the commencement of burning a kiln to a very intense heat if required. The burner is applied directly to the arches or chambers containing the bricks, and furnaces can be dispensed with. It is claimed for this process that to burn a kiln of average clay into good hard bricks requires about 40 gallons of crude oil per thousand bricks, and as the operation of cooling off is much more rapid than with the ordinary processes, a considerable saving in time is effected.

In erecting kilns, to obtain a successful result, and an equal quantity of hardness and colour in the bricks burnt, the point to be desired, yet difficult to attain, is a method of accurately ascertaining and regulating the heat so as to afford a uniform temperature. Messrs. Lauth and Vogt, of Paris, have recently made a series of experiments with the different pyrometers in use for ascertaining the amount of heat in a kiln or chamber, and speak favourably of the water pyrometer invented by Boulier. This pyrometer consists briefly of a thin copper cylinder having one end closed and the other terminating in the tubes, one of which is connected with a reservoir of water, and the other is joined to a thermometer. In making a test of the heat the thin copper tube is inserted into the kiln, and a current of water is made to circulate from the

reservoir. The water in the cylinder is heated by contact with the hot air, and the rise of the temperature is registered by the thermometer at the exit. In order to insure the regular circulation of the water, an electric balance is introduced into the copper vessel, which, at the least interruption, stops the flow of the water. Another method for ascertaining very high temperatures has also been used in France with success. This consists of employing as tests different metallic alloys of known composition, and whose melting points are known. For temperatures between 960° and 1075° a gold-silver alloy is used; above this temperature an alloy of gold and platinum.

We illustrate above (Fig. 20) a chamber-kiln for drying and burning bricks, pipes, tiles, &c., from the designs of the Bedford Ironworks Co., Bedford. The kilns consist of a series of arched chambers, connected with an overhead main hot-air flue, through which the heat and waste gases are conducted to any chamber that may be desired, the heat and waste gases being afterwards utilised in drying the green bricks in the drying-shed. Each chamber of the kiln is fired independently from a grate beneath the chamber. They are also fed from manholes and handholes formed on the top of the kiln. The distribution of the heat is controlled by dampers in the various flues. The chief feature claimed for the kiln is the general arrangement of the flues, &c., and the utilisation of heat by means of the overhead flue, which diverts the heat into any given chamber, instead of its flowing to the chimney or drying-shed at once from the kiln. The consumption of small coal per 1,000 bricks is stated to be from 1½cwt. to 3wt., according to the size of bricks and kind of clay.

Amongst the more modern form of chamber kilns, that of Hoffman is the best known, the one that has been most largely adopted, and upon whose principle of working most of the later improvements have been founded. These kilns are made either rectangular or circular, and fitted with a number of chambers so arranged that their action is continuous—that is, as the bricks are finished burning in one or more chambers, other chambers are at the same time being piled with green bricks, which before being burnt undergo a preliminary drying by means of the waste heat and gases which pass away from the chambers where the bricks are being burnt. In the ordinary kilns this heat is usually passed away into the air and wasted. An additional economical feature is also secured by utilising the heat from the cooling bricks, after they have been burnt, by employing it to warm the air which is used to supply the furnace fires, so that the air necessary for combustion is raised to a high temperature before being introduced to the fire. The heat required to warm the ordinary cold air to the high temperature necessary to combustion is therefore saved. The flues from the furnaces and various chambers are so arranged, that by means of valves and dampers communication between the flues and chambers and the kiln chimney may be cut off at pleasure. As some of my readers may not be familiar with the working of a Hoffman kiln, I give the working of an ordinary circular kiln, taken from a paper read some years ago by Professor Thompson, who says:—"The kiln is built in the form of a large arched passage like a railway tunnel, bending round in going forward to the ground

FIG. 21.

fill it closes with itself, to form a great circular ring-chamber, within which the burning of the bricks is carried on. This ring-chamber may be of any convenient dimensions, 160ft. diameter being a suitable size. Round its circumference there are 24 entrance doorways, admitting of being closed with temporarily-built bricks and clay, so as to retain the heat and exclude all entrance of air by the doorways so built up. The great ring-chamber may now be conceived as consisting of 24 compartments or spaces, with one of these doorways to each. In the centre of the ring a high chimney is erected, and from each of the 24 compartments of the annular chamber an underground flue leads into the chimney. There are, then, 24 of these flues converging towards the centre like the spokes of a wheel, and each flue has a valve by which its communication with the chimney can be cut off. Arrangements are made by which a partition like a damper can be let down at pleasure, or otherwise placed, so as to cut off all communication between any of the 24 compartments of the ring-kiln and the next one. Let us now suppose the working of the kiln to have been already fairly established; for, after being once kindled, the fire is never extinguished, but the burning of new bricks and the removal of the finished produce are carried on by a continuous and regular process from day to day. Two adjacent compartments have this day their entrance-doors open, all the rest being perfectly closed. By the arrangement of the valves in the flues, and the large partition, the air which gets admittance alone by the two open doors has to go round the whole circuit of the ring-kiln in order to be drawn into the chimney. From one of the two open compartments men are taking out the finished and cooled bricks, and in the other one they are building up newly-formed unburnt bricks which are not yet quite dry. The air, entering by these two compartments, passes first among bricks almost cold and takes up their heat, and then goes forward to warmer bricks, and then to hotter and hotter, always carrying the heat of the cooling bricks forward with it till it reaches the part of the ring diametrically opposite to the two open-and-cold compartments. At this place it gets a final accession of heat from the burning of a very small quantity of small coal, which is dropped in among the bricks from time to time by numerous small openings furnished with air-tight movable

lids. Thus at this part of the kiln there is generated the full intensity of heat which is required for the burning of the bricks. The hot air, including the products of combustion, which, for brevity, we may call the smoke, though it is really perfectly gaseous and free from sooty particles, then passes forward to the bricks, which, by its continuous current, are being heated; and it passes on among them from hot bricks to those which are less and less hot, heating them as it goes, and then passes on to those which are still damp, drying them as it goes; and then it passes to the chimney, in a state almost cold, and saturated with the moisture, in the form of steam or vapour, which it has taken from the damp bricks. On the following day to that on which the operations just described have been going on, the partition is shifted forwards by the space of one compartment, and a corresponding change is made as to the flue which is to communicate with the chimney, and as to the pair of compartments open for the admission of air and for the removal of finished and cold bricks, and the building in of fresh damp bricks; and so the air, including the products of combustion, at the end of its circuit in the annular chamber just before passing off to the chimney, now passes among the fresh bricks which were described as built in on the yesterday of this new day. The place where the small-coal fuel is thrown in is also advanced round the circle by the stage of one compartment, and so now the whole process goes on just as it did yesterday. The fire thus makes a complete circuit of the annular chamber in twenty-four working days. The whole process may be left dormant on Sundays, merely by the closing of all apertures for the admission of the current of air."

We illustrate herewith (Fig. 21) an improved form of Hoffman's continuous-working chamber kiln, patented by Mr. F. H. Jung, of Parkstone, Dorset, who incorporates a heated air system with the ordinary chamber kilns. In this kiln a flue arrangement is constructed between the chamber arches and the floor of the kiln, by which means the outer air is heated to about 600° Fahr. This heated air can be directed into any part of the kiln, which is filled with green bricks, and it is claimed that by this hot-air flue system the green bricks can be thoroughly dried in from one and a half to two days. Any part of the kiln or any chamber can be connected with or disconnected from hot-air flue as may be re-

quired. The hot-air flue and drying chambers are not connected directly with the chimney fire. The air in the flue is heated by the hot brickwork and hot sand on the kiln, and the draught from the kiln chimney causes the circulation of the air through the flue, and at the same time carries off the vapours from the drying chambers. With this arrangement it is claimed that the bricks burnt are of much better average colour than those burnt in ordinary chambers, there being a much greater freedom from steam stain, which largely affects the heads and faces of bricks under ordinary circumstances. Mr. Jung says this is solely caused through the green bricks not being perfectly dry when brought in connection with the fire, the consequence being that the bricks sweat, and the passing smoke and gases from the fire adhere to their damp surfaces, and effect a stain which cannot be burnt off. By drying the bricks thoroughly in a chamber before passing into the kiln, this stain is largely prevented; at the same time, the burning proceeds much more rapidly than is the case with damp bricks, as the steam which in this latter case arises has a tendency to damp and check the progress of the fire.

We are informed that a considerable number of these improved chamber kilns are now in use, giving very satisfactory results. The inventor guarantees to burn from 6,000 to 10,000 bricks with one ton of small coal, according to the nature of the clay—say 6,000 bricks of sandy or fire clay, and from 9,000 to 10,000 bricks from rich clays.

#### HILL'S MANSION, SHREWSBURY.

THE accompanying illustration represents the only old example of the brick-and-stone period now remaining in Shrewsbury. The "shell" is all that remains of this building—the fine stone porch and entrance door, the upper floors and ceilings, old chimney pieces, and staircases, &c., having been taken away and sold for what they would fetch.

The interior of the building is completely stripped, most of the windows are filled in with either brickwork or louvres, and the basement is used as a lumber-room to an auction mart. At the back are some fine examples of half-timber work, used formerly as the servants' quarters, stabling, &c., but now in a very ruinous condition. The date on one of the lead cistern heads is 1618.

The front faces a very narrow street, and being closely built up all round, it is difficult to get a sight of much at a time. The sketch was made in the spring of 1889.

GEO. P. BANKART, Leicester.

On Monday the newly-erected post-office in Hall-street, Bilston, was opened for business. The new building, which has cost £2,700, was erected by Messrs. Bradney and Co., Wolverhampton, from plans furnished from the Office of Works, London.

A new Presbyterian church in Belvedere-road, Sunderland, was opened last week. It is built of red Dumfriesshire sandstone, and has a lofty tower, the style being Perpendicular Gothic. Sitting accommodation is provided for 1,000 persons, and there are folding seats, to be used when required, for 200 more. The large hall will seat about 720 persons, and the lesser halls on the ground floor 320 and 110 respectively. The halls and class-rooms are on the Stockton-road side of the church. The planning admits of all the buildings being used separately, or all in combination, so that 2,210 persons will be able to sit in the building at once. The architect is Mr. John Wilson, of Glasgow, and Mr. Robert Hindon, jun., of Sunderland, is the contractor.

Above £1,000 has been raised during the past few days at a bazaar held at Selby, on behalf of the restoration fund of the abbey church in that town, and the total sum now in hand or promised reaches about £5,500. Mr. J. Oldrid Scott is the architect for the restoration, which will include the repair of the choir, thoroughly overhauling the roof, the filling of the great east window with stained glass, the replacing of the very ugly modern windows on the south side of the edifice by others more in harmony with the main architectural features of the abbey, and the relaying nearly all the floor of the choir and side aisles. The fine arcading on the north and south sides of the aisles is also to be renovated, and all that part of the structure which stands east of the tower is to be thoroughly restored, made weather-proof, and otherwise presentable. The nave was restored from the late Sir Gilbert Scott's plans in 1872-3.

## CONTEMPORARY BRITISH SCULPTORS.

(See description on p. 782.)

## THE GLASS AND DECORATION OF FOLKESTONE PARISH CHURCH.

Our illustration shows part of the wall of the north aisle which has recently been ornamented with mural decoration, pictures, and stained glass by Mr. A. O. Hemming, of Margaret-street, Cavendish-square. Over the door is a group of angels, of which we only show a part, and to the west of the doorway is the largest picture, which is over 12ft. long. The stained glass represents five of the principal Archbishops of Canterbury, with scenes from their lives. One of the windows is given by Sir Edward Watkin. Mr. Hemming is now busy on the south wall, and hopes to complete this series of pictures, which illustrate the "Stations of the Cross," during the summer. The design for this work is now being exhibited on the line at the Royal Academy.

## C. E. MISSION HALL.

There are no particulars worth having of this. It is a sketch design prepared for a Cambridge College, and is estimated to cost £3,000. The site is near the Old Kent-road.

## BEDFORD GRAMMAR SCHOOL.

We give a double-page illustration from a drawing, now at the Royal Academy, of the new building in course of erection for the trustees of the Harpur estates, Bedford. It is situated near St. Peter's Church, at the southern end of the cricket and football ground. The architect is Mr. E. C. Robins, F.S.A., of London. Mr. Spencer, of Bedford, is the builder, and the clerk of works is Mr. Tanner, of Bristol. The design is in the Tudor style, and an endeavour has been made to give an exterior and an interior view in one and the same drawing, which, moreover, is also accompanied with a small plan. The building is faced with red Cattybrook bricks from Bristol, with Weldon stone dressings and Broseley tile roof covering, pitch pine being used for the internal hall roof and other timber and joiners' work. Provision is made for 1,026 pupils, in 41 classes—6 of 36, 11 of 30, and 24 of 20 pupils in each. The building is three stories in height, with four staircases. In addition to the above class-rooms, there are the administrative rooms for the headmaster, office and printing room, masters' common room, and waiting room; also lavatories and a.m.c. on each floor. The various rooms are grouped around three sides of a great hall, 50,000 square feet in area and 50ft. high, with a double tier of galleries, the southern side being sustained on an arcade of stone. About 1,200 persons may be accommodated in the hall and galleries. Much to the regret of the archi-

tect, and for reasons not under his control, it is not a perfect example of the "hall passage system." On the north side, under the great hall windows, is an external ambulatory, broken in the centre by a projecting organ-chamber, and a turret for the flagstaff and bell. A ventilating roof turret is situated in the centre of the hall roof. The cost of the building, exclusive of school fittings, is under £20,000, or less than 5d. a foot cube. A chemical laboratory, completely arranged, is projected as a separate block, to cost another £3,000. Houses for several of the masters are also in hand by the same architect.

## CHURCH OF OUR LADY AND THE ENGLISH MARTYRS, CAMBRIDGE.

The exterior of this church has been previously illustrated in the BUILDING NEWS; the interior now given is exhibited this year at the Royal Academy. The church is almost finished, and the "Stations of the Cross," now being fixed, will complete the internal fittings, which have all been designed in harmony with the style of the church by the architects, Messrs. Dunn, Hansom, and Dunn, of Newcastle-on-Tyne and Bristol. The High Altar, with oak baldacchino (now being decorated by Mr. Westlake), together with four other altars, the stations, and the statues at the west and tower doors, have been executed by Mr. R. L. Boulton, of Cheltenham; and the beautifully-worked oak screens which surround the chancel are by Mr. Ralph Hedley, of Newcastle-on-Tyne. All the windows are filled with stained glass. We gave a description of the plan and general treatment of the design when the exterior view appeared, so that it is needless to recapitulate.

## MUNICIPAL LODGING-HOUSES IN GLASGOW.

THESE plans are interesting just now on account of the proposal made by the London County Council to erect such buildings within the metropolitan area. In all large towns there are always a large number of people who have no home, and the horrors of the casual ward are familiar to many more persons than the well-to-do have any idea of. Common lodging-houses have fallen into disrepute among the better class of itinerant lodgers, though periodical inspection on the part of the authorities has done much in preventing these places from becoming perfect pest-houses. The Corporation of Glasgow a few years ago erected seven large model lodging-houses, capable of sleeping 1,929 persons in the aggregate, and in any one of these 3½d. per night will insure a clean bed, light, fire, and appliances for cooking. That which we give the plans of is to-day in Clyde-street, and we are indebted to Mr. J. Williams Dunford, the architect to the Salvation Army, for the loan of the originals, which were supplied by the authorities of H.M. Office of Works, when it was thought practicable to erect similar buildings for the work of the Salvation Army. The plans readily explain themselves. In the basement there is a caretaker's house and a large dining-room and kitchen, a hall, and general shop for sale of cheap provisions. The ground-floor entrance is central, and it is commanded by an office. The day room occupies the front, and to the rear is a dormitory for 32 beds, with lavatory and w.c. adjoining. Above, the whole space is devoted to dormitories, one for 48 beds, one for 40, and one for 32 beds, with an isolating landing and staircase between the two wings. The front-wing arrangement is repeated on the second floor. The sketch given of the bunks shows how each sleeper has complete privacy. The door of the first bunk is shown open, and the bed is on the top tier. The sleeper in the next bunk is below, so that by this hit-and-miss arrangement the utmost is made of the available space, and each lodger is independent of the other. The doors bolt, and there are two hooks in each bunk to hang clothes upon. The passage between the rows of bunks is 5ft. wide, and the whole series standing free of the walls has an entire circulation of air round, with a cubical air space of 400ft. per head. A woven wire spring mattress is provided, 2ft. 6in. wide, and each bed has a hair mattress, two hair pillows, one sheet, and a pair of full-sized blankets folded in four. Round the walls of the kitchen are lockers, for one of which every lodger may have a key if he deposits 6d. for the time he holds it. Everyone cooks for himself, and teapots, saucers, and basins are provided. The kitchen fire does all the cooking and heats the house throughout. Feeding is confined to the basement. These houses pay a dividend,

and the total revenue proceeding from them for 1888 was more than 4½ per cent. on the original cost. Of course, they are very plainly designed. The houses are for males only, with the exception of one in Russell-street, where there are 96 beds for women.

## COMPETITIONS.

**BARNSELY.**—The unfortunate dropping of the date in June out of the advertisement of the Barnsley Town Council in our last issue has, we fear, caused trouble to many. The date by which designs for the reconstruction of the large hall are to be sent in is the *ninth* of June.

**RAWALPINDI.**—In the recent competition for designs for the Lansdowne Institute, at Rawalpindi, Upper India, the drawings submitted by Mr. W. Arundell, M.S.A., were awarded the premium of 300 rupees, and will be carried out subject to slight modifications. The object of the building is to provide accommodation for theatricals, concerts, and dances, while ordinarily it will be used as a library and reading-room. The hall is 67ft. by 33ft., with a screened gallery for native ladies at one end and the stage opening out from the other, with retiring-rooms, green-room, carriage porch, and verandahs. The style is a modification of that of the Mogul Dynasty, and the central portion is surmounted by a 20ft. dome. The estimated cost is 26,000 rupees.

**SALE.**—A free library is to be built at Sale, and a limited competition has been held among the following architects: Mr. George Truefitt, of London; Messrs. Heathcote and Rawle, of Manchester; and Mr. Robert J. MacBeath, of Sale. On Monday last, at a meeting of the local board, the report of the sub-committee was adopted, unanimously electing Mr. MacBeath as the architect for the work, which will be proceeded with at once. It was announced at the meeting that £1,000 had been already subscribed towards the erection of the building.

## CHIPS.

At the Tavistock County Sessions last week an action was brought by the Tavistock Highway Board against Messrs. Relf and Pethick, the contractors engaged in the construction of the Lidford Junction Line of the London and South Western Railway, claiming damages in consequence of injury caused to three roads by the heavy traffic in connection with the making of the new railway. The defendants were ordered to pay £56 11s. as damages with costs, but the Bench agreed to state a case for the superior court.

Last week the new Trinity Wesleyan Sunday School erected in Roundhay-road, Leeds, was opened. The school is built in the Italian style of red pressed bricks and Harehills stone dressings. There is an assembly-room, with accommodation for 400 persons, lighted by clerestory windows at the sides and large windows at each end. On both sides of this room are class-rooms—ten in all, and at one end is an infants' room seating 180 children. The building has been erected from the designs of G. F. Danby, Leeds, at a cost of £2,100.

At a meeting of the Association of Public Sanitary Inspectors, held on Saturday at Leamington, an address by the president, Sir Edwin Chadwick, was read, in his absence, by Sir Douglas Galton. In it the writer insisted on the necessity of forming a central sanitary authority for the kingdom, with a Minister of Health added to the Cabinet. Sir Douglas Galton also enforced the necessity of creating such a public department.

The Plymouth, Devonport, and South-Western Junction Company's new line from Lidford to Tavistock, Devonport, and Plymouth will be opened for traffic on Monday next by the South-Western Railway Company, whose trains will run over the line in connection with their through services from London and with the North of England via the Midland Railway and Templecombe. This new railway, which is a double line throughout, will enable considerable accelerations in the journey between Waterloo and Plymouth to be made.

The Tivoli Theatre, Music-hall, and Restaurant in the Strand, which was built, so far as the carcass was concerned, from Mr. Walter Emden's designs, and has been completed by Mr. C. J. Phipps, was opened on Saturday.

The loan collection of works of art with which the new premises of the Corporation Art Gallery at Guildhall will be inaugurated will be opened by the Lord Mayor on Tuesday, June 10, at two o'clock. Some valuable and interesting paintings and sculpture have been lent to the City Corporation for the occasion.

## NEW DRINKING FOUNTAIN IN VICTORIA PARK.

THIS new drinking fountain, lately uncovered in Victoria Park by Sir E. H. Currie, is one of a series which Mr. J. Passmore Edwards, the proprietor of the *BUILDING NEWS*, the *Echo*, the *Weekly Times and Echo*, the *English Mechanic*, the *Southern Echo*, the *Hampshire Independent*, &c., is erecting in London and the provinces to the memory of distinguished public characters and personal friends. The Victoria Park fountain is dedicated to the memory of John Bright, and is appropriately simple and solid in character

and design. It is composed of Cornish granite, quarried by Messrs. J. Freeman and Sons, of Penryn, and was designed by Mr. Robert Keirle, F.R.I.B.A., architect.

The area of forest land in India demarcated and reserved by the State is steadily increasing year by year, especially in the Central Provinces, which now contain by far the largest area of reserved forests of any province in the peninsula. There were at the close of 1889 54,917 square miles of demarcated forest, as against 17,705 square miles so recently as twelve years since.

St. Peter's parish church, Little Driffield, was reopened after restoration and partial rebuilding on Friday. Mr. Temple Moore was the architect, and Messrs. George Shepherdson and Son, of Driffield, were the builders: the outlay has been £1,200, besides special gifts.

A new Bible Christian chapel in Locking-road, Weston-super-Mare, was opened on Friday. It is built of native stone with freestone dressings, and the fittings are of pitch-pine. It is seated for 400 persons, and has cost, with schoolroom at the rear, £1,400. Messrs. Hans Price and Wooler, of Weston, were the architects, and Mr. T. Allen, of the same town, was the builder.

## WAYSIDE NOTES.

IT is quite possible for both parties to make a good case for or against the proposed changes in the Architectural Association. The reformers urge that the voluntary system has been tried in the balance and found wanting, while the keep-as-we-are gentlemen proclaim that the A. A. has been from its foundation a mutual, self-help society. Here we have clearly Liberal, if not Radical, sentiments, and good old English stick-in-the-mud Conservatism. At the discussion on Friday evening last the reformers had the best of it, as might have been expected, seeing that the "Bill," so to call it, for improvements in the organisation of the Association has been fathered by the "Government." The "Opposition," however, may be largely represented at this evening's meeting, and, if so, there will be a vigorous discussion on the merits of the scheme and the desirability of carrying it into execution.

It may be said in favour of those desiring the change, that their action is in harmony with a commendable spirit of improvement, while at the same time it may be asked, In what respect has the voluntary system been found wanting? Has it not done all that could be expected of it under the conditions imposed by the very nature of the Architectural Association? We do not say that a watch has been tried and found wanting because it does not inform us of the probable state of the weather or the direction of the wind. The change may be for the better, as it appears likely to be—for the student of architecture, at any rate—but the Association of the past will have disappeared. From a mutual self-helping society it will have changed to a teaching academy, and this point is one that should be well considered by members taking an active interest in the future of the A. A.; and at a crisis like the present all will be interested in the future. It is this latter point that those opposed to the reform, or revolution, will fasten upon as weighing heavily in their favour. They will hark back to the commencement of things, and declare that the Association was founded, not as an academy, but as a self-helping society, formed of young men interested in the study of architecture, who should mutually assist one another, and do all in their power to forward the common weal. They will say that the raising of the subscriptions, in conjunction with the abolition of the voluntary system of teaching, will result in the formation of a new mutual society for young and poor students. And these objections will be worthy of careful consideration by all interested in the true welfare of the Association, and all who are not led, by curious ambition or self-seeking, to favour a radical change in its working until it has been proved undeniably good and pleasing to the majority of members.

The reformers will have to show that the above objections are nothing worth. They will have to demonstrate, if possible, that the proposed changes will be to the benefit of architecture and architects, through architectural students—that is to say, that the greater perfection of educating machinery will produce architects of superior skill and more powerful to advance the interests of architecture and of architects, which must of necessity go hand in hand. If they can do this, few will be selfish enough to oppose merely because they feel that the change is for the student and not for themselves as members, continuing their membership for the sake of the interest and enjoyment they derive from fellowship and attendance at entertaining lectures, &c. Such persons have every right to object to changes in a society originally intended to be conducted on certain lines; but I suppose the meetings, &c., of the Association would, under the new state of things, continue much as heretofore, so that the grievances of non-student members would be more imaginary than real. The most realistic of any would be the raising of the subscription, not to a vast amount, it is true, but enough to cause opposition. Here, however, there should be a tendency for matters to right themselves, for, both theoretically and practically, the burden of the increased subscription would fall most heavily on the student class, and students have less money to expend than the older members. But it is the students who are to benefit, while the latter class of members do not benefit. There are exceptions to the above rule of students being poorer than young architects; and Mr. Com-

missionless, of the fourth-floor "back," who, it will be remembered, offered to take on the job of an assessor for a ten-pound note, says he knows a thing or two on this point. Nevertheless, the rule holds good in spite of exceptions.

The pith of this matter seems to be the attitude of the student himself. Does he want to pay one guinea subscription instead of the half-guinea, and receive supposed benefits? If he does, all well and good; let the scheme go through. If, on the other hand, he fails to recognise the benefit of the change, I don't see how the Association Council and its committee are to make him take kindly to the proposed innovation. They cannot stuff it down his throat willy-nilly. Students vary as the face of the sky; but as a class they are the same, and if A. A. students do not want the change now, it is not likely that those who will join the Association in days to come will be in a different frame of mind. If, as asserted by those bringing forward the proposed reforms, the benefits are for the student, let us ascertain first whether he is himself as enthusiastic in the cause as some imagine. One of the most sensible suggestions put forward on Friday last, was to the effect that a poll should be taken of members, to ascertain their views on the subject, and I would add all my weight to this suggestion. The matter may be decided by vote, and possibly this evening, so members holding decided views and having any reason or wish to vote one way or another, must bestir themselves to-day and wend towards Conduit-street at eventide.

There won't be any Channel Tunnel ready for the holiday exodus of architects and students to the Continent this summer; but since Carlyle's well-known and oft-quoted saying seems wonderfully applicable to a large portion of the English nation, who, having a "right little, tight little island," would literally undermine its tightness and rightness by constructing a dry thoroughfare from it to the Continent, there seems some reason to believe that in days that have grown yet more evil the tunnel will be commenced with serious intentions, be it ultimately finished or left incomplete. Of ideas and schemes there are plenty. What with tunnels and bridges, and a combination of the two means of crossing the silver streak, not to mention the marvellous designs for blowing-up or flooding a tunnel at a moment's notice—a fascinating subject to reflect upon, one would think, when in the bowels of the earth midway between Calais and Dover! The latest scheme, the details of which have been put before an admiring public, who take it all in for gospel, is that of M. Varilla, a Frenchman, who, according to the *Daily News* correspondent, "singularly resembles Napoleon." M. Varilla's scheme consists of bridges, combined with a tunnel. Piers or "bridges" would run out from the shores of either country, and at their extremities would be lifts to lower the trains into the tunnel. There is no denying the originality of the idea, which, it is to be supposed, was conceived with the object of rendering seizure of the end of a tunnel on the Watkin model impossible. Otherwise it might be docketed along with many other schemes as issuing direct from an inventor in Bedlam. The trains on this system would be run some way out to sea, let down 160ft. or 170ft., run along the tunnel, up the lift in the twinkling of an eye, along the other bridge, or pier, and there you are—if nothing goes wrong with the works.

M. Varilla is not aback in practical details, or, at least, in general practical scheming, which is often found to differ from practical detailing when the works are commenced. The tunnel has to be constructed with its two ends submerged, and this is to be done with caissons measuring 600ft. and 400ft. by 90ft., which will each form "a peaceful lake" in the waste of waters. One wears of these Channel tunnels in the air (where, by the bye, they are more easily constructed than in the sea), and it tries one's patience considerably to have to repeat them as they come along. Those wishing for fuller details as to this, the latest scheme for enabling persons to go under to Paris, may consult the *Daily News* of the 28th, wherein will be found the account of the correspondent's interview with the originator. Enough of the Channel Tunnel, and its variations in bridges, &c., except that I would point out that the foolish Great Tower

business and the Channel Tunnel have been fathered by one and the same person.

Descending from the airy flights into which the what "might" be done leads us, we arrive at ordinary works of architecture, and find that the summer competition season is upon us, when, emboldened by the fine weather, public bodies decide to invite designs at a time when the works should have been well under way. Instead of taking time by the forelock, and making architects busy indoors in the winter and out of doors in the summer, they neglect to get designs till the summer, and very often this bad management finds the building commenced in the worst of weathers. The two particular circumstances to which I allude may, however, be different. The Barnsley Town Council, possibly, may prefer that the work of reconstructing the interior of their public hall should be carried on at some particular time of year; and the time of announcing competitions for free libraries must necessarily depend upon the taking of the vote for the adoption of the Act authorising the imposing of the requisite tax, so it is to be charged to no one's account whether the parish of Bermondsey asks for plans for a free library in spring, summer, autumn, or winter. As competitions, these two advertisements require little notice. They are of the ordinary run, with nothing to lift them out of the commonplace, unless it be the fact that, judging from the wording of the announcement from Bermondsey, the commissioners for the public libraries of the parish unnecessarily waste the time of architects and their assistants or agents, by requiring competitors to call for particulars. GOTH.

## CHIPS.

The new parish church of Ancrum, N.B., was opened on Friday last. It has been built from designs by Messrs. Hardy and Wight, architects, Edinburgh, carried out in local red freestone, granted free by Sir William Scott, of Ancrum. The style is Early Decorated, the windows having mullions and tracery characteristic of the style. The church is seated for 470, 80 being in an end gallery. The most striking detail of the interior is a stained-glass window erected from a design by Messrs. J. Ballantine and Son, Edinburgh, and is a rendering of Da Vinci's "Last Supper." The works have been carried out at a cost of £1,650.

The dedication of a new memorial reredos which has been presented to St. Ann's Church, Birkenhead, took place on Friday, the Bishop of Chester being the preacher. The reredos, which is the work of Messrs. Norbury and Patterson, and wrought in oak, is a representation of the Lord's Supper.

The parish church of Milton-next-Sittingbourne was reopened for public worship on Wednesday week. The interior of the church has been restored, and the high-backed pews have been removed for seats of modern design, under the superintendence of Mr. W. Leonard Grant, of Sittingbourne. The work has been carried out by Mr. W. Beaumont, builder, of Milton, at a cost of £1,400.

The dissolution of partnership heretofore subsisting between Henry Saxon-Snell and Son, Southampton-buildings, Chancery-lane and elsewhere, architects and surveyors, is announced.

The following resolution was passed by the Society of Antiquaries at their meeting on Thursday, the 22nd inst.:—"That this society hears with deep regret that the 18th-century glass that was formerly in the north transept window of Westminster Abbey Church has been irretrievably injured by cutting it down to fit a new window of an entirely different design; and at the same time expresses a hope that the old glass now in the east and west windows will be preserved uninjured." A copy of this resolution was forwarded to the Dean and Chapter of Westminster.

The name of Alfred J. Beesley, Buckingham-street, Strand, architect, appears in Friday's list of receiving orders in bankruptcy.

The old grand stand on the Knavesmire at York, built from the designs of Alderman Carr, of that city, a well-known architect in his day, in 1753-4, is being demolished down to the ground story, and will be rebuilt on an enlarged plan, providing for 2,000 spectators. The works are being carried out from the plans of Messrs. Fisher and Hepper, of York, at a cost of £3,000.

The Home Arts and Industries Association will this year hold their meeting at Birmingham in the town-hall on Thursday, June 5th, and the intention, by thus localising the exhibition, is that increased interest and practical value for the working members attending the classes in this great centre of activity will be secured.

## CONTEMPORARY BRITISH SCULPTORS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THIS sheet, which includes a portrait of Mr. Ruskin, the author of the "Stones of Venice" and "Seven Lamps of Architecture," is the second plate given by us devoted to British Sculptors. No one has influenced modern art more in some respects than Mr. Ruskin, who, as an art critic, has no equal in this country, so that any series of photographs of architects and artists would be incomplete without his portrait. Professor John Ruskin, M.A., LL.D., was born in Hunter-street, Brunswick-square, London, in February, 1819, and he is son of a London wine merchant. He was the Newdigate Prizeman at Christ Church, Oxford, in 1839. He then devoted himself to painting. A pamphlet in defence of Turner was his first attempt at literature, and this was developed into a standard work entitled "Modern Painters," commenced in 1843 and completed in 1860. "The Seven Lamps of Architecture" was published in 1849, and the "Stones of Venice" in 1851-3. The works since written by Mr. Ruskin are too numerous to mention here. They include "The Two Paths: Lectures on Architecture and Painting," 1854; "Giotto and his Works," "Elements of Perspective," "Lectures on Art, Decoration, and Manufacture," 1859; "Ethics of the Dust," "Studies of Architecture in Our Schools," "Crown of Wild Olive," 1866, and "The Queen of the Air." Mr. Ruskin was Rede Lecturer at Cambridge in 1867, was elected Slade Professor of Fine Art at Oxford, and in 1872 published "Aratra Pentelici: Six Lectures on the Elements of Sculpture," given before the University of Oxford. He devoted £5,000 for the payment of a mastership of drawing in the Taylor Galleries at Oxford in 1872. "Arrows of the Chase" appeared in 1880. Prof. Ruskin resigned his Slade Professorship in 1884 on account of failing health. He founded and furnished a unique museum, now the property of the Corporation of Sheffield. His autobiography is published under the title of "Præterita." Mr. Ruskin's home is at Brantwood, Coniston. His portrait is from the studio of Messrs. Elliot and Fry, of Baker-street, W.

Mr. Thomas Woolner, R.A., was born at Hadleigh, in Suffolk, in 1826, and was educated at Ipswich. He was a pupil of Wm. Behnes, under whom he acquired skill as a sculptor and draughtsman. "Eleanor Sucking the Poison from Prince Elward's Wound" was exhibited at the Royal Academy in 1843, and a life-size group of "The Death of Boadicea" in Westminster Hall, the latter attracting considerable notice. "Puck" and "Titania with her Indian Boy" were shown at the British Institution, and an "Eros and Euphrosyne" and "The Rainbow" were placed in the Academy in 1848. Two years later Mr. Woolner, in conjunction with Mr. Millais, Mr. Holman Hunt, and Dante Gabriel Rossetti, took a leading part in publishing a paper called *The Germ*, which soon died. It was founded in the interests of the "Pre-Raphaelites." Mr. Woolner's work and statues are very numerous, and include Lord Macaulay at Cambridge; Sir Bartle Fere for Bombay; Lord Lawrence for Calcutta; Lord Palmerston for Palace-yard; Richard Cobden, Charles Dickens, Canon Kingsley, Lord Fredk. Cavendish, Sir Edwin Landseer's monument in St. Paul's Cathedral, Bishop Fraser at Manchester, and many others. His work this year at the Royal Academy is Sir Thomas Elder, G.C.M.G., for the Great Hall of Adelaide University, South Australia. He was elected A.R.A. in 1871, and R.A. in 1874. He was Professor of Sculpture in the Royal Academy in 1877-79. His portrait given to-day is by Messrs. Done and Ball, of Baker-street, W.

Mr. George Frederick Watts, R.A., was born in London in 1820, and first exhibited at the Royal Academy in 1837. He is best known as a painter. In 1843, at Westminster Hall, he obtained one of the highest prizes (of £300) for his cartoon of "Caractacus led in triumph through the Streets of Rome," and again in 1847, on his return from Italy, he took the highest honours at the competition, also in Westminster Hall. His two colossal oil pictures, "Echo" and the "Landing of the Danes," were purchased by the Commissioners for the Houses of Parliament. One of his statues is to the memory of the late Marquis of Latham, in Blickling Church, Norfolk. The equestrian statue of "the First Earl Grosvenor as he Hawked in the Welsh Marches" is another. His gallery at Kensington has for

years been open to the public on Sunday afternoons. We illustrated Mr. Watts's house in the *Building News* for Oct. 7, 1881. His portrait is the work of Mr. Donovan, of Brighton.

Mr. Alfred Gilbert, A.R.A., was born in Berners-street, London, in 1854, and studied his art under Boehm in 1874, after which he entered the Ecole des Beaux Arts under M. Cavelier. He went to Rome after three years in Paris, and executed his "Kiss of Victory" in marble. He first attracted attention by his "Perseus Arming," and a small bronze head exhibited soon after made a great impression among his brother sculptors. "Icarus" (1884), amongst other works, marked him out for early distinction, and in 1886 his "Enchanted Chair" was unquestionably a masterpiece, which resulted in his election as A.R.A. soon after. The bronze monument in Westminster Abbey to Professor Fawcett is one of his works. This year he shows a bust of Mr. Cyril Flower. He now is engaged on a great fountain for the triangular site at the end of Piccadilly, facing the top of Waterloo-place. He exhibited a bust of Mr. G. F. Watts, R.A., last year, and a bust of Mr. J. S. Clayton, and designed the medal for the Art Union. In 1888 he erected the statue of the Queen, at Winchester, in bronze; and lately he has designed the Pastoral Staff for the Bishop of London, in conjunction with Sir Arthur Blomfield, A.R.A. His portrait is from the atelier of Mr. Frederick Hollyer, of Kensington.

Mr. Charles Bell Birch, A.R.A., was born at Brixton in 1832, and his early art studies were conducted at Somerset House, and afterwards he worked in the Berlin Royal Academy, and was a pupil under Professors Rauch and Wichmann till 1852. In 1864 Mr. Birch won the Art Union prize of £600 for his group, "A Wood Nymph," afterwards executed in marble. Among a large series of portraits and other works, we may mention a colossal statue of S. T. Chadwick, M.D., in bronze for Bolton; "The Last Call," a group of heroic size in 1879; Lieut. Hamilton followed the next year, and the Maharajah of Bulrampore, a colossal statue, in 1881, done in bronze; Lord Beaconsfield, for Liverpool; General Earle; and a large group of "Godiva." Mr. Birch has long been engaged as a draughtsman on wood and stone for the *Illustrated London News*, and in 1880 he did a series of twenty designs for the Art Union of London in illustration of Byron's "Lara." A marble statue of Earl Dudley was erected in 1888, and in 1889 one of Professor Robertson, of Oxford. This year, Mr. Birch exhibits at the Royal Academy a medal design for the Company of Musicians, and a bust of Mrs. J. Morgan Richards. He designed an equestrian statue for Blackfriars Bridge. In 1885 the bust of the late Sir Horace Jones was shown by him at Burlington House. He was elected an Associate of the Royal Academy in 1880.

Mr. George Tinworth was born in a cottage in Milk-street, near Camberwell-gate, Walworth, on the 5th of November, 1843. His father was a master wheelwright, in a very small way of business. At an early age Mr. Tinworth began to work at his father's trade, and to help him in the shop. In 1860 he first heard of the Lambeth School of Art, which had been founded by Canon Gregory in 1854. The young student entered it in 1860, and on the 22nd of December, 1864, he was admitted to the school of the Royal Academy. On his modelling "Hercules" from the antique in 1865 he gained the second silver medal in the Antique School, and for modelling the "Dying Gladiator" he won the first silver medal in the Life. In 1878 the French Government awarded him the silver medal and a decoration, making him an officer of the French Academy, for the work he sent to the Paris Exhibition that year. He left the wheelwright's trade when he was 23 years of age, and has worked for Sir Henry Doulton ever since, during which time he has designed many works of great importance, including the panel for Mr. Street's reredos in York Minster, besides 28 panels for him in the Guards' Chapel in Birdcage Walk, which he designed and modelled also under the direction of that great architect. He also did the figures and panels for Mr. Oldrid Scott's reredos in old Lambeth Church, and seven panels for Sir Arthur Blomfield's Church at Copenhagen; likewise a figure of David in Wells Cathedral; the Ascension for the reredos in St. Mary's Church, Tooting; and many other works, both at home and abroad, some of which we have illustrated in the *Building News* at various times. His photograph is by Messrs. Done and Ball, of Baker-street.

## NEW NEWSPAPER OFFICES IN BREAM'S BUILDINGS.

AN extensive block of buildings, built for the publishing and printing offices of the *Queen, Field, and Law Times* by Messrs. Dove Bros., builders, is approaching completion in Chancery-lane, from the designs of Messrs. Satchell and Edwards, architects. The new structure is self-contained, and presents a long frontage towards Bream's Buildings, the angles pronounced by cupolas arranged in pairs at each end. The elevation is of stone and red brick, the two lower stories being in the former material, massively treated as an arcaded basement. Slight projecting wings forming staircases crowned by cupolas mark the ends, and these are of stone exteriorly. On the ground-floor are a suite of publishing offices and paper stores, and other offices well lighted by three-light windows in the arched recesses. A roadway paved with Claridge's patent asphalt, a very excellent specimen of the Company's work, leads through the building to the back premises, and we note that the arches and flats, damp and vertical courses of the basement are protected by this asphalt about  $\frac{1}{2}$  in. thick. The roadway and footways are laid with a  $\frac{1}{2}$  in. thickness of the material, finished at the sides with skirtings and fillets, all done by the workmen of Claridge's Asphalt Company. In connection with the basement we may mention the commodious machine-room, constructed of iron and glass, having a central roof carried on lattice ribs of wrought-iron, and surrounded by lean-to aisles glazed. The floor of hard slab paving extends under the main building to the front, where it is amply lighted by Hayward's semi-prism lenses introduced horizontally on a level with the paving of street and vertically. White glazed bricks round the walls reflect the light also, and add much to the effect. The floors of the main building are constructed on Homan and Rodgers' system of iron and concrete, with dovetail brick to form the key of the ceilings. The flooring to the corridors, &c., is of marble mosaic and granolithic paving. Lowe's wood-block flooring is used in many of the rooms. Ascending by a stone staircase, one at each end, we find hydrants placed on each landing, and double-folding iron doors at the doorways. Reaching a spacious and well-lighted corridor, the front rooms are entered—one of these is the principal, Mr. Cox's room, with a walnut dado. Miss Lowe's apartments are at the east end of corridor. Lavatories fitted with George Jennings's appliances are on each floor. On the second floor are Mr. Phillips's apartments and those of the composers, lighted by windows on both sides, with white glazed-brick facing and red glazed-brick dado, Mr. Lowe's wood paving being laid throughout. The third floor is devoted to another large room for composers, lighted by skylight; also to readers' rooms. Ascending to the roof, which is a flat, the whole surface, excepting the raised skylight, is laid with Claridge's patent asphalt, having an easy gradient, and with the Company's system of asphalt skirting and fillets round the parapets and skylights. Altogether an area of roof of about ten thousand superficial feet has been covered with this material, in addition to the flats in other parts of this very efficient and complete building. We may add that Mr. T. Fiske is the clerk of works under the architects. We understand the Architectural Association paid a visit to the building last Saturday afternoon, and expressed their satisfaction with the work.

## BUILDERS' IRONMONGERY AND STAINED GLASS.

WE have seldom seen such comprehensive and sensibly-arranged builders' catalogues as the three sent us by Messrs. Young and Marten, of the Caledonian Works, Stratford. The prices are moderate throughout, and the reputation of the firm is a sufficient guarantee of good value. The sanitary catalogue contains 83 pages and 404 illustrations. The elaborately got-up sheet of leaded cathedral lights illustrates 139 subjects, embodying all classes of work, and, of course, at all prices, but always moderate and marked by good taste. The "No. 13 Tariff of Wholesale Trade Prices" is revised to date, and is a perfect builders' *vade mecum*. We notice, glancing through it, on page 7, some Stucco Centres, combining extreme lightness, extreme cheapness, excellent designs. On page 16 is

A SPECIAL report on the progress and present condition of the Ordnance Survey has been prepared by Sir Charles Wilson, the Director General. The work began in 1784 with the measurement of the base line on Hounslow Heath; a trigonometrical survey for military purposes was ordered in 1791; but it was not until 1797 that the design of a general map of the United Kingdom, founded on a minute survey, was first conceived. The map was published on the scale of lin. to a mile, and by 1824 the whole south of England and parts of Wales and Scotland had been surveyed. The work was then suspended in order that Ireland might be surveyed on a scale of 6in. to a mile for a general land valuation, which was almost completed in 1840. The changes made in the work of the department have resulted in a programme which embraces the production of six sets of maps. These, with the degree of completion in each case, are as follows:—(1) Plans on a scale of 126·72in. to the mile of all towns with more than 4,000 inhabitants. These are all published. "The gigantic nature of this work may be gathered from the fact that no less than 374,470 acres, or 585 square miles, have been

surveyed on a scale sufficiently large to show detail down to the size of a doorstep and an area grating." (2) Parish plans on a scale of 25·344in. to a mile have been completed for all England and Wales, except Lancashire and Yorkshire. (3) County maps on a scale of 6in. to a mile, in two editions, one with, the other without, contours, have been practically completed, and are published for all counties except Devon, Salop, and Wilts. (4) A topographical map on the scale of 1in. to the mile was commenced in 1801, and completed in 1870. But a new 1in. map was commenced in 1872, of which about half has been published in outline and a fifth with hills. (5) A map on the scale of four miles to an inch is in the hands of the engraver. (6) A map on the scale of ten miles to an inch does not seem to have been commenced yet. The current work of the department includes the survey of new town areas which have come into existence since the original survey was made, and in revising old town areas, and in re-surveying on the 25in. scale counties originally surveyed on the 6in. scale only. In Lancashire and Yorkshire the town areas, which in 1842-54, when the original survey was made, amounted to 80,389 acres, now include about 120,000. On the portion of the Yorkshire coast recently surveyed it has been found that the sea has encroached 215ft. since 1852. Some extraordinary subsidences have been discovered on the re-survey; in the neighbourhood of Barnsley, Doncaster, and Rotherham the ground has sunk, over an area of 100 square miles, in some cases as much as 5ft. The force of the survey includes 319 officers and men of the Royal Engineers, 1,573 Civil assistants, and 437 labourers—in all 2,329.

#### CEMENT PAVING AT HEREFORD.

MR. JOHN PARKER, city surveyor of Hereford, in a paper on the sanitary works and water supply of that city, read before the Association of Municipal and Sanitary Engineers and Surveyors during their visit to Hereford on Saturday last, described a form of cement pavement which he is having laid in Broad-street by the corporation men, and which he regards as satisfactory. The bottom bed, 3in. thick, consists of clean gravel and cement, in the proportion of six to one, on a solid foundation, the surface or top coat being floated in 1½in. thick, consisting of 1in. clean washed sand, Dalbeattie (or Cleve Hill) crushed ½in. granite, and cement in equal proportions. As the success of such a pavement depends upon the quality and condition of the cement, the specification employed by Mr. Parker may be usefully reproduced:—

"The cement is to be Portland, of the best quality, ground so fine that the residue on a sieve of 5800 meshes to the square inch shall not exceed 10 per cent. by weight. A struck bushel shall weigh not less than 109lb., nor more than 116lb., the cement to be run through a hopper with spout 6in. above top of measure. When tested, should the proportion which will not pass through the sieve be greater than 10 per cent., a quantity of cement proportionate to such excess must be added. When delivered, it is to be put into a dry shed at Corporation-yard, and will not be accepted or paid for until it is tested by samples taken from different sacks or casks. About 10 per cent. of its weight of water shall be added and briquettes formed into moulds of 1in. sectional area at the weakest point. The briquettes, having in the mean time been kept in a damp atmosphere, are to be put into water twenty-four hours after being made, and remain in water until tested. It must not, at any time of the year, set in less than 1 hour, and must bear, without breaking, a weight of 350lb. to the square inch fourteen days after the briquettes have been made. If it does not, it will be rejected, and must forthwith be removed from the stores by the contractor."

A new Wesleyan Chapel at Upper Poppleton, near York, was opened on Friday. It is Early English in style, and is built of white bricks with stone dressings, and the whole of internal woodwork, including rostrum pulpit and seats is of pitch-pine. The chapel is seated for 165 persons, and has cost £900. Mr. C. Anderson, of Lendal, York, was the architect, and Mr. J. Simpson, of the same city, the builder.

A memorial to the miners who lost their lives in the disastrous explosion at Longton will shortly be erected. It takes the form of an obelisk of grey granite surmounted by a cross inscribed with the names of the unfortunate men, and resting upon a slab representing a coal seam, in the front of which a miner's pick and safety-lamp appear. Several designs were submitted in competition, and that of Messrs. Jones and Willis, of Birmingham, London, and Liverpool (described above), was finally selected, and the work placed in their hands for execution.

## Building Intelligence.

BIRMINGHAM.—An important block of buildings, consisting of villa residences, and having a frontage of about 500ft., is now approaching completion. These houses have good reception-rooms, kitchens, &c., entrance and back halls and vestibules, well-arranged bedrooms, bath-rooms, and other conveniences. Being situated in the best part of Edgbaston (the fashionable suburb of Birmingham), and being well adapted to the requirements of merchants, professional men, &c., these houses have every probability of being speedily tenanted. They have large gardens both at front and back. The front elevation is Gothic in character, with bay windows, two light windows above with stone columns, arches, labels, and tympana, Minton's tiles, large dormer windows, ornamental porches, &c. The total cost is about £10,000. The architect is Mr. J. Statham Davis, and the builder Mr. Edward Airey, both of Birmingham.

CANTERBURY.—The restoration of St. Anselm's chapel in Canterbury Cathedral being now complete, it has been set aside for purposes of private prayer and meditation. This chapel, which is on the south side of the Cathedral, and at the east end, escaped the fire of 1174; but when the present choir was built, its roof pressed upon the north wall of the chapel and crushed it. Accordingly various means were adopted to support the building and resist the thrust of the choir roof. Amongst these was a buttress wall, which was built across the apse of the chapel, and cut off one-third of the old Norman arcading. About two years ago Canon Holland undertook the restoration of the chapel, and after carefully strengthening the walls by iron girders and masonry, he was enabled to take down this buttress wall, and then there was discovered behind it, on the north wall of the apse, the fresco which has excited so much interest. The whole of the chapel has now been restored, under the guidance of Mr. J. L. Pearson, R.A.

DERBY.—At a meeting of the governors of the Derbyshire Infirmary, at Derby, on Friday, a report was presented from Messrs. Young and Hill, architects, London, who had been specially appointed to examine the building owing to the discovery of sanitary defects, which had led to an epidemic of typhoid fever amongst the nurses. The report disclosed a very serious state of affairs, the drainage being so bad that work was recommended which would cost £50,000, and as an alternative the architects suggested the entire reconstruction of the Infirmary, at a cost of about £60,000. The President, Sir William Evans, said all the in-patients who could be sent away had been removed, and no fresh ones were being admitted. A house had been hired for the nurses to sleep at, and a temporary wooden hospital and tents had been erected in the grounds for cases of accident or emergency. A strong committee was appointed to consider the best course to pursue in this serious crisis. It was stated that the institution had been regarded as a model hospital. The older part of it was built about seventy years ago.

DUNBAR.—St. Anne's Episcopal Church, Dunbar, was opened by Bishop Dowden, Edinburgh, on Friday. The cost of the edifice, as now erected, is estimated at £2,700 and sitting accommodation is provided for 250 people. In design the church follows on the lines of Mediaeval architecture. There is a nave 68ft. by 24ft., with choir and sanctuary 34ft. 6in. long, and the full width of the nave. On the north side of the nave and near the west end, is the entrance porch. Externally, the chief characteristics of the edifice are the traceried windows, between which there are large unbroken surfaces of solid wall. A large east window has been avoided, thus giving room for a high reredos. At present it is not intended to complete the tower. The work has been carried out under the supervision of Dr. Rowand Anderson, of Edinburgh, who has adhered as closely as possible to the original ideas of the late Mr. Hugh Wardrope, who designed the building.

GLOUCESTER.—The foundation stone of the new municipal buildings for Gloucester was laid on Friday by the Duke of Beaufort, K.G., Lord High Steward of the city. The buildings, which are expected to cost from first to last about £30,000, were designed by Mr. George H. Hunt, of Gray's Inn, London, whose plans were placed

first in the competition for the premiums offered by the Corporation, Mr. A. Waterhouse, R.A., acting as adjudicator, and Messrs. Bowes and Co. of Hereford, are the builders. The site, which was formerly occupied by Sir Thomas Rich's school, offered special difficulties to the architect, and though it was originally hoped that at least some portion of the existing building might be utilised, Mr. Hunt found this impracticable, and commenced by making a clean sweep of the old edifice. The offices are to be placed on the ground floor; the council chamber and committee rooms on the front part of the first floor; and a public hall at a slightly lower level to the rear. The town clerk's, surveyor's, accountant's, rate collectors', school board, and other offices are provided for, and also the mayor's parlour, retiring-rooms, and kitchen. The council-chamber is 45ft. by 31ft., exclusive of a public gallery; and the public hall is 78ft. by 40ft. with a platform and gallery. The main front is designed in a phase of the Renaissance style, and will be executed in stone; the floors and staircases will be of fireproof construction; the floors in the entrances, halls, and gallery in vitreous mosaic; the remainder of the galleries paved. The internal fittings will be of wainscot oak and red deal. We illustrated Mr. Hunt's design, together with those placed second and third, in the BUILDING NEWS for July 26th, 1889.

HEAVITREE.—The dedication of the new tower of Heavitree parish church took place on Saturday. It stands on the same ground as did the old tower. The latter was condemned some years before its demolition in 1887 as being unsafe; but it was found, after about 10ft. had been removed, that the masonry was solid, especially on the south side. Mr. Phillips, of Exeter, the contractor, had to resort to dynamite in order to separate the masonry of the old pile, which was about 45ft. high, and did so without serious injury being done to the church. In an open competition in the same year, the plans of Mr. E. H. Harbottle, Exeter, were selected by Mr. Ewan Christian, of London, the adjudicator. From those plans the new tower has been built, in the Perpendicular style. The foundations are of concrete, and the tower is built of limestone from the Babbacombe quarries, the main quoins being of Chudleigh limestone with Bath stone dressings. The height of the tower is 101ft.; the total height to the top of the vane is about 133ft. The west window is to be utilised for the erection of a memorial stained-glass window. It is also intended to have a peal of eight bells put in the tower. Mr. F. S. Mitchell, of Heavitree, has acted as clerk of the works; and Mr. E. T. Rogers, of Exeter, has executed the carving. The cost is about £3,000.

LEEDS.—The International Exhibition at Leeds was opened on the 21st May. The buildings consist of five courts, with dining rooms, kitchens, &c., covering an area of 4,000 yards. The exhibits comprise an interesting collection of works of art and manufactures, and include a variety of building appliances. The buildings and grounds have been lighted with arc-lights, the dynamos are driven by a gas-engine. The buildings have been designed and carried out under the superintendence of Mr. William Bakewell, architect, of Leeds. Messrs. Ives and Co., of Shipley, are the contractors for the work.

PERTH.—The new hotel at the joint station, forming with that structure the largest and most important building in Perthshire, has been built from designs by Mr. Andrew Heiton, F.R.I.B.A., Perth, and will be opened in June. The style of architecture chosen is Flemish with bold and effective gabled outlines. Light freestone from Dunmore quarries, with red Dumfriesshire stone facings, has been used, so as to form a contrast to the station walls. The central block, containing the kitchen and offices, is built of white glazed enamelled bricks, and all w.c.'s and lavatories are lined to the height of 5ft. with white glazed tiles bedded in cement. The principal floor of the hotel is on a level with the station platform, the connection from which is by means of a corridor, extending to the entrance hall. On this floor are situated the parlours, drawing-room, writing-room, coffee-room, commercial room, smoking-room, billiard-room, and the kitchen, in addition to still-room, waiters' pantry, and plate-room, boot-hall, store-room, larder, pantry, sculleries, manager's office and room, clerks' office, linen-room, steward's-room, private smoking-room, lavatories, bar, and luggage and porters' room. On the south-east

angle of the building is placed the drawing-room, which has a panelled plastered ceiling, panelled dado and stone chimney-piece. The coffee-room is the largest on this floor, being 48ft. by 27ft., and is finished with panelled wooden ceiling, and stone chimney-piece. The billiard and smoking rooms communicate with each other, and have lofty open roofs, the partition and folding doors being partly glazed. The kitchen offices are all one-story buildings, lighted and ventilated from the roof. On the bedroom floors there are 35 bedrooms for visitors, eight bedrooms for house and visitors' servants, and four private sitting-rooms, with bedrooms in connection, to form suites of apartments if required. Many of the bedrooms are arranged with doors of communication. There are six bath-rooms, four of which have fireplaces, and 15 w.c.'s. The lavatories on the first and second floors have floors of Portland cement carried on iron girders, the floor and walls being finished with tiles, and thus rendered sound and waterproof. The hydraulic lift is in the form of a double cage, the upper end being for passengers and the lower for luggage. The whole of the principal rooms, staircase, and corridors are heated by means of hot-water apparatus, consisting of piping carried round the several rooms, and coils of piping and radiators in the staircase and corridors. Fire hydrants have been introduced on the several floors, and large water-tanks are constructed for flushing drains and extinguishing fires. The operations have been carried out under the supervision of Mr. David Kidd, master of works. Including furnishings, the total cost of the hotel is estimated at £20,000.

#### ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

**EDINBURGH ARCHITECTURAL ASSOCIATION.**—On Saturday the members of this association visited Bridge Castle, Bathgate, under the leadership of Mr. Thomas Bonnar, who described it as a baronial mansion of the regality of Ogilvie, in the parish of Torpichen, situated in a beautifully-wooded dell rising up from the Barbauchan burn, a small tributary of the Avon. The party then proceeded to Torpichen, which Mr. Bonnar said was historically interesting from its association with the once-powerful and famous order of military Churchmen, the Knights of St. John of Jerusalem, who were also known as the Knights of Malta and of Rhodes. Mr. Bonnar also briefly sketched some of the incidents connected with the order and its preceptors, from the date of its establishment in 1153 until the final suppression and extinction of the Knights of St. John in 1560. The party next proceeded to Linlithgow, and returned to Edinburgh by rail.

**NORTHUMBERLAND AND DURHAM ARCHÆOLOGICAL SOCIETY.**—On Saturday these archæologists held their first meeting for the present season in Northallerton district, when they visited the parish church of Kirby Sigston, which is in process of restoration, being at present unroofed, and Mount Grace Priory, at Ingleby, Arncliffe. At Kirby Sigston Church the rector, the Rev. C. S. Atkinson, read a paper giving the early history of the church. Mr. C. C. Hodges explained the architectural features of the church, which had been recently exposed by the restoration, while the visitors were shown the historic stained glass in the east window. Afterwards a journey was made to Mount Grace, where papers on the history of the ruins and of the monks who once inhabited the edifice were given by Mr. Wm. Brown, son of the present owner of the ruins, and Mr. Hodges, after which the party visited Lady Chapel and St. John's Well, and drove back by way of Brompton to Northallerton, inspecting St. Thomas's Church at Brompton on the route. Interesting observations were made by Canon Greenwell, of Durham, on the objects of interest which came under notice by the way.

Lady Wolseley will lay the foundation-stone of the Church of St. Paul, Harringay, to-morrow (Saturday).

A terrace, a quarter of a mile long, with shelter halls, built by the corporation of Brighton at an expense of over £15,000, was opened on Saturday. The structure also includes a lift for the conveyance of passengers from the Marine-parade above to Madeira-road beneath, the sea wall at this point being about 50ft. in height. This practically completes the works on the sea front at the east end of the town.

## Engineering Notes.

**THE FORTH BRIDGE CONNECTING LINES.**—Another of the new sections of railway—that between Winchburgh and Dalmeny—which it has been necessary to construct in order to secure for the systems of the north and south sides of the Forth the full advantage of the Forth Bridge, was inspected on Friday by Major Marindin, on behalf of the Board of Trade. The new section forms the connection between the Edinburgh and Glasgow main line and the Forth Bridge. The construction of the line has presented no serious engineering difficulties beyond the erection of several over and under bridges and culverts. As an illustration of expedition, it probably stands alone in the history of railway undertakings in Scotland. The four and a half miles of which it consists, involving a number of heavy cuttings and embankments, have been completed in nine months, a large staff of workmen having been employed both night and day from the start. The contractor for the work is Sir William Arrol, who also constructed the Corstorphine and Dalmeny line, the operations under both contracts being carried on under the superintendence of the manager, Mr. Inglis. At the close of the inspection Major Marindin gave permission to begin at once the running of goods trains over the line.

#### CHIPS.

The foundation of a new Board school at Sciennes, a suburb of Edinburgh, was laid on Saturday. It will be the largest school yet erected by the Edinburgh School Board, and will accommodate 1,700 children. It will be three stories in height, in addition to a basement arranged as a gymnasium and swimming-bath. Mr. Robert Wilson is the architect, and the cost, including site, will be £28,000.

The parish church of East Farleigh, Kent, is about to be restored from plans by Mr. J. L. Pearson, R.A., at the sole cost of Mr. Herbert Ellis.

The organ in Rotherham parish church, originally built by Snetzler, was reopened on Sunday after undergoing restoration and enlargement by Messrs. Abbott and Smith, of Leeds.

New Board schools are being built at Clapham-terrace, Leamington, and will be opened in July. Mr. F. Foster is the architect, and Mr. John Feil the builder.

The new Episcopal Church of St. Leonard, Lasswade, near Bonnyrigg, was consecrated on Saturday by Bishop Dowden, of Edinburgh. It is a plain building, Norman in style, is seated for 200 persons, and cost about £1,000. Mr. Hippolyte J. Blanc, of Edinburgh, was the architect, and Mr. R. Ketchen, of Bonnyrigg, the builder.

A new bridge is being erected on the river Wear at Pensham for the Houghton-le-Spring and Sunderland district highway board. It is of iron with approaches of masonry from the Marsden quarries, and is being erected under the direction and from the plans of Mr. D. Balfour, C.E., of Sunderland.

The Council of the Glasgow Institute of Architects have agreed to place upon record their deep sense of the loss sustained by the city, the architectural profession, and that Institute by the death of Mr. John Carrick, the Glasgow city architect.

Mr. Thomas Tomkins, a well-known South Stockton contractor, died suddenly on Thursday night, at the early age of 31 years, from the bursting of a blood-vessel.

The Royal Hotel at Cardiff is about to be enlarged and reconstructed from plans by Mr. J. P. Jones, of the same town, at a cost of about £20,000. Messrs. Shepherd and Son of that town have taken the building contract. Mr. A. D. Dawnay, of London, will execute the garden work and concrete floors; the hydraulic lifts by the Standard Elevator Company (Limited), London; and the parquet floors by Messrs. Turpin and Sons, London.

Alterations have been made to the corporation offices, Glossop, embracing the ventilation, which is now carried out on the Boyle system, the extraction of the vitiated air being effected by the latest improved form of the self-acting air pump ventilator.

Through the exertions of Mrs. Thomas, widow of the late county surveyor of Carnarvon, what has been felt as a great need for the seafaring classes of Carnarvon was supplied by the opening on Monday of a sailors' home. The present county surveyor of Carnarvon has remodelled the building free of cost, and the furnishing of the home has been undertaken free of cost by the local tradesmen.

#### TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

#### TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

#### ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

#### SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

#### NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII, XLVI, XLIX, L, LI, LIII, LVI, and LVII may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—H. and H.—V. S. and Co.—R. S. and Co.—T. M. D.

"BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Sector," "Y" in a circle, "S. A. H.," "Dot," "Syak," "S. C. D.," "Piddler," "Menelaus," "Renaissance."

## Correspondence.

#### EDUCATION AND THE ARCHITECTURAL ASSOCIATION.

To the Editor of the BUILDING NEWS.

SIR,—I request permission to address the general body through you. It has for some time been evident to those members most intimately acquainted with the working of the Architectural Association, that a desire existed among the restless members for some change. A result of this is seen in a report from a sub-committee (who were appointed not by the Association but, in great part, by themselves) which was brought before us on Friday, 16th inst. It is evidence of their zeal; but it is unfortunately crude, ill-arranged, incomplete, and admittedly impracticable. It further mixes up a number of distinct matters which should be discussed separately.

The members who have put it forward are wishful that it should be passed *en bloc*: but those who are really anxious to raise the tone of education—who have been working for it for the last twenty years, and who wish to save the A.A. from being wrecked by ambitious and indiscreet zeal—desire to inaugurate a proper scheme, which will not have to be dropped again in a year's time, to the discredit of the A.A. and the discouragement of all true friends of education.

It is most necessary that the separate recommendations of Messrs. Stokes, Farrow, and some others should be fairly discussed one at a time; and, with this view, an amendment was moved in the following sense:—

"That the sub-committee be cordially thanked for the time and attention they have given to the report; and that it be referred back to them,

with a request that they will divide their recommendations into distinct sections, and bring them up by separate resolutions at a future meeting."

This suggestion, made to expedite the business, was not accepted; and, therefore, all members who wish well to the A.A. are requested to attend the meeting on Friday of this week (30th inst.), and to support it.—I am, &c.,  
May 28.  
HUGH STANNUS.

P.S.—I may add that if the question of an educational scheme were to be more carefully considered by a distinct committee of representative and experienced members before it is again brought before us, such a course might prevent any well-intentioned but damaging blunders being made in the cause we all have at heart. The time is becoming ripe, but we must not fail through undue haste. The world has rubbed along till now; surely another six months will not be lost if we should be spared a false step.—H. S.

SIR,—I dare say to an old fogey member the reforms proposed by the committee of the Association seem a needless and harmful departure from the traditional customs of the A.A.; but I cannot help thinking that his ideas are what they are just because he is an old fogey member, and unfamiliar with the latest developments of thought in the Association.

May I, therefore, try briefly to explain the reasons why any change is wanted at all?

First and foremost, I would place the great dissatisfaction which has been lately making itself visible among the students themselves, those actually working in the classes. I have, perhaps, mixed as much with students as anyone, and I can testify to the fact that there really does exist in the student-ranks of the Association a deep-set, earnest desire for change. And this desire is not confined to any particular "set" or clique. At the very time when the Classes of Construction met together and passed that series of resolutions which have given rise to this great educational movement, the Design men were striving in their own way to get the Board of Visitors to reform their classes in a similar direction. Besides, however, these concerted movements, individual grumbling has been almost incessant. I have even heard the Association course stigmatised as a "fraud." This is, no doubt, a hard and unjustifiable word; but it shows what some men think. Of course, it may be said, "These young men are foolish and inexperienced; they don't know what they want, and their complaints are only a form of insubordination, and must be put down by force, if persuasion will not do." But the Committee did not go this way to work; they appointed an Inquiry Committee, who inquired long, carefully, and patiently, with the result set forth in the Education Report. I hope I am not betraying confidence if I say that, when the Inquiry Committee first set to work, there was far from unanimity among its members; but their inquiries convinced them that a change was wanted, and now there is not a single member of that committee who does not believe in the urgent necessity for reform. Might not history repeat itself in the case of an ordinary member?

Then there is another great and potent force which demands some attention, and that is the scheme of examination established by the Institute. It is impossible for us to ignore this examination, even if we do not altogether approve of it. There are very few students who, seeing an examination before them for which their fellows are all preparing, can afford to despise it. Occasionally, of course, we come across a genius whose talents are so palpable that to pass an examination would be a superfluity; but most poor ordinary mortals are not so blessed, and when they begin to talk of not approving of examinations, they are apt to be reminded that there is such a slang word as "funk," and as they do not particularly care for such reminders, they go up for the examinations. This is but human nature, and, after all, it is for the poor ordinary mortal that we legislate, not the brilliant genius. Therefore, whether we prepare them or not, they will go up for the examinations, and the question then simply resolves itself into one whether we shall accept a certain existing fact, welcome or unwelcome, and build our argument on that, or whether we shall shut our eyes to the real state of things, and go on in our old way. I need not point out that the advocacy of the latter course will be a great encourage-

ment to private cramming, and if members think that by giving a fillip to cramming as it never yet has had, they will benefit English architecture, the Association, and the individual student, let them accept the responsibility and reject the A.A. Committee's petition for reform.

Why I have written this letter is to try and help those who have not actively worked in the Association for some years, to see that the "grand scheme" is not "a little game which a certain clique are endeavouring to inaugurate at Conduit-street." To say so is unfair and unjust to those who have, in an honest, even if humble, way, tried to solve the problem that their greater knowledge of affairs enables them to see before them. To maintain that the committee have gone the wrong way to work to solve the problem is perfectly justifiable criticism; but to say that the problem is non-existent implies a deplorable ignorance of the true state of opinion in the Association, and if the report be rejected on that ground, I foresee troublous times ahead. It is not always wise to fasten down the safety-valve on a boiler.—I am, &c.,  
London, May 26.

OWEN FLEMING.

#### THE INSTITUTE COUNCIL.

SIR,—In my letter last week a curious misprint, substituting the word *is* for *in*, occurs. What I intended to say was, "What is wanted in such a body as the Council are representative men."

Will you kindly correct this in your next issue, as it completely alters the sense of my letter? and oblige—Yours, &c.,  
F. T. W. MILLER.  
73, Queen Victoria-street, E.C., May 27.

#### CHIPS.

A pillar lamp and fountain, erected in the Market-square, Jedburgh, as a Jubilee memorial, was inaugurated on Saturday. It has been erected from designs by Mr. Bell, of Glasgow.

In accordance with the bequest of the late Miss Sanderson, of Wetherby, a stained-glass window has this week been placed in the west window of St. James's Church, Wetherby, Yorks. The subject is "Christ blessing little children." Messrs. Powell Bros., of Leeds, have executed the work.

The *Royal Cornwall Gazette* says: "At their last meeting the Redruth Local Board resolved to thank Mr. Passmore Edwards for the promised gift of a fountain to the town, and to look out for a suitable site on which to erect it. The offer of Mr. Edwards is most noble and generous, and the authorities will do their best to find a suitable and worthy site. It must be seen, though, that open spaces in the streets of Redruth are exceedingly small and most rare."

The eighth annual meeting of the Society for Preserving Memorials of the Dead was held on Saturday afternoon in the parish school-room, Lambeth. The parish church was visited, when the rector, the Hon. and Rev. Canon Pelham, read a paper on "The Monuments in the Church." A visit was afterwards paid to Lambeth Palace.

The Local Government Board have granted a provisional order approving of the greater part of the scheme for the extension of the municipal boundaries of Manchester. The townships of Crumpsall, Newton-leath, Openshaw, Moston, Blackley, Clayton, the hamlet of Kirkmanshulme, and half the local board district of Gorton are to be added to the city; but Moss-side, which had been included in the scheme, is excluded. The number of members of the City Council will be increased from 76 to 100, and an addition of about 110,000 will be made to the population, which will then be close upon half a million.

On Saturday week the opening ceremony of the John Bentley Gymnasium, in connection with the Warehousemen, Clerks, and Drapers' Schools at Purley, took place. A key was presented by the architect to Mr. S. Hope Morley, who declared the building open. The gymnasium is the gift to the institution of Mr. John Bentley. It is built from plans prepared by the architect, Mr. J. Kingwell Cole, of 28, Mount-street, Grosvenor-square, W., and follows the style of and is in close proximity to the main buildings.

The annual exhibition of the Home Arts and Industries Association will be opened in Birmingham on Thursday in next week, the 5th June, and will remain open till the following Monday.

The Council of the Royal Society of British Artists, at the request of the National Sunday League, have consented to open the annual exhibition of pictures in their galleries, Suffolk-street, Pall-mall, on Sunday next, and following Sunday, 1st and 8th June, from three till six p.m.

## Intercommunication.

### QUESTIONS.

[10286].—**Iron Oxide.**—Would some one kindly inform a subscriber of any mineral oxides or iron minims of different tints, principally reds, for colouring and using with Portland cement, and of guaranteed quality, free from any vegetable bodying?—H. H.

[10287].—**Ventilation.**—It is proposed to ventilate a large hall by placing ventilating tubes over sunlights. How do you calculate the velocity of air through tube? The tube proposed is 24in. diam., 30ft. long, with a bell-mouth at bottom, in which will burn 40 ordinary gas-jets. The internal and external temperature would vary 50°, and at times the internal air would be cooler than the external. Would there be any danger of a down-draught? or what would be the best form of cover externally?—WOMBAT.

[10288].—**Stains on Granite.**—How can stains of smoke and soot be removed from granite without re-chiselling the surface? Washing by jet seems utterly ineffective.—D. M. R.

[10289].—**Timber Conversion.**—Does it make any difference to the strength of a beam whether it be cut so that the annual rings run lengthwise or crosswise with the section? which is best for floor boards?—H. W.

[10290].—**Preserving Stone.**—I should be glad if one of your practical readers will say which is a good preservative solution for stonework. I have found painting ineffectual.—GETRA.

[10291].—**Fire-Proof Floors.**—Which system of iron construction has been found to give the best results? I should like the opinion of any of your readers whether a floor 40ft. by 18ft. can be constructed of timber of sufficient strength for an ordinary warehouse floor, or whether iron joists and concrete is not better?—BUILDERS.

[10292].—**Portland Cement Manufactory.**—Would some reader kindly give me a rough estimate of the capital required to establish the above on a small scale? How much would be requisite for machinery, and how much for floating capital? Both the mud and chalk contain the necessary constituents, and are within a distance of two miles of each other by water.—HARVEY A. DIXON.

### REPLIES.

[10279].—**Italian Oak.**—This variety of oak is used for shipbuilding, ornamental panels, furniture. Italian or Sardinian oak, as it is called, is of a brownish tint, very hard, and, I believe, capable of a fine polish.—G. H. G.

[10280].—**Provisional Amounts.**—Contractor cannot justifiably ask for a trade discount from specialist if the amount has been included in quantities, though many contractors do so.—G. H. G.

[10281].—**Bench-Mark.**—From the bench-mark, most certainly.—GUP.

[10281].—**Bench-Mark.**—This is the starting-point of a line of levels, and the heights are so much above or below this point, whether it be on the ground or 10ft. above it.—R. WATSON.

[10281].—**Bench-Mark.**—The expression "below bench-mark" means below the mark itself, which is generally stated.—G. H. G.

[10284].—**Shores.**—Consult "Stock's" work on shoring, or G. H. Blagrove's treatise.—J.

[10285].—**Continental Cathedrals.**—In Germany several instances of two-storied churches are to be found. The church of Schwartz Rheindorf (1151) is one of these. The lower church is a sort of crypt. Ferguson mentions another at Nuremberg, and illustrates a two-storied chapel at Landsberg, near Halle.—G. H. G.

The members of St. Paul's Ecclesiastical Society will visit the churches of Stone and Northfleet tomorrow (Saturday) afternoon, under the direction of Mr. H. Roumieu Gough.

The memorial stone of the new Courts of Justice at York, about to be built from designs by Mr. Hugh A. Mearns, will be laid by H.R.H. the Duke of Clarence and Avondale in June.

The inauguration of the memorial which has been erected at Killin in memory of the Rev. James Stewart (1700-89), who was the first to translate the New Testament into Gaelic, took place on Friday. The monument, which occupies a site granted by the Marquis of Breadalbane close to the church of which the Rev. Mr. Stewart was pastor, is 15ft. in height. Upon the base rests a die of Peterhead granite, on two sides of which is an inscription, the one in English and the other in Gaelic. Above the inscription is an octagonal block of Aberdeen granite, and this is surmounted by a Celtic cross. The sculptor and designer was Mr. Beveridge, Perth.

The Jubilee festival of Wells Theological College took place on Friday, the special feature being the inauguration of new buildings. Early in last year the trustees and governors of the college purchased for £1,800 the old archdeaconry, a house of great architectural and historical interest, which had been alienated from ecclesiastical uses in the middle of the 16th century, and has been applied to secular uses up to the present date. Its noble halls and rooms have been restored from the plans of Mr. Buckle to their original proportions. For the restoration of the archdeaconry, and the building of a new house for the principal, £6,000 is required.

## LEGAL INTELLIGENCE.

**IN RE CHARLES KILLINGBACK.**—The debtor, who had carried on business as a contractor in James-street, Camden Town, applied on Friday for an order of discharge. He petitioned the Court on February 28 last, his liabilities being returned in the statement of affairs at £10,311, with assets estimated by the trustee as likely to realise £1,432. The debtor commenced business 20 years ago with a capital of £150 or £200. In January, 1839, his excess of assets over liabilities amounted to between £500 and £1,000, and he then entered into a large contract with the London County Council for the construction of sewers at Lee, Kent. He attributed his failure to a heavy loss upon that contract owing to flooding and to the nature of the ground not being in accordance with his expectations. The Official Receiver and the trustee opposed the application on the ground of insufficient bookkeeping and on other statutory grounds, and Mr. Registrar Brougham suspended the order of discharge for six months.

**COMMISSION FOR SALE OF BUILDING LAND.**—**PARR V. HEADDEY.**—(Before Mr. Justice Grantham and a Common Jury.)—The plaintiff in this action was a member of the firm of Parr Brothers, who carry on business at Peterborough as auctioneers and estate agents, and he sued the defendant for commission on the sale of 16½ acres of building land in that neighbourhood. The defendant's solicitor requested the plaintiff to find a purchaser, and promised a very good commission in the event of a sale being effected. The plaintiff, in consequence, brought the matter to the notice of the Rock Building Society, who ultimately bought the land for £3,300, which seems to have been its outside value. On this sum the plaintiff accordingly charged a commission of 2½ per cent., but the defendant considered that 1 per cent. was the proper scale of remuneration, and paid £35 into Court as sufficient to satisfy the plaintiff's claim. The scale of the Surveyors' Institution with respect to sales of freehold and copyhold estates and houses by private contract appears to be £5 per cent. on the first £100, and after that £2 10s. per cent. up to £1,000. The jury returned a verdict for the plaintiff for the 2½ per cent. commission—that is, £47 10s. beyond the amount paid into Court—and judgment was given accordingly.

**EVIASION OF BY-LAWS.**—Mr. J. C. Foulkes, Camden-road, was summoned to the Highgate Police-court on Monday by the Hornsey Local Board for a breach of by-laws of the Board. The defendant submitted plans for some warehouses to be built at Hornsey, and the Board passed them, and after the buildings had been erected shop-fronts were put in. The buildings faced Turnpike-lane, and the side in which the shop fronts were put in abutted on a public footway only 6ft. wide. The defendant said he was prepared to admit he was wrong, but thought the Board should have given him notice that he had infringed the by-laws. He was prepared to put matters right, and he hoped that if he paid the costs that would satisfy the Bench. The Bench were of opinion that it was a deliberate attempt to evade the by-laws, and fined the defendant 1s. and costs on each summons, and the Local Board's costs, ten guineas.

## STATUES, MEMORIALS, &amp;c.

**CRANBROOK.**—During last week a memorial was erected in St. Dunstan's Church, Cranbrook, by Mrs. Webster to the memory of her husband, the well-known Royal Academician. The memorial is the work of Mr. Hamo Thornycroft, R.A., and is placed in the south-west aisle on the west wall. The tablet is of white marble, with a dove marble margin, and is about 9ft. 6in. in length, by 4ft. in height. The figure of the deceased painter is represented in a recumbent position with the hands on the breast clasping a Bible and paint brushes. An angel kneels at the head holding a palm branch, and another at the feet with a wreath of immortelles. The angels are represented by winged boys, typical of the characters the deceased artist was so fond of portraying. The tablet bears the inscription:—Thomas Webster, Royal Academician, born 20th March, 1800; died 23rd Sept., 1886.

The private Bill granting an extension of time for four years within which to construct the Regent's Canal, City and Docks Railway, has been passed by a committee of the House of Lords.

Some workmen, while digging for the foundation of a new building in Watergate-street, Chester, have found the base of a Roman column standing on a foundation of boulder concrete. It is thought, together with similar relics that have been discovered in the neighbourhood, to have formed a portion of a Roman building that extended as far back as Common Hall-street. In addition, there were embedded in the foundation-walls the head part of a stone coffin in a good state of preservation, and portions of an Early English floriated coffin-lid.

## Our Office Table.

THE eighth annual exhibition of the Royal Cambrian Academy, opened in the Elizabethan Mansion of Plas Mawr, Conway, on Saturday, is only an average show; 216 works by sixty artists are hung, the president, Mr. Clarence White, being worthily represented by "Arthur in the Gruesome Glen," from Tennyson's "Launcelot and Elaine." Among the numerous landscapes, the most striking are "The Return of Spring," by Anderson Hague; "A Breezy Day off Anglesey," by Peter Ghent; "Half a Gale off Lys Faen," by E. A. Norbury, vice-president, and two works by Charles Potter. "Going to the Fair," representing a stillion being led for sale, is effectively treated by Charles Jones. Portraits by Leonard Hughes and J. D. Watson are among the best hung. Of the loan exhibits, the more noteworthy are Sir F. Leighton's widely-known "Elijah and the Angel," lent by the Corporation of Liverpool, two figure-subjects by G. F. Watts, R.A., and two by J. C. Hook, R.A.—"The Day for Provisioning the Lighthouse," and "The Return of Torello."

MR. GEORGE A. MACMILLAN, the hon. secretary to the British School of Archaeology at Athens, appeals for further aid in support of the examination of Byzantine architecture in Greece by two architectural students—Messrs. R. W. Schultz and Sidney Barnsley. For the last two sessions they have been making drawings of the Byzantine churches in and around Athens. During the early part of the present session they have been drawing the important Monastery of St. Luke, near Livadia, in Northern Greece. They are at present travelling in the Peloponnese for the purpose of studying and making drawings of the most important Byzantine buildings, and if sufficient funds are forthcoming, they intend to proceed to Salonica and Mount Athos. The last letter received from Mr. Schultz is dated from Mistra, and indicates that he and his colleague are very hard at work, and at the same time living in the most economical way. Messrs. Schultz and Barnsley will publish two illustrated monographs on the Byzantine churches in Greece and on the monasteries of Mount Athos respectively. Although many works generally descriptive of monastic life at Mount Athos have been published, no book has yet appeared illustrative of the architecture and general decoration of these unique churches, which exist to-day in much the same state as when they were first built.

FOLLOWING hard upon the opening of a committee of inquiry into the City water supply and its cost by the Corporation, the vestry of St. James's, Westminster, have invited the other vestries and district boards of the Metropolis to appoint delegates to a conference shortly to be held for the purpose of considering the whole subject of the Metropolitan water supply, and especially the desirableness of asking the Government to introduce a Bill (1) either to confer on the County Council power to acquire the present undertaking or to establish a competing supply; and (2) to require the water companies to supply water by meter at a fixed tariff.

THE London School Board, at its last meeting, considered the results of a recent experiment of placing a musical tube in the turret of a school in lieu of the usual bell. The experimental tube was provided at the London Fields School, Hackney, and a committee regarded the penetrative power of the sound as so satisfactory, being audible at a distance of nearly half a mile, that they recommended the Board to substitute these tubes for bells in all schools to be erected in future. The cost of providing and fixing one of these tubes was stated to be about £15. The report was adopted by the Board.

A LITTLE book on "German Labour Rates of Wages" supplies some details about wages and hours of labour that are peculiarly interesting during the present eight hours agitation. As examples of the pay received, we note that joiners, locksmiths, and upholsterers earn 3s. for eleven hours' work; painters, carpenters, and glaziers, 3s. 2½d. for eleven hours' work; and builders and plasterers, 3s. 6d. for eleven hours' work. Labourers or unskilled men work the same hours as the skilled or crafts men, and are paid 1s. 9d., 2s., or 2s. 6d. for eleven hours' work, according to circumstances. Two shillings

per day may be taken as the average labourer's pay. Nineteen shillings a week represent the average earnings of a workman.

## MEETINGS FOR THE ENSUING WEEK.

**SATURDAY (to-morrow).**—St. Paul's Ecclesiological Society. Visit to Churches of Stone and Northfleet, under the direction of H. R. Gough. Train from Cannon-street, 2.47 p.m.

**MONDAY.**—Surveyors' Institution. Annual Meeting, 3 p.m. Annual Dinner at Holborn Restaurant, 6.30 p.m. Society of Engineers. "Pick's System of Manufacturing Salt in Vacuum," by P. F. Nursey. 7.30 p.m. Royal Institute of British Architects. 8 p.m.

**TUESDAY.**—Institution of Civil Engineers. Annual General Meeting, 8 p.m.

**THURSDAY.**—Architectural Association. Supper at the Mona Hotel, Covent-garden. 7.30 p.m.

**Architectural Association, 9, Conduit-street, W.**—The Special Business Meeting, adjourned by resolution on May 16, will be resumed on May 31, at 7.30 p.m. On June 5th, Supper at the Mona Hotel, Covent-garden, at 7.30 p.m. Tickets, 3s. each, from W. Burrell.

FRED. R. FARROW. } Hon. Secs.  
ERNEST S. GALE. }

## Trade News.

## WAGES MOVEMENTS.

**ABERDEEN.**—The master-masons and stonecutters have agreed to advance the standard rate of wages of their operatives by a halfpenny per hour, the advance to take effect after 1st August. The advance brings the standard to 7d. per hour in the case of builders, and 6½d. in the case of stonecutters.

**TYNE DISTRICT.**—The house carpenters and joiners in the Tyne District, which comprises all the towns between Newcastle and North and South Shields, have arranged with their employers for an advance of a halfpenny per hour, commencing on Whit-Monday. This also applies to Blyth, and makes the rate of wages 8½d. per hour, overtime rising in proportion. The whole affair has been carried out by the Tyne District Committee.

**YORK.**—Work was resumed on buildings on Wednesday, the bricklayers' labourers having accepted the advance offered by the masters of ½d. per hour, raising wages to a uniform standard of 5½d. per hour.

## CHIPS.

Mr. John Winskill, of Settle, a retired builder and contractor, has died at an advanced age. Most of the houses and public buildings erected in the Settle district during the past forty years have been reared under Mr. Winskill's direction, and for several years Mr. Winskill was one of the Poor-Law Guardians for Settle.

A relay telegraphic station has just been built at Weston-super-Mare for the Commercial Cable Company, from the designs of Mr. Sydney J. Wilde, of that town. Mr. H. A. Forse, of Bristol, was the contractor.

Mr. J. L. Pearson, R.A., who has undertaken the completion of New College Chapel, Oxford, has added two rows of figures to the reredos; he expects to finish the whole by the end of the long vacation.

The foundation-stone of a new Wesleyan chapel was laid at Danderry, Plymouth, on Monday week. Mr. Madams is the contractor.

Mr. Shier, of Ilminster, has been elected borough surveyor of South Molton. Although the salary offered is only £100 a year, there were over forty candidates for the post.

It having been decided to rebuild almost entirely the old parish church of St. Werburgh, Derby, a subscription was opened a fortnight ago, and £3,500 has already been promised towards the sum of £9,000 required.

Holloway's Pills are specially adapted for the young and delicate, their gentle and purifying action enables them above all other medicines. In indigestion, nervous affection, constipation, and rheumatism these Pills have achieved for themselves universal fame. They expel all impurities from the blood, and thus restore cheerfulness and vigour.

## ELECTRIC LIGHTING.

COMPLETE INSTALLATIONS  
OR WIRING ONLY { ESTIMATES GIVEN.

**STRODE & CO.** 45, Oldbath-st., N.W., and 67, St. Paul's Churchyard, E.C.  
New Branch Showrooms:—188, PICCADILLY, W.

## FREE PUBLIC LIBRARIES.

THE development of the free library movement throughout the country, and the erection of buildings to meet the requirements of the Act, have opened a fresh field and propounded a new problem for the architect. To some extent allied to museums and art schools, with which the library may be associated, the requirements nevertheless demand a distinct treatment, and as every town and village throughout the country is now promoting the erection of a free library, it may be of some practical value if we lay before the architectural reader the main principles that should be kept in view in the design of these buildings, and describe some of the more important buildings of the class that have been erected in the Metropolis and elsewhere—a few of which we have illustrated. For a number of years the Metropolis was far behind the larger provincial towns in establishing free libraries, and if it had not been for the efforts of the few, the Metropolitan Free Libraries Committee, who in 1878 set to work by appealing to the larger vestries, the progress would have been even slower than it is. The provincial towns have more readily availed themselves of the Free Libraries Acts. The first free library was established at Manchester soon after William Ewart's Free Public Libraries Act of 1850. It was, we believe, the earliest library at least which established the popular lending and reference system, which issued to readers during the first year 138,312 volumes. The plan represents one central reference library, with branch rooms for lending library, news-rooms, &c. Special reading-rooms for boys constitute an important department in the Manchester libraries. Bradford adopted the Act in 1871, and in 1878 lending and reference libraries and museum were opened in the present commodious corner building. In Liverpool the handsome group of buildings in Lime-street is a still more noble example of the movement due to the interest taken by the late Sir J. A. Picton. The library is in connection with the Museum and the Walker Art Gallery, and the buildings, conceived in a truly Classic spirit, are thoroughly monumental in character. Another imposing example of the united museum and library is the Harris Library and Museum, Preston, opposite the market-place, a notable instance of private munificence. It is a Classic design of Greek Ionic, quadrangular, symmetrical in plan, standing by itself. A portico of six columns gives access by flights of steps to the vestibule, which is 10ft. above the street level. There is a large central hall 54ft. square, with lantern over, which is emphasised by being carried up. On the south side is the news room, and on the north the reading-room, each 55ft. by 29ft., the large lending-library is 50ft. square, the other 55ft. by 29ft. On the principal floor are the reference-libraries, each 120ft. by 30ft., on each side of the central hall, which is set apart for casts from the antique. This monumental edifice ranks as one of the most complete buildings for the purpose. The north and south sides are 170ft. in length, the frontage 130ft. The cost has been about £100,000.

The Birmingham Free Library is one of the most spacious and sumptuously-fitted buildings, L-shaped in plan; it has a fine news-room, 100ft. by 64ft., furnished with polished oak desks and tables; adjoining at right angles is the lending library, 82ft. by

75ft. Both are lofty and well lighted, and decorated by bands of colour; the walls of deep red with terracotta arches; iron columns with foliated brackets carry the girders. Above is the reference library, also L-shaped, with the Shakespeare library, 30ft. by 21ft. The first has an arched-ribbed roof, 50ft. high, and side aisles divided by arches 23ft. high. The latter has wrought-iron elliptical ribs; both are lighted from the roof, and a clerestory filled by stained glass surrounds the larger room, which is apsidal-ended. An average of 10,000 people visit these rooms daily, and nearly 3,000 volumes are issued daily. Hot air and water heat the buildings. Externally, coloured materials, brick, terracotta, marble, and tiles are employed, and the style is Italian. The Salford Library and Museum was opened before the Act of 1850, and is a charmingly situated building, and the books for free circulation number about 80,000 volumes. Then we have the Leeds Public Library, housed in the New Municipal Buildings, which we illustrated—a fine Palladian structure—comprising a reading-room, lending and reference libraries; the first 80ft. by 40ft., divided into nave and aisles by arches upon polished granite shafts, carrying a vault of hexagonal bricks of various colours, resembling mosaic, the whole treated in a Romanesque manner. The library has 146,502 volumes. Newcastle-on-Tyne has also a handsome library and newsroom, designed in a Classic and dignified style, characteristic of the purpose. The Derby Free Library and Museum opened in 1879, designed by R. Knill Freeman, has a lending library 56ft. by 24ft., carried up, with gallery round, lighted by a lantern; the reference reading-room, of the same size, has a large bay for students. The Sunderland Museum and Library, by Messrs. Tillman, architects, is a single-story building, of an imposing Italian design. At Ipswich, a museum, library, and school of art was opened in 1881, in a pleasing Italian Renaissance style. Blackburn, Bristol, Plymouth, Norwich, Ipswich, notably Glasgow, have their libraries and branches; but it is needless to say more on the working of the movement previous to the recent revival of the Act—how spontaneously the provinces have adopted the measure.

Our present remarks are chiefly, however, confined to the development of the movement and the types of a few plans that have been adopted. One of the first of these is the free public library at Wimbledon, the designs for which we commented on in 1885. The plan is a simple parallelogram, the centre entrance and lobby leading into a central reading-room, top-lighted, divided by screens from a reference library on the left-hand side, occupying the whole length of block, and also from the lending department on the other side. In the rear are two other entrances, stores, and lavatories. The librarian's office at the front end of the lending-room enables that officer to overlook the entire area. The newspaper desks and tables are placed near the entrance, and the tables for those consulting books of reference in the more retired parts. The cost has been £3,000, and the building is designed in brick, of Late Domestic Gothic character. The rectangular plan is well utilised in Mr. J. M. Brydon's design for Chelsea Free Library, of which we gave the plans, sections, and elevation in our issue for June 7th, 1889. Here a central semicircular portico leads into a hall, with ladies' and boys' reading-rooms on right and left. The main body of ground-floor is divided longitudinally, the news-room 75ft. by 31ft. 6in. being on left side, and the lending library 49ft. 6in. by 31ft. on the right, each lighted by side windows. The librarian's room is placed in communication with, and to overlook, the lending and boys' rooms. In the rear, transversely, is a magazine room, 63ft. long and 24ft. 6in. wide, fitted with 12 tables. The accommo-

dation of news-room is for 116 readers at the tables, of which there are four rows of 20 tables, and 100 at newspaper desks, in all 216. The allowance is 15sq.ft. to each person. A total of 29,520 volumes is provided for books on floor and gallery—9 volumes to the square foot being the calculation. A stairs for staff is placed at the junction of the three main rooms. On the first floor is a reference-library, 63ft. by 24ft. 6in. transversely, and parallel thereto are four similar book-stores in the rear, accessible by the staff stairs. The reference library is lighted by a domical roof, and at ends, and has a gallery all round. There are tables for 72 readers, and book space for 15,920 volumes at 8 volumes per square foot. The book-stores give accommodation at the same unit for book-case space for 105,000 volumes. The design is of Georgian Classic, brick and stone. A smaller but very compact library of rectangular plan, is that recently built at West Norwood from the designs of Mr. Sidney R. Smith, A.R.I.B.A., the first of the buildings undertaken by the Lambeth Commissioners. Entering by a recessed lobby to a spacious hall, the lending library is on the right hand, with table and desk for librarian and assistant in front, commanding the news and reference rooms, which are arranged side by side behind, and are top and end-lighted. A side lobby leads to these principal rooms. A small ladies' reading-room is in front, corresponding to the lending library on the other side. The recessed portico and loggia over, and the ornamental red brick, stone, and terracotta front, and high-tiled roof make up a pleasing building of Renaissance design. Another library in the Gothic style of red brick and terracotta, designed by the same architect for Lambeth, is the Durning Library, Lower Kennington-lane, the cost (£10,000) having been defrayed by Miss J. Durning Smith. The Tate Free Library, South Lambeth-road, is a third library by the same hand. The awkward nature of the site has been ingeniously dealt with by placing the entrance vestibule, women's and private room in the corner of site at the junction of the two roads. The borrowers' lobby, taken out of the lending-room, 48ft. by 23ft., occupies one side of the main structure, and a news-room and reference-room, 96ft. by 27ft., divided by a glazed partition, form a parallel room, top-lighted. These are single-story buildings, the librarian's house being carried up in front. We illustrated this building April 19, 1889. The accommodation for lending library is for 30,000 vols.

An important library is that of Battersea, the architect being Mr. E. W. Mountford, A.R.I.B.A. The exterior, of red brick and stone for dressings, has a rather domesticated look. On the ground floor is a magazine room on left and news-room on right of entrance corridor, which leads to a lending library at the back, with rows of cases and counter, and with a side office for librarian, with windows overlooking news-room and lending library. Over the latter, up-stairs, is a reference library and a ladies' reading-room over office. In front is a large book-store and the house of librarian. An angle bay is formed at the corner of news-room.

As a cleverly planned arrangement for a square site open on three sides, we may incidentally refer to the design of Mr. George Washington Browne for the Edinburgh Public Library, just carried to completion. The plan of each floor partakes of a Greek cross, three arms of which form recesses for book-cases, these recesses opening by arches into the centre lending library, 70ft. square. A domical light is over the centre of cross on the reference library floor, and the recesses have large end windows. Ample light is thereby secured on all sides.

As many corner sites are triangular in

shape, the architect has a problem of some difficulty which is not experienced in square or rectangular forms. Which way can the main departments be placed? The architects of the selected design for the Clerkenwell Free Library, of which we gave a plan and view (May 17, 1889), Messrs. Karslake and Mortimer, have ingeniously placed their news-room (56ft. 6in. by 22ft. 6in.) along one side, with windows facing the road, and have thereby cut off to a triangular shape the space on the other side, devoted to the lending library, 33ft. 6in. by 22ft. 6in. To compensate for the encroachment, the news-room is reduced in width by setting its inner side as far as possible within the news-room area, by which a space for the public is obtained next lending library, and by cutting off an angle of news-room for the entrance lobby. By this stratagem all the room possible is utilised on the lending library side. The reading-room and reference library are on the first floor, and above that the caretaker's rooms, librarian's rooms, &c. The design is of a Renaissance character of red brick and terracotta. The Clapham Library, by Mr. Edwd. B. T'Anson, we have already described. A borrower's lobby leads to the lending library for 27,000 volumes, top-lighted; cases are arranged in centre and along walls. From the same lobby the news-room is entered, at the rear of which is the reference library. The counter has a Cotgreave indicator showing books in use and available. A museum is placed over the front part of building, and Boyle's ventilators are used here, as in many other of the buildings we have described.

From the plans we have described it will be noticed that a free library requires at least three departments—a news-room, a lending library, and a reference library—though in the larger town districts a reading-room, a ladies' and boys' reading-rooms are required in addition. If possible these rooms should be placed on the ground floor, or at least the news-room and lending library ought to be; the readers' and students' and ladies accommodation preferably taking the first floor. In the metropolis and large towns the latter alternative becomes almost an essential condition on the score of economy. Easy access, avoidance of unnecessary steps and corridors, lobby room for borrowers, and above all, ample light in every part, and a comfortable temperature and efficient ventilation, are absolute necessities to a well-designed building for a public library. With regard to plan, we may point out that the most essential condition of success appears to be concentration to insure general supervision of the departments. For this end it is necessary to bring together those in most frequent use, as the news-room, the lending and reference libraries, and to afford easy means of intercommunication between them. The separation may be, in large buildings, by walls pierced by openings here and there, and in smaller ones by light partitions partially glazed. Ladies' and boys' rooms should be provided in distinct parts, the latter being under the eye of the librarian or his assistant, and, of course, lavatories and conveniences are essential, arranged to obtain external ventilation. Another point of manifest importance is the borrower's lobby and counter; these should be arranged to give ample room, and be within tolerable proximity to the entrance. The arrangement of stands, desks, and tables for newspapers and books must not be lost sight of in the plan, and spacing of windows in reference to them. The shelving may be along walls or form screens; but the American alcove system is worth more consideration than it has received. Other details comprise the form of "indicator" by which a borrower is informed if the book he wants is out or not. These are details to which we may again refer. The planning of village libraries is a problem of no less importance. In these

concentration and economical arrangement are the leading requirements. Two departments or ordinary rooms are sufficient, with a spacious hall. In another article we may show a few typical arrangements, and refer to some of the details we have here only incidentally mentioned.

#### RENOVATED STREETS AND COMMERCIAL ARCHITECTURE.

MANY of the older streets are beginning to assume a new dress, either by the rebuilding of the premises or the addition of new shop-fronts. There are many considerations that are worth the thought of owners and their architects, as well as the local authorities. First come the legal obligations. For one man to boldly push his shop-front out a few feet in the front of his side neighbours, and to their manifest inconvenience and injury, is one of those anomalies in the law which we have never been able to understand, though it is done every day. Where are the district surveyors, and who are the authorities that permit these individual erections are the natural questions everybody asks. We see the irregularity in many old streets, the pavements of which are wide, as if it were allowable for everybody to come within a certain distance of the roadway. Because the encroachment has been permitted years ago in some part of the street, it appears to be assumed that the said encroachment forms a new building-line to which every other owner, if he likes, can bring out his front. We see this process just now going on in many of the renovated streets at Fulham, in the Tottenham Court-road, in the London-road, and other streets converging at the Elephant and Castle. Sometimes a number of owners or tenants in a row make the alteration simultaneously. Perhaps a dozen or a score of house-owners who begin all at once to recognise their rights combine to advance their shops a few feet, and before very long we find a row of new fronts, with cornices and flats to match. This is certainly less objectionable than to see one isolated shop, and then another several houses apart stuck forward with blank brick walls at the sides, forming corners of a very objectionable character; though it would be more tolerable if a design for the alteration as a whole were made compulsory, and submitted to the Board or Vestry. The manner in which it is usually done is as follows:—The old shop windows are taken out and the front supported, the side party-walls are brought out to the required extent and height, and upon the ends of these walls a framed girder or breastsummer is placed, which in turn is hidden by a wooden cornice. In front of the breastsummers, and resting on the ends of the party-walls, are large stone consoles which serve to stop the cornice and facias of the shop. Zinc or lead flats are put over the extended story thus brought out, and the shop is complete. The perspective presented is a long line of one-story shops projecting from the old fronts; the old house façades, in fact, look as if they are built on the raised flat. This leads to the architectural question whether a more satisfactory and pleasing method of extension could be devised. We are aware of the difficulty of the problem, as light to the premises so extended must be secured. We should prefer to the flat, often a receptacle for all kinds of rubbish and snow in winter, a gabled roof to each shop; but the obvious difficulty is that a gabled roof would necessitate the blocking of the first-floor windows. A lean-to would be unobjectionable if sufficient height of story could be obtained. The only other alternative is a hipped roof over the extended shop, or a domical-shaped roof. For economical reasons the flat is generally adopted; but even with this form of roof architectural genius could devise a more agreeable treat-

ment than that usually seen, and which spoils as well as contracts the width of street.

Then there is a further subject to which the commercial architect might devote his attention in connection with street renovation—the practicability of using other materials than brick or stone and wood. Light and ample display for goods are the two essential requirements of street buildings devoted to trade. Both these requirements can be met by the use of moulded or cast materials. The terracotta front, though occasionally seen, is not a very usual introduction, probably owing to the supposed cost and the delay in getting the blocks ready; but the latter is an obstacle to its use that can be removed. We have seen in Oxford-street, Piccadilly, and other West-end streets, windows in this material that give all that is necessary. The framework or mullions of the window can be made of small section and in pieces that admit of speedy erection. The top part of the window admits of being filled in with open tracery or panels, the windows can be arched in form, and the most delicate and tasteful decoration in relief be given to the panels, spandrels, and other parts. In the Kennington Park-road a new window of this character has been put up, the upper portion being a flat elliptical arch in buff terracotta. The Ruabon terracotta of J. C. Edwards, for instance, is a material suitably manufactured in shades of red, pink, and buff. With terracotta manufactured with accurate lines, the architect has a material he can well apply for such a purpose, admitting of lightness and more freedom in design, far more durable than wood, which is now generally used where glass and ample light are essential. The natural buff or red colour in which it is burned is pleasing also. The avoidance of sameness in the design of street-fronts is desired above everything, and we should be sorry to see the day when window-fronts will be reproduced wholesale to one design in iron, as is the case in the United States; but alluding to metal, we cannot understand how the shop-front architect has neglected iron—more especially wrought metalwork—from his menu. In restricted glass windows a filling or design in wrought iron would be very appropriate as an outer grille, adding to the protection of the plate-glass and to the architectural appearance of the front. Bars and tracery of metal in the head would not materially obstruct the light, and, what is of much importance, they could not impede the view of the objects displayed in the window. We believe much of the well-founded objection to large plate-glass fronts might be avoided by the use of wrought metal judiciously disposed over the surface. The employment of brass has to some extent been seen, such as twisted brass pillars and arched heads; but the artist in metalwork can do better than in thus imitating rigid structural forms. The filling in of smaller panes in woodwork on the upper part of shop windows is undoubtedly a step in the right direction in giving substance to the window and in reducing the surface of mere glass. The transom has come to the aid of the designer in reducing the height of glass plate, as he justly thinks that all above the level of the eye is so much wasted. When architectural design is studied in reference to the actual requirements of such prosaic matters as shop windows, it may dawn on the minds of architects and their patrons that it is as easy to make a window pleasing and artistic as to make it dull and ugly. The architects of commercial premises have not as yet learned, it would appear, that every shop window should be arranged and designed with a particular reference to the goods displayed in it. Costumes, drapery, and woollen stuffs require a treatment different in the apportionment of the glass panels to that required for the display of jewelry

and small articles, and, in short, every description of goods requires a design that shall appropriately set off the qualities of the wares exhibited.

### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary meeting of the Institute was held on Monday evening, the President, Mr. Alfred Waterhouse, R.A., in the chair.

#### ELECTION OF COUNCIL AND COMMITTEES.

The PRESIDENT read the report of the scrutineers on the voting-papers, who stated that for the Council 526 were received, of which 15 arrived too late, 1 unpaid postage, 2 invalid, and 27 irregular, leaving 491 good votes. The following were the results:—

President: A. Waterhouse. Vice-Presidents (4): Professor George Aitchison\*, J. Macvicar Anderson\*, Arthur Cates\*, and Henry Currey\*. Hon. Secretary: Aston Webb\*. Members of Council (18): T. E. Collicutt\*, 442 votes; John Slater\*, 399; Alexander Graham\*, 391; Ernest George, 388; William Emerson\*, 383; John Belcher\*, 379; R. Phené Spiers\*, 377; Thomas Blashill\*, 376; James Brooks\*, 364; Wyatt Papworth\*, 360; Campbell Douglas\* (Glasgow), 300; J. MacKean Brydon, 298; John Dando Sedding, 297; Octavius Hansard\*, 288; Edward Cookworthy Robins\*, 281; John Holden\* (Manchester), 280; Edward A. Gruning\*, 268; and James Barlow Fraser\* (Leeds), 254. Not elected: Lucy William Ridge, 247; Edwin Thomas Hall, 235; Robert J. Johnson (Newcastle), 234; Edward J. May, 207; John P. Seddon, 206; Joseph Goddard (Leicester), 197; Rowland Plunbe, 179; John Wreghitt Connon (Leeds), 142; H. G. W. Drinkwater (Oxford), 142; Benjamin Ingelow, 120; Edwin Seward (Cardiff), 113; and Hugh Roumieu Gough, 102. Associate-Members of Council (2): Reginald Theodore Blomfield, 292; and Thomas Miller Rickman\*, 241. Not elected: Arthur Edmund Street, 235; George Richards Julian\*, 159; and George Alexander Thomas Middleton, 50. Presidents of Allied Societies (5): H. Crisp\*, Bristol Society of Architects; Thomas Drew, R.H.A., Royal Institute of Architects of Ireland; R. Knill Freeman, Manchester Society of Architects; Thomas Mellard Reade, Liverpool Architectural Society; and Herbert Walker, Nottingham Architectural Society. Representative of the London Architectural Association: Leonard A. S. Stokes, President. Auditors (2): W. Kidner and Wm. Woodward.

The PRESIDENT, whose name had been received with loud applause, thanked the members for electing him for a third term to the chair.

The voting for the four Standing Committees was as follows:—

Art Standing Committee.—Fellows (10): R. Herbert Carpenter\*, 416; Mervyn E. Macartney\*, 407; J. M. Brydon, 400; Ernest Newton, 386; Edward S. Prior, 375; Ralph Nevill\*, 360; E. J. May, 350; William Kidner\*, 332; C. Forster Hayward\*, 328; and T. J. Flockton (Sheffield), 313. Not elected: Maurice B. Adams\*, 293; and Ralph S. Wornum, 279. Associates: E. Ingress Bell\*, 410; G. H. Birch\*, 373; James Neale\*, 366; A. Beresford Pite\*, 334; Gerald C. Horsley, 332; Alfred Aitchison\*, 303. Not elected: Walter L. Spiers, 202; A. Needham Wilson, 185; and Thomas E. Pryce, 158. 463 good voting-papers were received, in addition to 23 that were spoiled.

Literature Standing Committee.—Fellows (10): Wyatt Papworth\*, 430; Hugh Stannus\*, 417; J. Alfred Gofch\* (Kettering), 409; Charles Locke Eastlake\*, 404; B. Ingelow\*, 401; Thos. H. Eagles\*, 398; E. P. Loftus Brock\*, 386; Mervyn E. Macartney, 373; Frank T. Bagdall, 370; Hampden W. Pratt\*, 359. Not elected: Edward S. Prior, 344. Associates (6): R. T. Blomfield\*, 414; Paul Waterhouse\*, 404; Arthur E. Street\*, 397; G. Richards Julian\*, 335; Thomas Garratt\*, 328; H. O. Cresswell, 247. Not elected: Thomas Arnold, 205; R. L. Cox, 194; H. T. Hare, 111. 462 good voting papers were received, besides 21 spoiled.

Practice Standing Committee.—Fellows (10): E. T. Hall\*, 398; S. Flint Clarkson\*, 389; Cole A. Adams\*, 388; Lucy W. Ridge\*, 382; Joseph S. Hansom\*, 379; G. E. Grayson\* (Liverpool), 370; H. C. Boyes\*, 342; Stephen Salter\*, 331; G. R. Crickmay\*, 317; Professor Banister Fletcher\*, 287. Not elected: John Norton, 224; R. M. Roe, 167; C. H. Shoppee, 159; Alfred Williams, 147; J. G. Finch Noyes, 139. Associates (6): T. M. Rickman\*, 420; Thos. Batterbury\*, 355; E. Woodthorpe\*, 352; F. H. A. Hardcastle\*, 330; A. Rowland Barker\*, 311; R. Stark Wilkinson\*, 291. Not elected: Walter L. Spiers, 244; Frederick Wallen, 172; Chas. B. Arding, 153. 467 good votes recorded, 15 rejected as invalid.

Science Standing Committee.—Fellows (10): Professor T. Roger Smith\*, 451; J. Douglass Matthews\*, 432; H. D. Appleton\*, 414; A. J. Gale\*, 411; Lewis Angell\*, 409; B. Tabberer\*, 393; T. H. Watson, 391; Ernest Turner, 382; T. W. Cutler, 376; Henry Dawson\*, 372. Not elected: Alex. Payne, 320; Oswald C. Wilson, 267. Associates (6): Chas. Henman\*, 384; Henry Tanner\*, 377; W. C. Street\*, 374; Herbert A. K. Gribble, 363; Francis Hooper, 326; Henry Lovegrove\*, 316. Not elected: A. C. Bulmer Booth, 299; G. A. Pryce Cuxson, 209. 475 good votes, 7 rejected.

Mr. W. WHITE, F.S.A., thought the names of country members ought to be printed in a list by themselves, but Mr. R. NEVILL, F.S.A., pointed out that they took good care of themselves, three out of eighteen members of Council being provincial men, in addition to those representative of allied societies.

A vote of thanks to the retiring members of

\* Re-elected.

Council—Messrs. H. D. Appleton, R. W. Edis, W. M. Fawcett, T. J. Flockton, C. Fowler, G. T. Hine, E. Kirby, W. A. Royle, and J. Tait—was passed on the motion of Messrs. Carpenter and Hansard.

#### THE ARAB HOUSE IN CAIRO.

A paper by Count d'Hulst, of Cairo, was read for the author by Mr. R. PHENE SPIERS, who had translated it, and also illustrated it with numerous water-colour and pencil drawings, and by photographs. The author explained that it was a general habit in the Orient for a monarch to build a fresh capital on ascending the throne. Cairo was conspicuous among examples of this habit, and, again, Egypt had been the most conquered and exposed to internecine quarrels. These causes, time, and an unreasonable imitation of European architecture, had furthered the destruction of Arab houses. Some beautiful old ones were, however, still left in Cairo, and proved that the richness and elegance displayed in Arab public buildings were also attributes of the private houses. According to Arab writers, private houses in Damascus were built after the fashion of the Late Roman houses; in Persia, especially in Bagdad, the ancient Persian houses served as examples; while in Northern Africa and Spain the Moors evidently copied those of the ancient Roman. The principles of the plan of the Arab house were: (1) Grouping of the rooms around courts and gardens; (2) absolute separation of the rooms for each sex; (3) prevention of passers-by seeing into the courts; (4) windows arranged so that a man on camel-back could not see in, and so that they neither overlooked, nor were overlooked by, others; (5) railing the windows of upper floors so that the women could see into the streets and courts without being observed; (6) arrangement of the entrance to the harem (female apartments) in a special court, or in a place remote from that to the salamluk (male apartments); and (7) the arrangement of rooms, kitchen, bath, stables, &c., with due regard to the ruling breezes, and the construction of ventilators to air the rooms. The Cairo house had generally several floors, and not infrequently, towards the streets, a row of small shops on the ground floor; while in the upper part of the house bay-like constructions protruded about 1½ ft., mostly composed of turned wooden lattice-work; the roof was flat, and surrounded by a pendent fretwork ornament. The foundation walls to the height of the first floor were of quarried stone or cased externally with the soft calcareous stone of Mokattam, while the superstructure was of plastered brick. The house was entered by a narrow and dark vestibule leading to the court, and forming one or two angles to prevent those in the street seeing into it. The horseshoe arch, commonly considered a characteristic of Mohammedan architecture, was not very frequent in Cairo; in all the remains of Arab houses he had examined he had only discovered two instances in which the arcades of the *mahad* (a reception room on the first floor) were horseshoe shaped. In the Cairo Arab house all decoration, exterior and interior, was the work of the architect, and not of the decorator or upholsterer. The exterior was very plain: all ornamentation, if any, being displayed upon the entrance. The house of the French Consulate General showed how well Cairene architecture could be adapted to modern requirements, and what handsome and artistic effects it could produce. Local taste and exigencies were important factors in Egypt; and in the towns of the Lower Delta and along the sea-shore there existed an altogether different style—namely, brick architecture. Here the door and doorways were ornamented with geometrical designs in a kind of mosaic, composed of thin pieces of red and black bricks, whose furrows were filled in with white plaster, and inlaid in the brickwork. Another mode of decoration was the utilisation of the brick itself to constitute the intended design. An anomaly was the employment of wooden chains, the walls being traversed by them, each one intersecting another to give them greater resistance. The knowledge the carpenters displayed in the execution of the joints was remarkable. The brickwork was carried up to the cornice of the first floor; this cornice consisted of a double row of wooden stalactites, which supported the projecting upper floors. It was notable that, notwithstanding such a developed technique, no trace of moulded bricks had yet been discovered. All the towns of the Lower Delta had a number of portals of mosques with pendentives con-

structed entirely of bricks. At Rosetta the ground floors were exclusively devoted to warehouses and offices; a separate door led to the dwelling with a staircase to the first floor; this staircase very often protruded with half of its breadth. In Damietta another arrangement existed: the house formed three sides of a square, the entrance on the open side led into a place partly court, partly hall, having a roof only in that which was built over, and this place served for receptions. Another style of brick architecture which was interesting was to be met with at Assiout. These brick constructions, being mostly in a ruinous state, were disappearing fast, their material being used for new buildings.

A vote of thanks was accorded to the author and reader of the paper, on the motion of Mr. J. D. CRACE, seconded by Mr. WELLBORE and supported by Messrs. R. H. CARPENTER, F. GOODALL, R.A., WILLIAM BRINDLEY, and E. J. TARTER.

#### THE PROPOSED CHANGES AT THE ARCHITECTURAL ASSOCIATION.

AN adjourned special meeting of the Architectural Association was held on Friday evening for the purpose of further considering the scheme propounded in the special report submitted by a committee and summarised in our issue of May 2nd, p. 618. The President, Mr. Leonard Stokes, occupied the chair, and only about a hundred members were present. The meeting lasted nearly three hours, but was characterised by a more conciliatory spirit than the previous one, and the plan of cutting up the scheme into some sixteen sections enabled the members to deal with each subject without loss of time in digressions, and a business-like tone marked the discussion. As will be seen by the subjoined report, the report was adopted in its entirety, the only change carried of the numerous amendments being a verbal alteration of "most" for "some" in the fourth resolution, emphasising the desirability of employing visitors in advanced classes.

The President, in introducing the subject, pointed out that as the report of the special committee had been adopted by the general committee, it was really submitted by the latter body. The committee had carefully considered Mr. Stannus's amendment, which was under consideration by the meeting when it adjourned a fortnight previously, and had decided to adopt the suggestion therein made, and divide their recommendations into sections embodying the principles on which the report was based. These were cast in the form of resolutions, and were as follows:—

1. "That some more methodical system of study is essential in the Architectural Association, and that the need of such a system is emphasised by the recent publication of the Institute programme of progressive examinations."
2. "That the mutual system, which was adopted by the Association at a time when the number of members was small, now presents great disadvantages and difficulties."
3. "That it is advisable to adopt the Institute programme as the basis, (but not the limit) of any systematic course of instruction established by the Association."
4. "That a combination of lectures and classes is preferable to teaching in classes or by lectures taken singly; and also that, as a general rule, instruction in any one subject is likely to be better imparted by a single teacher, but that for advanced students the system of visitors is in some cases preferable."
5. "That in formulating any curriculum of study the work should, as far as possible, be so arranged as not to necessitate, generally speaking, more than twelve hours of evening work in each week."
6. "That it is particularly desirable that an architectural studio be established by the Association."
7. "That it is desirable that a course of day instruction be established on the same basis as the evening instruction."
8. "That it shall be made possible for members to obtain books from the library during the day-time."
9. "That, inasmuch as it would not be possible to carry out the proposed curriculum relying only on voluntary helpers, it is desirable that additional paid teachers be appointed."
10. "That this meeting approves the scale of fees mentioned in the report, subject to such modification as may be found necessary."
11. "That it has become absolutely necessary that a paid assistant secretary be employed."
12. "That this meeting considers that the annual subscription for town members should be raised to one guinea, and that for country members should remain as at present."
13. "That this meeting approves the suggestion of the Committee that a Guarantee Fund and an Endowment Fund be established."
14. "That the best thanks of the Association be expressed to those gentlemen who so kindly, generously, and ably assisted the Special Committee in the preparation of their report."
15. "That the resolutions which have been passed be referred to the General Committee, with instructions to take the necessary steps to carry the same into effect."

The President formally moved the adoption of the first paragraph, which was supported by Mr. C. H. Brodie, Mr. W. J. H. Leverton, and Mr. Cole A. Adams. Mr. A. Needham Wilson complained that the report indulged in vague generalities, and did not show wherein the Association had failed in the past. It would be a mistake to convert the A.A. into a mere cramming shop for the Institute examinations. The motion was then put to the meeting, and unanimously carried.

The second section, averring that the mutual system presents great disadvantages and difficulties, having been proposed for adoption by the President, Mr. Leverton moved its rejection on the ground that the present method of teaching was not mutual, but voluntary, each class being managed by a chairman and a number of visitors, and as some of the best men in the profession were members, their services could be secured as visitors if they were invited so to act. They could not afford to pay adequately the best men as teachers; but under the present system he felt sure their voluntary aid might be secured. It might be said that the young men whom they could secure as paid teachers were equal to the senior men; but they did not and could not carry the same weight of influence. The mutual system, they were told, had been strained to breaking; but he did not believe they had reached the limit of elasticity. The instant abolition of the voluntary system would involve an enormous increase in expenditure and a risk of non-success. They could form some idea of the numbers who would attend an expensive curriculum by Professor Roger Smith's class, where, he understood, about 20 attended. So recently as 1887 Mr. F. R. Farrow gave utterance to views quite opposed to the report which he now supported. Mr. Farrow said he had been led to change his views. The Institute scheme of progressive examinations had necessitated the provision of a systematic course of study, and it would be a scandalous shame if the Association should not provide this education. If Mr. Leverton knew the difficulty there was to get visitors who would only give up a single night per session for classes, he would not speak so lightly of it. The fact was that the foremost men in the profession would gladly help with means, but could not afford the time necessary to practically assist in the classes. He believed that the new departure would be a commercial success, and as the number of students increased they would be able either to reduce the fees of students or pay better lecturers. Mr. Owen Fleming thought all were agreed on the principle of the resolution, although they differed in detail. Messrs. A. O. Collard and Brodie testified to the difficulties experienced in getting unpaid visitors to come forward. Mr. Cole Adams said he should have voted against the resolution if it implied the extinction of the voluntary system; but this was not intended. Mr. Max Clarke moved and Mr. E. Woodthorpe seconded an amendment providing that the voluntary system should not be altogether abolished; but the resolution was adopted by an overwhelming majority.

On No. 3, making the Institute examination the basis but not the limit of the systematic course, considerable discussion arose. Mr. H. Sirr complained that it virtually bound them to adopt the Institute programme. Mr. W. Burrell urged that the Association should be entirely independent of the Institute and its plans of examination, whether the Institute took them up or not. It was a mistake to introduce the name of the Institute into the report and resolution. Mr. Bernard Dicksee thought they ought to get substantial help from the Institute if they showed that the Association was preparing men for its examinations. The resolution was carried by a large majority.

No. 4, declaring a combination of lecturers and classes to be preferable to either system taken singly, was next considered. Mr. Brodie moved and Mr. Leverton seconded that the word "most" be substituted for "some" in the last line. This was agreed to, but a further amendment, proposed by Mr. Max Clarke and seconded by Mr. Roland W. Paul, providing that the system of visitors be adopted throughout, was rejected. Mr. Farrow and Mr. Baggallay stating that experience showed the plan of having visitors did not work equally well in all classes. The resolution as amended was then carried.

No. 5, restricting evening work in classes to 12 hours per week, was agreed to after remarks

from Messrs. Cole Adams, Thomas Pryce, and A. W. Earle.

The next section, establishing an architectural studio, gave rise to more controversy. The President explained that it was proposed to keep the studio open all day, so that a man could work or study there, while at certain hours an instructor or visitor would be in attendance to answer questions and give advice. Mr. Leverton moved as an amendment that the opening of the studio be postponed for the present. Men who wanted such facilities could already obtain them at the Royal Academy, which was free. Mr. Percy Smith remarked that this studio would be a stepping-stone to the Academy School, entrance to which was only gained by examination—by men under 23. The amendment was not seconded, and the resolution was carried *nem. con.*

As to No. 7, arranging for a course of day instruction, Mr. Needham Wilson said he was not in favour of the scheme, as, together with the clause just agreed to, it was too academic in character. He wished to make this protest against the establishment of a studio, except for youths not yet articulated. It should be restricted to men who had not yet entered office. Mr. Cole Adams heartily supported the resolution, feeling that the tide of events rendered its adoption inevitable. The Institute, in their new model form of pupilage, stipulated that the principal should afford reasonable facility for passing examinations. He believed these day classes would be a marked success. In reply to Mr. Sidney Beale, the President explained that the scheme would be begun tentatively, and that at first nothing would be omitted from the evening classes to be taken exclusively in the afternoon. Mr. Beale thought this too indefinite, and moved as an instruction to the committee that arrangements for the formation of day classes be made concurrently with any departure under the new scheme. Mr. Baggallay spoke in opposition to this, and the amendment finding no seconder, the resolution was adopted.

The next resolution, providing for the opening of the library in the daytime, was received with applause, and, after a protest from Mr. Brodie against any proposal to amalgamate with the Institute library, was carried unanimously.

No. 9, providing for the appointment of additional paid teachers, was supported by Mr. M. Garbutt, and after some comments by Messrs. Banister F. Fletcher, jun., S. Perks, and E. Greenop, was agreed to.

No. 10, approving the scale of fees, led to some discussion. Messrs. Burrell, N. Wilson, and other members complaining that the scale was too high for architectural students who were not wealthy, and there was no means of compelling principals to contribute, while parents might justly object to add five or ten guineas to the heavy premiums paid for articling their sons. Mr. O. Fleming said it was hoped to establish scholarships, and contended that if youths or their guardians could not afford £10 for classes they were wrong in entering the profession. Mr. Garbutt said the scale of fees was the very lowest that could be devised with safety, and the President, in reply to Mr. Dicksee, stated that the scale fixed was intended to make each class self-supporting. Messrs. Leverton, Paul, and M. Clarke opposed the resolution, which was supported by Messrs. Cole Adams, Brodie, Woodthorpe, and Pryce, and was carried.

The appointment of a paid assistant secretary was agreed to unanimously; but the next resolution, raising the subscription of town members from half-a-guinea to one guinea, led to a long discussion. The President pointed out that the members had practically committed themselves to it by voting for a studio, day classes and library, paid secretary and teachers, and that commensurate advantages would be given for the extra subscription. Mr. Cole Adams thought a plebiscite of the members should be taken before such a radical change was adopted; but Mr. M. Clarke, while objecting to the measure, thought no one who agreed to be bound by the majority who had passed the preceding resolution could logically oppose this one. Mr. Brodie moved as an amendment that a new class be formed to be called "honorary members," consisting of town members who had been in membership not less than ten years, and who should continue the half-guinea subscription. This was seconded by Mr. W. Henry White, and supported by Mr. N. Wilson, who urged that the conversazione and soiree should be abolished, and the £140 now spent on them devoted to the proper work of the

Association. Mr. H. W. Pratt, as hon. treasurer, supported the amendment, as he feared they would lose senior members if the subscriptions were raised. Mr. H. O. Cresswell said the amendment gave relief to those who least required it. He hoped the senior members would have more *esprit de corps* than to desert the Association because its increased usefulness made extra claims upon them for support. Messrs. Earle, E. W. Mountford, and Woodthorpe opposed the amendment, which on being put only received the support of 17 members, and was consequently lost. Mr. Leverton moved, and Mr. Sirr seconded, the adjournment of the meeting for a fortnight, voting papers to be sent out to all town members as to proposed change. Mr. Pryce pointed out that such answers would only be an expression of opinion and not a vote, and after further discussion this amendment was rejected, only 21 voting for it. The original motion was then carried, but eight hands being held up in opposition.

The three remaining paragraphs having been agreed to, the meeting was formally adjourned till that day fortnight for the amendment of the several rules affected by the resolutions.

### CONTEMPORARY BRITISH ARCHITECTS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THIS is the thirteenth sheet of portraits given in our pages since the commencement of the present year of living architects.

Mr. Ernest Newton, F.R.I.B.A., who comes first in the arrangement of the plate, was a pupil of Mr. R. Norman Shaw, R.A., to whom he was articulated in 1873 and remained with him three years after his articles had expired, when he began work on his own account in 1879. In 1883, in conjunction with some friends, Mr. Newton founded and presided over the "St. George's Art Society," which eventually became the "Art Workers' Guild," of which he is now a member—he is also a member of the "Arts and Crafts" Society, and Fellow of the R.I.B.A. He was the architect of the House of Retreat, Clerkenwell. The following is a list of his work: houses at Grove Park, Tenby, Beckenham, Chislehurst, Chertsey, Totteridge, Datchet, Bickley, Wimbledon, and Weybridge; besides various alterations and remodelling such as at Norwood, Chislehurst, Bickley, Chichester, Frimley, West Woodhay, Brighton, Folkestone, Croydon, St. Leonard's, Beckenham, Harrow Weald, Barnet, Clandon, St. Margaret's, and at Ware. His business premises, warehouses, &c., in London number some eight works. He has carried out furniture and decorations at East Barnet and at Lower Sloane-street. His ecclesiastical works are church at Lee; mission church at Widmore; mission church at Hither Green (for which plans of permanent church are prepared, and a view being hung in the Royal Academy this year); parish rooms at Bromley and Bickley. Cottages, lodges, &c., at Stratton Park, Godstone, Godden-green, and Chislehurst; also farm buildings at Godden-green. He is now engaged in building a large house at Bullers Wood, Chislehurst. In 1882 he was responsible for a small book of houses and cottages, published by Lascelles. His portrait is by Mr. E. D. Lavender, of Bromley.

Mr. Herbert A. Gribble, A.R.I.B.A., was a pupil of Mr. Alfred Norman, of Plymouth, but during the term of his articles he entered as a pupil the branch schools of the Science and Art Department at that town, and succeeded in obtaining five medals and two national medallions for architecture and for decoration; also one from the Polytechnic, Cornwall; another from the Albert Hall Exhibition; the National Gold Medal (during his minority) for Gothic Architecture, and the Gold Medal for Architecture, from the Commissioners of the Healthier Exhibition in 1884; and many other certificates of honour from the Science and Art Department and the Society of Arts. Mr. Gribble was the successful competitor in the Brompton Oratory competition, illustrations of which have frequently appeared in our pages; but the structure at present remains in a very incomplete condition. He also prepared the designs for the altars of St. Philip, the Magdalen, and the Sacred Heart connected with the same church, the commission for that of St. Philip being given by his Grace the Duke of Norfolk, E.M. The artisans' dwellings at Plymouth

the reconstruction of the West Hoe Pier, Plymouth, previously destroyed by a violent gale; and the remodelling of the plans for laying-out the West Hoe estate at the same town, all for the Naval Banking Co. A block of buildings for the firm of Messrs. Goad and Co., marble merchants, of Plymouth; the recent extensive additions to the Convent at Plymouth and the Catholic Church at Devonport, and the new Church of the Perpetual Adoration, London, N.W.; the National Armada Memorial, Plymouth; the Campanile and the High Altar for the church of the Holy Name, Poona, India; the Catholic Church at Sevenoaks; with various school buildings and other works of a miscellaneous character, most of which have appeared illustrated in our pages, and the originals at the Royal Academy of Arts. His photograph comes from the studio of Mr. C. E. Beach, of Brompton.

Mr. William Leiper, architect, Glasgow, was a pupil of Messrs. Boucher and Cousland, architects, of Glasgow, and he was afterwards in some London offices. Subsequently he entered the office of Messrs. Campbell Douglas and John Stevenson, architects, of Glasgow, and then commenced practice on his own account in partnership with Mr. R. G. Melvin, of Glasgow. He has designed and carried out Downhill U.P. Church, Partick; Burgh Hall, Dumbaron; Burgh Academy and Hall; mansion for Provost Corsar, Arbroath; Cornhill, Lanarkshire; for Mr. Robert Kay; Cobarn, Perthshire; Ruthven Tower, do.; Cairndhu Mansion for Mr. John Ure, late Lord Provost of Glasgow; "Moredun," for Mr. John A. Brown, Paisley; Lanark and Brechin United Presbyterian Churches; Camp-hill Church, Hyndlands Church, Glasgow. He recently built Ruyton Park, Shrewsbury, for the Rev. T. H. Hunt, and Kelly Mansion for Mr. Alexander Stephen. The Catholic Apostolic Church, South-side, Glasgow, and the recent alterations to the Park Church, for the Rev. Dr. Donald Macleod, have just been completed from his designs. He was elected a Fellow of the R.I.B.A. in 1881. The saloons and architectural decoration of the palace portion of the Russian imperial yacht *Livadia*, were executed from his designs and under his direction.

Mr. H. A. Peto, F.R.I.B.A., was born in 1854, and is a son of the late eminent railway contractor, Sir Samuel Morton Peto, Bart. His professional education was of a very practical nature, he having spent about a couple of years in the joiners' shops of Messrs. Lucas Bros. at Lowestoft. His more distinctly practical education has been with Mr. Clements, of Lowestoft, and Messrs. Karslake and Mortimer, of London. He joined Mr. Ernest George in 1876, and in company with him has carried out some important works, amongst which may be mentioned Rousden, in Devonshire, for Sir Henry Peek; Buchan Hill, the house of Mr. P. Saillard; Batsford, Gloucester, the residence of Mr. A. B. Freeman-Mitford, C.B.; Shiplake Court, for Mr. R. Harrison; and Poles, in Herts, for Mr. E. S. Hanbury. Mr. Peto's work in London is perhaps seen to the best advantage in Harrington and Collingham Gardens, S.W., he building ten houses in the one case together, and in the other nineteen. Of later years Mr. Peto has been more especially turning his attention to the decorations and furniture of the interior of houses, for which he has always had a special leaning—No. 3, Ennismore-gardens, for Mr. E. O. Bickford; and 15, Hyde Park-Gardens, for Mr. Peter Brotherhood; and the most important, 6, Carlton House-terrace, for Mr. C. H. Sanford, are among his latest works and his chief. Mr. Peto's photograph was taken in Venice by Fratelli Vianelli.

The work of Mr. Thomas J. Bailey, A.R.I.B.A., the architect to the School Board for London, will be best recognised in the buildings of the Board erected during the past five years. Mr. Bailey acted for many years as assistant architect under Mr. Edward Robert Robson, and can, in conjunction with that gentleman, claim that the public elementary schools built within the last seven years are (to use Mr. Robson's words in a report made by him in 1888) "the best elementary schools in the world, and produced at a cost per cubic foot little over that of cottage-building." Latterly, however, the Education Department have sanctioned a greater expenditure in the schools, so that at the present day a school for 1,200 children would be approved at an additional cost of £2,000 or £3,000. As giving some idea of the magnitude of the work in which Mr. Bailey is engaged, it may be stated

that since he succeeded Mr. Robson in 1885 he has (in addition to his ordinary work) erected some 48 new schools, and has enlarged about 57 existing buildings. He has also built five pupil teachers' schools, 15 cookery schools, and five schools for the instruction of deaf and dumb and blind children, and two groups of divisional offices. We understand that he is at present engaged upon many new schools and enlargements of more or less importance; among others, a large scheme embracing a school for 2,000 children on a site at Clerkenwell, and including a deaf and dumb school, a blind school, a cookery school, and a large store building. In addition, a school at Anerley for the accommodation of 140 truants, with dormitories, dining-hall, bath-rooms, infirmary, committee rooms, and governor's house. Also an extensive enlargement of the Board's head office, comprising a new board-room, library, committee-rooms and offices, and rooms for the general staff. The likeness given of Mr. Bailey is from the camera of Mr. T. Atkins, of Upper Norwood.

Mr. Rowland Plumbe, F.R.I.B.A., was articulated to the late Mr. Frederick Peck (formerly of the firm of Cooper and Peck), who was the architect of the Agricultural Hall, Islington, and many other large buildings. Mr. Plumbe passed the examination under the Metropolitan Buildings Act in 1865, and has held the office of district surveyor for the last 15 years. He studied under Professor Donaldson at University College, and was a Double First Prizeman of his year. He also obtained a National Medal for freehand drawing at the Science and Art Department, South Kensington, in 1857. He has served on the Council of the R.I.B.A., and is architect to the Artisans', Labourers' and General Dwellings Company for their suburban villages, and is now engaged in building a village of between 3,000 and 4,000 houses at Noel Park, Wood Green, having completed the Queen's Park village. Mr. Plumbe has been architect to the committee of the London Hospital in building their new nursing home, parsonage, and medical college, and is now engaged in remodelling and enlarging the hospital. He has built many churches and chapels, mission-halls, schools, &c., not a few of which have been illustrated in this journal; also a number of country mansions and suburban houses, including more particularly one for Mr. Wilberforce Bryant at Surbiton, one for Mr. Frederick Bryant at Leatherhead, for the Rev. A. S. Bennett at Bournemouth, for Mr. J. Jeffreys in the New Forest, and he is now building a large mansion for Mr. W. M. Chinnery at Hatchford Park, Cobham. He has carried out many warehouses and factories, business premises, hotels, &c., both in the City and elsewhere, as, for instance, James Spicer and Sons' Queenhithe warehouses, Bryant and May's buildings at Bow, Greenwood's clock factory, Clerkenwell; Merriman and Pike's premises, Austinfriars; Unwin's printing works, Blackfriars; Burroughes and Watts' premises, Soho-square; Valley of Rocks Hotel, Lynton, North Devon, &c. Mr. Plumbe also laid out many estates, and has been actively engaged for the last 28 years in practice. He is now engaged in advising the South London Polytechnic Institutes Committee, being employed on the designs for their Borough-road Institute. Mr. W. Kent, of Eastbourne, did Mr. Rowland Plumbe's photograph.

Mr. Edward Cookworthy Robins, F.S.A., F.R.I.B.A., is a member of the Council of the R.I.B.A., and of the Society of Arts, and of the Sanitary Institute, vice-president of the Sanitary Protection Society, member of the Institute of Surveyors, and member of the Executive Committee of the City and Guilds of London Institute for the Advancement of Technical Education. He was a pupil of the late Mr. Sancton Wood, F.R.I.B.A., and he commenced practice in the year 1851, since which time he has executed a large number of commissions, among which may be mentioned the church of St. Jude and the church of St. Saviour, Brixton; the churches of St. John and St. Saviour, Wandsworth; the church of Emmanuel, Dulwich; and of Weeley, in Essex; together with parsonages, National and British schools; the Congregational and Baptist churches of Wandsworth, and of Streatham, Shadwell, and Camden Town, and elsewhere; a great variety of public and private buildings in London and the provinces; Springfield House, Staffordshire; and residences in St. Leonard's, Folkestone, Croydon, &c. As architect to the London Missionary Society he rebuilt

the Mission House, in Bloomsbury-street, and designed the four memorial churches for Madagascar, and the Theological College there, and at Kruman, in South Africa. He was architect to the Croydon Burial Board, and laid out their cemetery ground and building, and remodelled the Town-hall. Mr. Robins was also engaged in the ornamentation of many engineering works, such as the Evesham Bridge and the Morayshire Railway Stations for the late James Samuel; the Londonderry Bridge, projected by Sir William Cubitt and Mr. Peter Barlow; the Lambeth Bridge, erected by Mr. Barlow; and though the ornamentation was never carried out, the perspective view of the same was the last of the kind presented to the notice of the late Prince Consort just three weeks before his death. This design was exhibited in the International Exhibition of 1862. For 15 years he acted in the capacity of surveyor to the Worshipful Company of Dyers, until his election in the Court. He served the office of Prime Warden in 1879, and has ever since represented that Company on the Executive Committee of the City and Guilds Technical Institute, his services in connection therewith being acknowledged by the presentation of their silver medal. For the last 18 years he has held the office of architect and surveyor to the Berners Estate, and erected many business premises and artisans' dwellings thereon, as well as the choir schools for St. Andrew's, Wells-street. Mr. Robins has been a successful competitor in public competitions. He won the first premium for Mr. Spurgeon's Tabernacle in 1859, and was one of the four selected to compete for Mr. Newman Hall's church. He lost the Watford Orphan Asylum by the casting vote of the chairman, but gained the second premium. The Deaconesses' Hospital at Tottenham, opened by the Prince and Princess, was one among not a few successful efforts in competitive work. But his chief claim to consideration is his many elementary, secondary, and technical school buildings, from the Board School at Wapping to the Merchant Vintners' School at Bristol, which cost £40,000, and was opened by Sir Frederick Bramwell. We illustrated these buildings in our issue for June 5, 1885. A few similar works may be mentioned which have cost an average of £20,000 each: The North London Collegiate School for Girls, the Camden School, Kentish Town; Milton Mount College, Gravesend; Walthamstow Hall and Mission School, Sevenoaks; the National and Industrial Crippled Boys' Home at Kensington; the South Hampstead High School, the Congregational College at Caterham; the Grammar School at Bedford, now in course of erection, &c. Mr. Robins' literary labours have not been few. He has written 30 papers on professional subjects, and published a quarto volume entitled "Technical School and College Building." His portrait was taken by Messrs. Fradelle and Young.

Mr. Wyatt Papworth, F.R.I.B.A., member (for the third time) of the Council of the Royal Institute of British Architects, was educated for the profession in the office of his father, Mr. John B. Papworth. He was one of the founders of the Institute, and he represents in the third generation the traditions of the profession, as his grandfather, John Papworth, was one of the architects, builders, and decorative plasterers of the end of the last century, whose artistic works, as at Somerset House, the chapel at Greenwich Hospital, and numerous other places for Government and public bodies, exhibit a delightful contrast to the cast plaster work of later times. Taking office for a few years under the Commissioners of Sewers for Westminster and part of Middlesex—one of the almost forgotten predecessors of the late Metropolitan Board of Works—he left it for a short service in the office of Sir John Rennie, and then accepted the appointment of assistant, and later of surveyor, to the Alliance Fire Assurance Company, which positions he held for over forty years, retiring about two years since. The branch office at Ipswich was erected from his designs, and very numerous rebuildings and restorations were carried out under his superintendence during that long period. As showing the uncertainty of competitions, he has stated that although successful in about a dozen of them, only three or four have ever been carried into execution from want of funds or other circumstances. Among his other professional works may be cited the re-arrangement of the large corner building in King-street, St. James's, for the Junior Army and Navy

Club. He has devoted many years to literature, and published several useful works and papers. When the Institute removed to Conduit-street, in 1860, he undertook the arrangement of the books in the library (the cases having been designed and fixed under the direction of his brother, John W. Papworth), with the entire revision of the catalogue, with the formation of it as a classified catalogue, and the printing of it in 1864. This is an early instance of his connection with the usefulness of the Institute, and he is now a constant contributor to the *Journal*, a periodical often contemplated by members in the earliest days of that body. He was the chief promoter of the Architectural Publication Society, and with the kind co-operation of numerous friends, of whom many are deceased, he has carried on the "Dictionary of Architecture" nearly to completion, as the letter V is now entered upon. In 1864 Messrs. Longman and Co. intrusted to Mr. Papworth the editorship of a new edition of Gwilt's "Encyclopædia of Architecture," to comprise the vast amount of information accruing during the lapse of nearly a quarter of a century since that work had been first published. This was issued in 1867, a further enlarged edition was published in 1876, and a third one containing greater expansion and revision in 1889. In July of last year he attained the high distinction of Master of the Worshipful Company of Clothworkers of London, one of the twelve great City companies, and the pioneer of technical education in this country. The photograph reproduced to-day is by Messrs. Elliott and Fry, of Baker-street, W.

#### THE ROYAL CAMBRIAN ACADEMY AT PLAS MAWR, CONWAY.

THE scenery and the antiquities of Wales offer at all times a series of worthy subjects to the painter, and it is to be expected that a large portion of the work done year by year by members of the Royal Cambrian Academy should reflect those scenes which have always made the mountains, the lakes, the coasts, and castles of Cambria famous in the whole art of picture making.

We have already referred to some of the chief works exhibited by members and hon. members of the Academy, notable among which are the "Elijah" of Sir Frederic Leighton, P.R.A., and "The Prodigal," of Mr. G. F. Watts, R.A.

More than a passing comment is due to the quaint old mansion, "Plas Mawr," in which the exhibition is arranged. It is one of the few town houses of the Tudor period now to be met with, having been erected by Robert Wynne, of Gwydir, about 1580. The "crow-steps," and the angular pinnacles attached to the finial stones of the gables, hint very strongly at a Flemish influence in the design, though the grey local stone, and no brick, has been used throughout.

The "place" consists of three chief blocks of building, with a courtyard between each, the one first entered being remarkably picturesque—a parapeted terrace raised on arches, and approached by broad return steps extending across one end. Ascending these steps, the banqueting-hall (in which are held the council meetings of the Academy) is reached. Upstairs is a large drawing-room with oriel windows, and beyond a series of private rooms, which are reached by circular staircases, from the upper portion of which charming views up and down the valley of the Conway to the range of Carnedd Llewellyn on one hand, and the Great Ormes Head on the other, are to be had. Each of the rooms contains an elaborate plaster ceiling of good Tudor design, and massive stone chimney-pieces elaborately carved or decorated with relief work in plaster, much of which has been anciently decorated in colour. The place has been on the verge of ruin, having been sadly neglected or misused during long years; but, from the signs of careful use, and the development of its artistic resources, which are becoming more and more apparent every year, it is evident that the owner, Lord Mostyn, has taken a judicious step in transferring the charge and the use of the building to the Royal Cambrian Academy.

The good appearance of the quaint old rooms is greatly enhanced by the rich or bright colouring of the pictures, the gilding of frames and maroon drapery background giving, in combination with curious window recess or arched ingle nook, many an interior "bit" very tempting to the

sketcher. This quality of quaintness is to be greatly admired, but it has every year presented many difficulties to the hanging committee, for its cross lights and low ceilings give by no means the best conditions for picture viewing.

It is therefore intended by the council to erect a gallery for the annual exhibitions in the grounds adjoining the courtyard, using the present rooms as a museum for the display of Welsh antiquarian relics, furniture, armour, &c.

Still, the charm of the old rooms as they now are should not be too soon or too heedlessly dispelled, for a modern picture gallery might not command the same liking from the public, and the hanging committee, which consisted this year of Messrs. C. Potter, J. C. Salmon, and the two South Wales members of the council, Messrs. Edwin Seward, F.R.I.B.A., and T. Henry Thomas, have much to thank the picturesque old building for as to general effect, even if it must be blamed here and there in respect to detail results. The exhibition is open until the end of October, so that many of our readers will have the opportunity for a visit.

To touch further on the large assemblage of landscape and figure works in oil and water-colour would be travelling outside our limits as to space. Looking, therefore, with more architectural eye, we find a quiet but excellent drawing of Vitre in Brittany, by S. J. Hodson. In the same room is a strong pencil sketch on grey paper of the oak screen at Crewe Hall. This work is from B. S. Marks, a figure and portrait painter of merit; but the catalogue bears a note that it was sketched "for introduction into a large oil painting." Two realistic architectural sketches by Sir Frederic Leighton are interesting—"A Ruined Mosque near Damascus," and "The Villa Malta in Rome." Mr. Geo. Harrison exhibits an "Interior of an Old Church near Canterbury," a shadowy interior, well treated; and Mr. Edwin Seward, F.R.I.B.A., has several fair-sized works in pastel—some architectural, from Belgium and France, others almost entirely landscape.

Of the latter class are "Afternoon Shadows," a white-gabled cottage in a country lane; "A Rugged Nook, Gower," a rocky sea-cliff overhung by trees, under which nestles a village church; and also "Summer Gloom" and "Soft Summer," both moorland subjects. A larger work by this artist is "St. John's and the Castle Tower, Cardiff," in which Mr. Wm. Burges's huge tower and the elegant Perpendicular church tower are seen against an evening sky over the roofs of old buildings which overhang still water.

Mr. Alfred Slocombe has a warm-tinted drawing of "Pennard Castle, Gower"; Mr. Jno. Johnson "Bettws Old Church" and "Old Church, Caer Hun"; Mr. J. C. Salmon a striking drawing of "Conway Castle"; and Mr. Geo. Hayes "A Fair at Conway," in which a street view containing a timbered hostelry in the "overhanging" style is well shown.

The architectural drawings, pure and simple, are fewer this year than usual. They comprise a drawing of St. Silan Church, Llansilan, by Mr. Arthur Baker, F.R.I.B.A., and several designs by Mr. R. Grierson, A.R.I.B.A. One is for a grammar-school at Ruthin, another for Friar's School, Bangor, and a third a picturesque and carefully drawn design for a lych-gate at Llanegfai, Anglesey.

The catalogue of the exhibition contains one or two exterior and interior sketches of Plas Mawr, and moreover in a footnote, anent the new gallery scheme, part of a letter from Sir H. F. Ponsonby is reprinted, which says: "The Queen takes great interest in the development of art, and wishes the movement in the Principality every success." The Cambrian Academy has, like its older sisters—the Scottish and Hibernian Academies—not always enjoyed unalloyed prosperity; but its prospects for useful and long-needed work in Wales are bright at present, and the Plas Mawr exhibitions go far to establish its place among permanent and representative art organisations.

#### EDINBURGH ARCHITECTURAL ASSOCIATION.

THE annual general meeting of this association was held on the 29th May in the Architectural Hall, 42, George-street, Prof. G. Baldwin Brown, president, in the chair. The secretary (Mr. T. Fairbairn) read the report of the council on the past session, which stated that during the session 27 new members had been admitted, the

number on the roll being now 273. Mr. A. Dodds Fairbairn, C.A., next submitted the balance-sheet for the past session, which showed an excess of revenue over expenditure of £28 16s. 6d., the balance in hand being now £192 6s. 2d. Mr. R. M. Cameron read his report on the library. Mr. Hippolyte J. Blanc submitted his reports of the Work-Class and Sketch-Book Committees, by the latter of which an early issue of a new volume of the Sketch-Book was promised. All these reports were adopted by the meeting, and the prizes in the work-class were awarded. The election of office-bearers for the ensuing session was next proceeded with as follows:—President, Mr. John Kinross; past-president, Prof. G. Baldwin Brown; vice-presidents, Mr. Archibald Macpherson and Mr. W. W. Robertson; hon. secretary, Mr. T. Fairbairn; hon. treasurer, Mr. J. Johnston, C.A., hon. librarian, Mr. R. M. Cameron. Members of Council:—Messrs. J. Wallace, H. F. Kerr, D. W. Stevenson, R.S.A., J. McLachlan, D. MacGibbon, and G. S. Aitken. The following are the Conveners of Committees:—Sketch-Book, Mr. Blanc; Publication, Mr. Aitken; Work-class, Mr. John Watson; and Auditors, Mr. J. H. Tod, C.A., and Mr. M. A. Dodds Fairbairn, C.A. The retiring president, Prof. G. Baldwin Brown, then delivered his address, this subject being "The New Town of Edinburgh." Referring to the present position of the architectural profession in Scotland, he said questions of the organisation of architects and of the architectural education of students were under discussion, and it was to be hoped that the outcome would be a closer union among members of the profession for the furtherance of common aims as well as improvements in the methods of art education. He considered the "New Town of Edinburgh" both in itself as presenting standard examples of a particular style of architecture, and also in the relation to the general course of development through which cities had in all ages passed. After reviewing the characteristics of the old and new towns of Edinburgh in the light of historical parallels, the President said that the history of modern improvements in Edinburgh was not one which it was possible to look upon with unmixed satisfaction, for at almost every step there was evidence of narrowness of view or of interested motives influencing bodies or persons engaged in the common work. Parts have been shifted many times; sometimes the Town Council had been the attacking party, while at other times it had stood up to defend the city against individual lawlessness, or the aggressions of private or public corporations. For example, one of the feuars of land in Charlotte-square early in the century had tried to deviate from the plan given by Robert Adam, and was defeated in an action at law brought by the Town Council, while on the other hand this very body had in 1772 been sued by the feuars of the New Town to prevent their building on the land south of Princes-street. The building of the houses at the corner of the North Bridge and Princes-street, unsuccessfully resisted by Lord Cockburn and others, was another case in point, while at the present moment the Town Council was manfully resisting some schemes of a railway company which if carried on would reflect irreparable injury on certain parts of the city. In spite of these drawbacks, however, the New Town of Edinburgh had got itself built, and had remained, considering all things, fairly well preserved. It was well, however, to remember that the negligence of a single generation of citizens might result in the injury, or even destruction, of priceless architectural treasures, and the consequent degradation of the common civil life.

The annual excursion of the Association took place on Saturday, about thirty members leaving the Waverley Station for Dunfermline early in the day, under the leadership of Mr. Russell Walker. The party visited Pitreavie House, which they were shown over by Mr. Henry Beveridge, who described its architectural features and traced its history. The mansion-house, he explained, dated from the earlier decades of the 17th century, and was erected in its original form either by Sir Henry Wardlaw, chamberlain to Anne of Denmark, Queen of James VI., or more probably by his son of the same name, created Baronet by Charles I. in 1631. The house had been considerably altered both in its internal arrangements and in its outward aspect, probably in the early days of the last century, when it passed out of the hands of the Wardlaw family, and became the property of Sir Peter Blackwood,

Lord Provost of Edinburgh. Mr. Beveridge mentioned that the ground immediately surrounding the house was the scene of the battle of Inverkeithing or Pitreavie, fought in 1651 between Cromwell's troopers and the supporters of Charles.

#### BUILDERS' BENEVOLENT INSTITUTION.

AN election of one pensioner on the funds of this institution took place on Thursday, the 29th ult., at the offices, 4, Vernon-place, Bloomsbury-square, Mr. George Plucknett, J.P. (hon. treasurer), presiding. There were six candidates for the one vacancy—viz., one man and five women.

The scrutineers, Messrs. T. Stirling and E. Rider, announced the result of the polling to be as follows:—Charles Sabey, 97, St. Peter's-street, Islington, aged 70, builder (second application), 1,198 votes; Margaret Alice Richardson, North Shields, aged 65, widow of T. B. Richardson, builder (third application), 1,179 votes; Mary Ann Shapland, 132, Stamford-street, Lambeth, aged 70, widow of Wm. Shapland, builder (second application), 690 votes; Emma Bird, 48, Chippenham-road, Paddington, aged 60, widow of Joseph Bird, builder (second application), 3,085 votes; Elizabeth Darby, 2, Sangora-road, Clapham Junction, aged 80, widow of Edward Darby, builder (second application), 728 votes; and Bessy Webb, 314, Old-street, E.C., aged 60, widow of Robert Webb, builder (first application), 1,050 votes. The successful candidate was declared to be Emma Bird.

Among the friends of the institution who took part in the proceedings were Messrs. W. Scrivener, C. Ansell, G. B. New, J. T. Bolding, C. Bussell, and R. Richardson.

The proceedings closed with votes of thanks to the chairman and the scrutineers.

#### CHIPS.

The annual meeting of the Cambrian Archaeological Society will be held at Holywell this year. It will be opened on August 18th, and will be continued over five other days, a visit to Mostyn Hall being arranged for the 22nd.

A stained-glass east window was unveiled at Christ Church, Great Homer-street, on Saturday. The window, the upper part of which represents our Saviour on the Cross, and the lower part the celebration of the Last Supper, was designed and executed by Messrs. Wailes and Strang, of Newcastle. The chancel has been redecorated by Messrs. Morton, of London-road, Liverpool.

The Duke of Clarence will open the completed North Sea Wall and Marine Promenade at Scarborough, on Friday, the 27th inst.

The Town Council of Glasgow adopted on Friday a report by the late Mr. Carrick as to his design for proposed back tenements of workmen's dwellings in Saltmarket, and a recommendation by a committee that the erection of the tenements should be proceeded with.

Memorial stones were laid on Friday at Rhyl in connection with the English Presbyterian Church now being built by Mr. Matthew Rogers, Flint, from designs prepared by Mr. Owen, architect, Liverpool. The church will be of local brick, with Ruabon terracotta dressings, and in Romanesque style, and will accommodate 250 persons.

The Gibbet-road Primitive Methodists, Halifax, have adopted plans prepared by Mr. James Farrar, architect, of that town, for a new chapel and school in Queen's-road. The cost will probably be from £5,000 to £6,000, and the style Gothic.

His Grace the Lord High Commissioner, the Marquis of Tweeddale, visited Musselburgh on Saturday afternoon, and performed the opening ceremony in connection with Inveresk parish church hall. The hall is built in the 14th-century style of Gothic architecture, from plans prepared by Mr. J. McIntyre Henry, architect, Edinburgh, at a cost of about £2,000, and is capable of seating about 750 persons.

At length work has been begun in connection with the proposed church of St. Mark to be erected at Fitzhugh, Southampton, the contractors, Messrs. J. Bull, Sons, and Co. (Limited), having commenced preparation for the foundations. The probable cost of the church is set down at £6,500, and of this sum only £4,200 is subscribed.

The old Carmelite Priory Church at South Queensferry was reopened for public worship on Sunday last after restoration. The services were of special interest, as being the first held within those venerable walls for about 250 years.

#### WAYSIDE NOTES.

I UNDERSTAND that that grand old German masterpiece, the tower of the Cathedral of Ulm, has recently been completed, and that it now soars into the air fully five hundred and thirty feet above the level of the ground, thus topping the Cologne spires by some fifteen feet, and becoming, in fact, the highest cathedral tower or spire in the wide world. It is fitting, too, that Ulm should have the tallest spire in Germany, for I believe that this cathedral is the largest in the empire, and especially noteworthy for its great breadth. Of old-world Ulm, however, I have only dreamed, so have no authority to speak concerning its famed cathedral; but, being so famed, we are all more or less acquainted with it from drawings and descriptions, and we are all interested in learning that the tower, left in the Middle Ages at a height of only about 340ft. (337, to be more exact) has since that time been growing, until now it has reached a breezy elevation indeed.

Because of the iron-tower mania, we need not think less of buildings like Cologne, and because of the Eiffel tower, and the hare-brained schemes afloat in this country and in America, we need not think less of the tower of Ulm. It should be easy for an architect, artist, or any person with educated sense and feeling to comprehend the difference between the merit of building a tower of architectural beauty and enduring materials, such as brick or stone, and one of perishable ironwork. The former is only erected with an infinity of patience and labour, and with vastly more difficulty and pains than the latter, and it lasts for centuries untended by the hand of man. Unless an iron building be continually and regularly kept from the atmospheric agencies by paint or other surface-coatings, it rapidly falls and decays. In days of iron towers, therefore, we should think no less respectfully and admiringly of great height in spires and towers of solid masonry. The height attained by endeavours in engineering iron construction should be regarded as midway in merit between that of a true architectural tower and that of a captive balloon. The reader will, perhaps, rightly consider that this merit is not of a very high order. I would certainly give more credit even to the man who erected a comely brick chimney-stack 400ft. high than to another who builded an iron tower of double this altitude.

The German nation is an example to us in many things; but I doubt if we can be fairly sent to the Teutonic race to learn much about architectural design—as a general rule, that is to say. As regards the management of architectural studies, we can afford to take many hints from many nations, and something, certainly, from the Germans. German students are methodical—even in duelling—and the German architectural student also plods along, believing, above everything, that "order is Heaven's first law," and pursuing his studies in fixed methods. We, perhaps, see the result in the streets of Berlin and other modern business cities in Germany. Academical studies of porticoes, *modulated* to the fraction of an inch in column, capital, architrave, frieze, and cornice, are prominent objects in the foreground. In some respects this is to be commended. On the Continent, where academical studies pertain, we do not have our architectural senses so violently outraged as in go-as-you-please England. In London we are disgusted with façades that daily arise, wherein nothing is so plainly evidenced as crass ignorance of Classic proportions and an utter absence of compensating inborn taste. In Paris, in Brussels, in Vienna, and in Berlin modern street façades are at least inoffensive; they have evidently been designed by men who, in their student days, learned that a base twice the depth of an ancient example is an eyesore, and that exaggerated entasis is neither quaint nor beautiful, but only suggests the belly of an alderman.

My allusion to German architectural students, I should have said, has been prompted by an article in *A.A. Notes* of this month, on "The Berlin Technical Schools," an article contributed by Mr. J. Hartree, who deals from the German capital. Mr. Hartree gives an account of the building in which the embryo architect is fostered, and a description of the methods of study pursued under the management of the Government Minister of Education. In a specimen of a week's study for first-year students,

the thing that strikes one as forming an immediate distinction between the English and German architectural student is the inclusion of the integral and differential calculus in the curriculum of the latter. I don't say that the regeneration of modern English architecture hangs upon integral and differential calculations; but our architects could do with a much more mathematically imbued brain, whatever gentlemen of the ultra-artistic-cum-bottle-glass school may aver. Anyhow, putting aside mathematics, we see from Mr. Hartree's list of subjects that the German architectural student is, in his first year, well grounded in such sciences as geometry, physics, and chemistry, which are all directly useful to the practising architect. This is over and above the instruction in architecture proper and in drawing. In his last year, a student goes in largely for design, in any style he may prefer, and carries on many studies that will be of the greatest service to him in his every-day duties as architect. As distinct from things in this country, it appears that study is not confined to architecture as a fine art, as at our R.A. schools, and, further, that the work is carried on by Government, so it is not a voluntary institution such as the Architectural Association. If anything, it is more like our S.K. system, but vastly more thorough and complete.

The article was very timely, now that all the talk is about the Architectural Association scheme of reform, touching which, I understand that the temper of Friday's meeting at Conduit-street was wholly in favour of the movement, the "Opposition" not appearing or making itself heard, at least to any effect. This being so, I hope that things will be carried boldly forward. My only fear is that the Association may be taking upon itself more than it has the power to accomplish; but since nothing can be positively assured, there is no reason why an endeavour should not be made. It is becoming evident that we want fuller and more complete education for the architect even in these unregistered days, and in lieu of a national concern that might consolidate South Kensington, the R.A. Schools, and the Association classes into one powerful educating body, we must be thankful for the present scheme. In establishing new schools and instituting new methods for educating architectural students, it should be our aim to get all the benefits that we painfully see accrue from the Continental systems, while, at the same time, preserving the freedom of the English school and avoiding the crystallising process that generally accompanies academical teaching.

In view of the failure of the Association's scheme, let us thank Mr. Bidlake, the accomplished sketcher, for a suggestion, in *A.A. Notes*, that may yet save the architect. One would have thought that there would have been a good deal about the education question in this month's issue of the Association's journal; but Mr. Bidlake alone touches on "The A.A. and Architectural Education." The Institute exam., says (in effect) our writer, is very good, and so is sketching, and it might be as well for young architects to write a decent specification; but what is wanted to save such persons from ruin is the study of—well, not Ruskin, Gwilt, Fergusson, Rivington, or Scott or Street, but something of a totally different genus. And when one gets a good tip, there is something in the flesh that prompts us to keep it to ourselves; but I will not be selfish in this instance. It has been written in *A.A. Notes* in an article under the title of "The A.A. and Architectural Education," and I will openly and frankly give it, in my own words, to yet another portion of the world:—"If young architects would be worthy of their calling, and rise to honour and respect in their profession, let them see to it that they study their 'Architects' Compendium.'"

There has been a vast amount of croaking about the new buildings erected on the west side of Westminster Hall, the reason of which I do not quite grasp. The hoarding has lately been taken down, and the buildings are in full view. On Tuesday last I passed by, and had a good look at their exterior prospect. Perhaps there is something objectionable about the fact that the building now appears to be in a hole, and, to all intents and purposes, is in a hole, with an area around. Of the architecture of the new work I really don't see cause to complain. It has been

said that the pinnacles on the buttresses are large and dwarf the Hall; but this effect has not made itself apparent to me. Internally, I have not examined the new apartments, nor have I seen the gruesome beasts about which so much has been said, and I take the adverse criticism to be mainly caused by the success of a scheme which at the outset was opposed by a small section of the community, who now weep and wail unceasingly.

A correspondent writes me about a competition for a brewery at West Hartlepool, the advertisement for which may be fresh in the memory of readers. The result of the competition, according to my correspondent's account, is about as bad as it can be. It appears that seven sets of designs, including detailed estimates, specifications, of plant, &c., and general specifications, were forwarded to the promoter of the competition, only to be returned at the end of a fortnight to their respective owners, with no award made, and the premium withheld. This is pretty cool, even for a brewer! My correspondent gives me other information with respect to the competition which would interest the profession; but for obvious reasons he can scarcely expect me to repeat it here *verbatim*. He should know that you are always willing to print letters from ill-used competitors, and if he will put the whole facts before you, I am sure you will consider the case one that should be known to all, and I shall then be in a position to do what little I can in my own way. GOTH.

#### BOOKS RECEIVED.

*St. Alban's Cathedral and its Restoration.* By EDMUND, LORD GRIMTHORPE, Q.C.—A second edition, revised and enlarged, of this piquant little guide-book has just been published. The author explains in his preface, "I have rearranged [the book] into a history of the church until its cathedralisation, and then a description of it in its present state, and of the recent restorations which happened to begin exactly at that time. It is impossible to explain them properly without the contests which have surrounded them to a degree quite unparalleled. I soon saw that I, and all who agreed with me about every successive piece of restoration, would be overwhelmed, and the public deceived, by a very small number of unscrupulous writers, if I did not, like Nehemiah, hold the trowel in one hand and the (feathered) sword in the other, and use it every now and then. I never threw the first stone, but only laid them; which, in this case, seems to be thought worse." The comparison with Nehemiah, the most egotistical and authoritative of the canonical writers, is good, for does not that prophet say (v. 7): "Then I consulted with myself, and I rebuked the nobles and the ruler"; and does he not pray (xiii. 14): "Wipe not out my good deeds that I have done for the house of my God and for the officers thereof"? Lord Grimthorpe broadly asserts that all the architects and committees who have been concerned with the restoration of St. Alban's, as well as those who have made measured drawings of it, the writers of its history, were guilty of great and ludicrous blunders, and that he only was able to set them right. A new plan of the Abbey, made by the late Mr. Chapple in 1885, and corrected to date, is a useful feature of the book.—A new edition of *Picturesque Wales* has just been published under the auspices of the Cambrian Railways Company. It contains some additional views and descriptions of the Mid-Wales portion of that line.

The old parish church of Jesmond, Newcastle-on-Tyne, has recently been renovated and embellished, and has been reopened. Among the additions are a reredos, costing £450; an oak altar table, £50; and a reading desk, £30. In the centre of the reredos is a carving in lime-wood, being a representation of the Lord's Supper, after the picture by Leonardo da Vinci. It is 6ft. 6in. wide and 3ft. 6in. high. The work was designed by Mr. R. J. Johnson, architect, and the carving is by Mr. Ralph Hedley, and the decorating by Messrs. Atkinson Brothers.

At the request of the National Sunday League, the Council of the Royal Society of British Artists opened their Annual Exhibition in Suffolk-street, Pall-Mall, on Sunday, between the hours of three and six o'clock. The concession was accepted by 1,500 persons. Nominally admission was by ticket, but all who came were freely admitted, as they will also be next Sunday.

#### COMPETITIONS.

**SHEFFIELD MUNICIPAL BUILDINGS.**—On Monday last, the 2nd inst., the drawings prepared by the six selected architects were sent in for the second or final competition. The competitors' names are Mr. James Lindsay, A.R.I.B.A., 246, West George-street, Glasgow; Messrs. W. Harvey, F.R.I.B.A., and Bernard Smith, of Whitehall-place, S.W.; Mr. E. W. Mountford, A.R.I.B.A., 22, Buckingham-street, Strand, W.C.; Messrs. Flockton and Gibbs, St. James-row, Sheffield; Mr. Henry T. Hare, A.R.I.B.A., of 3, Lombard-court, E.C.; and Mr. F. H. Tullock, A.R.I.B.A., 5, Lancaster-place, Strand. Various statements have been made as to the names of the selected competitors, but all of them have been more or less incorrect. None of the competitors have furnished us with the information which we now give for the first time. As some of the names have, however, been made public property, it can serve no good purpose to hold back the correct list any longer, especially now that the designs have gone in.

**HYMER'S COLLEGE, HULL.**—The professional referee in this competition, Mr. E. C. Robins, F.S.A., in his report, says: There were 37 sets of designs, ranging in cost from £30,000 to £10,000 according to the authors' own estimates accompanying the plans, though none of them could be finished fit for occupation for less than £14,000. I selected six for honourable mention, either for excellence of planning or for beauty of design, or both, from which the premiated plans are selected. The price is taken at 5d. a foot cube, which seems to be the customary local standard of price for school buildings generally. I may remark there is but one design which completely satisfies the specific requirements contained in the "Instructions," one only which realises in every essential particular what I understand to be comprehended under the title "hall passage system," which has been adopted by the committee, with my full concurrence, as the latest improvement in school planning. The author of this design has summarised his views thus: Strict attention has been paid to the instructions that "the controlling idea in the arrangement of the plans is that of perfect openness of supervision, and generally to carry out the spirit of the hall-passage system thoroughly"—that is to say, every classroom is entered directly from the floor of the central hall or of the galleries surrounding three sides of it, while the whole hall, with its entrances and exits, and also its principal staircase, is completely commanded from the head master's and the porter's rooms, what corridors there are being employed for secondary entrances to the hall and for access to the lavatories, &c. They are, however, perfectly straight, wide, and as short as possible, their continuation indicating the direction in which future extensions can most fittingly be made. In too many of the plans the "heart of the design," the great hall, is not looked upon as a "hall passage," but is itself surrounded with corridors more or less open to the hall, thereby variously increasing the stipulated area of the hall, stated to be "not less than 4,000sq.ft.," and by inference not more than 10 per cent. in excess thereof. It is obviously advantageous that the central block should, as far as possible, be made to contain the great hall with its 16 classrooms in two stories, and its administrative department in one story. Less than this would scarcely be sufficient, because the temporary use of some of the classrooms for other purposes than they are ultimately intended to serve will be the only means of carrying on the work till the number of pupils enforces enlargement. I have no sort of hesitation in determining which of all the plans should take the first place. Its total cost is under £15,000, and with reference to the portion proposed to be erected for £10,000, the author has so arranged the plan that the moderate-sized hall is inclosed by the 16 classrooms; and the music and drawing schools, the dining-room and porter's residence are added as extensions on the line of the main corridor, and are not, therefore, necessarily included in the main building; consequently, without any variation in the area of the hall, the author is able to provide in the first £10,000 the great hall, 12 out of the 16 classrooms, the administrative block, boys' conveniences, and one staircase exterior to the hall in addition to that within its purview; therefore this plan offers to you the nearest approximation to a complete building for the primary expenditure of any of the plans sent in. This design,

submitted under the motto "Supervision" (No. 31), is a suitable rendering of collegiate architecture, avoiding flashy ornamentation or baldness; the outline is good, and the details all that is required, and not concentrated in the west front only, as is the case in several of the designs; therefore, I have much pleasure in recommending that this design should be accepted as the first and best. The design marked "Balbus" (17) has an excellent plan, with central staircase opposite the administrative department, the head-master and the porter having free supervision of the hall and classrooms. The music-room is well isolated, though the secondary staircase is too distant and is encased in a costly tower. None of the remaining designs equal the foregoing as examples of the "hall-passage system," therefore I have selected "Wilberforce" (No. 21) for the premium of £25, as one of the most original and interesting of the artistic designs, illustrated by charming drawings. The authors of the selected design are Messrs. Botterill Sons and Bilson, of Hull. The second premium was given to Mr. E. T. A. Wigram, B.A., A.R.I.B.A., of London, and the 3rd place to Messrs. Chorley and Connon, of Leeds. The drawings are now on view at Hull.

#### CHIPS.

The ceremony of laying the last stone of the spire of Ulm Cathedral took place at six o'clock on Saturday evening. The official celebration of the event will take place on June 28 and three following days. The cathedral spire is now the highest in the world, having an altitude of 530ft.

Salisbury has, by 984 votes to 853, adopted the Free Libraries Acts.

An adjourned meeting of the Carnarvon County Council was held at Carnarvon on Friday for the election of a county surveyor in succession to Mr. Thomas, who has accepted a similar appointment in Buckinghamshire. Out of seventeen candidates, the committee selected Messrs. W. Lloyd Jones, Bangor; D. T. Davies, Menai Bridge, assistant to the county surveyor of Anglesey; Evan Evans, Llangollen; R. Grierson, Bangor; and M. Williams, Trevor, Llanaelhaearn. The final voting was between Messrs. W. L. Jones and Evan Evans, the latter being elected by 29 votes to 24.

Some interesting Flemish tapestry has been discovered in the stores of the Foreign Office, and is now being hung upon the walls of the large building in Downing-street. The tapestry is well preserved.

The new Roman Catholic Church at Teignmouth, dedicated to Our Lady and St. Oswin, was solemnly opened on Tuesday by the Bishop of Exeter and Newcastle. The church has been built by Mr. William Fogg, of Newcastle, at a cost of £1,200, to accommodate 200 worshippers.

On Tuesday the members of the London and Middlesex Archaeological Society assembled at the Bank of England to view the site of the church and churchyard of St. Christopher-le-Stocks, under the guidance of the president, Dr. E. Freshfield, by whom they were conducted along the course of the Wall Brook. Afterwards, at Brewers' Hall, Addle-street, papers were read by Mr. C. Welch, F.S.A. (City Librarian), the hon. secretary, on "The Early History of the Brewers' Company, as Told by their own Records," and by Mr. E. W. Brabrook, F.S.A., on "Some Eminent Members of the Company."

The new park which has been formed by the Shipley Local Board, at a cost of £2,000, for the use of the inhabitants, was formally opened on Saturday. The inclosure, which will be henceforward known as Crowgill Park, is centrally situated near Shipley Church, and overlooking a considerable stretch of the Aire valley. It is nearly four acres in extent.

The Sunday schools attached to the David Thomas Memorial Church, St. Andrew's, Bristol, are being enlarged. The large lecture-hall, and which was provided with partitions by which it could be divided into classrooms, has been dismantled, and the fittings removed. The old roof has been replaced by a new one, which gives considerably more height, additional light being supplied from a traceried window at each end of the building. A gallery has also been built at one end and another at the side. On each side of the entrance in Effingham-road wings two stories high have been built, which will be used as classrooms. The architect is Mr. Alfred Harford, Broad-street, and the builders are Messrs. R. Wilkins and Sons, Surrey-street, Bristol.

Professor T. McKenny Hughes, F.R.S., has been re-elected president of the Cambridge Antiquarian Society for the ensuing year, with Professor J. Henry Middleton as vice-president.

CONTEMPORARY BRITISH ARCHITECTS. — PROMENADE, MADEIRA-ROAD, BRIGHTON.—LIVESEY HALL, LANCA-SHIRE.—CITY HALL, PHILADELPHIA.—CALLIS COURT, BROAD-STAIRS.—SKETCHES FROM THE ARMOURERS AND BRAZIERS' EXHIBITION.

## Our Illustrations.

CONTEMPORARY BRITISH ARCHITECTS.

(See description on p. 792.)

## SHELTER HALL AND PROMENADE, BRIGHTON.

THESE new buildings have just been opened to the public use on the Madeira-road at Brighton. The promenade consists of a raised terrace, 1,304ft. in length and 25ft. in width, extending from the steps opposite the Royal Crescent to the steps opposite Paston-place, forming a raised walk between the esplanade on the Marine Parade and the Madeira-road, and protected on the outer edge by a strong fence and hand-rail. This terrace is accessible either from the Marine Parade or the Madeira-road by the Royal Crescent or the Paston-place steps, or by the hydraulic lift which has been placed opposite the centre of Marine-square, and for which a nominal charge is made. By means of this lift, visitors and others are enabled to save the fatigue of climbing the steps or the more prolonged ascent of the Duke's Mound, and invalids in hand chairs may be lowered from the Marine Parade to the raised terrace on the Madeira-road, or *vice versa*. A continuous seat is also provided on this raised terrace next the wall, extending the whole length. In the centre and underneath the raised terrace near the lift is a spacious shelter hall, with well-appointed lavatories on either hand—on one side for ladies and on the other for gentlemen. Adjoining the shelter hall and opening therefrom are two reading-rooms, each 56ft. by 24ft., and beyond these are covered walks, 18ft. in width, extending the remainder of the length. The raised promenade is supported on cast-iron columns and wrought-iron girders, with ornamental spandrels, the roof or ceiling being of concrete, with asphaltic walls on the top. The following materials, &c., have been used in executing these works, viz.:—About 5,000 cubic yards of excavation, 2,000 cubic yards of concrete, 300,000 bricks, and 600 tons of iron. The scheme was designed by Mr. Philip C. Lockwood, C.E., the contractors being Messrs. J. Longley and Co., of Crawley. The contract sum is £13,975. The work was carried out chiefly under the direction of Mr. G. R. Andrews, C.E., who succeeded Mr. Lockwood as borough surveyor to Brighton, but who has since resigned for a more important appointment.

## LIVESEY HALL, LANCA-SHIRE.

LIVESEY is one of the best examples of the smaller stone-built halls of North Lancashire. It stands in a pleasantly sheltered situation about two miles out of Blackburn on the old road to Preston. The hall appears to have been built at three different periods, easily traceable by date-panels built in the walls. The centre part bears the date

1608, the east wing 1666, and the west wing 1689. It was built by members of the Livesey family, from whom it takes its name, and was occupied by their descendants until the middle of the 18th century. At the present time one half of the building is occupied as a farmhouse, the other half being in a neglected condition, and rapidly going to ruin. The view shows the south front and what remains of the characteristic old garden and wall. Mr. Harrington's drawing, herewith given, is now in the Royal Academy Exhibition.

## THE CITY HALL, PHILADELPHIA.

THIS vast structure, only now being completed, was designed by the late John MacArthur, jun., the City architect. Its architecture is essentially modern in its leading features, and presents a rich example of what is known by the

generic term of the Renaissance, modified and adapted to the varied and extensive requirements of a great American municipality. The official description says that it is designed in the spirit of French art, free from servile imitation either in ornamentation or in the ordinance of its details. This immense architectural pile is located on the intersection of Broad and Market streets, in the City of Philadelphia. It covers, exclusive of the courtyard, an area of nearly  $4\frac{1}{2}$  acres, and consists of one building, surrounding an interior courtyard. The north and south fronts measure 470ft., and the east and west fronts 486ft. in their extreme length. The four fronts are similar in design. In the centre of each an entrance pavilion of 90ft. in width rises to the height of 185ft., having receded wings of 128ft. elevation. The fronts terminate at the four corners with towers or pavilions of 51ft. square and 145ft. high. The whole exterior is

bold in outline and costly in detail, being elaborated with highly ornate columns, pilasters, pediments, cornices, enriched windows, and other adornments. Archways of 18ft. in width by 36ft. in height, opening through each of the four central pavilions, constitute the four principal entrances, and at the same time afford passages for pedestrians up and down Broad and Market streets directly through the buildings. The basement story is 18ft. in height, and stands entirely above the line of the pavement. Its exterior is of fine white granite of massive proportions, forming a fitting base for the vast superstructure it supports. The exterior of the building above the basement embraces a principal story of 36ft. and an upper story of 31ft., with an attic over the central pavilions of 30ft., and over the corner pavilions of 12ft., all of white marble from the Lee Quarries, in Berkshire County, Massachusetts. The small rooms opening in the courtyard are each subdivided in height into two stories. In the centre of the group a courtyard of 200ft. square affords light and air to all the adjacent portions of the building. From the north side of this space rises a grand tower, the crowning feature of the city, from whatever point it may be approached, as St. Peter's, Rome, and St. Paul's, London. The foundations of this tower are laid on a bed of concrete, 8ft. thick, at the depth of 20ft. below the surface of the ground, and its walls, which at its base are 22ft. in thickness, are built of dressed dimension stones, weighing from 2 to 5 tons each. This tower, which is so deeply and so strongly founded, is 90ft. square at the base, diminishing at each story, until it becomes, at the spring of the dome, an octagon of 50ft. in diameter. A statue of the founder of Pennsylvania, 20ft. in height, crowns the structure, and completes the altitude of 550ft. making it one of the highest towers in the world. The entire structure contains about 1,000 rooms, giving provision for all the departments of the City Governments, classed under the heads of Legislative, Executive, and Judicial; besides which, a vast amount of room remains for use in the classification and preservation of the archives of the city, for storage, and for increased accommodations, which will undoubtedly be required from time to time by the natural increase of the public business, and the accumulation of the public records. Every room in the building will be well lighted, warmed, and ventilated upon an approved system, and every part of the structure will be absolutely fireproof. The several stories are approached by four large elevators, located at the intersections of the leading corridors, so as to facilitate the intercourse of citizens with the public offices, courts, and other branches of the Government. In addition to these means of approach there are large and convenient stairways in the four corner buildings, and a grand staircase in each of the centre pavilions on the north, south, and east fronts. The following materials have been used in the foundations:—74,000c.ft. of concrete foundations, 636,400c.ft. of foundation stone, 70,000c.ft. of dressed granite, 8,000,000 hard bricks, 23,300 pressed bricks, 36,972 white bricks, 366 tons of wrought-iron floor beams, 63 tons of wrought-iron clamps, 28 tons of cast-iron lintels, askewbacks, drain pipes, iron bricks, &c., 16,700sq.ft. of bond slate. The excavations for the cellars and the foundations required the removal of 141,500 cubic yards of earth. The preparation of the ground for the excavations involved the change of the gas-pipes, and of the two water mains of 20in. in diameter, from their course through the centre of Broad-street to a circuit around the site of the buildings. The tracks of the West Philadelphia Railway were changed from the centre of Market-street and laid round the site; and the freight railroad owned by the city and which ran through Market-street was entirely removed after it had ceased to be of use in the transportation of materials for the buildings. These changes involved a heavy outlay, which was charged to the Commissioners. The contractors engaged on the work are too numerous to mention. The architect's assistants were Messrs. R. W. Peterson, H. M. Wilson, Geo. T. Pearson, and Thomas U. Walter. The chiefs of the staff were Mr. John Ord, the present city architect, and Mr. Frank A. Hays. Mr. William C. McPherson was clerk of works; Mr. Alexander M. Calder was the sculptor. The foundation-stone was laid on July 4, 1874, and the work was finished this year all but the clock-tower, which

is now in progress. The commission was won by Mr. McArthur in a competition in 1869. The following dimensions of building are interesting:—Height of main tower, 517ft. 3½in. above pavement; from north to south, 486ft. 6in.; from east to west, 470ft.; area, 4½ acres; width at base, 90ft.; centre of clock face, 361ft. above pavement; diameter of clock face, 23ft.; height of upper balcony, 296ft. above pavement; total number of rooms in building, nearly 1,000; total amount of floor-room 14½ acres; heights of each centre pavilion, 202ft. 10½in.; each corner pavilion, 161ft.; basement story, 18ft. 3½in.; principal story, 33ft. 6in.; second story, 35ft. 7in.; third story, centre pavilion, 26ft. 6in.; third story, wings, 24ft. 3in.; third story, curtains, 20ft. 5in.; attic of centre pavilions, 15ft.; attic of corner pavilions, 13ft. 6in.; crowning statue, 36ft.; figures on centre dormers, 17ft. 6in.; on corner dormers, 12ft. 10in. The comparative heights of the principal buildings of the world are useful:—Washington Monument, 550ft.; City Hall, Philadelphia, 547ft. 3½in.; Cologne Cathedral, 510ft.; Great Pyramid, 480ft.; Strasburg Cathedral, 468ft.; St. Peter's, Rome, 448ft.; St. Stephen's Cathedral, Vienna, 441ft.; Salisbury Cathedral, 404ft.; Toraccio di Cremona, 396ft.; Freiburg Cathedral, 385ft.; Amiens Cathedral, 383ft.; Church of St. Peter, Hamburg, 380ft.; the Cathedral, Florence, 376ft.; Hotel de Ville, Brussels, 374ft.; Torre Asinelli, Bologna, 370ft.; St. Paul's, London, 360ft.; Church of St. Isaac, St. Petersburg, 336ft.; Cathedral, Frankfort-on-the-Main, 326ft.; Bell Tower, St. Mark's, Venice, 323ft.; Hotel des Invalides, Paris, 310ft.; United States Capitol, Washington, 287ft.; Masonic Temple, Philadelphia, 230ft.

#### CALLIS COURT, BROADSTAIRS.

The external walls of this house are built hollow, having a 2½in. interspace; they are executed in Lawrence's red bricks, with Portland stone dressings up to the first floor, and with Broseley tiling for the other floors. The half-timber work is of oak, the interstices being filled in with rough-cast and some portions with sgraffito work. The roofs are of two tints of Broseley tiling laid in patterns. The interior finishings are of expensive character, being all of hard wood, with parquetry flooring, ornamental ceilings, &c. Messrs. Paramor and Son, of Margate, are the contractors. The parquetry flooring and ornamental woodwork, including the staircase, will be executed by Messrs. Turpin and Co., of Queen's-road, Bayswater. The ornamental ceilings and plaster details will be by Messrs. Jackson, of Rathbone-place, Oxford-street. The sanitary fittings will be supplied by Mr. Geo. Jennings, of Stangate Wharf, Lambeth. Special attention has been paid to the heating, ventilating, and sanitary arrangements, which will be perfect. Attached to the house are a lodge, wrought-iron entrance gates by W. T. Allen and Co., of 132, Queen Victoria-street, and stables of considerable size, the fittings for which will be supplied by the St. Pancras Ironwork Company. The cost of the building, exclusive of laying out the grounds, lighting, &c., will be about £20,000. The residence is for Mr. Harry H. Marks, of the *Financial News*. The joint architects are Messrs. H. H. Collins, and M. E. Collins, of 61, Old Broad street, City.

#### SKETCHES FROM THE EXHIBITION OF THE ARMOURERS AND BRAZIERS' COMPANY.

We give this week a sheet of sketches from the above exhibition of metal-work which took place quite recently at the Armourers' Hall, Coleman-street, City. An account of this exhibition may be found in the *BUILDING NEWS* for May 23 last, p. 745, therefore little further need be said. Most of the subjects shown on our sheet of illustrations obtained well-deserved prizes—notably, the quaint Hall Lantern by Messrs. Strode and Co., of 48, Osnaburgh-street (in which case both the designer and craftsman were awarded extra money prizes), and the Finger-Plate, by Mr. Samuel Cope, representing the use of armour. Mr. Koester, whose excellent figure of a Jester we illustrate, executed the whole of the chasing on the crosier for the late Bishop of Durham, which was published in our pages on Feb. 7th last. The Lock-plate, by Miss Georgie Cave France, is a beautiful piece of decorative work; and there is much merit in the Cabinet Furniture of saw-pierced metal, for which Messrs. Hopkins and Son obtained an extra prize.

## Building Intelligence.

**ABERDEEN.**—The different estimates for the clock of St. Nicholas' Church, Aberdeen, were submitted to Lord Grimthorpe for his approval by the town council of Aberdeen. He recommended the three following firms:—Messrs. J. B. Joyce and Co., Whitechurch, £350; Messrs. Gillett and Johnston, Croydon, £430; and Messrs. Potts, Leeds, £375, with cast-iron wheels. After considerable inquiry by the council, it was decided to have gunmetal wheels, and the work to be intrusted to Messrs. Joyce, who have made many of the cathedral and large clocks in the kingdom. This clock will be the largest in Scotland, the frame, which will be in one solid piece, 7ft. 8in. long by 3ft. wide. All the wheels will be of the best gunmetal, and the teeth to be engine-cut. The wheels of the striking and quarter part will be 24in. diameter. The Doncaster quarters are to be used, and the hours will be struck on a bell of nearly three tons. It will have Lord Grimthorpe's double three-legged gravity escapement, and a compensated pendulum. Messrs. Joyce also erected the one at Glasgow University, of which Professor Grant reports, after a long observation, that the clock was going to within two seconds a fortnight.

**WESTMINSTER ABBEY.**—A preliminary meeting of the Royal Commission on Westminster Abbey was held on Monday in the Jerusalem Chamber, the Right Hon. David Plunket, M.P., in the chair. The reference to the Commission is (1) to inquire into the present state of the Abbey of Westminster as regards the facilities which it offers for providing for the interment and otherwise preserving the memory of the most illustrious Englishmen in the manner which has been customary for many centuries; and (2) to hear evidence and to consider plans for providing, at the Abbey or elsewhere, an additional place for memorials, should such a provision appear necessary. At the next meeting the Dean of Westminster and other officials of the Abbey will give evidence on these points.

#### CHIPS.

The widow of Mr. J. Turtlewood, who materially assisted her husband in his explorations at Ephesus, has been granted a Civil List pension of £75 per annum.

The honorary degree of D.C.L. will be conferred on Mr. W. Q. Orchardson, E.A., by the Convocation of Oxford University on the 25th inst.

A coffee tavern and shop are approaching completion at Castleford, Yorks, from plans by Mr. R. M. McDougall, of that town. Mr. A. S. North, also of Castleford, is the builder, and the outlay will be about £1,800.

The County Council decided, on Tuesday, with reference to the assistance it should give towards the maintenance of certain disused burying grounds which the Public Gardens Association had laid out, to maintain them until October, 1892, at a cost not exceeding £900 per annum.

It is reported that a Mediaeval sacramental wafer dish and wine-cup, composed of a low class of gold and weighing altogether 45oz., have been found near the residence of Mr. Pritchard Morgan, M.P., at Dolgelley, on a site formerly occupied by the monastery of Llanelltyd.

The foundation-stone of All Souls' Church, Invergowrie, near Dundee, was laid on Friday by Sir Reginald H. A. Ogilvy, Bart. The new church is designed by Mr. Hippolyte J. Blanc, Edinburgh.

The memorial stones of a new Wesleyan chapel and school at Stanfield, near Burslem, were laid last week. The building is being erected from plans by Mr. Slater (Messrs. Ford and Slater), and will seat 100 persons; but by the removal of a screen the schoolroom can be added to it, and a hundred more worshippers accommodated. The cost will be about £900, and the contract has been let to Mr. W. Cooke, Burslem.

Lord Clinton has recently caused his Georgian mansion at Trefusis to be pulled down, preparatory to the erection of another one on the site. Mr. James Hicks, of Redruth, the architect, writes that worked into the structure just demolished were numerous remains of the house which preceded it, and which was of the Tudor period. The fifteenth-century mantelpiece and four-centred doorways, and some panels, the oak fittings of the library, and some plaster casts will be replaced in the new building. In this Tudor house, Mr. Hicks adds, "the mortar was little better than wetted earth without cohesive properties."

## ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

**NOTTINGHAM ARCHITECTURAL SOCIETY.**—The annual general meeting was held on Friday evening. It was resolved that the society subscribe the sum of £10 10s. to the guarantee fund for holding the Congress of the National Art Association in Nottingham in 1891, and £5 5s. to be awarded as a prize to architectural students studying at the School of Art or University College, in that town; the special form the prize will take to be decided by the Council of the Society after consulting the authorities of the institutions named. Mr. G. T. Hine, F.R.I.B.A., retired from the presidency after two and a half years of office, and Mr. Herbert Walker, F.R.I.B.A., was elected in his place, with Mr. William Jolley, F.R.I.B.A., vice-president. Messrs. Fred. Jackson, F.S.I., R. Booker, F. Watson, J. Howitt, and A. E. Heazell were chosen members of the Council, and Mr. J. W. J. Barnes, F.S.I., honorary secretary and treasurer.

**THE SURVEYORS' INSTITUTION.**—The annual dinner of the Surveyors' Institution took place on Monday evening at the Holborn Restaurant. Mr. R. C. Driver, the president of the institution occupied the chair. Mr. G. M. Freeman proposed "The Houses of Parliament," to which the Earl of Jersey and Mr. W. J. Beadel, M.P., responded. Mr. E. P. Squarey (past president) proposed the toast of the evening, "Prosperity to the Surveyors' Institution." He said that the total number of members was 1,617, which was an increase of 11 per cent. over the number of last year. The institution also held in cash and securities a sum of £13,300 besides their leasehold property in Great George-street. Although the material prosperity of the institution was a matter for congratulation, it should not be forgotten that its great value lay in the fact that by the following up of an unwritten tradition it had led to a better conception by the profession of its duties, both towards its clients and the general public. Mr. F. Meadows White, Q.C., proposed "The Past Presidents and Council of the Institution." Mr. E. Ryde, in responding, said that the institution was really worth £25,000; but money was not everything, and there would never come a time when a land surveyor in England would prosper unless he brought not only ability, but the greatest industry and the strictest integrity, to bear upon his work. They must keep a tight hand as to those who were introduced into that institution, and must not relax their rules, and then he believed the institution would always flourish. Among the other toasts were those of "The President," "The Provincial Chairmen," and "The Visitors."

An additional part of the new west wing of the Museum of Science and Art, at Edinburgh, of which Dr. Rowand Anderson is the architect, has been opened to the public. The first gallery and adjoining room in which are displayed the Ethnographical and Persian collections, were opened over a year ago, and the present extension, which is filled with models of machines, leaves only the upper floor still closed. That floor is being filled with the rocks and minerals of Scotland, and in the course of a few months will be ready for view, thereby completing the museum as originally designed by Captain Fowkes thirty years ago. In the main entrance hall additional casts illustrative of Mediaeval and Norman architecture are being erected, as well as a second portion of the enamelled brick frieze of the palace of King Darius at Susa, which was unearthed by Mons. Dieulafoy.

At the monthly meeting of Cheltenham town council, held on Monday, a committee brought up a report as to the charges of Mr. Knight as architect in connection with the Colonnade improvement, a work which has been delayed from time to time, and described by one of the members of the council as a disgrace to the town, having extended over a great many years. The charges were against three owners of property with whom the corporation treated, £200 for a detailed survey of site and plan of same, £25 for making several sets of plans, elevations, tracings, and making copies of plans, lithographing, attendances, &c., £250, making a total of £475. The committee recommended the payment to Mr. Knight of 400 guineas in full discharge of all charges and claims against the corporation to the present time, on the understanding that copies of such of the plans produced before the committee as the committee may require shall be supplied free of charge. An amendment was proposed that the account be referred back for the purpose of being taxed, but after a discussion was lost, and the report of the committee was adopted.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 33fr. 30c.). To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 1s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

## NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII., XLVI., XLIX., L., LI., LIII., LVII., and LVIII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—B. and P.—M. and Co.—J. C.—T. T.

## Correspondence.

## THE ARCHITECTURAL ASSOCIATION.

To the Editor of the BUILDING NEWS.

SIR,—As a member of the Architectural Association of many years' standing, and one who has watched its progress with much interest, I would congratulate the committee on the result of last Friday's voting on the recommendations of the special education committee.

The adoption of the resolutions has initiated an era in its history. By the process of evolution, and not revolution (as has been affirmed in some quarters), the Association has entered upon a career of which it is impossible to foresee the full results; but it may safely be predicted that it will be a career of great honour and influence.

The educational aim of the A.A. will, I take it, remain as heretofore—viz., to supplement our system of pupilage. During last Friday's discussion more than one member suggested that in becoming a College of Architecture it would supplant the pupilage system. Had I thought so, I should not have supported the resolutions. I am convinced that to the English pupilage system is due much of the variety and freshness of our best designing as compared with those countries where the training is begun, continued, and ended in the Polytechnic Colleges. What is wanted is a system of study which from the first will both guide and instruct the arted pupil in his studies, and thus enable him to derive full value from the practical application in his principal's office.

That such supplemental training will pay the principal handsomely is obvious, and he may therefore be counted upon to help to support the College, first, by giving his pupil facilities to attend the classes and lectures; and secondly, by subscribing towards the fees either directly or indirectly by lowering the premium for articles.

At the outset, however, the ways and means are a source of some anxiety. Too much must not

be attempted at first, and economy must be considered.

I am glad to see the report of the Special Committee alludes to the existence of "Institutions in London where knowledge of great importance to the architect may be obtained," and it has occurred to me to suggest the possibility of making use of some of this instruction in connection with the new College of Architecture. I have a letter from Mr. E. C. Robins, in which he says:

"Sir Philip Magnus and myself—to whom the question of an Architectural College was referred by the Examining Committee of the City and Guilds of London Institute for the advancement of Technical Education—were unable to obtain the necessary funds for the establishment of Professorships for Architecture as a Fine Art and Constructive Science. All we have been able to do is to get occasional courses of lectures delivered upon kindred subjects."

And Professor Unwin, F.R.S., Dean of the City and Guilds of London Institute, also writes me that:

"The course of instruction here is much better adapted at present to engineers than to architects. It is just possible that next year we shall have some further architectural instruction."

May not the Architectural Association get a grant towards the maintenance of its teaching staff, on the understanding that a certain proportion of its students attend such of the technical Institute courses as can only be adequately taught in such specially-fitted buildings?

Among other courses, I would suggest the relegation to technical institutes of the following:—

## PURE SCIENCE.

Mathematics.  
Physics.  
Geology.  
Natural Philosophy.

## APPLIED SCIENCE.

Mensuration.  
Modelling.  
Light and Shade.  
Building Construction  
(some departments).  
Hygiene.

## Practical Work in the Laboratories.

The Architectural Association is preparing itself to cope with the necessity in the near future for a thorough examination of all who aspire to practise architecture.

Statutory education must come, because the public have discovered that bad architecture is as costly as bad law and as dangerous as bad medicine, and because the profession is discovering that it must purge itself by this the only means available of those who bring it into disrepute.

I shall be happy to promise £50 per annum for three years towards the guarantee fund (which it has been voted necessary to create).—I am, &c., W. H. SETH-SMITH.

SIR,—Will you kindly allow me, through the medium of your valuable paper, to appeal to all members of the A.A. to make an effort to attend the next meeting, and vote—yea or nay—on the proposed alteration in the rule relating to the subscription?

At the last meeting a suggestion which had been made both by Mr. Cole Adams and Mr. Stannus, that a paper should be sent to every member asking his opinion on the question, was formally moved as an amendment, and although supported by some influential officials who know the risk that is run at the present crisis of losing a large number of members, was lost when put to the vote. The (comparatively speaking) handful present objected to those who were not there having an opportunity of expressing their opinions.

Those members who will not be able to attend might write to the secretaries, stating their views. It is most important that such radical changes as are now proposed in the rules should not be voted on until as many expressions of opinion as possible have been heard.—I am, &c., AN OLD MEMBER.

## UNIVERSAL PROVIDERS' ARCHITECTURE.

SIR,—In your issue of the 16th, under the heading of "Universal Providers' Architecture," a righteous indignation is expressed. At the same time, I don't see why a properly constructed "w.c." should not enter from a lady's sitting-room if she desires it. This enables the greatest privacy to be enjoyed, and 'tis better than being in proximity to sleeping-rooms, a common arrangement in large houses.

As for taking the bread out of the mouths of

competent, but struggling, architects, we do not require to go outside of our profession to find men sordid enough even to undersell the "Universal Provider." An instance has just come to me of one of the leading firms in this city, at present engaged on an important public building, who does work for the miserable payment, not of 5 per cent., but less than a fifth of the remuneration!

O Registration! why were you not here years ago? Too many of us have crowded into the profession!—I am, &c.,  
Edinburgh, May 31. ARCHITECT.

## NOTES ON BUILDING PRICES.

SIR,—I am glad to find a surveyor of Mr. John Leaning's standing, in writing on the above subject, lay stress on the fact that a contractor's profit may be turned into a loss by "foolish and harassing interference by the architect, or his clerk of works." A practical builder of many years, I have experienced this but once. In that case, the "foolish and harassing interference" came from "his clerk of works," whose practical knowledge, conspicuous by its absence, led him into exactions of a most ridiculous character. Not recognising that each kind of material in the hands of the artisan requires a different treatment no less than it does by the architect in his design, added to which the man's naturally hesitating and vacillating temperament, with a monomania for altering things, made him (perhaps unintentionally) a source of continual obstruction to the progress of the works. Men of this kind, as a means of fortifying their position, are ever apt at the expression, "Why don't you get on?" "Foolish and harassing interference" seldom comes from architects, or from clerks of works, who are practical men; but frequently from men who, having failed in the attempt to practise architecture, or some other "business," also fail to become useful clerks of works. A PRACTICAL BUILDER.

## TIVOLI THEATRE.

SIR,—With regard to your notice of this building in your issue of this week, would you allow me to make a correction? The buildings have been erected entirely from my designs, Mr. Phipps having superintended the work only.—I am, &c.,  
WALTER EMDEN.  
105 and 106, Strand, London, W.C., May 30.

## CHIPS.

On Saturday Lady Wolsey laid the foundation-stone of the church of St. Paul on a site in Burgoyne-road, Harringay, a rapidly-growing district of the old parish of Hornsey. The church, which will take the place of an iron building, will accommodate 800 worshippers, and will be built in the Early English style at a cost of £7,000 or £8,000.

A special meeting of the Caledonian Railway Company, in Glasgow, on Friday, approved the construction of new railways from Crieff to Comrie, in Perthshire; another from the Caledonian and North British systems to Milngavie, Kilmearn, and the port of Monteith; another to Ballantrae, and another to Brechin.

The Portsmouth sewage outfall works are seriously threatened by the action of the tide, and the drainage committee of the town council propose an expenditure of between £6,000 and £7,000 for the protection of the massive sewage tank, constructed from the plans of Sir Frederick Bramwell, C.E., on the glaciis of Fort Cumberland, and the outfall pipes from it, which extend in the direction of the Wolseners.

The Board of Agriculture have under consideration several regulation schemes, which will, if passed, have the effect of dedicating about 2,700 acres around London to the public as open spaces for ever. The lands in question comprise Epsom Downs and Common, Mitcham Common, Banstead Downs and Heath, Park Downs, and Burgh Heath, and the Hackney Marshes.

The town council of Leamington have adopted plans by Mr. W. De Normanville, the borough engineer, for the demolition of the Adelaide-road Bridge, a brick structure of 70ft. span, carrying a thoroughfare across the river Leam, and for its replacement by a wrought-iron arched structure.

A bust, on a pedestal 3ft. high, of the late Alderman Jones, who for a quarter of a century was connected with the Corporation of Cardiff, has just been placed in one of the niches in the staircase leading to the assembly room in the Town Hall of Cardiff. The bust is the work of Mr. Johns, sculptor, of the same town.

## Intercommunication.

### QUESTIONS.

[10293].—**Roofs.**—Can anyone kindly give me strengths for a 40ft. span semicircular wood principal made of spruce deals bolted together, and is it advisable to tie at floor level? Also for a roof 28ft. span, with spars and collars only, on the Scotch system.—H. G.

[10294].—**Cantilever—Girder.**—Would some mathematical reader kindly inform me the relative breaking loads of cantilevers and girders of equal section? Say, if a rolled iron I girder, 16ft. bearing, fixed at ends, not merely supported, would break with a distributed load of 20 tons, what would be the distributed breaking load of a cantilever projecting half the length (8ft.) of similar section, and securely pinned in at the wall end?—Zero.

[10295].—**French Tour.**—Can any of your readers give me information relating to architectural tour, making Rouen a centre, returning home by Beauvais, Amiens, and Calais, to be away a fortnight? Also, could they kindly recommend a handbook of French Medieval architecture in French or English, if possible on the same lines as Parker's "Handbook of Gothic Architecture."—RANULPH.

[10296].—**Dry Rot in Timber.**—To Mr. W. STEVENSON.—I have sent you a specimen of a peculiar growth which has just been taken from the timbers in part of a house here. I am much interested in timber, and should be glad if you could answer the following questions:—1. What is the cause of this growth? 2. What is the remedy? The facts are as follows:—The house in question is a detached one, and was built in the year 1884 under my superintendence, and by a very good builder. The growth occurs in the ground floor timbers of the drawing-room, and was first observed about this time last year. There is a fair space under the floor, at one end about 3ft. deep, with air bricks in wall. At that time it was thought that there could not be sufficient air-circulation, and new timbers put in to replace the old. They are now covered with this fungus. When it dries the ground is coated with the dust from it. The situation of the house is on high ground, the side of a hill, with very little in the way of trees or shrubs surrounding. The soil is of a close, firmly compacted marl of considerable depth lying over the chalk. In excavating to a depth of 9ft. or 10ft. not a trace of moisture was found, all surface water is entirely conveyed away from the premises, and the stuff was so stiff that no shoring was required. I address you on the subject from having seen your name in connection with much information relating to timber in the BUILDING NEWS of last year.—A.R.I.B.A.

[10297].—**Worm-Eaten Wooden Figure.**—A fine carved and painted wooden figure, life-size, is found to be very extensively worm-eaten. Is there any certain method by which the insects can be destroyed, and their ravages repaired?—G. B. M.

### REPLIES.

[10289].—**Timber Conversion.**—It is a nice point in the strength of a beam whether it be cut with the annual rings to run lengthwise or crosswise in the section. The strongest and best wood is that immediately below or beneath the sapwood; the more central zones are apt to be coarse, faulty, and brittle from age. In the instance of beams cut as shown in Fig. 1, the central beam would

FIG. 1.

FIG. 2.

FIG. 3.

have the best wood on its edges; such a beam would be liable to the weakening influence of knots, as they radiate from the centre. This relates especially to beams of fir-wood, in which the knots are relatively larger than in Norway or Canadian spruce. In placing such beams in work, the clearest edges should be placed the lowest, as the wood in this position is in tension. The uppermost edges in compression calls for little or no consideration under this heading. The side beams would be cut from the best and strongest parts of the tree, but the two slab corners are liable to weakness arising from the presence of sapwood, which, after being some time in work, in a damp situation, is liable to destruction from vegetable action, and if in a dry situation to disintegration from the mechanical action of insects. "H. W." presses his question further, and from the consideration of beams turns to that of the flooring boards. In the conversion of timber into flooring boards we have to view the woods from a different standpoint—viz., that of wear. By far the best flooring is that cut with the edges of the annual rings or zones of wood on the surface. For this purpose the centre beam, as shown in the above diagram, could alone be used. This, after cutting out the heart, would make two widths of flooring. If the boards are prepared from the side beams, you would have the grain in layers upon the surface, in which case they would tread up and splinter. Take this instance (Fig. 2):—The annual layers of wood are composed of two parts, the soft (vernal) and the hard (autumnal) layers. When these lie flat upon the surface of the board the cellular tissue of the soft parts give way under the feet, and the hard parts remain as shells

or splinters. Such boards wear hollow upon the surface. If you turn the board over the case is not much improved, for the two edges of the rings or zones coming to the surface shell up or splinter. Anyone curious on this point will find interesting confirmation of this on examining the wooden platforms of our railway stations. During the prevalence of the fashion for clean flooring which obtained in the last century, the boards were all cut the wrong way: the great point was to obtain the pattern of the grain down the centre of each board. This was done by cutting parallel lines through the conical stems of the trees. The following (Fig. 3) was the principle adopted, in which each board bore the same relative position to the heart; the centre and the four corners of the logs were used for other purposes. The introduction of carpets in the present century caused the decadence of clean floors; but wherever they exist the manner of their wear and their splintery character must be condemned. Quartered wood—i.e., wood with the edges of the grain on the surface—the oak excepted, is the best for wear. In the case of oak the extraordinary development of the undulatory plates or silver grain detracts from its wearing qualities, as they shell and tread up like the hard and soft layers on the surface of firwood boards. This may be seen in the oak floors at the British Museum and other public buildings, where the most figured boards are the most worn. Makers of wood-block flooring will do well to take note of the above remarks on the wearing qualities of wood, for, judging from all the examples I have seen in work, they are ignorant of the above facts.—W. STEVENSON, Hull.

[10291].—**Fire-Proof Floors.**—I have gone very closely into this matter, and had much experience. A building constructed with timber properly protected with silicate cotton and plaster, is infinitely more fireproof than one where the flooring consists of a combination of iron and concrete. Iron and concrete, though incombustible articles in themselves, are actually a bad combination, in consequence of the inevitable action that goes on when heat is transmitted by the concrete to the iron. Apart from the superiority of timber over iron, so far as fireproofing is concerned, it is much less expensive.—E. GARDNER.

### CHIPS.

The Bishop of Gloucester and Bristol attended at Cinderford on Thursday, the 29th May, and consecrated the nave of the new church of St. Stephen, which will replace a temporary church built a few years ago. The new church has been erected by Mr. Dowland, of Pontilias, from plans by Mr. Lingen Barker, London and Hereford. Accommodation is provided to seat 550 persons. It is proposed later on to add a chancel tower, spire, bells, and vestry, estimated to cost £2,000. At present about £2,700 has been spent.

The long projected restoration of Haddington Abbey has progressed another stage, the heritors having accepted a proposal to remove the galleries on the north and south sides of the abbey church, and to rearrange the sittings. The accommodation will be reduced from 1,233 to 1,080 seats.

Messrs. Waller and Son, architects, Gloucester, have prepared plans for the erection of a new vestry and organ chamber, and the removal of the gallery at the west end of St. Matthew's Church, Twyworth, near Gloucester, which was built and endowed 50 years ago.

A new post-office has just been opened at Saltburn-by-the-Sea. Structural alterations have been made in an already erected building to adapt it to the purpose. The fittings are entirely new in pitch-pine and mahogany, specially designed, and the whole of the offices are heated by hot water upon the low-pressure system. The whole of the works have been carried out from the designs and under the special superintendence of Mr. William Peachey, architect and engineer, of Saltburn.

The Prince of Wales will lay the foundation-stone of the new building for the Royal South London Ophthalmic Hospital in July next. The new premises—a portion of the sub-structure of which has already been laid—will stand on an extended area covering the site of the old institution at St. George's-circus, Southwark.

The Woodd memorial pulpit was opened on Whit-Sunday in St. Andrew's Church, Calstock, Devon, by Canon Hullah. The pulpit is of Corsham stone, in the Perpendicular style, and elaborately carved. The paterae, of which there are over forty, are all different, the artist having taken models of those in Devon and Cornwall churches. The traceried panels are crocketed and moulded. The pulpit was designed by Mr. J. Piers St. Aubyn, London, and the work has been executed by Mr. John S. Rogers, of Tavistock.

The parish church of Werrington, near Launceston, is about to be restored at a cost of £2,500, from plans by Mr. J. Piers St. Aubyn. The present low flat ceiling will be replaced by a half-timbered roof spanning the nave and its aisles; choir seats of oak will be placed in the chancel, and for the pews in the nave open benches of pitch-pine will be substituted.

The Water Commission of Dundee have decided upon the duplication of the Lintrathen water main between Pitnappie and Clutto, in accordance with the report of Mr. Watson, the water engineer. Mr. Watson has been instructed to prepare the necessary plans, prior to a Bill being presented in the next session of Parliament for the requisite authority to construct the works.

### LEGAL INTELLIGENCE.

IN RE W. JACKSON.—A first sitting was held on Tuesday under the failure of William Jackson, a railway contractor, carrying on business in Bucklers-bury, against whom a receiving order was made on May 2. The debtor had been engaged on a contract for a railway in the Isle of Wight, but in December last the company determined it on the ground that the work had not been completed within the specified time. The statement of affairs showed liabilities £25,172, of which £3,012 only are expected to rank, with a large estimated surplus in assets subject to realisation. On behalf of the debtor a scheme of arrangement was proposed; but a preference being expressed in favour of cash proposal, the meeting was adjourned to admit of such an offer being made.

### WATER SUPPLY AND SANITARY MATTERS.

LONDON WATER SUPPLY.—The inquiry into the water supply of London was resumed on Wednesday at the Guildhall. The City Chamberlain and other civic officials gave evidence of the increase in the ratable value of the Metropolis. The advance in the City had been from £824,539 in 1840, to £3,845,995 in 1890. The City Remembrancer said he believed that when the Metropolitan Valuation Act was passed it was never contemplated that that measure should be taken advantage of largely to increase the water rate. The committee adjourned to Monday.

MEADVALE.—The sanitary committee were called together at Cronk's Hill recently to look at the new automatic flushing tank at work. The borough surveyor (Mr. F. D. Clark), and the contractor (Mr. Faulkner) were also present. The tank is built of 9in. brickwork, surrounded with concrete, and is fitted with one of Adams' Patent Automatic Siphons; it has a capacity of 500 gallons, and can be regulated to discharge at will; at present it is so regulated to discharge 500 gallons of water down each sewer (Cronk's Hill and Somerset-road) once a week. The examination was perfectly satisfactory, the tank when full emptying itself in under one minute, and all expressed themselves perfectly satisfied. This is the first automatic flushing tank erected in the borough, and was designed by the borough surveyor, Mr. F. D. Clark, A.M.I.C.E., and built by Mr. Faulkner, contractor, Lesbourne Lands, Reigate.

TETTENHALL.—The laying of the memorial-stone of the Tettenhall sewerage works was performed on Friday at Trescott, by Major Pritchard, the chairman of the Tettenhall Local Board. Mr. H. J. Marten, the engineer, explained the character of the works. It is proposed to lay about ten or eleven miles of sewers. When the sewage arrives at the works it will enter a tank, and from there will flow through a mixing-house over a small water-wheel. The object of the water-wheel is to mix the sewage with lime or chemicals. From the mixing-tank it will pass through tanks which enable the rougher and coarser sewage to drop to the bottom. From these again it will pass into the precipitating tanks, where the solid matter will remain, and the effluent will be operated upon until it becomes clear. The cost of the works would be about £14,000.

Trinity Sunday was selected for the opening of the new church at the south end of Formby, near Liverpool, which is to be dedicated to the Holy Trinity. The style is Early English, the outer walls being of Penmaenmawr stone, rough hewn, and the inner walls of brick. At present only the nave has been completed; but the entire building is to consist also of transepts the same width as the nave, chancel, vestries, organ-chamber, south aisle, and tower. Lancet windows are being inserted throughout, and the western window already completed, being a triple light, represents in itself and in various emblems the Trinity. The open benches are of pitch-pine, the nave seating 384 persons, and the proposed accommodation being for 750. The roof is entire timbered. About £2,000 will be required to defray the cost of the work already executed.

Mr. Thomas Newson, architect, of 17, Gracechurch-street, E.C., was drowned by the upsetting of a boat in Totland Bay, Isle of Wight, last week. Mr. Newson, who was a little more than sixty years of age, had for upwards of forty years practised in the City as an architect. At first associated in business with Mr. Bell, of Gracechurch-street, he subsequently entered into partnership with the late Mr. Corbett, in conjunction with whom he entered into extensive building speculations, more especially in connection with the erection of large blocks of buildings suitable for offices. Indeed, Mr. Corbett and he led the way in the raising of the huge blocks of offices now so much in vogue. He leaves a widow and eight children.

## Our Office Table.

The Society of Antiquaries having resolved that the complete and systematic investigation of the site of the Roman city at Silchester is desirable, and that the excavations begun by the late Rev. J. G. Joyce for the late Duke of Wellington should be continued, it has been determined to endeavour to carry on the undertaking from year to year. A paper has been published by Messrs. G. E. Fox and W. H. St. John Hope, containing a summary of all that has been done to elucidate the plan of the city, and an outline of the scheme upon which it is proposed to continue the excavations. The council of the Society have granted £50 from their funds, and appointed an executive committee for the purpose of carrying out further investigations on the site. A general committee has also been elected to aid the executive committee by their advice and experience, and to raise additional funds for carrying on the work. The Duke of Wellington, the owner of the soil, has promised every facility to the society.

RIVETED pipes are made of wrought-iron or steel plates in lengths up to 25ft., and from 4 to 72in. in diameter. In the Colonies and in America the riveted pipe seems to be gaining favour for sewage and water supplies. Of course they can be used where great pressure is required to be resisted, as, being put together like a steam-boiler, there is no risk of sudden fracture or bursting under a head of water; while, for sewerage, the great points in their favour over stoneware are that there can be no imperfect pipe with flaws; the unequal settlement of the ground, or the ramming, does not injure the joints or break the pipes, as in the case of stoneware; and the entire length of piping is absolutely reliable throughout. The joints are above suspicion, and the spigot and socket can be made perfectly secure and watertight. For conveying drainage under houses they are preferable, certainly, to either stoneware or cast-iron.

The Cabinet of New South Wales has approved a proposal submitted by the Minister of Works for the complete reorganisation of the Colonial Architect's Department. After thirty years' service, Mr. Barnett will retire, leaving many monuments of his great ability. In future, designs for public buildings estimated to cost over £5,000 will be submitted to public competition, and the successful architect will carry out his design. The position of Colonial Architect is to be abolished, and a general superintendent of works in progress will be appointed.

The Corporation of Liverpool have received a report from the city engineer and the veterinary superintendent as to the proposal to construct in that city a 12-cell destructor. They state they have inspected similar appliances at Hampstead, Ealing, Battersea, and Whitechapel; that they are admirably adapted for the purpose of destroying house refuse, and that no nuisance whatever is caused, although in some cases erected in densely inhabited districts. The engineer reports that the most convenient site would be one adjoining the Chisenhale-street Wharf. The engineer further prepared plans and an estimate for the construction of a destructor upon this site, and laid them before the Health Committee, and they have been approved. The city engineer and the veterinary superintendent also say that the amount of ashpit refuse at present taken to the Chisenhale street and Sandhills depots averages nearly 1,750 tons per week, and the cost of taking it by barge to the Stanley Dock and subsequent removal to sea for the year 1889 was 1s. 11d. per ton. This sum includes depreciation of the canal tank barges and of the hopper barges, but it is exclusive of rent of the depots, wharves, and berths. With reference to the proposed destructor, the cost may be assumed to be £530 per annum, including interest, repairs, and working. A 12-cell destructor would consume 600 tons of refuse per week, leaving a residuum of clinker and ash of 120 tons to be dealt with, either for the making of mortar, or formation of foundation of roads, &c. The estimated cost per ton is about 1s. 8½d. The Health Committee on Thursday last recommended the City Council that the plan submitted by the city engineer for the construction of a 12-cell refuse destructor at Chisenhale-street Wharf, at a cost of not exceeding £6,000, be approved, and that they be authorised to adver-

tise for tenders for carrying out the work. The Aston Local Board have also this week received a report from a Committee recommending the erection of a refuse destructor at a cost of £1,600. In that town the present cost per annum of "tipping" is £110, and 20,000 loads are disposed of yearly.

### MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Architectural Association. Visit to Shiplake Court, near Henley. Ernest George and Peto, architects. Train 1.40 p.m. from Paddington.  
THURSDAY.—Society of Arts. "The Rationale of Indian Railways," by Sir Theodore C. Hope, K.C.S.I., C.I.E. 5 p.m.  
FRIDAY.—Architectural Association. Meeting to consider proposed alteration of rules. 7.30 p.m.

## Trade News.

### WAGES MOVEMENTS.

DUBLIN.—About 700 carpenters struck work on Monday. They demand a reduction in the working hours from 57 to 54 per week, with the existing scale of wages untouched, and this the employers feel themselves unable to yield, owing to the state of trade.

EXETER.—The first strike which has been known in this city for many years commenced on Monday, when the carpenters and joiners went out, owing to the masters having refused to increase wages to 6½d. per hour. The employers allege that the state of trade will not permit of any higher wages than at present, and business is now admittedly slack. Only about fifty men remain at work.

HAWICK.—The Hawick plasterers have granted the demand of their men for an advance of wages of from 6d. to 7d. per hour.

LIVERPOOL.—The operative plumbers of Liverpool, Birkenhead, and district ceased work on Saturday, as the employers did not concede the advance in wages asked for, 1d. per hour, they having had a reduction of that amount ten years ago.

SOUTH SHIELDS.—The operative bricklayers of South Shields, who have been on strike several weeks for an advance of wages to 9½d. per hour, have accepted the award of the arbitrators of 9d., and have returned to work.

WADEBRIDGE.—There is a strike among the stone-cutters at the works of the Eddystone Granite Company, Limited, De Lank. Recently a number of Italians were imported into the quarries as labourers; but having been put to work with masons' tools, an infringement of the society's rules was thus created, and about fifty Englishmen have ceased to work.

WEST HARTLEPOOL.—By an amicable arrangement, the bricklayers' strike at West Hartlepool has been brought to a satisfactory termination.

### CHIPS.

The President and Council of the Royal Academy have commissioned Mr. W. Reynolds Stephens to paint "a wall decoration" in the refreshment-room of the Royal Academy. The sketch for it obtained the prize for a decoration at the Academy Schools in 1887, and was exhibited at the Academy in 1888. The subject is "Summer."

Considerable additions have been made to the West Ham Union, Leytonstone, and special attention has been paid to the ventilation, the latest improved form of Messrs. Robert Boyle and Son's patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

A brass lectern and oak lectern-stool have been made for Portchester Church by Messrs. Jones and Willis, from the designs of Mr. Graham Awdry, F.R.I.B.A., architect, of Westminster.

Mr. Hugh Symington, the railway contractor, died suddenly at his residence, Stewarton House, Coatbridge, on Tuesday night, in his 58th year. He successfully carried out work for all the Scotch railway companies, the Glasgow and Greenock Corporations, and the Greenock Harbour Board.

The United Presbyterian Church at Kilmacolm, N.B., was reopened for public worship on the 25th ult., after alterations and decoration. Mr. Alexander Gardner, Glasgow, was the architect, and the work of decoration was carried out by Messrs. A. and J. Scott, Glasgow.

On Saturday the large statue to the late Dr. Gregor, of Nairn, by Mr. Hutcheson, R.S.A., of Edinburgh, was unveiled. The day was observed as a half-holiday in Nairn.

Holloway's Pills offer relief in all the disturbances of digestion, circulation, and nervous tone which occasionally oppress a vast portion of the population. These Pills possess the highly estimable property of cleansing the entire mass of blood, which, in its renovated condition, carries purity, strength, and vigour to every tissue of the body.

## ELECTRIC LIGHTING.

### COMPLETE INSTALLATIONS OR WIRING ONLY {ESTIMATES GIVEN.

STRODE & CO. 48, Osnaburgh-st., N.W., and 67, St. Paul's Churchyard, E.C. LONDON.  
New Branch Showrooms:—188, PICCADILLY, W.  
Telephone No. 3908.

## DOULTING FREESTONE.

THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLE DITCH STONE is of the same crystalline nature as the Chelynych Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES FRANK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

## HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material. Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—

THE HAM HILL STONE COMPANY  
NORTON, STOKE-UNDER-HAM, SOMERSET.  
London Agent:—  
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

## BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

## GEO. FARMILOE & SONS,

Lead, Glass, Oil, Colour, and Varnish Merchants.

ALL LETTERS TO OFFICES AND WAREHOUSES:—

34, ST. JOHN STREET, WEST SMITHFIELD, LONDON, E.C.

Lead Works: Island Lead Mills, E.  
Sanitary Appliances and Plumbers' Brass Work Factory: Eagle Court, Clerkenwell, E.C.  
Stained Glass Works: 109, St. Martin's-lane, W.C.  
Wharf: Queen's Wharf, Wapping Wall, E.

## CRAIGLEITH STONE.

UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear. VERY HARD, and NEVER WEARS SLIPPERY.

SOLE AGENTS for England,

J. & A. CREW, Cumberland Market, London, N.W.

## WM. OLIVER & SONS,

MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,  
120, BUNHILL ROW, LONDON, E.C.  
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

### TENDERS.

\* Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BAYSWATER.—For the erection of new residence, Palace-court, Bayswater, W. Mr. A. Young, architect:—Oldrey, W., and Co. (accepted).  
(No competition.)

Bewcastle.—For new Presbyterian Church, Bewcastle, Cumberland. Mr. W. Marshall, Boothby, Brampton, architect:—

(Accepted tenders.)

Mason:—	
Kyle, G., Newcastleton	£239 0
Joiner:—	
Routledge, J., Dorrifield Brampton	280 0 0
Slater:—	
Murray, J., Newcastleton	36 10 6
Plasterer:—	
Ormerod, W., Carlisle	33 10 0
Plumber:—	
Murray, J., Newcastleton	21 10 0
Painter and glazier:—	
Penfold, J. W.	38 8 3
Total	£648 18s. 8d.

CARSHALTON.—For the erection of a house in Denmark-road, for Mr. E. S. Anstie. Mr. Seckham Witherington, F.R.I.B.A., 79, Mark-lane, E.C., architect:—  
Russell, Sutton (accepted)... £1,655 0 0

CHAIFONT ST. GILES, BUCKS.—For rebuilding the Three Crowns, for Messrs. Salter and Co., Ltd., Rickmanworth Brewery. Mr. C. P. Ayres, Watford, architect:—

Turner, T., Ltd., Watford ...	£372 0 0
Waterman, G. and J., Watford ...	818 0 0
Darlington, G., Amersham ...	810 0 0
Bates, J., Chorley Wood ...	790 0 0
Darvell, G., Chorley Wood ...	770 0 0

\* Accepted.

DUNSTABLE, BEDS.—For sanitary work at Red Lion, for Messrs. Benskin and Co., Cannon Brewery, Watford. Mr. C. P. Ayres, Watford, architect:—

Limbrey, J. H., Dunstable (accepted) ...	£102 18 6
--	-----------

DUNMOW.—For house and offices, Dunmow, Essex, for Mr. T. Young. Mr. C. Pertwee, Chelmsford, architect:—

Parmenter, S. ...	£1,400 0 0
Letoh, W. ...	1,390 0 0
Brown, A. (accepted) ...	1,375 0 0

All of Braintree.

EDINBURGH.—For constructing compensation works at Threipmuir, for the Water of Leith Commissioners:—

Young and Son (accepted) ...	£7,167 1 10
------------------------------	-------------

(Lowest of eight tenders received.)

EDINBURGH.—For the construction of new West Princes-street Station, for the Caledonian Railway Company:—

Kinnear, Moodie, and Co., Iona-street, Edinburgh. (Accepted.)	
---	--

FOREST GATE.—For the extension of the Forest Gate Sanitary Steam Laundry, in Upton-lane, E., for Mr. B. L. James. Mr. W. C. E. Styche, Harlesden, N.W., architect:—

Gregor ...	£1,721 0 0
Sharp, G. ...	1,390 0 0
Hosking, G. ...	1,339 0 0
Yates, J., and Co. ...	1,190 0 0
Neil, W. ...	1,172 0 0
North Bros. ...	1,108 0 0
Watson, W. ...	1,044 0 0

Boiler setting and chimney stack:—

Noble, W. ...	263 0 0
Howlett ...	249 0 0
Lema Bros. ...	198 0 0
Watson, W. ...	190 0 0
Neil, W. ...	178 0 0
Yates, J., and Co. ...	172 0 0

LEIGHTON BUZZARD.—For a detached residence in Grove-road, Leighton Buzzard, for Mr. T. H. Bishop. Mr. St. Pierre Harris, 1, Basinghall-street, E.C., and Orpington, Kent, architect and surveyor:—

Garside, G., Leighton (accepted) ...	£881 0 0
--------------------------------------	----------

(No competition.)

KENSAL GREEN.—For the erection of mission house, dispensary, and boundary walls in Kensal-road, W. Messrs. R. Pite and Son, 5, Bloomsbury-square, W.C., architects:—

Martin and Barkley ...	£1,657 0 0
Treasure ...	1,521 0 0
Sealy ...	1,457 10 0
Yeates ...	1,420 0 0
Barrett and Power ...	1,368 0 0
Gregory and Co. ...	1,357 0 0
Oliver and Richardson ...	1,333 0 0
Smith, J., and Son ...	1,329 0 0
Oldrey and Co. ...	1,292 0 0
Scharien and Co. ...	1,237 0 0
Chinchen ...	1,173 10 0

LONDON, S.W.—For alterations, &c., to the Old Bag O'Nails, Buckingham Palace-road, S.W., for Mr. H. Guest. Mr. H. I. Newton, 49, Victoria-street, Westminster, S.W., architect:—

Prestage and Co., Fimlico ...	£393 0 0
Godden, S., Bryanston-square* ...	350 0 0

\* Accepted.

LONDON, W.C.—For alterations, &c., to the Fountain, Newcastle-street, Strand, W.C., for Mr. F. A. Rhodes. Mr. H. I. Newton, 49, Victoria-street, Westminster, S.W., architect:—

Mark, F., Edgware-road ...	£463 0 0
Burman, H., and Sons, Kennington Park ...	460 0 0
Godden, S., Bryanston-square ...	435 0 0

\* Accepted.

LONDON, S.E.—For alterations, &c., to the Garibaldi, Blackfriars-road, S.E., for Mr. W. Gibbs. Mr. H. I. Newton, 49, Victoria-street, Westminster, S.W., architect:—

Godden, S., Bryanston-square ...	£1,500 0 0
Mark, F., Edgware-road ...	1,450 0 0
Burman, H., and Sons, Kennington-park ...	1,429 0 0
Mills, J., Blackfriars (accepted) ...	1,345 0 0

NANTWICH.—For laying a water main extension in White Horse-lane, for the rural sanitary authority. Mr. Davenport, surveyor:—

Wood, J., and Son (accepted).	
-------------------------------	--

NEWCASTLE.—For alterations to stable buildings. Messrs. Plummer and Burrell, Newcastle, architects:—

(Accepted tenders.)	
---------------------	--

For paving, drainage, &c.:—

Maucklin, J., Newcastle ...	£125 2 3
-----------------------------	----------

Alterations to yards, stable, &c.:—

Scott, G., and Sons ...	111 10 0
-------------------------	----------

Stable alterations:—

Scott, G., and Sons ...	31 10 0
-------------------------	---------

MEVAGISSEY.—For an organ to be placed in the parish church:—

Hele and Co., Plymouth (accepted) ...	£230 0 0
---------------------------------------	----------

NEWPORT, MON.—For Phoenix Foundry, for Messrs. Morley and Carney, James-street, Mr. A. Swash, M.S.A., 3, Friar's-chambers, Newport, architect:—

Lock, C. ...	£485 10 0
Moulton and Browncombe ...	479 0 0
Gradwell, W., Exors. of ...	455 0 0
Richards, E. ...	440 0 0
Linton, J. ...	431 0 0
Jonas, W., and Son ...	410 0 0
Morgan and Roberts (accepted) ...	363 4 2

All of Newport.

NEWPORT, MON.—For house, Potter-street, for Mr. E. Simmons. Mr. A. Swash, M.S.A., 3, Friar's-chambers, Newport, architect:—

Prosser, T. ...	£583 7 2
Pice, W. ...	577 7 0
West, C. ...	550 16 0
Moulton and Browncombe ...	515 0 0
Webb, T. ...	510 0 0
Richards, E. ...	500 0 0
William, R., and Son ...	459 0 0
Morgan and Roberts (accepted) ...	458 0 0

All of Newport.

NEWPORT, MON.—For premises, for the Diamond Patent Fuel Co., Ltd., Portland-street. Mr. A. Swash, M.S.A., 3, Friar's-chambers, Newport, architect:—

Morgan and Roberts ...	£343 0 0
Price, W. ...	334 0 0
Matthews, J. ...	325 5 0
Richards, E. ...	275 0 0
Moulton & Browncombe (accepted) ...	259 0 0

All of Newport.

ORPINGTON.—For additions and alterations to private house at Orpington, Kent. Mr. St. Pierre Harris, 1, Basinghall-street, E.C., and Orpington, architect and surveyor:—

Holt, W., and Son, Croydon ...	£215 0 0
Somerford, H., and Son, Clapham ...	215 0 0
Owen, W., Farnborough (accepted) ...	198 0 0

ORPINGTON.—For additions and repairs at a private residence, Orpington, Kent. Mr. St. Pierre Harris, 1, Basinghall-street, E.C., and Orpington, architect and surveyor:—

Taylor, W. R., Orpington ...	£133 0 0
Somerford, H., and Son, Clapham ...	110 0 0
Holt, W., and Son, Croydon ...	105 10 0
Lowe, R. A., Chislehurst ...	99 18 0
Payne, D., Bromley ...	98 0 0

## JENNINGS' PATENT VALVE CLOSET & TRAP.

IN ONE PIECE OF STRONG GLAZED EARTHENWARE.

OVER 100,000 NOW IN USE. Fixed in all the principal MANSIONS, CLUBS, HOTELS, RAILWAY STATIONS, HOSPITALS, BARRACKS, and ASYLUMS in all parts of the world. The CLEANEST and MOST EFFICIENT Closet of the day, free from complication; adapted for buildings of all classes, public and private, with the latest improvements, new Service Valve, Ball Overflow Discharge Plug, and base under Trap, ensuring the maintenance of a perfect connection with soil-pipe. This Closet can be arranged with waste-preventing valve mechanism, or with his Improved Waste-preventing cistern, either of which secures the necessary after-flush to the basin. "JENNINGS' extra long drawn-lead Bend" should be specified for connecting the outlet of this Closet with soil-pipe.

Architects specifying any fittings "to be obtained from George Jennings" can rely on securing most satisfactory results for their clients, and as a guarantee of efficiency, all articles of his manufacture bear the Name and Address,

**GEORGE JENNINGS, STANGATE, LONDON**

Illustrated Catalogues forwarded on application of latest improvements in Lavatories, Baths, Urinals, Sinks, Sanitary Appliances, and Water Fittings of every description.

Awarded the GOLD MEDAL, Paris Exposition, 1889.

## F. BRABY & CO.'S PATENT GLAZING.

GLASS SET FREE,  
ALLOWING EXPANSION AND CONTRACTION, AND PRECLUDING BREAKAGE.

Absolutely Watertight. Painting & Putty Superseded.

OVER THREE MILLION FEET FIXED.

Drawings and Prices on application. Models and Sections on View. (Special) AM 26a.

London: 352 to 362, EUSTON ROAD.

Liverpool: 6 & 8, HATTON GARDEN.

Glasgow: 47 and 49, ST. ENOCH SQUARE.

## WHAT TO SPECIFY.

A SKILFULLY studied design may be seriously impaired by a slipshod or negligently written specification. Good outline, proportion, well-arranged plan, and masterly details may be shown in a set of drawings; but unless the intentions of the architect are known and expressed, the executed building may fall considerably short of the standard proposed. What is it that people admire and talk about in a new building? Is it not the costliness of the material, the beauty of the design in detail, the handsome fittings? But none of these things are possible if they have not been described and inserted in the contract. It is not what the architect shows in drawings, but what he includes in the contract, that makes the result. In one word, the specification and the quantities are the potent factors in the successful carrying out of every building. Perhaps if the profession looked at the matter in this light they would be less eager to show on paper what they cannot fulfil, and there would be less of that "tall talk" about the superiority of architects over the surveyor's functions—we mean the *infra dig.* character of quantities. After all, it is what is put in the building—not that which is represented—that makes it. The line between design and execution has been so sharply drawn of late years—all that belongs to the one being deemed "high art," all that belongs to the latter mere "trade"—that we are not surprised to find the evil of unrealised expectations. The same line of separation has been drawn between architects and workmen, between designers and manufacturers. Each has no interest in the other, and the consequence is that opposite interests have made genuine art impossible.

To correct this unfortunate tendency as it regards architecture, we must try to bring back the connection between design and workmanship. The specification is the great link which connects the architect to the workman and manufacturer, and as everything that is to appear in a building must be detailed in the quantities, so it must be first described in the specification. Yet this document is far from being a valued branch of the young architect's education. It is a common remark that for a dozen architects who can draw, scarcely one can write a specification. We are glad to see that in the contemplated reconstitution of the classes of the Architectural Association, the subject of specification writing will be made a particular object of study. It may be useful in this part of the question if we remark on the evident connection there should be between this study as a distinct branch of practice and instruction in the building trades. We should certainly make the art of specification writing a distinct study, but it ought to be led up to by a course of instruction intended to prepare each student for specifying each trade, remembering that such instruction should not be general or applicationless, but directed to a definite problem or building. General classes of instruction in building, science, or trades, useful though they are, are of not much value in teaching the student what to specify in a particular trade or a building of a special kind. He wants, for instance, to know how to specify the fittings required for a church or school; what and how to specify for a public library or a museum, a system of heating or of ventilation. General know-

ledge of bricklayers', carpenters', masons', or plasterers' work will not do this. We should recommend a class of instruction in fittings alone, in which the student will be taught to know the requirements and dimensions of church seats and benches, stalls, prayer-desk, and pulpit; or of school benches and desks, technical school joinery, such as demonstration tables, sinks, draught and hot closets, lecture theatres, and other details of laboratory teaching. Library fittings, desks, tables, and bookcases would form another branch; museums, hospitals, laundries, and other classes of buildings of a technical kind a third; each have their special requirements demanding attention in these details. Again, skylights and windows, swing doors, sanitary fittings, plumbers' work, are matters about which instruction is required before a proper specification can be written. Each of these branches of workmanship ought to form special objects, or courses of lectures, on which the students be required to write specifications before passing an examination, showing their knowledge of them. The specifications would necessarily be accompanied by detailed drawings or sketches. A scheme of architectural instruction ought to include all these as well as architectural details and decoration.

Having so far digressed upon what we hold to be an essential branch of the architect's education, we now refer to the system or method of specification writing. Mr. Rickman, in a paper read before the Sheffield Society of Architects some time ago, observed that drawings or specifications required synthesis, or putting together, and quantities analysis, or pulling to pieces; but, in fact, a specification and a bill of quantities require equally the exercise of both functions of the mind, for a man must, in each trade case, grasp the whole of a certain as well as take it to pieces. Attempts have been made to classify specifications; grouping all belonging to a particular structural portion as Walls, Floors, Roof, to describe the work in reference to structure not as to trades; but we fancy the old method of grouping in trades is more convenient and practical. The chief advantage of a scientific classification is that it would be more helpful to the memory in associating one thing with another, as, for example, rafters, boarding, felting, and slating, with the roof. But the old plan of specifying each trade allows the distribution of the written instructions to those who have to do the work or to give a price, and has undoubted practical advantages. The conventional order is known, and little advantage would be derived from any change. What we, however, wish to enforce is the desirability of a system in specifying, the importance of describing correctly and completely, and the evidence of more knowledge of certain descriptions of work. The courses of lectures and classes to which we have referred are the means to this end. Now the architect who has entered into practice and begins for the first time to write a specification hardly knows how to commence, and what to describe. He takes an old specification as a guide. About many things and details he is quite at sea, and he therefore contents himself with the hackneyed formula which covers his ignorance, "Provide and properly fix somebody's range or bath at so many pounds prime cost"; or "Fit up in a complete manner as per drawings the church benches of 1½ in. wrought rounded seats, with proper bearers, &c.," the whole of the detail being thrown on the drawings, which may be very inadequate for the purpose of estimating from, certainly insufficient to work from. Very much is left to the builder or the joiner in framing, especially if there are no detail drawings supplied. The descriptive powers of some architects are certainly very defective and often amusingly curt. What can be made out of the ordinary phraseology for a door or a cup-

board? The description merely gives the thickness, number of panels, and kind of mouldings or framing intended; but not the slightest idea can be formed of the proportion of the panels, their division, or the design. A marginal sketch would give all these particulars, if supplied; but as a rule the joiner has to form his own conception. The specification should, at least, describe what it does not show by sketch, or refer to in drawings. Thus the dimensions of the door should be given, the number of panels, and the heights of panels, and widths of rails, so that the intended division of the panels may be understood. A church bench or seat should be sketched, if not referred to a drawing, the thickness of framing and bench ends and seats should be stated, the height and width of seat, whether the back is vertical or sloped, the width between the backs, the top rail. It would be far more sensible to describe what is really wanted in plain English terms, stating, for example, that the seats are to be 14 in. wide, fixed on bearers so many feet apart, the backs to be inclined (if they are high) to a slope of 1 in 8, a clear width of 3 ft. being obtained between the backs, which are to be of a stated height, every additional inch in height making it necessary to increase by so much the width between, than in a formal sentence, which describes very imperfectly a thickness or two, and throws the whole matter upon the drawings. What we say is that the specification should describe in general as well as in particular terms, unless a detail is supplied. The material, the thicknesses, and the general dimensions of all fittings ought to be made clear.

If these remarks are considered just in respect of ordinary specification provisions, they are still more applicable to the specification of special fittings and trades such as those we have named. All essential points in their design or construction should be made clear. Thus the section of meeting stiles and rails for a French casement to enable it to keep weather-tight, the kind of weather-bar and bolt for closing the casement, are points that should be particularly described, if not shown by a sketch. A special fitting, such as a laboratory table or a draught closet, ought, of course, to be drawn to a large scale, so that its general form and arrangement can be understood. Its details should be specified. For these purposes the architect should obtain information from those best able to give it—the professors who have to teach chemistry, physiology, or engineering; they alone can say what is required and describe the sort of fitting necessary. The draught closet of a chemical laboratory requires a particular description of materials, such as the slate slabs or lead-lined top, to resist chemical agents or heat, the requirements for carrying away liquids, the material of roof of the closet, such as galvanised iron; the draught flues for carrying away the fumes, assisted by Bunsen burners, as used at Owens College, and fresh-air inlet to the bottom of closet. Then the dimensions of length, height, and width of closets should be given, also the fastenings, ironmongery, porcelain fittings. Two or three lines of specification devoted to a special fitting of this kind are useless, and it would be far wiser to let a specialist of respectability describe his own work. Engineers, smiths, and ironmongers' goods are particularly open to imperfect description. The ordinary clauses inserted describing horticultural buildings, conservatories, heating-apparatus, and ventilation schemes contain very little, if any, useful information of the requirements, and therefore the employer obtains just what the builder supplies. Each of these things require a technical knowledge and a number of specified particulars. A valuable mode of arranging information of this kind is to keep a commonplace book, such as described by Mr. John Leaning in

his useful articles on "Building Prices"; but not merely for prices, but for actual details. The information so gained can be classified—materials, construction, dimensions, and details. The specification writer should supplement, not necessarily repeat, what has been furnished in the drawings and details. Thus in the decorative trades such as parquetry, mosaic paving, stained glass, or decorating to walls and ceilings, clauses ought to give instructions as to the foundation for laying, thickness of parquet or mosaic, describe the woods or marbles, and how they are to be laid, the special kind of decoration in every case, naming the firm and the trade price if it is a certain pattern. The ordinary clause merely gives the work required, and leaves both surveyor and builder in uncertainty as to what is intended—a favourable opportunity for speculation and trade profits. Therefore, it is in the best interests of the profession and the trades that the specification should have more attention bestowed upon it, that architects should endeavour to realise the points of a good specification. In the main these are (1) materials, including all knowledge of quarries and timber brands; (2) dimensions, involving a technical knowledge of various fittings; (3) thickness and details; (4) specialities and patented improvements; (5) the names of reputed firms of manufacturers; (6) prices; all of which are required to enable a proper specification to be prepared.

#### ARCHITECTURAL BRICKWORK.— XXXV.

##### ORNAMENTAL ARCHES.

IN our last article we gave a few examples of the proper treatment of ornamental brick voussoirs, and we said that the ornament or diapers impressed on them should not cover the face or be close to the edge, but form a band of ornament in the arch with a plain margin on each side. In sketch 1 we give a further example of this treatment from an actual building—a Romanesque doorway. There are three members recessed one within another; the upper or outer ring has a trefoil leaf beneath the label moulding. The second ring has a band of circles, and the inner, or third, ring a four-petalled flower in relief. All three ornaments have a plain margin of brick on each side. A detailed sketch of a portion of arch is shown in Fig. 2, with the section of arch-members; also the section of jamb, with shafts in the angles. Each member, or ring, consists of alternate headers and stretchers. In specifying arches, which are to have ornamental voussoirs, it is necessary to select the pattern or to make a drawing full size, specifying the diameter and radius of the arch, and give a detail drawing of each brick. Sketch 3 is a design for a moulded arch with a band of diaper ornament on the lower member. Such an arch would be suitable for a church arcade. The outer members are bold mouldings, which, by contrast, set off the inner enrichment.

##### MODERN EXAMPLES.

Good modern examples of ornamental red brick arches and terracotta are those over the windows of the Economic Assurance Company, New Bridge-street, Blackfriars, designed by Mr. Ewan Christian. The ground-story windows are very effective; the principal arch rings, semicircular in form, are composed of brick voussoirs, the joints of which are broken by small squares of blue terracotta set diamond-wise. A bold edge moulding runs round the under edge of this arch, the soffit of which is enriched by a series of small coffers and pateras in bold relief. The upper windows have three recessed arch rings, each ornamented by foliage in bold relief both on the face of arch and on soffit.

Arches of this description have a high decorative value in the facades of brick buildings. The effect of the panelled soffit is to give lightness and richness to the arch, and this kind of enrichment can be increased to almost any degree by two or three members similarly treated. We can name many recent works of this description on mansions and other buildings. The arches to the ground floor of the Green Park Residential Chambers, Piccadilly, those to the large block of residences near the Albert Hall, designed by Mr. Norman Shaw, and the entrance and loggia over of a house in Upper Grosvenor-street, are examples of moulded arches with panelled soffits. The large red-brick block of insurance offices at the corner of Pall Mall and St. James-street, by Mr. Norman Shaw, R.A., comprises some very effective moulded brick arches on the ground story, in which some excellent cutting is seen in the intersection of the arch members on the piers or jambs. These and other modern examples are worth the study of the young architect and brick-cutter. A very piquant and beautiful example of brick-cutting is the dying away of each member of a moulded arch against a splayed jamb, or into an octagon pillar. Of course, considerable skill and nicety is required in executing the intersection—each round, ovolo, and hollow or fillet, has to die out on the plane.

##### FOREIGN EXAMPLES.

It would be exceeding the limits of the present articles to describe the many notable instances of brick arches of the kind we are describing. The Low Countries, North Germany and North Italy, are the principal countries in which brick architecture has

been developed, in any of which the student will find the art of arch cutting and moulding has been carried to a perfection. Take, for example, the arch-work found in such a city as Ypres in Belgium, and applied not only to archways, but to window-heads and tracery, one or two instances of which we have already given.

The courtyards or cortiles of many Italian palaces, such as that of the Palazzo Bevilacqua at Bologna, have arcades round them often of two stories, the arches of which are of red terracotta voussoirs, with an ornament on the face and in panelled soffits. Very beautiful examples of Gothic brick arches inclosing three lights of trefoiled arches occur in many of the Venetian and Sienese palaces;—at Siena the brick arches of windows in the Palazzo Buon-signori. Bands of red and white brick-work are common in the wall surfaces, and we might name the cathedrals of Orvieto and Como, the latter of marble, each having three fine circular-headed and enriched doorways, suggestive of the decorative work of this material. Sta Maria of Strada affords another instance of a highly embellished exterior in brick and terracotta, sketches from which we may give, if space permits.

#### THE HYDROPATHIC ESTABLISHMENT AND ITS BATHS.—VIII.

By R. OWEN ALLSOP, Architect.

(Author of "The Turkish Bath: Its Design and Construction.")

VAPOUR baths have, in the past, been for the most part administered by means of boxes of such shape and size as to

allow the head of the bather to be free. Vapour boxes, of this description, are always of service, because in certain cases physicians may consider it desirable that their patients should not breathe a vaporous atmosphere. Of late years, however, the Russian bath has been increasingly employed. This appliance I shall therefore proceed first to describe, and subsequently deal with minor varieties of vapour baths.

#### THE RUSSIAN BATH

consists of a chamber, heated partly by hot-air and partly by steam, in which the bather remains a longer or shorter time, until perspiration is induced and he is ready for the operation of shampooing and washing, such as follows the sweating in the hot rooms of the Turkish bath. If the Russian bath be included in a bathing establishment without a Turkish bath, it must comprise, in addition to the sudorific chamber with vaporous atmosphere, a lavatorium and shampooing room, a douche room, and a cooling room. Where, however, the Russian bath is provided in addition to the Turkish bath, it is most conveniently placed as an appendage to the shampooing room of the latter. It may be connected by a lobby or heated corridor; but it would be undesirable for it to communicate

directly with the shampooing room, since, when the door is opened, steam will escape into the atmosphere of the Turkish bath, which, at all costs, must be kept perfectly dry.

In some elaborate bath-houses—such, for example, as the Friedrichsbad at Baden-Baden—the sudorific chambers of the Russian bath are two in number. They are then known as the “warm” and “hot” rooms respectively. Increase of temperature, however, is usually gained in the Russian bath by ascending to a higher level in the chamber or room. Following the custom in the original bath as arranged in Russia, wooden benches are provided round the walls, and these are stepped one above the other, there being at times as many as half-a-dozen tiers. The benches are constructed of open wood-work—much as the benches or shelves in a conservatory—so that the steam may freely circulate round the persons in the bath. The vapour-laden air being hotter and denser towards the ceiling of the bath, the bather can choose a comfortable temperature by selecting a higher or lower position.

The indicated temperature of the Russian bath is slight compared with that of the Turkish bath, varying only from 100° to 112°. It must be remembered that, whilst it is

possible to stay for some length of time in a temperature varying from 200° to nearly 300° in the dry atmosphere of the Turkish bath; if the thermometer register 120° Fah. in a vapour bath of ordinary density, the bather will be scalded.

The maintenance and regulation of the temperature of vapour baths is therefore of the greatest moment. The Russian bath is prepared by the aid of steam pipes which raise the temperature of the air at the same time that they supply the requisite steam. Ordinarily the lengths of pipes in the bath-room are relied upon to heat the air; but in the accompanying illustration I have shown an improvement, in the shape of an additional air-heating chamber with a small steam coil. This chamber would communicate with the bath by means of a hit-and-miss grating placed about 5ft. about the floor level, and side by side with another grating controlling the supply of cool air. A steam-pipe runs under the benches and returns, the return pipe being perforated with a number of holes to let out the steam; and a screw-down regulating valve is placed in a convenient position for the attendant to reach. 1in. wrought-iron pipes will do for this purpose. There should be a large number of holes in the length of the supply-

pipes, so that the steam may escape as noiselessly as possible, and not distress nervous invalids.\*

A great desideratum in this bath is some means of rapidly clearing the chamber of "steam," and letting it into a convenient channel. Ordinarily the window or windows are opened, but this may be slow, and it may also be undesirable to turn a lot of vapour into the air at such and such a point. A large clearing vent would be a great improvement, and in the illustration I have shown one with a sectional area of 4ft. This clearing vent also serves as a ventilating shaft. In clearing the bath-room, the valve is opened full, and adjusted as required for purposes of ventilation by the rack and screw adjustment shown on the section. In the example given, the shaft is only of sufficient height to clear the roof, but it could evidently be carried to any desired height or position.

Theoretically, there should be some ventilation of the bath at the floor level; but, for practical purposes, waste steam and air should be taken out at the top of the Russian bath.

The bath shown in the accompanying illustration is connected by a lobby with the lavatorium and shampooing room of the Turkish bath. The whole shows a portion of a design for a public bath-house comprising various kinds of baths. Hollow walls and double windows are provided to the Russian bath for the sake of maintaining equal temperature and preventing loss of heat by absorption and radiation. The walls are lined with white glazed bricks, and plenty of light is given—important in the obscured atmosphere—by means of windows and glazed partitions and doors to the lobby and shampooing room. The benches are of wood-work with wood dado. Thin tiles are screwed to the ceiling joists to form a ceiling, and slag-wool should be placed over to keep in the heat. The regulator to ventilating shaft is intended to be of well-seasoned wood, in suitable frame, and swinging on its centre.

#### CONTEMPORARY BRITISH BUILDERS.

THIS double-page is the third sheet which we have given of representative contractors and builders. It begins with the portraits of Messrs. Henry William and Edward C. Bull, the builders of the Palace of Justice in the Strand, from the designs of Mr. G. E. Street, R.A. Mr. Edward C. Bull, whose portrait appears first in our group of this week, commenced life by serving his articles to the architectural profession, at the expiration of which he was engaged with his father, Mr. Joseph Bull, contractor, who died in 1867. Some time previous to this the three sons—Henry Wm., Frederick, and Edward C.—became partners, and the firm was then styled Joseph Bull and Sons, and is now Joseph Bull, Sons, and Co., Limited, of Belvedere Works, Southampton, and 1, Clement's Inn, Strand. They built the New Law Courts, and have carried out many other works for the Government, amongst which may be mentioned:—Barracks at Portsmouth, Winchester, Dorchester, and other centres; military hospital at Eastney; post-offices at Chester, Shrewsbury, and at Portsmouth; probate registry at York and Patent Office, London, &c. They also built for the Colonial Government the New Houses of Parliament at Cape Town, South Africa. They erected the joint station of the London and South-Western and London, Brighton, and South Coast Railways at Portsmouth, and were for many years contractors to the first-mentioned company, for whom they have carried out a large amount of work in all parts of their system. Among other buildings by them are:—West London District Schools; Gas Works at Portslade, Brighton, and Southampton; Corn Exchange, churches and chapels, Philharmonic

Hall, Capital and Counties Bank, National Provincial Bank, Ordnance Survey buildings, &c., at Southampton; Town Hall, Romsey; Corn Exchange, &c., Ringwood; Town Hall, schools, &c., at Winchester, and several other important works. The portrait of Mr. Edward C. Bull is from a photograph by Walery, of Regent-street; and that of Mr. Henry William Bull is by Mr. T. Illingworth, of Halifax.

Mr. Tom Frank Rider was born in 1843, and became a partner with his father in 1865, in the business established by his grandfather about 1804, and carried on at present address since 1866. Mr. T. F. Rider was educated at Dr. Pinche's, Clarendon House, Lambeth. The following is a list of works he has carried out:—The British and Foreign Bible Society, Queen Victoria-street, Mr. P'Anson, architect; the Freemasons' Hall and Tavern, Gt. Queen-street, Mr. F. P. Cockrell, architect; Messrs. Peek, Frean, and Co.'s biscuit factory, Drummond-road, Messrs. Snook and Stock, architects; Messrs. Tarn and Co.'s premises, Newington Causeway and New Kent-road, Mr. Knowles, architect; additions to head office London and County Bank in Abchurch-lane, Mr. Z. King, architect; branches at St. Alban's Mr. F. Chancellor, architect; Kingston, Mr. Pannell, architect; Kensington, Mr. Williams, architect; mansion, Hastings, for Captain Hankey, Mr. Pilkington, architect; Rockingham Arms, Newington Causeway; and Argentine Hotel, Charlton, Mr. F. J. Eedle, architect; and restoration of All Saints, Witley, Mr. Aston Webb, architect; Holy Trinity, Latimer-road, and house for Miss Kate Greenaway, Hampstead, Mr. Norman Shaw, R.A., architect. He is past president of the Builders' Clerks' Benevolent Institution, having served for two years as president, the only instance on record. He is also a member of the Builders' Benevolent Society, and is now president of the Builders' Institute, and vice-president of the Central Association of Master Builders. Mr. Rider is a director of the Builders' Accident Association, and representative of London Association of Master Builders at the National Association of Builders of England. He is a member of St. Saviour's District Board of Works, and for the last three years of the Metropolitan Board of Works acted as the representative of that division. He lost the election as London County Councillor by 500 votes, and was the highest unsuccessful candidate. He was a warden of great account for St. Saviour's parish for two years, during which time the church-rate, imposed in reign of Charles II., was abolished, and the patronage of the living vested in the Bishop, who promised to undertake the restoration of the great ancient church, which is now about to be commenced. Mr. Rider is a Fellow of the Royal Geographical Society. His portrait was produced by Messrs. Maull and Fox, of Piccadilly, W.

Mr. Benjamin Ebenezer Nightingale, of "Albert Works," Albert Embankment, has extensive workshops, &c., at the Vauxhall end of the Albert Embankment, S.E., and close to Vauxhall Station (L. & S.W. Railway). In addition to building contracts executed in Westminster, the City, and South London, he carries on a large business of painting, decorating, and repairs. Some of the principal works carried out during the past fifteen years are the following: St. Giles-in-the-Fields and St. George's Workhouse, Bloomsbury, the Birkbeck Literary Institution, Fetter Lane, and Messrs. Burt and Son's printing offices adjoining; a number of schools for the London School Board, the Guildhall new council chamber, and Leadenhall Market, for the City of London Corporation; the "Butchers' Hall," Bartholomew Close; additions, and new board room, &c., Stationers' Hall, Paternoster Row; Messrs. Evans, Lescher, and Webb's chemical works, Bartholomew Close; new centenary hall and new wing Royal Masonic Institution for Girls, Battersea Rise; the General Steam Navigation Company's offices, Tower-street; Charing Cross Hospital, new top story; Messrs. Ward, Lock, and Tyler's new book warehouse, Dorset-street, E.C.; the Homerton Infirmary, for the Hackney Guardians; new clock factory, Ray-street, Farringdon-road; new pianoforte warehouses for Messrs. Moore and Moore, Bishopsgate-street; new pumping station, Hampton, for the Southwark and Vauxhall Waterworks Company; blocks of shops and residences, Mount-street, Berkeley-square; Cleveland-street additions to the Sick Asylum, new additions Leavesden Asylum, for the Metro-

politan Asylums Board; new bank, Peterborough; sundry blocks of warehouses, Houndsditch, London Wall, and Fenchurch-street and Cornhill; new Colonial warehouses, Wapping; new block of offices, residences, &c., St. Helen's-place, Bishopsgate; the Tate Free Library, South Lambeth-road; Messrs. Francis and Co.'s revolving shutter factory, Gray's Inn-road; London and South Western Bank, Regent-street branch, W.; additions to the London and Westminster Bank, St. James's-street branch; Church of St. George, Catford; St. Barnabas' Church, Kentish Town; Emmanuel Church, Harrow-road; St. Andrew's Church, Streatham Common; Presbyterian Church, Wandsworth Common; St. Peter's Church, Limehouse; All Souls' Church, Harlesden; Baptist Chapel, Hendon; Bloomsbury Dispensary; Wilson's Grammar School, Church-street, Camberwell; fittings and decorations, No. 213, Oxford-street; police stations, West Hampstead and Staines; &c. This photograph herewith reproduced was by Messrs. West and Son, of Bournemouth.

Mr. Henry Lovatt, of Wolverhampton and Great George-street, Westminster, commenced his career in 1851 as an architect, in conjunction with Mr. George Bidlake, and they designed and carried out together several public buildings, chapels, churches, and private houses in various parts of the country. In 1858 he took over the builder's and contractor's business in Darlington-street, Wolverhampton, previously carried on by Mr. John Elliott, and quickly developed a large trade. In the past thirty years Mr. Lovatt has been engaged on undertakings of great extent—both Government works, railways, and railway works, reservoirs and other engineering works, churches, banks, &c. From 1864 to 1878 he did the principal portion of the Great Western Railway Company's new constructions and alterations, including the widening of the first portion of the line out of Paddington, the widening at Corsham, the Pontypool and Talywain Railway, and the Netherton and Halesowen Railway and stations, and he is now carrying out the Abertillery deviation and a relief line at Bristol for that company. Mr. Lovatt has also completed large contracts for many of the other leading railway companies. For the Great Northern, the Copenhagen Tunnel, the Leen Valley Railway, Notts, and several other lines in the same district; for the Great Eastern Company, the Farnett and Wymondham, and Cambridge and Mildenhall Railways; for the Midland Company, the Walsall Wood Railway, the Poplar Sidings, and (in conjunction with Mr. William Mousley) the Skipton and Ilkley Railway; for the London and South Western, the Corfe Mullen and Bailey Gate Extension, and the Netley and Fareham Railway. He was the contractor for the construction of the section of the Banbury and Cheltenham Railway from Cheltenham to Bourton-on-the-Water, and (jointly with Mr. W. E. Shaw), for the third section of the Barry Dock Railway. Mr. Lovatt has also worked for many of the leading architects who have been his contemporaries. Under Mr. R. Griffiths, county surveyor of Stafford, he did important works at Stafford Gaol, Chester Prison, and at Macclesfield Asylum; at Worcester Asylum, under Mr. Rowe, county surveyor of Worcester; under Mr. Alfred Waterhouse, R.A., the Central Technical Institute, South Kensington, and a mansion at Stevenston, Hants; under Messrs. Giles and Gough, the Grammar School, Wolverhampton, and county asylums at Gloucester and Bridgend; for the late Mr. G. E. Street, R.A., church restorations and the new American church in the Avenue de l'Alma, Paris. Commencing in 1883, he built all the mansions on the Kensington Court Estate under Mr. J. J. Stevenson. For the Government Mr. Lovatt carried out the Lichfield Brigade Depot, a contract of over £200,000, besides having done additions to forts on the south coast, and works at Portsmouth Dockyard. He put in the foundations of the National Liberal Club (Mr. A. Waterhouse, R.A., being the architect); and the new Middlesex Asylum at Woodford, under Mr. G. T. Hine, F.R.I.B.A., architect, Nottingham, now in course of erection. Amongst engineering works may be mentioned a large gas tank at Salford (Birmingham Corporation), reservoirs at Papplewick (Nottingham Water Works Co.), and at Shobnal, Burton-on-Trent (South Staffordshire Water Co.), besides the important works in 1877 for the South Staffordshire Mines Drainage Commissioners. In addition to the work now in hand for the Great Western Co., already alluded

\*The original design included a basement under the bath-rooms shown on this plan, but by an oversight they have been delineated without the basement. The boilers for supplying steam were arranged in this basement, and pipes to the various bath-rooms, and heating-coils conducted along passages under the warmed corridors.

to, Mr. Lovatt has secured the contract for a new tunnel for the Great Northern Company at King's Cross, is erecting very large works at Bushbury for the Electric Construction Corporation, and at Bishopstoke, for the London and South Western Railway Co. (to which place that company are about to remove their carriage and waggon shops). He has works in hand at Middlesbrough, Portsmouth, Birmingham, Wolverhampton, and in Worcestershire. His workshops, timber yards, machinery, and stores at Wolverhampton are very extensive. The portrait published was taken specially for our series by Mr. Thos. Fall, of 10, Baker-street, W.

Mr. William Higgs, the head of the firm of Higgs and Hill, is the eldest son of the late Mr. William Higgs, the founder of the business carried on at Crown Works, South Lambeth. He entered his father's firm at the beginning of the year 1868, and continued with him till his retirement in 1874, when he was joined by his present partner, Mr. Joseph Hill, whose portrait appeared in our issue of April 4 last, with an account of some of the principal works carried out by the firm. His father, having served his apprenticeship to the late Mr. Joshua Higgs, of Davies-street, Berkeley-square, commenced business in the year 1845 at Bishop's-road, Bayswater, an undertaking which proved to be a success. In 1847 he moved to larger premises in Euston-road, and again in 1852 to Palace Wharf, Stangate (now occupied by Messrs. Jennings); from thence in 1867 the business was removed to the premises in the occupation of the present firm. An annual social gathering of his workmen and their wives, instituted by Mr. Higgs, is still continued by his successors. Messrs. Byrne and Co., of Richmond, produced the photograph herewith copied to-day.

#### NEW BATTERSEA BRIDGE.

THE new bridge which replaces the old Battersea bridge has so far progressed that it is contemplated to open the new structure in July. The old timber bridge was found unsafe for vehicular traffic some years ago, and the then Metropolitan Board of Works resolved to erect a new bridge. The demolition of the old structure was completed in the early part of 1886, and the work has been carried out uninterruptedly. The contract for the new structure was undertaken by Messrs. Williams, Son, and Wallington in May of the same year, for the sum of £143,000, and the bridge is being erected from the design of Sir Joseph Bazalgette, and has been carried out under the supervision of Mr. Edward Bazalgette. We paid a visit this week to the bridge, and, although the scaffolding and temporary bridge and staging obscure the view of the new structure from the river, a fairly good idea can be obtained of the design and proportions. The river is spanned by five segmental arches or cast-iron ribs, which spring from granite piers. The centre span is 165ft., and has a rise of 18ft.; those on either side have a span of 140ft., with a rise of 13ft., and the abutment arches are 113ft. span, with a rise of 8ft. 6in. The headway above high water of these will be 10ft. 6in., and the centre arch will have a headway of 20ft. From these figures it will be seen that the bridge assumes a bold curve, or a gradient of 1 in 30 rising from the approaches to the centre. The width between parapets (supported by seven cast ribs) is 40ft., the footways of 8ft., leaving a carriage-way of 24ft. wide, and these footways are being paved with Claridge's patent asphalt, a material which has won favour amongst all engineers for the purpose of bridge flooring. Nothing can be cleaner, better suited to give to the slight vibrations of iron structures, or more durable. We may state that these footways project on cantilevers, which are covered below by a cast-iron coving with ribs, forming a bold and pleasing feature in the view of the bridge as it is seen from the steamboat. The parapet now being fixed is of cast iron, and in design consists of an arcading of circular-headed arches. The approaches have granite parapets, and the levels from Chelsea Embankment and Cheyne-walk are raised. The arches forming these are covered also by Claridge's patent asphalt, a very important provision, as we have before pointed out, in the protection of brick arches and iron structures from damp and sudden changes of temperature. The iron arches externally are relieved by ornamental cast-iron spandrels with a circular opening.

#### ADJUSTABLE T-SQUARES.

THE illustration herewith represents a new patent adjustable T-square, manufactured by E. L. Deane at Holyoke, Mass. Some of the leading points which make these squares specially useful are that they can be instantly adjusted to conform with existing lines or drawings, which are frequently disturbed by atmospheric changes. This makes them invaluable for tracing. The adjustment is accomplished by loosening the jam or outer nut on the regulating-screw, and bringing the blade to the desired position with

the vernier or inner nut. It is then locked with the jam nut, making the head as rigid as if made of one piece. The inner, or bearing head, being in no place confined, will, if affected by the weather, shrink or expand equally its whole length and remain straight, which the heads of common squares, under like conditions, cannot do. The position of the blade is such that when necessary to work near the lower edge of the drawing board, a bearing of at least one-half the length of the head is retained. The heads can be used on old blades when desired.

#### ARTISANS' DWELLINGS AMENDMENT ACT.

A BILL has been introduced by Mr. Ritchie, Mr. Matthews, and Mr. Long to amend the Acts relating to artisans' and labourers' dwellings and the housing of the working classes. It imposes upon every local authority the duty to cause inspection of their district to be made from time to time with a view to ascertain whether any premises therein are in a state so injurious to health as to be unfit for human habitation, and, if any premises are found to be in such state, they are required to forthwith take proceedings before a Court of summary jurisdiction against the owner or occupier for closing the same. The Court is empowered to make a closing order, and to impose a penalty, and the tenants of the premises will be liable to a penalty if they fail to leave them within the time prescribed in the order. Power is then given to the local authority to order the demolition of the premises if not rendered fit for human habitation. Where an order for the demolition of a building has been made, and it appears to the local authority that it would be beneficial to the health of the inhabitants of the neighbouring dwelling-houses if the area were used for all or any of the following purposes—(1) Dedicated as a highway or open space; or (2) appropriated, sold, or let for the erection of dwellings for the working classes; or (3) exchanged with other neighbouring land which is more suitable for the erection of such dwellings, and on exchange will be appropriated, sold, or let for such erection; or where it appears to the local authority that the closeness, narrowness, and bad arrangement or bad condition of any buildings are prejudicial to the health of the inhabitants, the local authority may direct a scheme to be prepared for the improvement of the said area. If no opposition is offered to the order within two months, the Local Government Board may confirm the order, and the area must be acquired within three years from the date of the confirmation of the order. There is a special clause prohibiting persons interested from voting

as members of any local authority. The Bill contains, it will be seen, many useful changes, some of which are of pressing necessity; but it has, we fear, no chance of being passed this session. A separate Bill, backed by the same members of the Government, proposes to consolidate the Acts relating to artisans' and labourers' dwellings and the housing of the working classes.

#### NOTES ON BUILDING PRICES.—II.

By JOHN LEANING.

##### CANALS.

THE condition of the waterways of the kingdom has been a subject of regret for some years. The neglect and gradual decadence of canal traffic has proceeded in proportion to the development of the railways. The public mind, intoxicated with that marvellous phenomenon, has allowed itself to lose sight in a great measure of the canal and river system which, at an outlay comparatively small, would prove an admirable adjunct to the railways and an immense advantage to the trade of the country. Of this, some of the northern and midland sections of the existing canals afford convincing proof. The facilities which this method of transit offers for inexpensive loading or unloading at any part of the course, the comparative cheapness of the means of carriage, traction, and maintenance will commend them to any observer. France and Belgium offer us striking examples of the benefit of a good canal system judiciously fostered. In England the acquirement by the railway companies of sections of canal forming parts of the great through routes, which they have closed or upon which they levy prohibitive tolls, is a striking contrast which has repeatedly provoked public opposition and agitation in Parliament. Some of these difficulties the Railway and Canals Traffic Act will ameliorate, but will not remove. Some of the conditions which the country requires to put its internal trade on the most prosperous footing are as follows:—The acquirement by the State of the interests of both railway and canal companies throughout the kingdom, and the consequent removal of the conflict of their interests. A general revision of rates. The widening of the waterways in parts and the enlargement and reconstruction of locks so that barges of 90 or 100 tons may pass through the whole system without breaking bulk. At present a barge of 80 tons starting from Brentford on the Midland Canal would, before reaching Birmingham or Liverpool, require reduction to a little over 30 tons. The route from London to the Derbyshire coal-fields would involve a reduction to 24 tons, as some parts of the canal on this line are only 7ft. wide. These conditions have produced the long, narrow barges known as fly-boats. The *Grand Junction Canal*, commencing at Paddington Basin, runs through Paddington, Southall (with a branch to Brentford), Wendover, Aylesbury, Buckingham, Northampton, Bucks, Bramston, &c., a length of about 135 miles. By it sand and stocks from the immediate neighbourhood and Staffordshire bricks, tiles, &c., are brought into London in large quantities. Barges of 80 tons can get as far as Cowley. The larger part of its traffic comes to Paddington Basin or Brentford. There is no printed schedule of dues: some of the incidental charges are as follows:—

	Paddington.	Thames	Above
		below Kew.	Kew.
Bricks, per ton.....	11d.	4d.	6d.
		Thames below Kew and London Bridge.	
Sand, per ton.....	10½d.	10½d.	
Canal Dues, Lighterage, and Towing:—			
Sand, from Hayes and its neighbourhood,			
per ton.....	1s. 6d.	—	
Bricks, per thousand	4s.	4s. 9d.	
Lighterage and Towing:—			
Bricks, per ton.....	1s. 8d.	—	

A common rate for the discharge of cargo at a Metropolitan canal wharf is 10s. per day. Demurrage is not generally considered, as, if proper arrangements are made, it is quite easy to discharge 40,000 bricks or a cargo of sand in a day. The *Regent's Canal* is connected with the Thames by a dock at Limehouse, runs through Stepney,

Mile End, Bethnal Green, Hackney, Shoreditch, St. Luke's, Islington, St. Pancras, Marylebone, and Paddington, where it joins the Grand Junction Canal. It has basins at Limehouse, City-road, and King's Cross. It communicates with the River Lea (at Bromley) by the "Limehouse cut." Its total length is about 8½ miles. There are wharves at intervals, either exclusively draw wharves or such as may be arranged for at the 10s. rate before mentioned. The Great Eastern, Great Northern, Midland, and London and North Western Railway Companies have goods stations on the banks of this canal, and the Great Western at Paddington Basin. The following are some of the rates:—

REGENT'S CANAL.—The locks admit barges 78ft. long and 14ft. wide.

Rates on cement, lime, slates, tiles, and timber (in barges)		Per ton.
To or from Thames, and points short of Great Eastern Railway	s. d.	0 8
To or from Thames or River Lea, and points short of Old Ford Lock (except to railways)	s. d.	1 0
" " " and points between Old Ford Lock and City Road Lock	s. d.	1 3
" " " City-road Lock and Stop Lock, Regent's Canal	s. d.	1 4
On all other articles except explosives, gas liquors, and ice (in barges)		If towed by the Owners.
And on all articles except " " " (in boats)		If towed by the Company.
To or from the Thames and Old Ford Lock, and 1st Lock, Hertford Union Canal (and points between)		Per ton. s. d.
" " " and points between Old Ford Lock and Kingsland-road Bridge, and beyond 1st Lock, Hertford Union Canal		0 7½
" " " Kingsland-road Bridge and St. Pancras Lock		0 9
" " " St. Pancras Lock and the Grand Junction Canal		0 9½
To or from Grand Junction Canal and Hampstead-road Lock (and points between)		0 10
" " " and points between Hampstead-road Lock and Islington Tunnel		0 7
" " " Islington Tunnel and Old Ford Lock		0 8
" " " beyond Old Ford Lock, to the Thames and Hertford Union Canal		0 9½
To or from the River Lea (via Hertford Union Canal) and Old Ford Lock and Mile End Lock (and points between)		0 10
" " " and any point beyond Mile End Lock to Thames		0 7
" " " between Old Ford Lock and City-road Lock		0 9
" " " City-road Lock and the Grand Junction Canal		0 8
" " " (North of Enfield Lock) and any point between Mile End Lock and the Grand Junction Canal		0 9
To or from the Great Western Railway, London and North-Western Railway, Midland Railway, Great Northern Railway, and Great Eastern Railway.		35s. per barge.
Coals to any point		0 6
All other articles to any point		0 8
" " from Great Eastern Railway to Thames or any intermediate point		0 7

\* All articles passing to or from the Grand Junction Canal will be charged 1d. per ton less (except as back carriage). Barges to be charged for not less than 30 tons (except as back carriages). Boats to be charged for not less than 20 tons each (except as back carriage). Boats to be towed by the owners. Articles loaded or unloaded in the waterway to pay an additional 3d. per ton.

Bow Creek connects the Thames with the Lea and Stort Navigation, terminating at Bishop Stortford, 33 miles. Dues on the Lea are lower than those on the Regent's Canal. The *Grand Surrey Canal* commences at the Surrey Commercial Docks between Rotherhithe and Deptford, runs through Hatcham, Bermondsey, Peckham, and Camberwell, terminating with a basin in Camberwell-road, a length of about 4½ miles. This canal largely contributes to supply South London with timber and deals, besides the usual traffic. There are draw wharves at Old Kent-road Bridge, Plough Bridge, and Camberwell Basin. The usual charge for permission to discharge a cargo is 5s. The charge for towing a barge to any wharf is 10s. The schedule of dues, so far as it concerns the estimator, is as follows:—

#### SURREY CANAL RATES.

To or from the River Entrance and the following Places:—	Plough Bridge (1 mile) and Windmill-lane.	Between Windmill-lane and Brighton Railway.	Beyond the Brighton Railway.
	Per Ton. s. d.	Per Ton. s. d.	Per Ton. s. d.
Chalk, Empties, and Pipe Clay	0 4	0 5	0 6
Asphalte, Blue and Black Bricks, Fire Bricks, and all kinds of Ornamental Bricks, Cement, Drainpipes, Fireclay, Lime, Plaster of Paris, Slates, Stone (including Paving Cubes), Tar Paving, and Whiting	0 4	0 5	0 8
Building Materials, Iron, Lead, Paint, Paper, and Wood	0 6	0 7½	0 10
Articles unenumerated, and of higher value than those above	1 0	1 3	1 6
Bricks (ordinary) and Tiles	Per 1,000.	Per 1,000.	Per 1,000.
Ballast, Batts, Flints and Broken Stone for Roads, Gravel, Hard Core, and Sand	0 6	0 7½	0 9
	Per Barge.	Per Barge.	Per Barge.
	12 0	14 0	16 0

The Undermentioned Goods are Charged by Measurement:—

Deals, Battens, Rough Boards, and Ends. A Petersburg Standard is taken as (Prepared Flooring Boards one-eighth less.)	2½ Tons.
Lathwood, a fathom of 216 cubic feet, taken as	3 "
Firewood	2½ "
Pitch Pine, Fir, and Soft Timber, a load of 50ft. is taken as	1 "
Hard Wood, a load of 40ft. is taken as	1 "
Cement, 100 bags is taken as	9 "
Fire Bricks, Red Bricks, and all Ornamental Bricks, 1,000 is taken as	3 "

REGULATIONS.—Back Dues.—Barges going up the canal laden and returning light are not charged back dues. If the upward freight does

not exceed 15 tons, a lockage rate of 2s. 6d. for each passage through the lock is charged in addition to the dues on the upward freight. Barges going up the canal laden with a freight of not less than half the barge's carrying capacity, and returning with a freight for the same firm, are charged half dues on the back freight when such freight exceeds 20 tons. Barges which have discharged their upward freights and reloaded downwards ashes, breeze, manure, or rubbish, are charged 10s. for such back freights from any part of the canal. Barges going up the canal light and returning laden are charged full dues on the back freight. If the back freight does not exceed 15 tons, a lockage rate of 2s. 6d.

exceeding £5. Stage-boards may be hired from the canal ranger at 2s. per freight. Barges remaining in the canal more than twenty-four hours after completion of discharge will be subject to a charge of 2s. 6d. for each day or part of a day. Barges found adrift in the canal will be moored by the Company's servants, and a charge of 2s. 6d. will be made in each case. Barges navigating the canal must not exceed 17ft. 9in. in width, nor 4ft. 9in. in draught.

A complete map of all the canals and inland navigations is attached to the Report of the Select Committee on Canals, May, 1883, Vol. 13, Parliamentary papers.

#### DOCKS.

The Surrey Commercial Docks are the principal place of entry for the timber and deals, prepared flooring and matched-boardings, pine, oak, and pitch-pine from Northern Europe and North America; the West India Docks and Millwall—principally the former—for cedar, mahogany, teak, American oak and walnut, sequoia, whitewood, kauri pine, &c. Much of the material thus landed is conveyed by barge up the Surrey canal for the supply of South London, enters the Regent's canal at Limehouse dock or Bow creek for the supply of North or Central London, or goes by that route into the Grand Junction canal for the supply of the home counties. Large quantities are carried by barge to the Upper Thames, and still larger quantities carted either by the sawmill proprietors (who saw and deliver), or directly by the purchasers. The dock dues are published in printed schedules; but they only slightly concern the student of prices. The wood supplied to London is usually purchased at the sales held frequently by the merchants, the greater part at the Baltic Sale-rooms, Threadneedle-street. When a large quantity of wood is required the builder buys at these sales, when smaller quantities of a retail timber-merchant. At most of the large seaports of the kingdom there are periodical timber sales. Landing rates and sawmill regulations will be dealt with in the section Carpenter.

#### RAILWAY RATES.

A familiarity with railway rates will be useful to the student in the adjustment of claims for carriage, the valuation of materials which are in some cases delivered into trucks at the railway-station adjacent to the manufactory, in others at that nearest to the proposed building. In the valuation of country work, as in the conduct of a building distant from London, much of the material must be worked at the contractors' shops in town and conveyed somehow to the building. Except for small parcels sent by passenger train and for return of empties, there is no published scale of charges. As a rule, the rates of the various companies for similar quantities conveyed similar distances in a similar way are very much alike; the exceptions are mainly referable to the acquirement by a large company of a smaller one, whose original Act contained (for some reason now possibly extinct) specially high rates, which are still maintained. The avowed object of the Railway and Canals Traffic Act, the details of which are now under consideration by the Board of Trade, is the assimilation and classification of the rates as far as practicable, and provides for their publication and sale in a book at a cheap rate, so as to be accessible to all. It seems probable that the Government will under this Act exercise an increased power over the charges of the companies, but to a far less extent than might be desired, because of the enormous vested interests with which nothing short of purchase can satisfactorily deal. Any sanguine expectation of a material reduction of rates will certainly be disappointed. The arrangements contingent upon the investigation above referred to will not operate for some time to come, and until they do, the rates for conveyance must be obtained by inquiry at the goods department of the railway company concerned. Through rates between the stations of one company and another may be best obtained by inquiry of the station-master of the station from which the goods are despatched, or at the chief office of its company, or the rate per ton for carriage may be obtained from the manufacturers if the question is asked at the time of making inquiry about prices. As a general rule, the cost of railway carriage does not increase in a regular ratio; the cost of conveyance for 100 miles is much less than twice that for 50 miles. Railway companies

convey at two rates: one under which they are liable for damage, called company's risk; the other (a lower one), under which they are not so liable, called owner's risk. It is obviously to the interest of the sender to adopt the latter when the goods are not easily to be damaged. Goods rates are modified as follows:—A certain set of charges is applied to all consignments not exceeding 500lb. in weight, regulated by a table used by all companies alike. Under this table nothing less than 28lb. is charged, and the charges for weights above 28lb. increase by multiples of 14lb. This scale applies uniformly according to its rate to all carriage between stations in England south of Newcastle and Carlisle and in Wales. A second set of rates is applied to material exceeding 500lb. and under two tons, called class rates, which include collection and delivery within the usual limits (three or four miles) in towns; a third set of rates, for two tons and over, called special class rates, which do not include collection and delivery. It is often cheaper to pay for a consignment of two tons, although it may weigh but little over one. At small country stations nothing is delivered except very small parcels in the immediate neighbourhood. In London such agencies as the London Parcels Delivery Company, Messrs. Carter Paterson, and the Metropolitan Railway convey and deliver small parcels at cheap rates, and similar facilities exist in most of the large towns of the kingdom. Small articles, designated by number in a trade list, may consequently be ordered by letter and conveyed in this manner. This may be remembered when a claim is made in a day account for labourer's time for half a day to fetch such a thing as a tap or other small article. When goods are ordered from the manufacturer by the truck load, in stating the position of the work, inquiry should be made as to the station to which he proposes to consign it, and it is advisable to test this information by an independent inquiry of the stationmaster of the nearest railway station to the proposed building, as he can frequently suggest a more convenient station for its delivery. As the Acts of Parliament under which particular lines of railway have been established only enumerate the rates of charges of quite a small variety of articles, there has gradually developed a classification of rates agreed on by the various companies called the Clearing House classification, in many respects unsatisfactory. Some of the railways carry timber at the *measured* ton. One principle of measurement is prevalent in some parts of the country called string measurement, another tape measurement, another caliper measurement; these differ materially one from the other, and all differ from the machine weight. It is probable that the revised classification will deal with the actual weight. When considering railway charges, the surveyor should insist upon the production of the original railway delivery note, which simplifies the matter when settling the accounts for a building erected or in progress; but in estimating the cost of a prospective work, the surveyor must be familiar with rates and the method of their charge. A map for the measurement of distances will prove useful in the calculation of all kinds of carriage. In view of the present uncertainty as to the new classification and the consequent incompleteness of the foregoing information, it may be necessary at a later stage to return to the question of railway rates.

## DELIVERY BY MANUFACTURERS AND MERCHANTS.

The makers of small articles do not usually deliver anything less than a cart-load, but when as much as a load is ordered, they may generally be induced to deliver without extra charge. In ordering a truck or barge load of material, it will generally be advisable to obtain a price, including carriage and delivery, as the merchant will often, for the sake of obtaining a good order, forego a part at least of the dues involved. The provincial manufacturer's price is generally stated to include delivery into trucks or barges at the nearest available point to their works; but they will quote a price, including delivery, at a station, canal, or river wharf adjacent to the proposed works. The makers of drain-pipes and similar goods, when a load is ordered, deliver free in London and its suburbs; or, if for the country, at a London railway station; smaller quantities must be sent for and carted by the purchaser, but it does not follow that every single article is separately sent for, as the zealous advocate will sometimes contend. The majority of the country machinery manufacturers limit their free de-

livery in London to articles over £5 in value, and many of them will deliver free at any railway station or shipping port in England. Country manufacturers of cast-iron pipes deliver free in London or any other town where the rate of carriage is equivalent. The saw mills, in the cases in which wood has involved a fair quantity of sawing, will collect timber and deals at the docks, and deliver to the builder free of charge. For saw-mill regulations see section Carpenter. The delivery of stone is almost always done by the merchants, who will, however, if desired, quote a price exclusive of carriage; but the builder can rarely cart it so cheaply as the stone merchant.

## CARTAGE.

Although convenience appears to dictate the separation in this inquiry of the various trades, it is difficult in dealing with cartage to entirely avoid allusion to Excavation, to which a trade or separate section will be afterwards devoted. The question of cartage is almost certain to arise in the adjustment of a day account, or a measurement on a schedule on prices; unless it is stipulated that the prices of items shall include it in the case of a schedule, it is generally understood that the prices include delivery; it is, however, safest to settle the question by a stipulation in its preamble. Cartage in a city like London will cost more than in its suburbs or the country, because of the congested traffic; it should also be remembered that in a hilly neighbourhood the cartage of fewer loads in a day, and consequent greater cost must be allowed for. A rough engineering axiom is "one shilling a load a mile." Assuming that a horse, cart, and man can in a day cart ten loads each a mile at 1s. per load, we thus have a result of 10s. per day. A common valuation of a load on a return journey from an original delivery is one half the price of the latter. There are a considerable number of men in London who are willing to contract to dig and cart away, and find a shoot at a price per cubic yard, measuring the digging in position before it is dug, as the surveyor does ("hole measured"). The method of measurement should be clearly defined in the agreement. General usage would be a strong argument for this construction, but should not be depended upon. When carting alone is agreed for, the builder arranges with the sub-contractor that his carter shall help to fill the cart. When the material removed is hard brick or stone rubbish, the carter may sometimes obtain more per load by its sale than the cost of the cartage. Sometimes brick or stone rubbish for which removal is provided in the contract is allowed to be used as one of the ingredients of concrete, and in such case the quantity of carting saved may be pleaded as an element of reduction, modified by the cost of breaking. Either in town or country, when the earth is good vegetable soil, it may often be sold for the purpose of making mounds or filling up depressions. In a well-known case in the country an arrangement was made with the freeholder of a field on the opposite side of the road to the contemplated building for the deposit of the earth thereon. A temporary wooden bridge was built across the road, the earth carted over it, and a large saving in cartage thus effected. A little trouble in examining a neighbourhood, especially in the country, will often discover a place where the earth will be welcome for filling. In London it will sometimes be cheaper to shoot the earth or rubbish direct into a barge at the nearest draw wharf, paying the wharfinger's charge for the convenience (usually 2s. per load), than to cart it to a land shoot, often in a distant suburb. In the latter case the cost may be reduced by arranging for the cartage of bricks, ballast, or sand on the return journey instead of coming back empty.

## CURRENT RATES FOR CARTAGE, &amp;c.

Horse, cart, and man per day, 10s. (10 hours at 1s. per hour); ditto in the country, sometimes as low as 7s. 6d.; two horses, cart, and man per day, 19s.; chain horse per day, 9s. Van (to carry 2 tons), horse, and man per day, 10s.; timber-carriage, horse, and man, 10s.; ditto two horses, 19s. Stone truck, one horse, and man per day, 10s.; ditto two horses 19s.; ditto three horses, 25s. Furniture-van, horse, and man per hour, 1s. 6d.; ditto two horses, 2s. 6d. In the City of London, rubbish is carted, including finding a shoot, at 3s. per load. Soft material, not easy to consolidate,

3s. 6d. per load. In the suburbs, rubbish is carted, including finding a shoot, at 2s. 6d. per load. Permission to shoot rubbish into barge at a river wharf per load, 2s. In a suburb like Brixton or Camberwell carmen may be found who will dig, cart, and shoot at 3s. 6d. per yard (hole measured). When sand is delivered in a London suburb by barge, a local contractor will unload, cart, and shoot within two miles for 2s. per yard—sometimes as low as 1s. 9d. Will unload bricks and deliver into carts for 1s. 6d. per thousand; will pay canal dues, unload bricks, load into carts, deliver, and stack within two miles at 4s. 9d. per thousand. An approximation to the usual charge of stone merchants for cartage is 5s. per load of  $1\frac{1}{2}$  tons within four miles. The charge for delivery of Bath stone (Bath Stone Firms) is 2d. per foot cube within four miles; the minimum charge is  $1\frac{1}{4}$ d., increasing at the rate of about  $\frac{1}{4}$ d. for each half mile. Cartages of deals from the Surrey Commercial Docks to St. Paul's or equal distances, 8s. per standard; ditto timber, 3s. Some of the distinctions made as to cartage in a schedule of the War Office may usefully illustrate the subject:

100. Carting rubbish arising from every description of trades from the premises of the War Department, including filling the carts, or loading, finding a deposit, a. d. and unloading, per yard cube, or load .. 2 0
101. Carting materials, water, rubbish, &c., one furlong or under, including loading and unloading, do. .... 0 9
102. Ditto for the first load when not more than two loads are ordered to be removed on the same day, do. .... 1 3
103. Add to items 101 and 102 for every additional furlong ..... 0 14

Mr. Hurst says in the "Architectural Surveyor's Handbook":—"The maximum distance to which earth can be wheeled in barrows economically is 100 yards, in Dobbin carts (three-wheel carts) 300 yards, in ordinary one-horse cart half-a-mile; when the distance is over half-a-mile it will be more economical to use waggons on rails." He has here in his mind very large excavations, like railways, whose design usually involves such a balancing of cutting and embankment as makes it convenient to run the earth in waggons on rails from the former to construct the latter (a process which has enriched the vernacular with the phrase "straight tip"). In the average operations of the builder carting in tumbrils is necessary.

## THE USUAL LOAD FOR VARIOUS VEHICLES.

A tumbrel carries ordinary earth  $1\frac{1}{2}$  yards, equal to 1 yard before digging; sand,  $1\frac{1}{2}$  yards. A builder's cart carries  $1\frac{1}{2}$  to 2 tons; do. carries ordinary bricks, 500; do. glazed or Staffordshire blues, 400; do. plain tiles, 1,000; do. Countess slates, 1,000; do. flooring, about 12 squares; do. timber or deals, 50c.ft.; do. lime, 1c.yd. (usually conveyed by the merchant in a one-horse van carrying 2 yards); do. light bulky materials, 80c.ft. A stone truck, 3 to 10 tons; railway vans, two-horse, about  $2\frac{1}{2}$  tons; railway trucks, 8 to 10 tons; a Thames lighter, 90 to 120 tons; a van and one horse will carry about 35 scaffold poles, each 25ft. long; a navvy's wheelbarrow about 50 bricks, or 4 hods of mortar; do. earth, about 1-10th of a yard cube; the average earth wagon, about 50 barrow-loads (Rankine); a large do., heaped, 3c.yd.; a small do. do.,  $2\frac{1}{2}$ c.yd.

## RINGS.

Merchants and manufacturers of various articles used in building have combined to keep the prices up to a certain rate in each case, and issue a tariff to which the majority adhere. The astute builder will nevertheless contrive to get large orders executed at a lower rate by special agreement. This applies to drain pipes, stock bricks, glazed bricks, Bath stone, Portland stone, plate glass, and iron. The combination in the case of bricks is likely to keep the price at a higher level than that of recent years.

The Lords of the Committee of Council on Education have decided, with the sanction of the Lords of the Treasury, to allocate a fixed sum each year in the vote for the Science and Art Department for grants in aid of technical instruction given under the Technical Instruction Act, 1889, or under the Technical Schools (Scotland) Act, 1887. The sum so allocated for the financial year 1891-92 will be £5,000. The grant in aid will not necessarily be equal to, and in no case will it exceed, the amount contributed by the local authority out of the rates.

SCULPTURE FROM THE ROYAL ACADEMY.—CONTEMPORARY BRITISH BUILDERS.—"BUILDING NEWS" CLUB DESIGN FOR A VILLAGE BANK.—NORMAN DOORWAY, GLASTONBURY ABBEY.—THE GUESTS' HOUSE, ST. MARGARET'S CONVENT, EAST GRINSTEAD.—NEW INFANT SCHOOL, ST. JAMES-THE-LESS, WESTMINSTER.—THRING MEMORIAL CHAPEL, UPPINGHAM.—SKETCHES IN GLOUCESTERSHIRE AND WORCESTERSHIRE.

## Our Illustrations.

## SCULPTURE AT THE ROYAL ACADEMY.

THESE four groups of sculpture, now on view at Burlington House, are among the most important works shown in the present Exhibition of the Royal Academy. The statue of Gordon on the Camel, in bronze, erected a week or two since at Chatham, in front of the Royal Engineers' Institute, and unveiled by the Prince of Wales, is in its way a masterpiece. At the Academy a duplicate (in composition) is exhibited standing in the middle of the central hall facing the vestibule. "Music" and "Peace," two statues by the same hand, Mr. E. Onslow Ford, A.R.A., occupy prominent positions deservedly in the adjoining Lecture Theatre. The former is a companion statue to "The Dance," both being commissioned by the Maharajah of Durbungah for niches in the ball-room of his palace. "Peace" was exhibited last year in plaster; this year it has been realised in bronze. "Life and Death," a marble group by Mr. Frank Fisher, stands in the central hall. The man is startled by the messenger of death as his wife is divided from him by the unrelenting arm which separates the living from the dead. This artist is to be congratulated on his work.

## CONTEMPORARY BRITISH BUILDERS.

(See description on p. 826.)

"BUILDING NEWS" DESIGNING CLUB: A VILLAGE BANK.

(A DESCRIPTION of this design appears on p. 850.)

## NORMAN DOORWAY, GLASTONBURY ABBEY.

THIS doorway is on the north side of the very beautiful edifice, known as St. Joseph's Chapel, the most perfect of the ecclesiastical ruins of Glastonbury Abbey, and is most interesting as occupying the site of the earliest Christian church in Britain—the venerated Vetusta Ecclesia or wicker church. It was dedicated A.D. 1186—that is, two years after the great fire. It is in the Late Transitional Norman style of architecture, and remains to this day an admirable specimen of Medieval masonry, fully bearing out the description, that it was "built of squared stones, and no possible ornament omitted," and so excellently were these squared stones cemented, that scarcely a mortar point is perceptible. The Transitional chapel, built upon the site of the Vetusta Ecclesia, was—until the middle of the 13th century, when the Early English part of it was built to connect it with the great church—of rectangular form, with a turret at each corner; two of these turrets at present remain. It consists of four bays or divisions. Two richly-carved doorways (one of which we give in our illustration) occupy the second bays north and

south. The sculptures decorating these beautiful doorways are, unfortunately, in too dilapidated a state for the subjects they represent to be given with any certainty, though a few of them may be distinguished. The south doors opened into the monks' churchyard, the spot where Joseph of Arimathea, with his son Josephus, and King Arthur, were said to be buried. Four round-headed, richly-moulded windows on each side, and a beautiful triple window at the west end, light the chapel. An elegant interlacing arcade, with Purbeck marble shafts, decorated the space beneath the windows. The flat buttresses, ornamented with shafts at the angles, terminate with a corbel—"Glastonbury Abbey: its History, Antiquity, and Ruins."—A. B. BAMFORD.

## THE GUESTS' HOUSE, ST. MARGARET'S CONVENT, EAST GRINSTEAD.

THE Guests' House, nearly completed, occupies a position on the south side of the chapel, and is connected therewith by a cloister. It forms one of the final additions to this extensive establishment. It is partly built of the beautiful local stone, the remainder being of half-timber oak-work; the ground floor is laid with Gregory's wood blocks on concrete. The contractors are Messrs. Wall and Hook, of Brimscombe, Stroud, Gloucestershire, their contract amounting to £2,922 17s.

## INFANT SCHOOLS, ST. JAMES-THE-LESS CHURCH, WESTMINSTER.

THESE new Infant Schools, together with a Vestry and Parish Room, are being built at the west end of the church. Owing to the site being limited, all available space has been utilised; this has necessitated the underpinning of the N.W. angle of the church. The school is to accommodate 150 infants, and this has been obtained on the ground floor. The external walls are of red brick, with Portland stone dressings, and the walls internally, for a height of 4ft. 6in., are lined with white glazed bricks. The floors are of Messrs. Dennett and Ingle's fireproof construction laid with Gregory's wood blocks. The contractors are Messrs. J. W. Bunning and Son, of 3, Talfourd-place, Cambridge, and their contract amounts to £3,093.

## THE THRING MEMORIAL CHAPEL, UPPINGHAM COLLEGE.

THIS addition to the chapel forms part of a memorial to the late Head Master, the Rev. Edward Thring, a seated figure of whom, by Mr. Thomas Brock, A.R.A., will occupy a position in the centre of the west end. Messrs. J. Parnell and Son, of Rugby, are the contractors, the amount of the contract being £846.

## SKETCHES IN GLOUCESTERSHIRE AND WORCESTERSHIRE.

CHIPPING CAMPDEN, in the northern part of Gloucestershire, will well repay the architect a visit. At one time a considerable business was done in clothing, but that has long since died out. Little alteration appears to have been made of late years in its buildings, most of them having been erected prior to the 18th century. There are, therefore, a goodly number of subjects for study, and Campden House takes a prominent position in the list. Built by Sir Baptist Hicks (Viscount Campden), who died in 1629, all that now remain are its entrance-gateway, terrace, pavilions, and a few ruins of the house itself, it having been burnt by Lord Noel, grandson of the above, to prevent its being turned into a Roundhead garrison. The Market House, standing prominently in the High-street and arcaded, also the almshouses, town hall, and not the least the church, are well worthy of more than a passing glance. A short distance from Evesham, on the road to Pershore, is the village of Cropthorne, where we have in the subject of our sketch a good example of half-timber work, a common construction for the domestic buildings of the neighbourhood. The timbers are usually blackened, forming a strong contrast to the plaster panels. Situated on the banks of the Severn, near Tewkesbury, is the village of Deerhurst, remarkable for possessing two ecclesiastical buildings of Saxon origin. The Saxon chapel adjoining the Priory or Manor House was discovered in 1885, and has since been carefully renovated. The parish church close by contains many features of interest, one of which is the 17th-century seating in chancel continued along the north, south, and east walls.—FRANCIS E. L. HARRIS.

## COMPETITIONS.

MANCHESTER.—Messrs. Royle and Bennett's designs for the new schools to be built for the School Board in Debster-street, Hulme, have been chosen for erection, and these architects have been now appointed for the work. There were six firms, all practising in Manchester, who competed by invitation.

WHITECHAPEL, E.—A few weeks ago we gave a reference to the limited competition held among twelve architects for the Free Library at Whitechapel. Mr. Elijah Hoole, F.R.I.B.A., who acted as professional referee, has awarded the prize to Mr. Arthur Hennings, of the firm of Messrs. Potts, Sulman, and Hennings, and he has been appointed architect for the new buildings by the commissioners. In a short time we shall probably give an illustration of the work.

## CHIPS.

The rural sanitary authority of Chard received, at their last meeting, a report from Mr. Charles Hawkesley, C.E., of London, as to the sewage of Crewkerne, together with an estimate of £15,000 as the probable cost of the scheme. The report was referred to a committee.

Several admirers of the late Richard Jefferies have exerted themselves successfully to secure a monument in Salisbury Cathedral to the man who has rightly been designated the "Gilbert White" of our time. The commission has been given to Miss Thomas, the Australian artist.

St. Edmund's Church, Exeter, has been reopened after restoration, including the construction of a new internal wagon-vaulted roof over the nave, and the erection of altar and pulpit, constructed from old carved woodwork belonging to the church. Mr. W. Cummins, of Exeter, was the architect, and Messrs. Tree and Bolley, of the same city, carried out the works.

The restoration of Linkinhorne Church is to be undertaken this summer under the direction of Messrs. Hine and Odgers, of Plymouth, at an outlay estimated at about £1,100. The church, which has suffered much from bad treatment at various times, possesses many features of interest, and when the west gallery, high deal pews, and the large central "three-decker" are removed, it will be of handsome proportions.

The partnership heretofore subsisting between Messrs. Cockcroft and Shoesmith, of Halifax, architects, surveyors, and estate agents, has been dissolved.

The Birkenhead town council have raised the salary of Mr. T. O. Paterson, the gas engineer, from £450 to £500 per annum; that of Mr. W. A. Richardson, the water engineer, from £400 to £450; and that of Mr. Birnie, the manager of the gas and water department, from £240 to £280 per annum.

A disastrous fire occurred on Wednesday on the extensive premises owned and occupied by Messrs. Peto Brothers, builders, in Gillingham-street, Pimlico, resulting in several of their workshops being burned out, while considerable damage was done to at least thirty other buildings. The official report states that "a range of buildings of one and two floors, covering an area of about 150ft. by 90ft., used as workshops, store, engine and boiler houses, and the contents, were nearly burnt out and partly fallen down; and a building of one floor, about 60ft. by 20ft., and stock in yard damaged by fire and water." Messrs. Peto Brothers are insured.

One thousand carpenters have resumed work in New York, thereby averting a general strike in the building trades.

At a meeting of the Bournemouth Improvement Commissioners, held on the 3rd inst., it was unanimously resolved to increase the salary of Mr. F. W. Lacey, the surveyor, to £500 a year, to commence from the half quarter. Mr. Lacey has held this appointment since March of last year.

A new Wesleyan church, dedicated to St. John, was opened by the Bishops of St. David's and of St. Asaph at Carmarthen on Tuesday. The building is Late Perpendicular, and consists of a clerestoried nave and chancel of the same height, with a turret for two bells over the chancel arch. Messrs. Middleton, Protheroe, and Phillott, of Cheltenham, were the architects, and Mr. T. Collins, of Tewkesbury, the contractor. The cost was £2,300, and seats are provided for 300 persons.

A supper took place last week in the large room of the hotel building erected near Fryston Colliery, near Leeds, which is to take the place of the old Milnes Arms Inn, on the Aire side. The new hotel is built of red brick, with stone dressings. Mr. J. H. Greaves, Leeds and Pontefract, is the architect; Mr. T. Heseltine, Pontefract, did the brickwork and masonry; and Mr. Hilton, Pontefract, the joiner's work.

## WAYSIDE NOTES.

EVERYONE knows that if an artist wants to produce a work that will attract the public he must paint some representation of stirring incident in history, or simple occurrence in daily life. In thus letting himself down from the high level of pure art, he enables all to appreciate his work. Somewhat on this principle, it comes about that, if we would restore a building of antiquity, we must endeavour to raise funds, not by appealing to the public's appreciative powers of beauty in architecture, but to their reverence for historical associations. Folk-lore attracts above everything, and the influences of association are all-powerful. Many a grand old work of architecture perishes by slow degrees because it has no stirring or interesting associations to appeal to public sentiment—many an ancient building containing gems of architectural design lies neglected because nobody in particular was born, married, or died within the shadow of its walls. Often we shall not regret this, seeing the import of the dread word "restoration"; but it is a little curious to reflect that the intrinsically beautiful starves, while the historically interesting feeds, so to speak, on the fat of the land.

I don't wish to insinuate by this that the old church of Burnham Thorpe is wanting in architectural merit, or that Horatio Nelson is worthy of one iota less glory than has been heaped upon him in days past, or of one particle less honour than will be paid to his memory in days to come. My capacity for true hero-worship is too large to allow any suspicion of the latter, and my reverence for all things East Anglian, and old Norfolk churches in particular, should reassure on the former point. Reading of the meeting, held early in the week, of the committee for the restoration of Burnham Thorpe, of which the Prince of Wales is chairman, reminded me of what I have before thought—that more often direct appeals might be made to the public on the score of the architectural beauty of a certain building, rather than because some obscure personage once in the dim past crossed the threshold; but in this case it is, of course, only right that architectural questions should be ignored, and the appeal made solely because the hero of Trafalgar spent many of his youthful days at Burnham, his father being then rector of the parish church. All will hope that the funds required will be rapidly subscribed, and the necessary works commenced. Sir Arthur Blomfield has been intrusted with the restoration, and having put the plans before the committee on Monday last, it is to be expected that the work will not be delayed. The restoration committee is so influentially composed that the money should be forthcoming with much less difficulty than in the majority of undertakings of this nature, and the historical associations are here worthy of honour and respect by every Englishman, and are not of that type, to which I have alluded, where the fact that somebody or another of whom the world knows little and cares less was associated with the building is employed as a lever to open the public purse.

I cannot for the moment call to mind exactly what sort of pulpit exists at Canterbury Cathedral; but, whatever it is, a proposal has been made to have another. The Rev. Thomas Field, of the King's School, Canterbury, suggests the new pulpit, which doesn't meet with general approval, so the letter-writer promptly appears upon the scene, with opposition or amendments to the original proposal. Among the latter class may be placed a letter to the *Times* from Mr. Cavendish-Bentinck, who appears to have a mild attack of architect-phobia, judging from his allusion to "any so-called 'church' architect." We need not be very indignant at this innuendo against architects who devote a large portion of their time to ecclesiastical work, for the term "church architect" has not been produced by ourselves. It is the creation of the general public, who are often pleased to talk of "church architects" as individuals quite distinct from the ordinary run of professional men. If the designation is objectionable, they should not employ it—no one wants them to. We say of such a one that he does much church work or ecclesiastical work, or that he designs many churches, but it is the public themselves who coined the compound word "church-architect." I can call to mind how, in the time immediately following my first passing beneath the portals of the profession, people often asked me, "Are you

articled to a 'church-architect'?" It used to impress me amazingly. Many a time I regretted that I hadn't been articled to a "church-architect." I believe I used to think of Spring-gardens, and sigh deeply; and when it happened that I had a protracted hour for dinner, and was late getting upon the stool and resuming tracing, ten-to-one it was because I had forgotten the swift flight of time in the dreary contemplation of the brass plates of one or another of the great "church" architects.

The scaffolding that has so long hidden the north transept of Westminster Abbey has lately disappeared, at least as far as regards the upper portion. I say *so long*, but in reality, considering the nature of the work done, the necessary restorations have been executed with great despatch. Now that the beautiful gable appears in freshly-picked and renovated stonework, one scarcely recognises it as the same as that with which we were formerly familiar, "old and brown" as the belfry at Bruges, and somewhat more soot-laden. The work appears to have been thoroughly done, in one sense only *too* thoroughly. It was evidently, however, either a matter of letting alone, or thorough renovation, half-measures such as are often best in restorations being out of the question. Critics will have something to say over the great rose window, as I believe that feature has been altered as we had reason to expect it would be. When the whole of the scaffolding and hoarding has been removed, the transept will appear new and prim for some time; but there is to be noticed an absence of that sleek hardness that some restorers manage to get into the work they do. By this I mean such an effect as that at Worcester, of which I complained, shortly after visiting the city last autumn. It is, doubtless, caused by too fine a finish to the walling, or possibly by the nature of some stone employed. If the former, it is the fault of the architect, certainly. This harshness of ultimate effect is bad enough in new buildings, but it is irritating in restorations. A man may spoil the effect of his own design by injudicious finish, but he has not the same moral right to injure old churches and cathedrals. Perhaps we ought not to complain, in this country, of harshness in masonry. By comparison with restorations carried out under the supervision of official Government restorers in France, the work in England is everywhere princely. It is only necessary to instance some of the interior restoration work in the Abbey-church on the summit of Mont St. Michel, where the stonework, or granitework, to be more correct, is pointed in much the same hard-and-fast and inartistic spirit as a painter lines a brougham or a locomotive; but this is only one specimen of what the French restorers can do when they make up their minds, as all who know France and old French architecture can testify. It is fortunate that here in England we have not any scheme of official restorations on the lines adopted across the Channel; for, although we all complain enough as it is, we are infinitely better off than our immediate neighbours.

I understand that there has been a species of canvassing in connection with the R.I.B.A. elections for officers for the ensuing session. Is this a proceeding calculated to increase the dignity of those concerned? It has been urged upon me by an old Fellow that it is not, and that the incident is to be greatly regretted. The method of procedure seems to have been that certain members of the Institute issued a circular advising the recipients to vote for certain gentlemen as councillors; and I am informed that this circular had the desired effect of influencing the returns of the poll. It may be all right according to the general view, but it hardly seems to me desirable to thus bias the voting, a better result being obtainable by allowing no circulars of any kind, each member being thus left to vote according to his own secret convictions.

"An Old Member" of the Architectural Association does well in endeavouring to increase the attendance at Conduit-street this evening. It is pitiful to think of the lack of interest evidenced by members in the proposed changes, as indicated by the sparse attendance at the last meeting. I do hope that there will be a better roomful to-night, and I should have liked to have seen a poll of members. But it may be safely taken as some guide to the frame of mind

of members as a whole that there has so far been no great opposition to the scheme. We may rest assured that, had there been anything included in the programme for the future that seemed plainly undesirable, it would have been made clear before now. *Silence* is generally construed as assent and consent. If, at the meeting to be held this evening, objection and opposition be again feeble or absent, the gentlemen desiring the reform may, with an easy conscience, push matters forward. On the other hand, you have received several letters from correspondents that plausibly indicate a feeling of distrust in some quarters, and of doubt as to the need or desirableness of the changes in the organisation of the Association's educational machinery. This seems ample justification for the demand of a poll. This demand, although supported by Mr. Cole A. Adams and Mr. Stannus, has been rejected, so the only way left for objecting members to show their opinion is to vote against the subscription being raised. For my part, I hope that the scheme goes forward; but only so long as it is the desire of the majority. What is offensive to me is the idea that by skilful management a section of the A.A. may make changes not to the mind of the whole. Even this, however, they are perfectly justified in doing, if no visible opposition is to be detected. Every member must now know of the proposed changes, and have had ample opportunity to say or write something.

The failure of the London County Council to enforce the "betterment" principle has given general satisfaction; but it is to be regretted that the views of the hybrid committee will in all probability cause the Strand improvement scheme to drop out for this session of Parliament. For this, it is to be supposed, will be the result of the committee's decision. The whole matter will have to be reconsidered. This seems a pity to those of us more directly concerned in the demolition of the Holywell-street "block," but it is some consolation to think that the adoption of a principle evidently objectionable to people generally has been discouraged. The County Council made a wonderfully feeble stand for the betterment clause. It appears, among other things, that the betterment on some £400,000 outlay in connection with Shaftesbury Avenue has only been £2,000, and that land on the Embankment which should have been greatly "bettered" has been lying vacant some 28 years! GOTH.

## CHIPS.

At a meeting of the governors of the college of Clebury Mortimer, Mr. Meredith, Kidderminster, architect, submitted tenders for the alterations necessary to be made to the old buildings to make them suitable for the extended education about to be given under the new scheme, when that of Mr. Veale, builder, Stourport, at the sum of £1,449, was accepted. The sum includes the cost of providing a hall (£382 10s.), which the vicar undertook to present to the charity.

The vicar of Ormskirk has just issued a final appeal for a fund of £3,000 for completing the restoration of the parish church. The restoration was commenced 12 years since by the late vicar, and is being completed by the present vicar at a cost of £17,000.

The committee appointed to undertake the restoration of Ramsbury Church have met at the Palace at Salisbury. The list of promised subscriptions amounted to nearly £2,300. Instructions were given to the architect, Mr. J. Arthur Reeve, to prepare drawings, specifications, and estimates for the repair of the body of the church, retaining the existing nave roof and putting corresponding roofs on the aisles, following the original lines, rebuilding a falling wall, and in every practical way preserving the present historical character of the church.

A new altar, dedicated to St. Patrick, was solemnly inaugurated last week in St. Francis Catholic Church, Cumberland-street, Glasgow. The structure, which has been erected at a cost of about £200, is from a design by Messrs. Pugin and Pugin, of Westminster, and is one of a series required for the internal completion of this church.

Old St. Paul's Episcopal Church, Jeffrey-street, Edinburgh, was reopened on Sunday after completion, from plans by Messrs. Hay and Henderson, of Edinburgh. The chancel, which has been divided from the nave by an arch, contains three new memorial windows, executed in stained glass by Messrs. Cox, Buckley, Son, and Co., of London; and the heating is on the hot-air principle, by Grundy, of London.

## "BUILDING NEWS" DESIGNING CLUB.

## A VILLAGE BANK.

"WALLABY" is the author of the design placed first for this subject. "North Star" comes in second, and the third place is awarded to "Fiddler." We do not quite like any of the designs, and we are bound to admit that some of our best members of the Club are not up to their usual standard on this occasion. Summer sports and outdoor engagements may account for this to some extent; but it is a pity not to do the work properly if it be attempted at all. The conditions issued for the competition were these:—"Subject G.—A Village Bank on a street frontage of 25ft. wide, with a depth of 70ft. The adjoining buildings to be taken as three-story ordinary houses with shops. The bank entrance to be on one side, and a private entrance to the manager's residence on the other. The bank to provide public office, manager's room, small waiting-room, and strong room, with clerk's lavatory, w.c.'s, &c. The house to have two sitting-rooms, five bedrooms, kitchen, and offices, with bath-room, and also a store-room. Light only front and rear of the buildings. A good house yard to be reserved at the back; but there is no back way to the site. The coal cellar may be in the basement. Style: 'Free Classic,' in red brick and stone dressings. Scale: 8ft. to the inch. Elevation, section, plans, and sketch." We publish illustrations of the two first designs. The banking-office in the plan by "Wallaby" is not well proportioned, and there is a want of ingenuity in the arrangement of the staircase leading to the manager's residence, to make room for which the banking-clerks' accommodation necessarily in such a plan is curtailed. The waiting-room and the manager's room are well contrived enough; but the desks for the sub-manager and clerks would be difficult to accommodate. The first-floor planning is better, though the landing would be very dark, and the dining-room bay on one side is not a very happy feature. The other arrangements explain themselves. Externally, the upper-floor windows are too squat, and the central ones on the first and second stories bear no reference to those on either side of them. The bald, blank gable, too, towering above, hardly accords with the horizontal treatment adopted for the greater part below. There is, however, merit in the design, and it shows an endeavour to break away from the ordinary commonplace of the regulation type of bank building. "North Star" arrives at his effect very simply—a distinguishing characteristic with him. The red-brick first floor above the stone ground story, with the rough-cast panels and gable crowning the whole, would secure variety without sacrifice of unity. The lower stage of the composition is, however, rather poor and featureless, and the flat arches are not made the most of. Another arrangement entirely would have been better, with probably a big window under one central arch. The banking-room is of better proportions than in the first design; but the living-room in the house part are not nicely set out, and are crude in idea. "Fiddler" can draw better than in this design of his for the Bank. His perspective is excessively paltry; his plan—of course, from his hand, has some originality about it, while his elevation is in good taste; but for all that, he has neither done the subject nor himself justice on this occasion. The front part of the house is on one level and the back part floors at another. The staircase here, as in the first design, cuts up the building needlessly; and in the house for the manager an absence of comfort and homeliness is very marked. Fancy the drawing-room with nearly all one side of it, 25ft. long, devoted to window space almost from floor to ceiling—cold in winter, and tropical in summer. "The Red Rover" may fancy, from the condemnation with which we have mentioned "Fiddler's" design, that his, at least, should have taken the precedence to it; but, as a matter of fact, we could not overlook the great mistake committed by "Red Rover" in wasting the central part of his building by a well area to light the banking room below—a necessary provision, in a way, because the manager's room and the waiting-room are located in front next the street, and thus shut off the window space, save at the rear. "Red Rover" deserves praise for care and ingenuity in planning. His elevation is pretty on the ground and first floors; but the semicircular windows above are not in agreement with the lower part, and although more pretentious, are really commonplace, expensive, and

out of character, at least, with bedrooms. This designer fails in details; thus, for example, the urinal almost under the nose of the clerks at their desk in the Bank is very bad—say what you will about it. "Syak" sends a sturdy common-sense façade in red brick and stone, with all the cornices and strings properly returned on to the face of the front without projecting on to adjoining property. This restriction is a real one, and although no doubt often very difficult to contend with patiently, it must frequently have to be dealt with. Usually a truss is stuck up, and the trick is managed to the satisfaction of district surveyors and adjoining owners; but seldom has good taste been consulted, and originality is generally an unknown quantity. The plan of this design is very good, save for the objection insisted on in "Red Rover's" arrangement—viz., the central open area idea. In so small a building this expedient is fatal. "Syak," with study and work, will do better than this Bank some day. Not a few of the leading designers of the rising school once contributed to our Designing Club, and we contributed our share in their improvement by pointing out their faults, and urging them on to further efforts. "Skull and Cross Bones" is one of our best contributors now; but he has lost his leading position this time. For one thing, he has cramped up his plan too much, and his bank is crowded to such an extent as to be almost made up of doors and windows. How the manager would manage to sit in his room we cannot imagine, and the waiting-room is equally uncomfortable and ill contrived. The kitchen on the ground floor, at the end of a long passage, facing the front door, occupies a wing at the rear, and has a bay window commanding all that goes on in the private room of the manager. The elevation is fairly good, but no more. "Saxon" comes next in merit; but he occupies nearly the whole of the site, extending the bank to undue proportions. He seems to have secured by these means very convenient premises, however, and works out the problem with skill, even if in excess of the wants of a village. "Tyne" draws an elevation as if he were unfettered by regulation methods, and there is an amount of reserve in the square common-sense outline of his façade, the cornice being made to return on to the face of the front. The effect in perspective, however, dispels the illusion engendered by the geometrical elevation, as one finds that the chimney stacks, so important in the "upright," are set back considerably. The lofty roof is made no use of, and the thin projecting hoods to the windows, in a dark climate like ours, would serve no good purpose, save on very sunny days, when the shadows, no doubt, would insure a certain effect. The manager is too much cut-off from the work of the bank, and the clerks, in their room beyond the Public Office, would be without supervision. The plan is otherwise convenient in many ways, and shows "Tyne" to be among those who do not always shirk their work. "West Anglian" cuts up his office with a screen, which we cannot account for, and he apportions his building generally into very small parts, though he nearly covers the whole of the site. He draws carefully, and, if the local authorities would permit him to build the projecting columns or pilasters on to the pavement, his front would work out fairly well, though the upper part requires recasting when drawing out the details. At present, the gable is not well proportioned. "Theta's" plan is not good, but it evinces care, while the main idea of the building outside, architecturally, is picturesque and suitable. How the projecting upper stage of the elevation is made flush with the walls of the adjoining houses, and yet, at the same time, be shown below in a line on plan with their ground stage, is beyond us. The half-columns are ugly, but the three arches to the bank-front would look very well otherwise. "Hubby" draws very badly, and his plan is not well contrived, but we place him here because there is some character in the elevation of his design. He ought, however, to learn drawing and take more pains with his work. "Dot" does his best, evidently, and his sheet shows painstaking industry. The plan is better than the elevation, which suffers from not having the windows properly delineated. "Coombe" who projects his cornice considerably on to his neighbour's part—believes in heavy, curved pediments, and has planned a convenient, well-arranged building, in many points better than some others already mentioned; but this is relatively the place in the contest we must award him. The other designs are by "N.B.," "Y.,"

in a circle; "Glaucus," "Bohemian," "S. C. D.," "X. Y. Z.," "Sector," "Mene-laous," "Renaissance," and "Box," who ranks last, because he does not attend to the rules and so coloured his drawings.

## BUILDING IN AUSTRALIA.

THE greedy landlord is rampant in Melbourne as in other parts. The "land-grabber" appears to be as obnoxious and objectionable an obstructive to light and health as he is in the Metropolis and our provincial towns. A writer in the *Building and Engineering Journal* of Australia and New Zealand complains of the selfish policy of the "land boomer" as he has affected Melbourne. The so-called "land boomer" is the "jerry builder," and has done apparently as much damage to the suburbs of this once-beautiful and charming city as he has in the neighbourhood of most towns. Houses by the hundred are erected, but without a chance of letting, to the manifest injury of other houses in their immediate vicinity. Then we hear that in most of these houses sanitary laws are quite neglected, the consequence of which is that a virulent form of typhoid and diphtheria has broken out in one locality. The evil complained of is that which we deplore—the sacrifice of light area, the covering of every available space to gain more accommodation. The same writer criticises the plans submitted in the recent competition for the Commercial Bank of Australia. The offices were in many cases arranged in positions that could not be properly lighted, the object of the competitors to obtain office accommodation being gained at the expense of proper lighting areas. These comments are instructive as showing that in a comparatively recent town like Melbourne, situated in a sparsely-populated country like Victoria, the very same tendency of overcrowding is manifested, and that builders and architects are playing into the hands of speculators. The rectangular division of towns has certainly not been favourable to light and air, as the plots on which buildings are erected are reduced to the smallest area.

## CHIPS.

Mr. Arnold Taylor, an inspector of the Local Government Board, opened an inquiry on Friday to consider an application by the Skipton Rural Sanitary Authority to borrow £9,000 for constructing waterworks and supplying the town of Barnoldswick, near Colne, with water. For many years the town has been practically without water, the only means of supply being by wells and hawkers who retail the water. The area of the township is 2,129 acres, and the population 5,000. The scheme is a pumping one (for which Messrs. Brierley and Holt, of Manchester and Bradford, are the engineers), and the yield of water is 190,000 gallons per day, equal to the consumption of double the present population. No opposition was offered.

On Wednesday week the foundation-stone was laid of a church to be erected on the Burton-road, Lincoln, to be called the church of St. Matthias. The architect is Mr. E. P. Loftus Brock, F.S.A., of London, and the contract is being carried out by Messrs. Wright and Sons, of Lincoln. The church is to be of stone, with pillars and arches of timber dividing the nave from the aisles. The style will be that of the middle of the 13th century. The church will have a rather low timber spire at the west end of the nave. Accommodation will be given for 500 worshippers in the nave and aisles, and the cost will be under £2,000.

The foundation-stone of a new church was laid at Revesby, Lincolnshire, on Friday. Messrs. Kirk and Knight are the contractors.

The joiners of Malmö, in Sweden, have struck work. Great disturbances have taken place, and it has been necessary to summon the troops from neighbouring towns to restore order.

The parish church of Bredvardine and Brobury was publicly reopened last week after restoration. New concrete floors have been laid with a surface of wood blocks. The tiles in the choir part of the chancel have been relaid upon a concrete bed. This work has been carried out by Messrs. Malvern and Sons, contractors, of Cheltenham. The organ has been taken down and rebuilt by Mr. Eustace Ingram.

The foundation-stone of the Eton Mission church in Gainsborough-road, near Victoria Park, E., was laid by Princess Christian on Saturday. The church will be Gothic in style, will be built of red brick with stone dressings, and will cost £10,000. Mr. G. F. Bodley, A.R.A., is the architect.

## Building Intelligence.

**DEWSBURY.**—Mr. Wyatt Papworth, F.S.A., F.R.I.B.A., as Master of the Clothworkers' Company, opened yesterday (Thursday) the new Technical School at Dewsbury. The school has been erected from designs by Mr. J. Lane Fox, of Dewsbury, chosen in competition, and is situate close to the infirmary in Halifax-road. The basement floor comprises the weaving department, the biological laboratory, store-rooms, &c. On the ground floor is the lecture theatre, which has a large auditorium and platform, a lecturer's retiring-room, which is fitted as a chemical-preparation room, and the platform has the demonstrator's table and draught-closet and other fittings. It is also fitted with diagram-screens, sliding blackboards, and other teaching appliances. On the same floor there are three class-rooms, one of which will serve as a smaller lecture-hall. In the upper story there are a freehand drawing-room, a model and cast drawing-room, and a small lecture-room, in addition to the chemical laboratory. The laboratory is a lofty chamber, fitted with benches for double lines of students, amply supplied with draught-closets, sinks, shelves, and drawers, together with gas and water supplies. Access is gained to the biological laboratory direct from the corridor. The library, secretary's office, and board-room are on the ground floor, closely adjoining the principal entrance. The heating of the whole building is to be carried out on the low-pressure hot-water system. The school was illustrated by perspective and plans in the *BUILDING NEWS* for July 27, 1888. The cost of the whole building, including £1,000 for the furnishing, will be £8,000.

**HEBBURN.**—The new cemetery, which the Bishop of Durham, Dr. Westcott, will consecrate on Monday next, is situated on the high road leading to Newcastle. The grounds cover 14 acres exclusive of the space occupied by the entrance lodge, gates, and a portion of the drive, and has cost about £10,000. The entrance lodge, which is built of stone, is in the Gothic style, and contains three living-rooms and a board-room, the dimensions of the building being 41ft. by 32ft. The walks, which have been laid out by Mr. Allinson, the clerk of the works, run parallel through the ground, and divide it into eight squares. The carriage drive is 20ft. wide, and the walks 9ft. At each side of them there is a border which has been planted with flowers and shrubs. In the centre of the grounds stand the chapel, which are also Gothic in style. Rising from the centre of the chapels is a spire 103ft. in height, and containing a gong. Each of the chapels inside measures 30ft. by 18ft., and is fitted with pews and reading desk of yellow pine. The roofs are open, and the buildings are lighted with eleven windows. The mortuary measures 15ft. by 10ft., and is lined round to the height of 4ft. 6in. with white glazed bricks. The cemetery is supposed to be capable of being used for burial purposes for 200 years. The architect is Mr. F. West; Mr. T. Allinson is clerk of the works; Messrs. Thos. Hepple and T. Lumsden, are the contractors; and Mr. Ramsay, of Yarrow, has superintended the laying out of the grounds.

**WOODHALL SPA.**—The Alexandra Hospital, which has been built from designs by Mr. C. E. Wheeler, of Boston, was opened on May 29th. The external walls are of red bricks, with dressings of red terracotta, Wakefield stone being used for window bands. The building is so arranged that, with one exception, the wards have a southern aspect. On the ground floor are two wards, one 25ft. by 18ft., intended as a day-room for patients, while the other, 30ft. by 18ft., will be a sleeping-room. All the wards are heated by hot-water pipes, and are ventilated on Tobin's system, while the mantelpieces are of Doulton's ware. The rooms are fitted with hanging closets. The main staircase is of pitch-pine, with oak rail, and sunk perforated panels. At the top of the stairs on the south side is a stained window, the glass of which is by Swain Bourne. On the upper story are three wards, two of which face the south, while the third runs through from the front to the south, being over the kitchen. The hospital is designed to accommodate twenty patients; but in case of pressure that number might be increased by ten. The matron's and nurses' bedrooms, linen-closet, &c., are placed on the landing opposite the wards. Mr. Oliver Cromwell, of Chislehurst and London, was the

builder; the lift was supplied by Messrs. R. Waygood and Co.; Mr. Gibson was the clerk of works.

## ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

**DUNDEE INSTITUTE OF ARCHITECTURE, SCIENCE, AND ART.**—The members of this institute held the first excursion for the season on Saturday last. The place chosen was Linlithgow, and the party, numbering about 70, travelled by the Tay and Forth Bridge to Forth Bridge Station, where the train was specially stopped to allow the party to alight. Brakes were in waiting to drive through the grounds of Hopetoun House. At Abercorn Church, the Rev. Mr. Crawford gave an address, pointing out the various parts of interest to the architect and antiquary. A Norman doorway now converted into a window, the old oak pulpit, and the wood-carving and panelling of the Hopetoun pew formed the chief points of interest. Mid Hope House, an interesting specimen of an old Scotch mansion, dated 1582, containing a handsome oak staircase, was next seen. At Linlithgow the old parish church and palace were visited. Mr. Russell Walker, architect, Edinburgh, who is publishing an illustrated work on the pre-Reformation churches of the Lothians, acted as guide to the church. The Palace was visited under the leadership of the Messrs. Henderson, of Linlithgow. The fine Parliament Hall and chapel, the room in which Queen Mary was born, and the bower in which Queen Margaret "wept the weary hour" watching for the return of King James IV. from Flodden were regarded with great interest. Having inspected the dungeons, torture chamber, kitchens, stables, &c., connected with the Palace, the fish hatcheries on the loch, and the portrait tablet of the Regent Murray, erected opposite the spot on the street where he was shot by Hamilton of Bothwellhaugh in 1570, were examined.

**NORTHERN ARCHITECTURAL ASSOCIATION.**—The second summer gathering of the Northern Architectural Association took place on Saturday at Sunderland, when there was a large assembly representing the profession in the whole of the district. It had been arranged that they should first visit the Commissioners' Pier Works at Roker. They were received at the railway station by a number of Sunderland gentlemen, and also by Mr. Brightwen Binyon, A.R.I.B.A., of Ipswich, who subsequently conducted them over the new Municipal Buildings in Fawcett-street, designed by him. On their arrival at Roker, the party were received by Mr. H. H. Wake (chief engineer) and Mr. G. T. Nicholson, his assistant. They proceeded to the Commissioners' Offices on the works, where Mr. Wake, by means of a large plan, explained the nature of the pier works which the Commissioners are carrying out under his direction, and also exhibited a model of the huge crane used at the end of the pier in laying the blocks, together with other working models. The party were next conducted by Mr. Wake through the Concrete House, where they saw the process of mixing the materials of which the blocks are made. One block, weighing about 43 tons, was hoisted on to a wagon and drawn by a locomotive to the extreme end of the pier. About 15 tons of concrete were deposited on the second course of the pier, and on that the block was placed. Close upon 2,000ft. have been laid, and only 760ft. more remain to complete the North Pier. The South Pier, its complement, will probably be started next year. After the process of dropping a concrete bag, weighing 105 tons, in the sea from the barge had been witnessed, and the sub-way had been inspected, the visitors proceeded to the new Municipal Buildings, where Mr. Binyon acted as cicerone.

At Stockport, on Saturday, the foundation-stones were laid of a mission church at Lee-street, off Middle Hillgate, in the district of the parish church. The new building is being erected by Messrs. Brown, contractors, from the designs of Mr. Peter Pierce, jun., architect, Stockport.

The new free public library for Edinburgh was opened on Monday by Lord Rosebery. It has been built at a cost of £20,000 from plans by G. Washington Browne, of Edinburgh, and occupies the site of Hope House, Cowgate, having a main entrance in the thoroughfare adjoining George IV. Bridge. The style is Renaissance, of the period of François Premier. Mr. W. Bruce was the clerk of works.

## Engineering Notes.

**THE ASSOCIATION OF MUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS.**—A meeting of the Lancashire and Cheshire district of this Association was recently held at Burnley. The president (Mr. H. Percy Boulnois, city engineer of Liverpool), and the members were received at the Town Hall in the morning by the Mayor. On the motion of Mr. Mitchell (Hyde), seconded by Mr. Dent (Nelson), Mr. S. S. Platt, of Rochdale, was re-elected secretary for another year. The members then inspected the new Town Hall, the new stone-yard at Danes House, and the sewage works, where Johnson's sludge presses have been recently introduced. On the return journey the Victoria Hospital, built on the circular-ward principle, was visited. In the afternoon the members visited the Cant Clough Waterworks, the most interesting feature in connection with which is that the puddle trench has been carried to the unprecedented depth of 190ft., raising the cost of the scheme from £59,000 to £150,000. On the return to Burnley Mr. Button submitted a paper on the works visited, and there was a discussion, in which the president, Mr. Lobley (Stafford), Mr. Blair (Bootle), Mr. Brierley (Newton-in-Makerfield), Mr. White (Sheffield), and others took part.

## CHIPS.

A new Congregational Church was opened at Heath, Halifax, on Thursday in last week. It is in style Early Gothic, and is intended for both school and church, but a church will, in time, be added beside it. The present building contains two floors, the school and vestries occupying the lower floor. The school is 42ft. by 35ft., with accommodation for about 350. The church is approached from the higher ground by a terrace, and is 78ft. 4in. by 35ft., and will accommodate 450. The seatings and fittings are of pitch pine, varnished, and the rostrum is of an ornate character. The cost, exclusive of fittings, is about £4,270. Messrs. Horsfall and Williams are the architects, and the chief contractors are: mason, Mr. E. Naylor, and joiners, Messrs. C. and W. Whiteley, Rishworth.

A new organ, built by Messrs. Wade and Meggitt, of Tenby and Pembroke Dock, was opened last week at St. Bride's Major Church, near Bridgend.

Memorial stones of a new Congregational Chapel were laid at Hemel Hempstead last week. The chapel will be Early English in style, and built of red and grey bricks, with Bath stone dressings, and the internal walls will be lined with white Arlesley bricks. The whole of the internal woodwork will be of pitch pine. The dimensions are 60ft. by 30ft., exclusive of organ-chamber and vestries. Mr. W. A. Fisher, of Hemel Hempstead, is the architect; and Mr. E. Horn, of the same town, has taken the contract at £1,893.

St. Patrick's Catholic Church, Edinburgh, was formally reopened on Sunday after having undergone alterations at a cost of several hundred pounds, and been redecorated. The chief new features are a porch at the west side, which forms the principal entrance, and the more abundant light admitted to the church itself by an alteration of the windows and the adoption of pale tints for decorative purposes.

Under the personal supervision of the painter, the canvas for Mr. Ford Madox-Brown's tenth decorative panel in the Town-hall of Manchester was unveiled on Monday in position. It is in a good light, its nearest neighbours are akin to it in tone and treatment. "John Kay, Inventor of the Fly-shuttle," is being hastily wrapped in a sheet by his wife and a couple of journeymen, and one of the latter is already shouldering the inventor, in order to carry him off undiscovered by the angry throng of weavers that is furiously attacking the house.

Memorial stones of a new Baptist chapel in Deacon-road, Widnes, were laid on Thursday, the 5th inst. The building will be Geometrical Gothic in style, carried out in red Ruabon terracotta, bricks, and local stone, and all inside woodwork will be of pitchpine. The chapel will be 47ft. by 31ft., and will be seated for 250 persons. At the rear is a schoolroom 46ft. by 17ft. The total cost will be £1,250. Mr. Richard Owen, of Liverpool, is the architect, and Messrs. Sayce and Randle, of Warrington, are the contractors.

The first reading of the Government Bill for the preservation of the Paris Exhibition buildings, and for the conversion of the rest of the Champ de Mars into a public garden, was voted by the French Chamber on Tuesday by an overwhelming majority.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

## NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII., XLVI., XLIX., LI., LII., LIII., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

"NO CHARGE MADE WHERE SATISFACTION IS NOT GIVEN!"

To the Editor of the BUILDING NEWS.

SIR,—The advertisement given below will show your readers the kind of competition architects have to put up with in this place. I cut the slip from one of our leading papers, and I now see that it has been written out, and with the additional information that the "architect of established practice" will prepare bills of quantities free of charge, is stuck on posts at the corners of streets in this city.—I am, &c.,

F. DE J. CLERE, F.R.I.B.A.,

Wellington Diocesan Architect,

Phoenix Chambers, Lambton Quay, Wellington, N.Z., April 18.

## ENCOURAGEMENT TO BUILD.

AN Architect of Established Practice prepares plans and specifications for half the usual price. No charge made where satisfaction is not given. Communications invited from parties knowing anyone about to build; liberal commission allowed. Before you build or make any alterations, apply to R. C. Shearman and Co., Lambton-quay, Wellington.

## ARCHITECTURAL MODELS.

SIR,—Referring to the proposal to establish a museum of architecture at King's College, "Goth," in "Wayside Notes," May 16, objects to the proposal, and says models are mere toys. I would refer him to the following, which appeared in your valuable journal:—

"To promoters of competitions and the general public the model is the only comprehensible representation, and its popular value for instruction in art may be estimated by the interest

the ordinary sightseer takes in looking into models of buildings and engineering works in any of the museums and exhibitions open to the public."

In addition to these advantages, authorities would in time secure possession of a valuable collection of architectural models of executed works, the educational value of which would be very great.—I am, &c.,

June 9.

C. N. THWAITE.

## VARNISH AND OIL ON OLD STONE-WORK.

SIR,—Some twenty years ago the interesting experiment was made at Lincoln Cathedral on the piers supporting the arcade below the triforium, or angels' choir, by covering them with a coating of oil and varnish after the white-wash had been removed. The effect, said to resemble Purbeck marble when it was first done by those who made the application, was, to my mind, anything but pleasing, though possibly the application may have deserved the character of preserving the old masonry. Sufficient time has now passed to judge better as to this, and I shall esteem it a favour if some competent correspondent who knows this cathedral well will tell us how the columns so treated look now, and if the oil and varnish coating is really a good method to adopt in such cases.—I am, &c.,

AN ODD FARTHING.

## ACCIDENTS TO TALL CHIMNEYS.

SIR,—I have been favoured by the owners with accounts of two tall chimneys being struck by lightning, and possibly they may be useful to those of your readers interested in these structures.

The tallest chimney shaft in the United States is that erected by the Clark Thread Co., Newark, N. J. It is 335ft. from ground line to top of cap, circular in form, 28ft. 6in. diam. at base, and 14ft. under cap (27ft. 6in. below the summit). It was built in 150 days of nine hours each, and completed in September, 1888, from designs of Mr. F. Stryker, under the direction of Mr. W. Clark, general manager to the company. The purpose of the shaft is to serve 21 boilers of 200H.P. each. The coping is of cast iron composed of 32 sections, bolted together by internal flanges.

On the 28th March last this shaft was twice struck by lightning. The first stroke tore out a few bricks under the bell-shaped top, then missed a length of about 20ft., and made four ragged-shaped gashes in the exterior wall of shaft, two to three bricks deep by 2ft. wide and several feet long, down the north side, and below this a serious crack about 50ft. long. The second stroke tore out a few bricks of the bell shaped portion of cap. This shaft had no lightning conductor.

The Hurst Mills chimney shaft, Ashton-under-Lyne, which is 225ft. from ground to top, octagon in shape, has an outside girt of 74ft. at bottom and 55ft. round top. It serves to convey the gases, &c., from 11 boilers. The cap of this shaft is in brickwork, and a copper-rope lightning-conductor is attached to the structure.

On the 12th May last the shaft was struck by lightning; the electric fluid passed down the conductor, struck the ground, and bursting some gas-pipes, set fire to the escaping gas, and lifted up some flag stones about 20 yards from the shaft; some of the escaped gas entered a toll-house close to where the accident took place, and an explosion followed, injuring the occupants. The chimney shaft itself escaped damage.

The shaft which preceded the above one was struck by lightning about 40 years ago.

Records of these occurrences may be worth noticing by readers of the BUILDING NEWS, and perhaps other correspondents may have accounts of similar accidents, which would be interesting to all who study the construction and stability of tall shafts and the efficiency of lightning-conductors.—I am, &c.,

R. M. BANCROFT.

## THE BEST BRICK AND TILE KILN.

SIR,—I saw in your paper of May 30 the plans of a new patent brick and tile kiln. I have one myself, but being poor, I could not get it into the market, as I could not afford to pay for advertisements. I have to lose by it, as I cannot afford to pay up my patent. If you could put it in your paper it might do some one good, for it is the very best that can be built or used for burning bricks. It is the cheapest to build, the simplest to work, and the best and coolest for men to work

in. The air passes through the green bricks in front of the fire, dries the bricks, and gets them warm ready to receive the fire, whereby a deal of coal is saved, the bricks also being more of a uniform colour and a deal more solid. It is the study of nearly thirty years. I have worked with the Hoffman ever since 1860, and it has been my study how to get the heat from the men and to turn it to a proper account, which by my arrangement you will see I have succeeded in doing. The heat where the men work is not so great as it would be out in the sun on a hot summer's day. I have been all my life a brick-maker from my infancy. I am now 58 years old, and I am sure there could not be a better kiln built, nor a cheaper one to build, nor one easier to work.

Fig. 1 is a combined side and end elevation of one of my oblong brick kilns showing the roof to protect the same from the weather. Fig. 2 is a sectional plan on line A B. Fig. 3 is a sectional end elevation on line C D. Fig. 4 is a sectional end elevation on line E F. Fig. 5 is a plan with the roof removed. My oblong kiln, as shown by the plan Fig. 2, is divided by green brick walls into twelve divisions or chambers, numbered from 1 to 12, which are shown by dotted lines on the drawings, these walls being burnt, as are the other green bricks, and removed from time to time when the chambers are emptied. The main flue, H, runs under the middle wall to the chimney, G; but this flue, to save expense in massive foundations, may run along higher in the wall than shown. The branch flues, J, run into the main flue, each division being connected with the main flue H, by such a flue and damper; but the two end divisions, 1 and 7, have two such exit flues and dampers for the purpose of varying the direction of the heat as it passes on. The dampers are marked with the letters K, K<sup>1</sup>, K<sup>2</sup>, to K<sup>11</sup>. The upper longitudinal flue, M, only runs along the length, or nearly the length, of the kiln, and is one of the most important features of my invention, by which I transmit the heat from one chamber or division of the kiln to another by means of the vertical shafts, U, U<sup>1</sup>, U<sup>2</sup>, U<sup>3</sup>, U<sup>4</sup> into this flue M and the shafts N, N<sup>1</sup>, N<sup>2</sup> to N<sup>11</sup> into the divisions or chambers, there being one shaft, N, to each division or chamber, of which there are twelve in this particular instance.

The portable bonnets P and P<sup>1</sup>, are also most important as saving considerable expense in flues and brickwork and heat, as they can be moved from one shaft to the other so connecting the various divisions or chambers with each other which, in conjunction with the dampers or branch flues, connect each division with the chimney G, thus transmitting the heat from any hot chamber in which the bricks have been burnt to one in which the bricks are green, to do the initial part of the drying.

The small holes r, r, r, through the top of each division are for the purpose of feeding fine slack into the said chambers to keep the kiln continuously burning. Of course in changing this kiln those accustomed to such work will leave the usual passages so that the heat will have perfect freedom and be guided amongst the articles to be burnt, so circulating throughout the whole mass of bricks to be burnt.

To avoid the necessity of rounding the corners of these kilns I place the passages s, s, s, in the end of the division chamber, No. 6, and the passages s<sup>1</sup>, s<sup>1</sup>, s<sup>1</sup> in the corresponding wall of division or chamber 12. These passages, s and s<sup>1</sup>, lead into the branch flue S<sup>2</sup> and S<sup>3</sup> and past the special dampers s<sup>4</sup> and s<sup>5</sup>, and thence, in the case of chamber 12, in the direction of the arrows to either dampers K<sup>1</sup> or K<sup>2</sup>, or in the case of chamber 6, to dampers K<sup>3</sup> or K<sup>4</sup>. The openings w are for discharging the kiln.

I will now follow out the action of the heat in the kiln herein illustrated, with the bonnets fixed as shown to connect the division or chamber 1 with the division or chamber 8—the other shafts in the flue M would now be covered by caps or plates—I will suppose that the fuel is still being fed into chambers 3 and 4; No. 2 chamber and No. 7 chamber are cooling off; we will also suppose that the men are drawing off No. 12 chamber; then the back draught from No. 3 chamber passes through No. 2 chamber to No. 1 chamber, then along the bonnet P and flue M to the bonnet P<sup>1</sup> and down the shaft N<sup>1</sup> into the division 8 and through the damper K<sup>2</sup> into the branch flue J, and thence to the chimney G. In the mean time chamber 4 is working with a front draught—i.e., leadings into chambers 5 and 6 in

FIG. 1.

FIG. 2.

FIG. 3.

FIG. 4.

FIG. 5.

B Dellagana &amp; Co

the direction of the arrows and thence through damper K<sup>6</sup> to the chimney.

I do not confine myself to the exact details, such, for instance, as the number of chambers the direction of the flues, as they may be varied without departure from the principle of the invention, but what I do claim is:—Brick kilns having the horizontal flue or tube, M, and shafts or openings, U and N, in combination with the bonnets, P, for the convenience of turning the heat in any desired direction in respect to the

chambers containing the bricks to be dried, as also the passages s, s, and flues S<sup>2</sup> and S<sup>3</sup>, all substantially as herein set forth.

You can build the kiln to any size you think proper, so that they shall burn from 60,000 to 100,000 bricks per week, and as regards the chimney you can build that anywhere, to suit your convenience to make it do the work from the steam-engine that works the machinery. You see by the kiln being built straight the bricks are not crossed so much as in a round kiln,

and that prevents the marks in the bricks where they are crossed in the setting. All the bricks can be set straight or nearly so, which is a great improvement, especially in bricks where colour is required.—I am, &c., G. PITT.

6, Ironmonger-row, Coventry, June 4.

#### CAIRENE DOMESTIC ARCHITECTURE.

SIR,—In your issue of the 6th June you give me the credit of the translation of Count d'Hulst's paper. It was, however, translated by its author,

and well translated, except in some of the technical terms, which are always very difficult to render in another language, the difficulty being increased in this case, Count d'Hulst not being professionally an architect. The principal drawings exhibited were those kindly lent by Mr. Frank Dillon, representing the interiors of some of the finest reception rooms in Cairene architecture, some of which are now destroyed.—I am, &c.,  
R. PHENE SPIERS.

Carlton Chambers, 12, Regent-street, June 6.

### CHIPS.

An explosion of gas occurred on Monday afternoon at 26, Charlotte-street, Bedford-square, on the premises of Mr. J. Aldam Heaton, decorator. A large gas stove was blown to pieces, and other mischief was caused, while a workman was badly burned on the face and hands, and had to be removed to a hospital.

The memorial of the centenary of the Old Church at Swinton will take the form of an extension of All Saints' Schools, Wardley-lane, in that township. Mr. Medland Taylor, of Manchester, is the architect, and the contract has been taken at about £1,000 by Messrs. Jonathan Gerrard and Sons, of Swinton.

On Saturday the village of Kilmacolm was presented with a public park by Mr. Adam Birkmyre. The park is situated about five minutes' walk from the town, and extends to seven and a half acres.

The Earl of Jersey laid, on Friday, the foundation-stone of Holy Trinity Church, Southall, for which he has presented the site. The new building will provide accommodation for 500 adults.

A new church was consecrated last week by the Bishop of Gloucester and Bristol at Cinderford. The architect was Mr. E. Lingen Barker, of Hereford.

The Bishop of Southwark laid the foundation-stone of a new Roman Catholic Church at Blackheath on Tuesday week. The church will be in the Decorated style, and will consist of nave, chancel, altar, two side chapels, and organ-chamber, with tower, spire, and baptistery, and two sacristies with furnace-rooms underneath for heating. It will accommodate 400 persons, and will cost £4,200. It will be built of Kentish rag with Monk's Park stone dressings. Mr. Purdie is the architect.

St. Clare's Roman Catholic Church, Liverpool, the gift of Messrs. Francis and James Reynolds, was on Tuesday week solemnly consecrated. The architect is Mr. Leonard Stokes, P.A.A., London.

The new high altar of St. Ethelbert's Roman Catholic Church, Leominster, was consecrated last week. It has been constructed from designs by Mr. Peter Paul Pugin.

The Duke of Cambridge laid on Saturday the foundation stone of the new theatre and other buildings now being added to the Royal Veterinary College at Camden Town. The buildings are being erected from plans by Mr. Arthur Vernon, F.S.I., of Great George-street, S.W., and comprise on the ground floor a ride of 200ft. long by 23ft. across, having a series of loose boxes behind, and on the floor above a central theatre 40ft. by 37ft., and seated for 350 persons, approached by an external double flight of stairs, with professor's room, bacteriological laboratory, and museum on the right, and private laboratory, reading-room, and library on the left. The outlay will be about £7,000.

Among the adjudications in bankruptcy announced in Tuesday's *London Gazette*, the name appears of Alfred Joseph Beesley, Buckingham-street, Strand, architect.

Messrs. Paley and Austin, of Lancaster, have reported on the proposed scheme of restoring the ancient church, St. Mary's, Whalley. They estimate that the work would cost about £3,000.

At the last meeting of the town council of South Shields the Improvement Committee reported that a premium of £50 had been paid to Messrs. Perkin and Bulmer, whose plan for the proposed new police buildings had been awarded the first place in the recent competition. The committee recommended the town council to erect the buildings, as designed by Messrs. Perkin and Bulmer, on the Keppel-street site, and that the committee be authorised to have the quantities taken, and to advertise for tenders for the erection of the building. The report was adopted.

At the Salon the Medal of Honour in the Class of Architecture has been awarded to M. Redon, and M. Fournereau and M. Marcel have obtained Medals of the First Class.

A new Wesleyan chapel and schools are about to be built at Beverley from plans by Messrs. Morley and Woodhouse, of Bradford.

## Intercommunication.

### QUESTIONS.

[10298.]—**Quantity of Mortar used Weekly in London.**—Some months ago, when in Liverpool, I was told by a gentleman that he had seen a communication from, he believed, the editor or a correspondent of the *Building News*, stating the probable quantity of mortar used weekly in London. Unfortunately, I did not make a note of it at the time, which I regret, as the information would be useful to me now. Can any reader give me the information, together with the average price per ton?—THOS. HYDES.

[10299.]—**Building Estate.**—Having had the management of a new building estate given to me, I should be glad to hear from some of your readers what they would consider a fair percentage to charge, including plans showing development of estate and arranging for sale.—PROUD P.

### REPLIES.

[10288.]—**Stains on Granite.**—You have a troublesome job before you in attempting to get smoke and soot stains out of granite. Try this: A paste of 1oz. ox-gall, 1 gill of strong solution of caustic soda, 1½ tablespoonful of turpentine with enough pipeclay to make it thick and consistent; scour well.—ELBOW GREASE.

[10288.]—**Stains on Granite.**—Washing is about as useful in getting stains of soot out of granite as tickling with a feather or fixing an electric belt round the window sill. Pick out a place where the stain is worst, and as a sample apply the following: Mix together 1lb. whiting, 1lb. soft soap, 1oz. washing soda, and a piece of sulphate of soda as big as a walnut. Rub it over the surface you propose to treat, let it stand four-and-twenty hours, and then wash it off. If it succeeds, try another portion.—A. MASON.

[10288.]—**Stains on Granite.**—Smoke and soot stains can be removed with a hard scrubbing-brush and fine, sharp sand, to which add a little potash.—G. D. M.

[10289.]—**Timber Conversion.**—I am obliged to W. Stevenson for his lucid answer to my question. From what he says I gather that the beams cut from the side of the balk shown (Fig. 1, p. 820) are the best adapted, the rings being in the direction of the width of beam. I can quite understand the reason why they should be stronger, as the rings act somewhat in the manner of plates inserted in the beam depthwise. The best direction for the rings to run in a floor board is crosswise, and this opinion is strengthened by W. Stevenson's remarks, yet, as he observes, the makers of wood-block floors appear to think more of the appearance of the grain or figure. Does W. S. think a beam cut from the centre of balk (Fig. 1) would be suitable at all for a breast-summer? Such a beam is often used, though there can be little question in my mind that it would be weaker, especially if the heart were placed in the lower half of beam, as it would weaken the tensile resistance.—H. W.

[10296.]—**Dry Rot in Timber.**—The wood fungus you have sent me is the *Merulius lacrymans*, of vigorous growth, therefore of great power of destruction and reproduction. The germs or spores of this fungus have been conveyed to the house with the timber used in construction, or in the filling in of the ground (if any) under the floor. It has found a favourable site, all the local circumstances being in its favour for development. This fungus requires heat and moisture. The moisture must have originally been supplied by the locality, after which the fungus is able to absorb and distil moisture from the atmosphere, and is therefore difficult to destroy. The heat is supplied by the temperature of the summer, and the setting up of decomposition in the wood, both which are aided or assisted by stagnation of the atmosphere. I advise you to lower the ground under the floor to admit a greater volume of air, and, if possible, to admit of a man moving about beneath the floor. Let this man scrape or brush off the fungi, and give the wood and the walls a good washing with hot lime. Strew unslaked lime on the ground, and ventilate the space beneath the floor. The main thing in ventilation is to move the air, which, on the ground, is heavy with moisture and stagnant. Arrange your ventilators so that a current is made through. This can be done by a clean draught from side to side of the house; the wind pressure is always on one side of the house, and a vacuum on the other. A better plan still to move this stagnant air is to connect it with one or more chimney flues or Tobin ventilators. The best work on the subject is "A Treatise on the Origin and Progress, Prevention and Cure of Dry Rot in Timber," by Thomas A. Britton. London: E. and F. N. Spon, 48, Charing Cross, 1875.—W. STEVENSON.

Four memorial stones of a new Wesleyan mission school at Colne, Lancashire, were laid on Saturday. The building is being erected from plans by Mr. John Varley, of that town, and will accommodate about 260 worshippers. The cost will be about £800.

Christ Church, Coventry, has been enriched by the addition of a handsome carved oak reredos of the Early Decorated period of architecture. The centre portion, or reredos proper, is carried the whole length of the window, and is divided into three bays by crocketed buttresses and pinnacles. The centre bay contains the sacred monogram, with gabled and crocketed mould over; the two side bays have traceried and carved panels of wheat and vines. On either side of the altar are traceried panels continued to the north and south walls of the chancel. The sides consist of traceried panels with carved buttresses dividing this portion from the centre, and crocketed and moulded gables with carved finials. The work has been executed by Messrs. Jones and Willis, of Birmingham, London, and Liverpool.

### LEGAL INTELLIGENCE.

THE OWNERSHIP OF PLANS.—CLARKE v. MACNAMARA.—At the Altrincham County Court, on Tuesday week, before Judge Wynne Ffoulkes, Mr. Thomas Clarke, confectioner, Station-road, Altrincham, sued Mr. Thomas Macnamara, architect, Hale-road, for £10, the value of the plans of certain property belonging to plaintiff, and £5 for detention. Liability was admitted, the sum of three guineas having been paid into court by defendant. Plaintiff's case was that in October, 1888, defendant was employed by plaintiff to prepare plans and specifications and supervise the erection of two villas in Altrincham. The work was done, but formed the subject of litigation in that Court, and was ultimately referred to architects in Manchester. Before the litigation in the County Court began, defendant was applied to by Mr. Clarke for the plans and specifications, it being important to him to have the work checked. Mr. Macnamara wrote saying he could not give up the plans until he was paid his charges. The amount of Mr. Macnamara's charges was one of the subjects in dispute in the action, therefore Mr. Clarke could not insist upon his right to the plans at that time; but early intimation was given to defendant that the plans were important, and were wanted. The litigation went on, with the result that the arbitrators awarded Mr. Clarke £25 damages by reason of defendant's breach of contract as to the joiners' work only. When the award was made, plaintiff renewed his application for the plans, and eventually received a postcard saying that the plans had been destroyed. For these plans Mr. Clarke had paid 20 guineas, and the architect had also received 2½ per cent. for the quantities from the contractors. Defendant afterwards declared that no duplicates of the plans were in existence. The three guineas paid into court were insufficient, as the plans were of importance to a man who had built a house because of the lay of the drains and the timbers in case of repairs. Plaintiff called, said he could not say how many plans there were, but they were those usually prepared. He had paid 20 guineas for them. The cost of the building was £900, roughly speaking. Witness would rather have reliable plans than 10 guineas. The plans were very elaborate and well prepared. His Honour remarked that the question was as to the intrinsic value of the plans. This could be ascertained by calling an architect or builder. Defendant was called, and said the plans had been destroyed. There were copies at the offices of the Altrincham Local Board. He had told Mr. Clarke that his charges did not include copies of the plans. Considering that he only had 21 guineas for preparing three sets of plans and superintending them, three guineas was a fair proportion. He was engaged 73 days in supervision. For the 73 days he should put on one-third at the rate of two guineas a day. He was so disgusted with the arbitration that he afterwards destroyed the plans. His Honour: Supposing you were to prepare these plans, Mr. Macnamara, and the owner said, "I won't employ you as an architect," what would your charge be? Witness: I should be satisfied with three guineas. His Honour: I can only say it is very different from the Liverpool architects. At the suggestion of the judge, defendant ultimately agreed, subject to the sanction of the clerk to the Local Board, to make tracings of the duplicate plans in their keeping, and to prepare in addition an elevation. The case was adjourned to allow of this arrangement being carried out. His Honour said he thought it right to say that defendant had taken a very mistaken view of his rights in the matter. If the action had been one of trespass the plaintiff might have claimed vindictive damages, because to destroy the property of another person was a very serious matter indeed, and one which the law visited with ample and adequate damages. Therefore he would recommend Mr. Macnamara to meet Mr. Clarke in all that was required.

IN RE THOMAS QUINN, M.P.—An application was made at the London Bankruptcy Court on Friday on behalf of Thomas Quinn, M.P. for Kilkenny, builder and contractor, to confirm a scheme of arrangement agreed to by the creditors, to accept 5s. in the pound, half in cash and half in six months. The gross liabilities were returned at £75,000, of which £70 were unsecured. An adjournment was ordered to ascertain if the sum paid in was sufficient.

RENDLE v. J. EDGUMBE RENDLE AND CO. (LIMITED).—In the Chancery Division on Friday, a motion was brought before Mr. Justice Kay by the trustees of the will of the late William Edgumbe Rendle, roofing contractor, and also proprietor of the Clarendon Hotel, Brighton, to restrain the defendant company and their manager, John Edgumbe Rendle, a son of the testator, from carrying on the business of glass-roofing contractors under the name of J. Edgumbe Rendle and Co. (Limited), or any other name calculated to mislead the public into the belief that such company was carrying on or had succeeded to the business of W. Edgumbe Rendle and Company, and to restrain the defendants from issuing advertisements, circu-

lars, or prospectuses representing or calculated to mislead the public into the belief that the defendant company were, as assignees of John Edgcumbe Rendle, or otherwise, entitled to the system of glazing used by W. Edgcumbe Rendle and Co. for the purpose of carrying out the contracts carried out by W. Edgcumbe Rendle and Co. mentioned in the defendant company's prospectus and circulars, or that John Edgcumbe Rendle was the inventor of Rendle's system of glazing, or was the senior partner in the firm of W. Edgcumbe Rendle and Co., or that he introduced their most successful patents; and to restrain John Edgcumbe Rendle from engaging in any business of a description in any way similar to the business carried on by the late William Edgcumbe Rendle, under the style of W. Edgcumbe Rendle and Co., or from doing anything to prejudice the business of that firm, or affect the sale thereof. Upon the death of the testator, William Edgcumbe Rendle, in September, 1881, disputes arose in the administration of his estate, which comprised his business of W. Edgcumbe Rendle and Co., formerly carried on by him in Victoria-street, Westminster, and at Battersea, and an action, still pending, was commenced for the administration of his estate by the Court. Subsequently the action was commenced in which the present motion was made. Mr. Justice Kay said the defendant John Edgcumbe Rendle was some years ago in business as a bookseller. His father, William Edgcumbe Rendle, had invented a system for glazing roofs, for which the father took out certain patents, and the father had met with considerable success in that business; but the son, John Edgcumbe Rendle, had not been very successful in business. In 1871 the son, and a man named Burrows, at that time a workman in the father's employment, started a business in opposition to the father. The son got into financial difficulties, and gave that business up, and then he went on with his old business as a bookseller and stationer, but in 1876 his brothers and sisters prevailed on their father to take him into his patent glazing business. Accordingly, the son signed an agreement not to go into any opposition business during the father's lifetime or during that of either of his brothers or sisters, and for his services he was to receive so much. Afterwards other patents were taken out by the father, who granted the son the right to use them in foreign countries. The father died, having, by his will, given the son an interest in the business, which he, the father, had established and carried on as "W. Edgcumbe Rendle and Co." The son then started business on his own account in England, either as "John E. Rendle and Co.," or as "J. Edgcumbe Rendle and Co."—his Lordship was inclined to the opinion that it was as "J. Edgcumbe Rendle and Co." However, he got into difficulties, and made an assignment to his creditors of his business, and of all the property he had in the world. Then he lent his name to a joint-stock company, of which he was the promoter, and of which he was appointed manager, the company being formed under the name of "J. Edgcumbe Rendle and Co. (Limited)," and this company started the business of glass roofing in opposition to W. Edgcumbe Rendle and Co., and that limited company was still going on. Then the son proceeded to issue circulars of so fraudulent a character that counsel were obliged to give up the contest as regarded them, and, therefore, an injunction must be granted as to those circulars. He also represented himself as the senior partner in his father's firm, which he was not. To make that out by his evidence, he struck out the last syllable in the word "partner," and represented that he had a "senior part" of the business. But that was not all, for he said, in the circulars, that he was the inventor of some of the patents taken out in his father's name. That he was not, in fact, the inventor was conclusive from the fact, that the patents were taken out in the father's name. In his Lordship's opinion all these facts were evidence of the dishonesty with which this man had attempted to interfere with an established business in which he had no interest, he having assigned all his interest to his creditors. It was a dishonest attempt on his part to get the benefit of the reputation of W. Edgcumbe Rendle and Co. Could a man who was not at the moment carrying on business be allowed to promote a joint-stock company, and lend his name to that company, and induce them to employ him as manager and to start business with his name, which, from its being so like one already attached to an established business, would be quite certain to deceive? As the law of England stood that would not be allowed. The fraud was transparent, and the Court was bound to restrain all these acts. His Lordship granted an injunction until the trial or further order to restrain the defendants from issuing the circulars and prospectuses, and to restrain the defendants from carrying on the business of manufacturing glass roofing or any other business like that of W. Edgcumbe Rendle and Co., in such a manner as to deceive the public into the belief that the defendants were carrying on the business of W. Edgcumbe Rendle and Co., or that they were

that firm, or that the defendant company was a company formed by members of that firm, and to restrain the defendants from representing that the defendant J. E. Rendle was the inventor of any patents taken out by W. E. Rendle, or that he was the senior partner in the firm of W. Edgcumbe Rendle and Co. Subsequently, the defendants consented to treat the motion as the trial, whereupon his Lordship granted a perpetual injunction in the above terms, and ordered the defendants to pay the costs of the action.

**ARCHITECTS' RESPONSIBILITY FOR REPAIRS.**—*R. GINN AND SON V. WALTER HENRY NORRIS.*—The plaintiffs are builders and decorators at Hertford, and the defendant is a surveyor at Hertford and Ware. The claim was for £13 10s. 3d. for work done at the Yews, Bengoe. Mr. Baker said that in 1886 the defendant was a member of the firm of Messrs. Norris and Shoppee, of Hertford, and they then acted for Captain Barry, the incoming tenant of the Yews, Bengoe. Plaintiffs' contract was with Messrs. Norris and Shoppee, who had dissolved partnership, and Mr. Shoppee had since died. Mr. Norris, however, had made himself responsible for the debts of the firm.—Mr. Avery, for defendant: The work was done in 1886, and the plaintiffs wait until Mr. Shoppee is dead, and then try to recover from Mr. Norris, who is not responsible in any way. The bill was not sent in to the firm while it was a firm. Not obtaining the money from the owner of the property, plaintiffs sued the defendant, but the owner of the property, for whom Messrs. Norris and Shoppee were acting, is liable.—Alexander Purkiss Ginn said he was a member of the firm of R. Ginn and Son. In July, 1886, they undertook work at the Yews, Bengoe, the order being given by Messrs. Norris and Shoppee as a firm. There was a change of tenancy at the time, the incoming tenant being Captain Barry. The specification produced was the first they received.—His Honour said the specification set forth that certain works were required to be executed for Captain Barry under the superintendence of Messrs. Norris and Shoppee. The specification clearly showed that the work was to be done for Captain R. M. Barry.—Mr. Baker, for plaintiffs: But Messrs. Norris and Shoppee were the agents.—His Honour: No, nothing of the sort. They were simply superintendents of the work, that is all. This is one of those cases which ought never to have been brought before me.—Mr. Baker: It is not Captain Barry who is the principal, but the defendant says somebody else is.—Dr. Packman, the owner of the property. Messrs. Ginn and Son's letter-book was handed to his Honour, who read a letter from it as follows:—"We herewith enclose you (Messrs. Norris and Shoppee) Dr. Packman's account as directed, and as the work was done in 1886, we ask for a cheque."—His Honour: I shall consult the plaintiffs on that letter. It is perfectly plain from that, that the defendant is not liable. After further discussion, his Honour gave judgment for the defendant with costs, remarking that the case ought not to have been taken into court, for never during the course of his experience had he met with one which rested on a worse foundation.

#### CHIPS.

The contract for the erection of Sale Free Library has been let to Mr. James Hamilton, of Altrincham; and it has also been arranged to face the building with red Ruabon bricks in lieu of Northwich.

The new Roman Catholic Church at St. Annes-on-the-Sea, which has been erected in memory of the late Colonel Clifton, of Lytham Hall, and the late Duchess of Norfolk, is to be opened on Sunday next.

The members of the local board for Shirley and Freemantle, near Southampton, formally inspected the sewage reservoirs at Fourposts on Friday. They have been constructed by Mr. H. I. Sanders, of Southampton, the contractor, and here the sewage of the whole district will be in the future chemically treated, the sludge being dealt with by the Southampton Corporation at their sanitary works at Chapel, it being transmitted thence by means of one of Shone's ejectors. The sewerage scheme has been carried out from plans by Mr. H. J. Weston, surveyor to the local board.

The Cardiff board of guardians have adopted plans by Mr. Edwin Seward, R.C.A., of Cardiff, for the extension of their pauper schools at Ely.

The latest additions to the National Gallery collection are two works, numbered 1305 and 1307, both hung in Room XIV. They are a "Landscape, with Figures and Cattle," by Thomas Barker (1769–1847), a picture bought with part of the Lewis Fund, and a "Portrait of Miss Caroline Fry," by Sir T. Lawrence, a bequest from Mr. W. Wilson.

St. Saviour's National Schools, Paddington, are being enlarged at an outlay of about £30,000. Mr. F. G. Coward is the architect, and Messrs. W. Oldrey and Co. are the builders.

#### WATER SUPPLY AND SANITARY MATTERS.

**BARNSWICK.**—On Thursday, the 5th inst., a Local Government inquiry was held at this place before Mr. Arnold Taylor, in respect of an application by the rural sanitary authority of the Skipton Union for sanction of a loan of £9,000 for purposes of water supply. After hearing the evidence, and inspecting the district and the site of the proposed pumping station and reservoir, and there being no opposition, but, on the contrary, a strongly-expressed wish that the works should be proceeded with as early as possible, the inspector intimated that there would be no doubt as to the sanction for the loan being obtained. There has been expended already in sinking shaft and bore-hole about £1,850, an abundant supply of water to meet requirements having been found. Messrs. Brierley and Holt, of Blackburn, are the engineers.

**EARL'S BARTON WATER SUPPLY.**—The Wellingborough rural sanitary authority have instructed Mr. W. H. Radford, C.E., of Nottingham, to prepare a scheme for the water supply of Earl's Barton, as an alternative to a scheme previously submitted by a local engineer.

**HUCKNALL TORKARD.**—Some time ago the Hucknall Torkard Local Board invited competitive designs from engineers for dealing with the disposal of the sewage at the various outfalls, and for the best means of effectually treating the same. After considerable discussion the schemes submitted by Mr. Herbert Walker, of Nottingham, and Mr. W. H. Radford were selected for further consideration, with the result that the scheme submitted by Mr. Walker was eventually selected. The adopted system is that known as the "international process," and consists of the precipitation and deodorisation of the sewage by means of a magnetic precipitant and deodorant called "ferrozone"; the removal of the organic matter in solution, and the aeration of the tank effluent by passing it through a specially-constructed filter-bed containing polarite. The sludge deposited in the tanks will be deodorised by the ferrozone and pressed into cakes for sale as a fertiliser. The effluent, after being passed over and through four acres of land, will be conducted into the river Leen. The estimated cost of this scheme is £4,000.

**PONTEFRAC TOWN WATER SUPPLY.**—A meeting of the Pontefract Town Council was held on Thursday evening. Mr. J. Robinson introduced a motion in favour of abandoning the well-sinking operations at Roall recently in progress, from plans by Mr. Hodson, of Loughborough. It was announced that an equitable agreement had been come to between the corporation and the contractor to sink a new well at a cost of £950, allowing £150 as compensation for stoppage of the works. On the suggestion of the mayor, Mr. Robinson withdrew his motion.

**SUTTON-IN-ASHFIELD.**—The Sutton-in-Ashfield Local Board made a waterworks for the supply of their district a few years ago, and the quality of the water proved to be so good, that they now supply populations in adjoining districts amounting in the aggregate to nearly twice their own number. The mains extend over an area of 50 square miles, and the board have decided, on the advice of their engineer, Mr. George Hodson, M.Inst.C.E., F.G.S., of Westminster, to duplicate their pumping machinery and increase the capacity of their well to 1,000,000 gallons per day.

**THE VYRNWY WATER SUPPLY FOR LIVERPOOL.**—The Liverpool Waterworks pipe line between Malpas and Tarporley, Cheshire, is so far completed that water from Lake Vyrnwy is being sent down the pipes as far as the valve-house at Egerton-green. Here the overflow pipes have been tested. The erection of the valve-house practically completes the work on this section in Cheshire. In a few days water will be sent down the pipes a further length to the valve-house at Beeston Moss.

**WALTON-ON-THE-HILL, LIVERPOOL.**—The Walton Local Board have just completed an enlargement in their sewerage system. The scheme was set on foot by the complaints which were received from the River Alt Commissioners respecting the pollution of the river, and from the ratepayers about the flooding of the cellars. This was caused by the sudden increase in the population, which is now estimated at 40,000. The outfall sewer, 24in. diam., has been increased to 4ft. 6in. by 3ft. 6in. for a length of 2,930 yards; also a length of 1,100 yards of cast-iron pipes, 3ft. 2in. diam., has been laid, in addition to the present 18in. pipe. At the sewage farm, where these two latter pipes empty the sewage, the size (105 acres) was found to be inadequate. A part abutting on the river Alt has therefore been set off for the purpose of intermittent filtration. A large tank (concrete, and faced with blue Staffordshire bricks) has been built, 100ft. wide by 102ft. long, containing, with the present tank, 700,000 gals., so that the whole of the sewage received between 6 p.m. and 6 a.m. next day may be stored ready for distribution at the latter hour. In case of floods, overflows are pro-

vided, so that the water may run on to the filtration bed. To prevent flooding of cellars, an intercepting sewer has been constructed about one mile in length, ranging in size from 3ft. by 2ft. to 3ft. 6in. by 2ft. 8in. The scheme has cost nearly £20,000, and has been carried out by Mr. W. Hope, Earlestreet, Liverpool, under the direction of the engineer, Mr. S. Middlebrook.

### CHIPS.

Mr. Norman Shaw, R.A., writes Mr. Roger L. Lowe, Farnworth, to say he thinks Mr. Lowe "is doing most excellent work" at New Scotland Yard, and the wood-block floors laid there "give us all satisfaction."

The memorial stone of an enlargement of St. John's Congregational Church, Spring-road and Cowper-street, Ipswich, was laid last week. The works take the form of a widening of the transept, its heightening by 5ft., and the addition of galleries, raising the accommodation to 430 sittings, while, at the back, minister's vestry, and infant school-room, with assembly-hall above for senior scholars have been added, and a new porch built at the entrance. Messrs. J. Pells and Son, of Ipswich, are the builders.

A Wesleyan chapel has just been opened in Sander-road, Birmingham. It is built of stone and red brick in the plainest style of Early English, and measures 81ft. by 30ft., forming a parallelogram of five bays. Sittings are provided for 460 persons at a cost of £4,600. Messrs. Bell and Barnsley are the architects, and Messrs. Moffat and Sons the builders.

At a meeting of the executive committee of the Bishop Parry Memorial Fund, held on Tuesday, it was resolved that a monumental tomb be placed in the nave of Canterbury Cathedral, and that the sum of £1,000 be expended for that portion of the memorial.

The First Saintfield Presbyterian Church at Belfast is about to be repewed, from plans by Messrs. Young and Mackenzie, of Belfast.

The Durham County Council have accepted the tender of Messrs. G. Gradon and Son, of Durham, at £1,550, for the rebuilding of Alden Grange Bridge, from the designs of Mr. Crozier, the county engineer and architect. For the reconstruction of four smaller bridges, at Daddysfield, Killhope (two), and Nancy-pasture, also from Mr. Crozier's plans, the tenders of Mr. E. Fairless, of Wearhead, Weardale, have been accepted.

The Art Gallery of the City Corporation was opened on Tuesday by the Lord Mayor, who attended at the Guildhall in State for the purpose, accompanied by the Sheriffs, after having been reconstructed, from plans by Mr. Alexander Peebles, the city architect.

Out of 41,788 pictures sold during the last 19 years at the autumn exhibitions at the Walker Art Gallery, the Liverpool Corporation have purchased 73 for the permanent collection, the catalogue prices of which amounted to £26,186. Up to last year no legal authority existed for expending the profit balances in the purchase of works of art; but by a special Act of Parliament obtained last season the expenditure of profits for the above purpose is legalised, so that the present and further balances will be available for buying pictures or other works of art.

The new Roman Catholic Church at Oswestry, erected through the generosity of Mr. Thomas Longueville, Llandfords, at a cost of over £4,000, was consecrated, on Tuesday, by the Bishop of Shrewsbury (Dr. Knight). The church is in the Early English style, and will accommodate 300 worshippers. There are also schools and a priest's house. The architect is Mr. W. H. Spaul, of Oswestry, and the contractor Mr. Bowdler, of Shrewsbury.

Alterations have been made to the Grocers' Hall, Cheapside, embracing the ventilation, which is now carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

A new church, to be designated the Church of St. John the Evangelist, situate at Robertstown, Aberdare, was opened for public worship by the Bishop of Llandaff on Monday. The church has been erected at a cost of about £600, from the designs of a local architect, by Mr. D. Davies, of Dean-street, Aberdare, and it will provide accommodation for about 150 persons. It is a Gothic structure, built of local stones, the windows, which are filled with tinted lights, being dressed with white terracotta.

The foundation-stone of the new church of St. Paul, Abertillery, was laid on Monday. It will be seated for 305 adults, and will cost £1,100, exclusive of the boundary walls. The contractors are Messrs. Turner and Sons, builders, Cardiff, and the architect Mr. E. M. Bruce-Vaughan, Cardiff.

## Our Office Table.

CARDIFF is to have extended free library accommodation, and additions with this view are to be made to the present institution, which was erected some years ago by Messrs. James, Seward and Thomas, architects, of Cardiff. Some endeavour seems to be on foot in favour of a competition. We can but agree with the six of the other architects in practice in the town who have issued an expression of opinion as to this uncalled-for proposal when they say: "We consider it would be most in accordance with professional usage, and distinctly preferable in this case, to intrust the original architects with a work which appears to all intents to be an extension of their original design." The Council of the R.I.B.A. have likewise given a similar opinion, "As the proper course and the most conducive to the interests of the committee." Unless there are some very good personal reasons to the contrary, it would be simply an act of wrong-headedness to do otherwise, to say nothing of the unnecessary expense of a competition in a work of this character.

As was generally anticipated, the London County Council failed to pass through the ordeal of a Select Committee their ill-considered plan for the removal of the Holywell-street block of houses in the Strand, although in Committee they repeatedly whittled down the area to be included in their crude "betterment" scheme of special rating. They have been more successful in the Bill promoted for the purpose of removing the gates and bars preventing direct access between the Strand and the termini of the three Northern railway companies. Four gates were selected for this preliminary attack, those in Sidmouth-street, Upper Woburn-place, Torrington-place, and Gordon-street, and the Select Committee not only decided to pass the preamble of the Bill, but declined to grant compensation to the Duke of Bedford and the lessees and occupiers of the streets affected. The outcry made about the destruction of privacy, and the consequent depreciation that would result if the obstructions were demolished, carried little weight in the face of Mr. T. Westmacott's testimony that since the gate in Mabledon-place has been removed the assessment of the adjoining house has been raised 33 per cent., and none of the other assessments in the street have been reduced. It was also shown that there is no covenant in the leases granted by the Duke of Bedford protecting the lessees from the removal by his Grace of the gates.

An important proposal with respect to the future management of the parks and open spaces under the control of the London County Council came before that body on Tuesday. During the past twenty years the area of the metropolitan parks and open spaces under municipal control has increased from 178 acres to more than 3,000 acres, about 400 persons are now employed, and the annual expenditure for maintenance alone is nearly £50,000. By a majority of 47 to 42 votes the County Council have this week decided to create a new department for the future management of this branch of the work, so as to obtain efficient control under a single responsible head. It was further determined to place over this department a professional landscape gardener, but a recommendation by a committee that his salary be £600 a year was left an open question.

THE appeal by the Rev. Thomas Field, Head Master of the King's School at Canterbury, for contributions from every diocese of the Anglican Communion towards the erection in Canterbury Cathedral of a pulpit seems to be uncalled for. Mr. Thomas Darling says the existing pulpit in the choir of the Cathedral was the gift of Dean Lyall only forty years ago, and is, he says, "thoroughly in harmony with its surroundings." Mr. G. Cavendish Bentinck, M.P., however, denounces the Lyall pulpit as the poor and spiritless modern work of a Belgian carver, and says that to make way for it the Archbishop's throne, an admirable work by Grinling Gibbons, and presented to the Cathedral by Archbishop Tenison, was stowed away as useless lumber in a dark and damp cellar leading out of the cloisters, where it has since remained. Mr. Bentinck makes, for once, a sensible suggestion—that a sum of money should be raised by Mr. Field, if he wishes to honour the Cathedral, to rescue

Gibbons' throne from its present obscurity and place it in a position where it can be seen and admired. There is no doubt about the throne being the work of Gibbons, for the original receipt for the money paid him for it is still to be seen in the Cathedral Library.

We regret to hear that owing to some carelessness on the part of the workmen engaged, a portion of the refectory wall at Kirkstall Abbey has been demolished. It seems that men in the employ of the Leeds Corporation have for some time been occupied in pulling down a number of trees that had grown within the walls of the Abbey. Their instructions were to remove them piecemeal, and in a number of cases this had been done with safety. On Saturday, however, it was found that an elm, which stood near the wall dividing the monks' refectory from the open court, was rotten, and, curiously enough, it was decided by those in charge of the operations, as there was a clear space in which it was expected it would fall, to pull it down bodily. Unfortunately, the anticipation was not realised; and the tree, in its descent, carried away half of one of the refectory windows and a portion of the wall. It is a matter for regret that since the remains of this beautiful Cistercian abbey have come into the possession of the Leeds Corporation it should have suffered serious injuries, not only from the depredations of roughs, but during the process of removing ivy from the walls and trees from the inclosure. No "restoration" can replace the walls in their old condition, and this is a case in which the unremitting vigilance of all interested in the protection of ancient buildings should be exercised.

MR. GEORGE ENGEL, of 18, Castle-street, Falcon-square, E.C., has sent us some samples of his new transfer graining sheets, which seem likely to be largely appreciated by painters and decorators. By simply wetting the back of the papers, the grain of oak, walnut, maple, mahogany, ash, rosewood, &c., and, in addition, any kind of marble grain, can be transferred on to surfaces painted in the ordinary way, and then varnished. The use of the papers is, of course, very economical, and saves time. A yard of surface can be grained and varnished in five minutes at a cost of one penny, and the designs are in most cases superior to those usually produced. The process is a most simple one, and in many cases will, undoubtedly, supersede graining by hand.

ONE hundred miles of street railway in the city of St. Louis, Missouri, U.S.A., will soon be operated by electricity. The city has granted franchises to new companies, and has also granted permission to old companies to change their horse railroads to electric railways. The work of altering some of these lines is in progress, and there are seven systems either using electric power or preparing for its immediate introduction. Lansing, the capital of Michigan, is to have a model electric street railway, built by the Westinghouse Electric Railway Company.

MR. DAVID J. CHATTELL'S sale on Friday, June 27, of the famous Camden Park Estate, Chislehurst, will be almost historic in its importance. It comprises the famous mansion called Camden Place, so long occupied by Napoleon III. and the Empress Eugenie, and the magnificently-timbered park of 125 acres. The estate is to be sold free from any restrictions, and ground-rents could, of course, be created with ease on such a site to a large amount. Mr. David J. Chattell, who is the recognised land and house agent at Chislehurst—nearly all the development of that lovely neighbourhood having been brought about or assisted by his exertions—will not improbably witness a considerable extension of the district if Camden Place is subdivided and built over—if it must be built on, which one almost regrets—with artistically-designed and substantial houses.

THE company for constructing a railway tunnel through the Simplon have prepared a new plan, which comprises a tunnel 29 kilometres long, 13 of which will be within Italian territory. They have addressed a memorial to the Italian Government praying for a subsidy of 15 million of lire (£600,000). This sum will be secured by differential rates of carriage in favour of Italian goods which are being exported.

In our description last week accompanying the illustration of the City Hall, Philadelphia, it should have been mentioned that Granolithic paving has been largely laid therein by Stuart's Granolithic Paving Company (Limited).

CAMBERWELL.—For alterations and additions to No. 57, Gloucester-road. Mr. W. A. Burr, M.S.A., 65, Chancery-lane, W.C., architect:—

Larke and Son	£1,157	0	0
Stevens Bros.	985	0	0
Walker	896	0	0
Shipton	876	0	0
Sloan	787	0	0
Mackie	775	0	0

CARMARTHEN.—For building new Independent Chapel, Creobin, near Carmarthen. Messrs. G. Morgan and Son, Carmarthen, architects:—

Howell, B., and Son, Llanelly	£893	17	3
Richards, E., Creobin, Kidwelly	679	10	9

(Foundations of building, also all stone, lime and sand, and haulage, done by the committee.)

CARMARTHEN.—For building new residence at Fountain Hall, Carmarthen, for Mr. H. B. White. Messrs. G. Morgan and Son, Carmarthen, architects:—

Jones, T.	£1,597	0	0
Morris, T.	1,550	0	0
Davies, W. (accepted)	1,465	0	0

(Grates, mantelpieces, and outbuildings not included.)

COLCHESTER.—For the alterations and additions to farm buildings, Stanway Hall. Mr. J. W. Start, F.S.I., Cups Chambers, High-street, Colchester, architect:—

Gardner and Son, Coggeshall	£1,483	0	0
Orfeur, C. E.	1,190	0	0
Chambers, W. A.	1,134	0	0
Dupont, F.	1,077	0	0
Ward, T. J.	1,070	0	0
Diss, A.	986	0	0
Beaumont, R., Lexden (accepted)	913	0	0

(Proprietor supplying all bricks, cement, lime, ballast, and sand.)

COVENTRY.—For cycle works, for Messrs. Taylor, Cooper, and Bednell. Mr. E. J. Purnell, A.M.I.C.E., surveyor:—

Hill, C. G.	£5,495	0	0
Worwood, J.	5,427	0	0
Haywood, C. (accepted)	4,875	0	0

COVENTRY.—For new street, for Hon. C. J. Irby. Mr. E. J. Purnell, A.M.I.C.E., surveyor:—

Hill, C. G.	£1,415	0	0
Turner, A., and Sons	1,405	0	0
Heatherby Bros.	1,247	0	0
Haywood, Jun.	1,085	0	0
Soon, W.	1,033	0	0

DARWEN.—For alterations to Theatre Royal Buildings, Darwen, for new post-office premises, &c. Messrs. Stones and Gradwell, Blackburn, architects:—

Lloyd and Millward, Darwen.			
-----------------------------	--	--	--

GRANTHAM.—For alterations to the Sessions Hall, for the town council:—

Hall, J. (accepted)	£117	2	6
---------------------	------	---	---

GRAMPOUND.—For Trenowth farm buildings, Gram-pound-road, for Mr. R. Harvey, J.P. Mr. S. Trevail, Truro, architect. Quantities supplied by the architect:—

Berry, J. P., Plymouth	£2,638	6	0
Giles, W., Jun., St. Austell	2,436	7	2
Smith, T. J., St. Austell	2,365	3	8
Tiddy, R., Gram-pound	2,361	10	4
Gellard, W. J., Pentewan			
Smith, W. H., St. Austell	2,151	2	8½
Jacob, J., St. Austell			
Blamey, W. G., Verran	2,135	13	0
Hugh, W., Verran	2,061	0	0
Lapthorne and Goad, Plymouth	1,995	14	2
Trevena, W., Plymouth			
Bennett, R., Gram-pound	1,993	13	6
Bennett, T., Gram-pound			
Richards, A., Gram-pound			
Julian, J., Truro (accepted)	1,961	12	2
Welsh, W. H., Truro	1,944	17	0
Tippett, W. P., St. Columb			
Startridge, J., Lanivet	1,889	0	0

HACKNEY.—For altering the old Well-street College into an auxiliary workhouse, for the Guardians of the Poor of Bethnal Green. Messrs. A. and C. Harston, 15, Leadenhall-street, E.C., architects. No quantities:—

Todd, G. E.	£4,520	0	0
Martin, Wells, and Co.	4,500	0	0
Oliver and Richardson	3,926	0	0
Johnson, W.	3,855	0	0
Croaker, W. and F.	3,790	0	0
Shurmer, W.	3,789	0	0
Holland, J.	3,743	0	0
Edmunds, J.	3,425	0	0
Barrett and Power, Hackney	2,970	0	0

HAMMERSMITH.—For heating apparatus, &c., for the Hammersmith Synagogue, Brook Green, W. Mr. D. Joseph, F.R.I.B.A., 17 and 18, Basinghall-street, E.C., architect:—

Strode and Co.	£92	0	0
Rosser and Russell	67	10	0
Musgrave and Co.	49	2	6
Fox, W. J. (accepted)	47	2	6

HEREFORD.—For altering the premises of the old Savings Bank, St. John-street, for the town council:—

Lloyd, J. (accepted)	£56	17	0
----------------------	-----	----	---

HORSHAM.—For the erection of a house and shop at Broadbridge Heath, Horsham, for Mr. J. Stanford. Mr. W. E. Challis, West-street, Horsham, architect:—

Potter, J.	£253	0	0
Potter, H.	249	0	0
Sharp, G.	223	0	0
Pannett Bros.	210	19	0
Rowland Bros. (accepted)	209	0	0

(The employer finding all materials for bricklayer and tiler; also doing all plumber's, glazier's, painter's, and ironwork, and all cartage.)

KIRBYMOORSIDE.—For the extension of the water supply, for the rural sanitary authority:—

Plaice, T., Kirbymoorside (accepted)	£53	0	0
--------------------------------------	-----	---	---

HYTHE, KENT.—For laying a watermain and construction of a reservoir, for the Corporation of the Borough of Hythe. Mr. A. R. Stenning, 121, Cannon-street, E.C., surveyor. Quantities by Mew and Ovenden, 121, Cannon-street:—

Johnson and Co., London	£1,181	0	0
Wallace and Son, Maidstone	1,090	0	0
Stiff, Dover	1,050	0	0
Amos, W. M., Hythe	1,018	0	0
Hayward & Paramor, Folkestone	990	0	0
Peattie, J., Oxford	979	0	0
Palmer, E. R., Beckenham	850	0	0

IPSWICH.—For the erection of the Ipswich Lyceum, in Carr-street. Mr. W. Emden, of London, architect:—

Patman & Fotheringham, London	£7,368	0	0
Pells, J., and Son	7,330	0	0
Reed, Blight, and Co., Ltd., Plymouth	6,885	0	0
Coe, A.	6,834	0	0
Pattinson, S. and W., London	6,818	0	0
Bennett, F.	6,690	0	0
Grimwood and Sons (accepted)	5,943	0	0

[Provisions: £400 for decorative work, £350 for electric lighting, £90 for fire appliances.]

KIRKCALDY.—For the alteration and extension of a mill in Black-street, Path-head, converting it into a linoleum factory:—

Fraser, A., jun., Kirkcaldy (accepted)			
--	--	--	--

LIVERPOOL.—For works of painting and repairing the reading-room and theatre of the Brown Library, William Brown-street, for the city council:—

Morton, G. H., and Son (accepted)	£107	0	0
-----------------------------------	------	---	---

LIVERPOOL.—For 100 tons of 7in. cast-iron pipes, for the city council:—

Firmstone, C. E., and Bros., Stourbridge (accepted)	£4	19s.	6d. per ton.
---	----	------	--------------

LIVERPOOL.—For painting the lodges and the iron and woodwork throughout Sefton Park, for the city council:—

Haywood, J. (accepted)	£454	18	8
------------------------	------	----	---

LIVERPOOL.—For the erection of boundary walls, pillars, gates, and railings at the labourers' dwellings, for the city council:—

Kelly Bros. (accepted)	£242	2	0
------------------------	------	---	---

LLANTOOD.—For building buttresses and restoring the stone dressings of Llantoood Church, Pembrokeshire. Messrs. G. Morgan and Son, Carmarthen, architects:—

Morgan, U., Cilgerran (accepted)	£172	0	0
----------------------------------	------	---	---

LONDON, W.—For rebuilding No. 49, Great Portland-street, W., for Mr. J. Thompson. Mr. A. E. Fridmore, 2, Broad-street Buildings, E.C., architect:—

Perkins, E.	£987	0	0
King, H., and Co.	960	0	0
Crane, J.	870	0	0
Killby and Gayford	843	0	0
Lundy, L. F. (accepted)	755	0	0

## AN ARCHITECTURAL CURRICULUM.

MANY attempts have been made to formulate an architectural scheme of education, but with only partial success. There are those who believe that, to make an architect proficient in his calling, it is necessary to subject him to a system of cramming and examination—that is, that he should undergo a course of instruction in various academical subjects; there are others who have no faith in scholarly attainments, and think it a waste of time that would be better spent in acquiring practical knowledge in some busy office. Between these two opposite opinions there are intermediate courses proposed, in which the academy or the workshop has a leading position assigned to it. The fault of both these extreme views is that they fail to represent the architect's requirements. The purely scholastic scheme, while an admirable training, does not fit the pupil to solve the problems he is called upon to consider, while the purely practical course fails to supply the student with the necessary motives for his work. The two must be combined in such a manner as to form a motive for study. Under the heads of Materials used in Construction, Construction, Requirements of Buildings including plan, History of Architecture, Aesthetics, Decoration, Professional Practice, the graduate in architecture may acquire both the theory and the application of science to his own special objects.

These remarks are confined to the question of—What ought to constitute a curriculum in architecture? The great objection to the schemes of the existing universities and colleges in which architecture is made a subject is that abstract science is learned as a separate course, having little or no relation to actual wants. Science and its applications are learned separately as two distinct branches. The lectures on particular sciences are given by professors who have made them distinct studies, and who are not necessarily architects, and with no particular reference to structures. Many who attend the lectures are general students, for whom they are well adapted. Take, for instance, mechanics: the instruction contains nothing appertaining to the problems of construction like the forces to be dealt with in roofs, the stability of walls, and buttresses, and arches, the stresses called into play in beams, cantilevers, &c. The lectures on chemistry rarely allude to the questions touching the composition or disintegration of stones, the composition of limes and cements, or the action of moisture and gases on materials such as iron, zinc, or copper. Geology is taught in its general principles without reference to the architect, and the same indifference to practical applications is shown in the instruction given in physics—heat, light, sound, hydraulics, pneumatics, &c. The examination papers show on all these subjects a want of practical requirements. A logically prepared programme for the architect ought to be something very different. Every lecture on the general properties of matter, like gravitation, motion, force, and friction, should have some reference to construction. On dealing with heat the lecturer ought to give point to his instruction by particularly noticing radiation and reflection, as they bear on the construction of grates, expansion of metals, and gases. Of what value is a study on gases, unless it shows him how to form his flues and to promote ventilation? The laws of sound ought to be taught as to make it clear how the archi-

tect can design his churches and lecture halls to insure the proper acoustical conditions, and how too much resonance and echo can be prevented. The study of electricity ought, of course, to be directed to touch all that appertains to the electric light installations, to the construction of dynamos, the wiring of buildings, and the merits of lamps. It may be replied, and in one sense truly, that these things cannot be best learned from a study of natural laws; but this is because lecturers have not generally the practical knowledge of details. Practical rules can only be deduced by knowing the requirements of actual buildings, therefore it is more likely for an architect to find them out than a student of pure science. Herein is the difficulty of forming a satisfactory curriculum for the architectural student. Hitherto he has been instructed partly by science professors, partly by practical men, each ignorant of the other's wants. To attempt to sketch out a programme, therefore, that shall be at once logical and progressive, is attended with some difficulty. A combination of the two requisites in the same teacher is rarely found.

We may imagine the student has received a liberal education of a general kind, and now wishes to commence a course of architecture. What should be the order of teaching? In many of the universities the mathematics, pure and applied, are pursued through the entire course. Physics and chemistry are taught theoretically and experimentally; general history is pursued as preliminary to the history of art and the development of architectural styles; and the languages are taught as accessory to critical and artistic literature. All very well as far as they go; but there is a strong line of demarcation between what is taught in theory and what by experiment. There is, moreover, a want of order in the lectures; the pupil is expected to put the whole together in his brains—to sift the wheat from the chaff. An architect's curriculum ought to begin with applying principles to real problems. It should begin with those of simple construction, and proceed to more complex conditions. Thus materials offer a capital opportunity to teach chemistry and physics practically. A course of instruction on brick, stone, concrete, timber, and iron should also include examples of design in those materials. The student, for instance, might be asked to show the construction of a dome or a vaulted building of stone or brick having reference to the action of weight and thrust, by which his knowledge of the "resolution of forces" or graphic statics could be tested. A certain section to scale should be given him to find out the thrust of the vault and its stability, and he should be asked to design a section that would give a secure margin of stability, showing the depth of buttresses. The lectures on materials might, in short, begin with their chemical composition, deal with their physical properties in the way described, and afterwards proceed to treat of them artistically. This threefold way of considering material would impress upon the mind of the student, by association of ideas, all that was necessary to be known of theories and physics as applied to material. Materials, as an important section, might form a distinct course of lectures. It would extend the limit of this article if we were to give examples of the kind of information that would be taught at this stage. For example, the constituents of Portland cement, the mode of manufacture, the precautions required in using it to avoid expansion and cracking, the different kinds of brick manufactured, bond, the load that may be safely placed on a pier of best stock brickwork—say, 2ft. square and 15ft. in height; the varieties of stone quarried for building, their chemical composition, their durability and means of protection, and the load a pier

of stonework of a given description will sustain. In concluding the course, the student would be required to submit designs of a brick or stone pillar to support a certain weight; to show plans of consecutive courses of brickwork for jambs, chimneys, bay windows, and other construction; and to submit designs for brick and stone details of a simple kind, such, for example, as base mouldings, capitals, jambs, arches, having particular reference to bond, joints, dowering, &c.

In timber the same course would be pursued, the natural description and growth, the conversion and seasoning, the proper kinds to be used for roofs and floors, and for internal fittings; the specification description, the causes, prevention, and cure of dry rot; the construction of timber beams and roofs, and the elements of design in timber, are points that would be necessarily dealt with. So with iron, concrete, and other materials used in building. After such a course of instruction in materials—which ought to be placed in the hands of specialists—the student would be better able to commence a course on Construction in which the higher branches of the science would be pursued. The kind of instruction should be given with more particular relation to actual requirements. Thus the student ought to be instructed in the necessary conditions of properly draining a site for a building on a clay subsoil; he should be taught how to apply a system of drainage to a house, how the soil and sink pipes, and rain-water pipes should be treated; where the traps and disconnecting-chamber should be placed, the ventilation, and the methods of damp prevention. In this advanced course the method of bonding brickwork for particular objects, wood and iron bond, hollow walls, composite walls of brick and stone, the proper methods of connecting stone in masonry, domical, and arch construction, vaults and groining, the thrusts, and modes of counteracting them, would be dealt with. In woodwork the stresses and framing of roofs, the theory of beams, and the formula for calculating girders and joists for safe loads, methods of jointing timbers, the framing of doors, windows, the construction of staircases, &c., would be comprised. Fireproof construction, the methods in use in which iron joists, concrete, and arching are introduced, iron columns and girders, would form another branch. Designs for warehouses, floors, roofs, and other special features of building would form a fitting test of the student's acquirements.

A third course of instruction would naturally be the application of the above scientific training to the actual requirements of various kinds of buildings. At this stage, the art of planning and designing domestic buildings, schools, churches, infirmaries, workhouses, factories, and other structures might be exercised. The course of instruction should point out the statistical data and main considerations in arranging plan for different accommodations, the areas of floor required per individual, the planning of houses in relation to aspect and prospect, the seating of churches, grouping of desks and benches in schools, beds in hospital wards, special fittings for other institutions. No university course in England has made this a special feature; but until it is, the practical knowledge of the architect's requirements will be neglected. Simultaneously with lectures and classes in this department, which would be best conducted in an atelier, the student should have access to models and examples of buildings of every class; lectures might be given on the history and literature of architecture, the development of styles, decorative design and ornament, perspective drawing, and modelling. In a fourth and final course of lectures, the science of aesthetics, the history of the fine arts, colour decoration, and specialities would

receive further attention, and the student would be required to submit designs for buildings of a more elaborate and decorated character.

Mensuration and professional practice could form an independent subject, and be given alternately with the earlier or later courses. In no other way, we conceive, can a thorough practical knowledge of the art be acquired in its various branches. The course sketched out would prepare the graduate step by step for his profession. The special branches of construction, which are not touched by the ordinary classes—warming and ventilation, electric-lighting, the special requirements and fittings of schools and hospitals—would be included in connection with the second and third stages—the courses dealing with construction and the requirements of buildings. Each course would be necessary for that which is to follow, though each might be pursued independently. The graduate at the end of his studies would be practically, as well as theoretically, grounded, and not, as now, obliged to acquire his practical knowledge afterwards in the pursuit of his profession. In the American Universities, mathematics and physics absorb so large a portion of the entire course as to render it impossible for the student to know anything of the actual requirements of building till considerably advanced. Thus the Report of the Committee on Education, read at the Convention of the American Institute of Architects, says:—"The students in the College of Fine Arts of the Syracuse University are not encouraged to originate designs for edifices of any kind before the last two years of the course, nor is it required till the last term of the senior year, when the candidate for graduation is expected to make an original design for an edifice, with the necessary working drawings and specifications." The point that appears of moment is that every science should be taught in its application to building or the requirements of the architect, instead of being taught independently of construction.

#### DUDLEY GALLERY ART SOCIETY.

THE water-colour drawings and sketches now open to the public in the Egyptian Hall represent very varying degrees of merit. As usual there is a large sprinkling of landscape, the amateur hand in which is discernible. Among these, of course, we do not include the works of such artists as Hubert Medlicott, Reginald Jones, Mildred A. Butler, John Fullwood, Rupert Stevens, J. Culverwell, and others, whose drawings are the chief attraction of the gallery. Going through in the order of hanging, we come across some nice drawing and colour by William V. H. Cobbett, as in "Canale Greco, Venice" (9), and his minutely-drawn and sharp little sketch, a *bon bouche* of delicate handwork, "St. Mark's Library" (103), in which the architectural detail and tone are expressed; also "The Salute, Venice" (270). Percy Dixon's "Misty Sunlight" and "Moorland View, Ross-shire" (6), are clever sketches, the former a coast view—a sleepy bay suffused with misty light. Celia P. Culverwell sends two or three delightful studies. "A June Morning on the Wicklow Coast" (17) is a clever piece of coast and sea drawing, the waves breaking on the rocks, and the soft smoothness of the sea, and blending and purity of the colour. "Golden Evening" (55), a river flowing between wooded banks, is another example of the softened tones of this painter. The president, Walter Severn, enthusiastically paints his usual subject—torrents and streams limping over rocky beds. "Kelburne Glen" (28) and "Auchen Darroch Glen" (37) are drawings of this description, in which a close study of nature and a strong and decided touch are shown,

perhaps a little hard. Besides glens, his views of Mentone, and his large view of "Kelburn Castle, Ayrshire" (259), will be noticed. Nice tone is seen in Arch. Webb's "Evening" (29). A bright bit of colouring is the sketch of "Dordrecht" (78); other sketches show a keen sense of colour. A large contributor is Hubert Medlicott, who sends several drawings of more or less merit. "Battersea Mill and Old Chelsea Church" (38) is a pleasing river sketch, the grey tones and atmosphere well rendered. The "Doorway, Venice" (39), an Italian Gothic example, and the sketches of the church of St. Germain l'Auxerrois and Rouen Cathedral (42-44), and other views from Rouen, show that Mr. Medlicott has not been idle. The sketch of "Porch of St. Germain l'Auxerrois," with its blue and star-spangled vault, is pleasing and feelingly drawn. Other sketches on the Thames (239) and "At Shoreham" (367) show that river scenery has not lost its charm. George Marks limns, in his usual rather mannered style, "The Miller's Daughter" (53), soft in handling and poetical in sentiment. "When the Sun is Low" (56) is another drawing mellow and harmonious in tone, a stippled effect being given to the shadows. John Fullwood is a strong painter of landscape. "The Vale of Shere" (63) is a large landscape of hills and wooded middle distance, autumnal in tone. The russet-brown trees and the hilly distance make a telling picture. "Isleworth" (57), "Brentford" (69), "Chiswick" (212), are bright and clear in colour and handling. We must pay a tribute to Mrs. Alfred Jephson's "Rainy Day in the West Country, Totnes Bridge" (61), a clever suggestion of moisture and humidity, grey in tone. The rift in the dark rain-clouds lights up the bridge and river very realistically. The Westminster sketch, "A Day of Fog and Snow," is also clever. William Henry Wallis (74) has a drawing of "Netley Abbey," showing the south transept, in which the details and colour are truthful, also some "Old Houses, Dieppe" (67). Fred Burgess's large views of "Santa Maria della Salute" (82) and "Afternoon Light, Venice," are more meritorious in point of colour and tone than drawing. Other views on the Continent show him to be an untiring member of the society. P. E. Bishopp's "Font, Winchester," and "High Tide, Rye," are noticeable; so also the works of Henry Terry in figure studies are worth attention. His portrait, "Most Reverend Signior" (1), is a caste of countenance we are most familiar with; "A Straw-Plaiter" (97) is a well-drawn and pleasing study of a girl standing, the expression and pose, simplicity of colouring, and manipulation worthy of the artist; "In Fault" (249), a neat cottage interior, in which sits an elderly woman correcting her grand-daughter, is characteristic—the sour expression on the girl's face is cleverly rendered. R. Werner has a good drawing of "Mantelpiece in Doge's Palace" (92); Frances C. Fairman's "Spring," a pleasing study of sunlight on light-green foliage; H. J. Thurnall's "Rochester" (109), with the Medway, is a nice study of atmosphere and grey light. At the end of room, in the centre, hangs a bold landscape—the only picture—by Rupert W. Stevens, whose work at this gallery we have so often admired. "Amberley" (133A) is delightfully picturesque. The painter has selected the old church, with its massive square tower and tiled roof seen above the tiled cottages and alders of the river bank; the breadth of handling and purity of colour—fresh and thoroughly English—are characteristic of Mr. Stevens's work. Two small works by Albert Stevens, both river sketches, are worth notice (122, 127). Carlo Giorisio (138) has a carefully-treated woodland subject, the sunlight effect clever. David Green's "Marshland" (141), and especially "A Wet Day"—a dock quay with a group of labourers under a shed—is

clever as a study of moisture and glistening wet, the colour excellent. Nor must we forget to mention the miniature studies of figures by Menta, of Nice, exceedingly clever sketches in colour. Reginald Jones's work is always charmingly bright and broad in treatment, simple washes of colour, with the lights left on the rough-toothed paper. "Monte Rosa" (173), "Spire of Chislehurst Church" (168), "In the Bright Month of May," "A Grassy Mere" (176) are brilliant examples of his pencil; also the atmosphere and colour in the fine mountain study, "The Oberalp from Andermatt" (320). Mildred A. Butler (171, 185, 183) is a lady whose cattle subjects and meadows are full of freshness and life. "Peace and Plenty" (185) is one of the best contributions. We must also notice the minute finish and conscientious work of Lexden L. Pocock (181, 186), Albert Stevens's clever sketch of Durham, Helen O'Hara's skilfully-painted sea studies, the realistic group of books by L. Block (194), Miss Bailward's "Lonely Shore" (227), Rose Barton's "Wallflowers" (237), B. J. M. Donne's "Autumn Evening near Bolzen," R. A. K. Marshall's view of "Needles and Alum Bay" (244), Haward Gaye's fine drawing of the west front of Ely. On the screen, Miss Dorothy Tennant contributes two or three sketch-studies in pencil of boys bathing, and a clever group, "Our Small Brother" (342); these, though small and unimportant, will have, just now, an interest. Another lady artist, Josephine Culverwell, in "Springtime at Lucan" (317), has made her mark in landscape. There is much that is mediocre and commonplace, but we believe that the last few exhibitions have shown greater strength. One large and powerfully-painted picture on this screen is a coast scene, "On the Welsh Coast," the rocks and sea in strong colour, but we find no name to it.

#### THE ARCHITECTURAL ASSOCIATION.

THE ordinary meeting of the Architectural Association, adjourned from the evening of May 16, was resumed on Friday evening, the President, Mr. Leonard Stokes, occupying the chair.

The names of three gentlemen nominated for election were read out.

Mr. FARROW, hon. secretary, announced that the next two visits of the class for sketching and measuring would be made to St. Mary Overy in July, the precise date not finally settled. A vote of thanks was awarded to Messrs. Satchell and Edwards in connection with the previous visit.

The PRESIDENT read the names of those who had signed the requisition to alter some of the rules—viz., Messrs. Stokes, Appleton, Baggallay, Burrell, Hooper, Horsley, Mountford, Pratt, Pryce, Slater, Town, Farrow, and Gale. It was decided to revise rules 3, 4, 5, 8, 10, 11, and 18, the most important changes being the mention in rule 3 of "an architectural studio" as one of the objects of the Association, and the recasting of rule 4 as follows: "The arrangements for each class or course of lectures shall be determined by the committee, who shall appoint the lecturers or visitors and fix the number of meetings, the fees to be paid by the members, and the remuneration to be given to the instructors, but members desirous of associating for the study of a specific subject shall, subject to the sanction of the committee, be allowed to form a class, frame their own by-laws, and appoint such officers as they deem necessary." Town and country members were defined in rule 5 by the addition of the words, "country members shall be those having neither residence nor occupation within a radius of thirty miles from Charing Cross." Rule 18 will read, "The annual subscription shall be one guinea for town members, and half-a-guinea for country members, due upon election, and at the commencement of each succeeding session."

Mr. STIR hand in a requisition proposing to alter Rule 43, so that it should in future read:—"All voting shall be taken by show of hands, but no question touching any alteration of the rules or constitution of the Architectural Association shall be decided upon at any meeting

without first submitting such proposed alterations to the whole of the members, and furnishing each member with a printed voting paper; the decision of the majority so voting shall be considered final."

The requisition was signed by Messrs. Sedding, Stannus, R. Phené Spiers, W. White, Boyes, Crace, Collins, Max Clarke, R. W. Edis, Needham Wilson, Bulman, Rope, Jacob, Sirr, Leverton, Hudson, Whitmore, Reavell, Waterston, Mew, F. Fawcett, Elphicke, Perks, and Lansdown.

Mr. STANNUS asked whether it was not usual to read the minutes.

Mr. FARROW replied that there were no minutes to be read, the present meeting being the adjourned meeting of the 16th. The minutes of the previous special business meeting would be read when the special business meeting opened.

The special business meeting was then opened and the minutes were read.

Mr. STANNUS rose to question the President about the proceedings at the last meeting, and ask what had been done with an amendment that he had proposed at the meeting on May 16. The necessary explanations were given.

The PRESIDENT said the special meeting had been called to consider the modifications to the rules formulated by the committee. All the members in the room and outside had had the notice paper with the proposed changes sent to them. They wanted to discuss these. They were now met by a countermove in the signed requisition to alter Rule 43. At a special meeting duly called, the proposal that "expression of opinion" papers should be sent round to all the members had not been carried. Now they were told that they were not competent to alter their rules, and at the same time they were called on to alter Rule 43. Not a soul outside the room knew of the requisition. The rules clearly contemplated that these matters should be known outside. Practically the requisition, if carried, meant the rescinding of the decision arrived at a fortnight ago. He left to the meeting to decide which requisition should be discussed first. If they decided to take the alteration of Rule 43 first, the only course would be at once to adjourn the meeting, and send out notice papers.

The ensuing discussion lasted about an hour. The attendance was not quite so numerous as on May 30, and it would have been still less only for the presence of members who seldom attend the meetings. The resolutions were as follows:

Mr. STANNUS proposed to consider the alteration of Rule 43 first. This was seconded by Mr. J. D. Mathews, and supported by Mr. Pite. 38 voted in favour and 26 against.

Mr. MAX CLARKE proposed that the meeting should adjourn for a week, and that notice papers be sent out. Mr. BRODIE seconded.

On an amendment by Mr. STANNUS to adjourn till after the Presidential address next session, 30 held up their hands in support and about 40 against. The result was received with great applause.

A further amendment by Mr. J. D. MATHEWS, seconded by Mr. LEVERTON, to adjourn for a fortnight, was lost by three votes—46 against 43.

The motion to adjourn for one week was then carried without opposition, and the meeting adjourned at 9 p.m.

#### No. 282, STRAND, W.C.

THESE premises have recently been rebuilt, and are now being fitted up and furnished for the purposes of a restaurant, with dining-rooms on the first floor over the shop. The basement is arranged as a smoking-room, with lavatories, &c., attached, and kitchen and living accommodation is provided on the fourth floor. The intermediate floors are arranged as offices. The Strand front is executed in Portland stone, with grey and red granite pilasters to the shop, and the carving has been executed by Mr. G. Arrowsmith, of Brixton. The premises have been satisfactorily erected by Messrs. Newton and Co., The Chase, Clapham Common, S.W., the contractors, from the designs, and under the supervision, of the architect, Mr. William H. Duffield, A.R.I.B.A., 2, King-street, Cheapside, E.C.

A new Wesleyan chapel, with schoolroom adjoining, is about to be built at Penryn, from plans by Mr. J. W. Trownson, of Penzance. The outlay will be about £3,200.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE closing meeting of the session was held on Monday evening, Mr. Alfred Waterhouse, R.A., President, in the chair. The minutes of the previous meeting were confirmed. The secretary stated that many donations had been made to the library, and mentioned some, time not allowing the long list to be read. Among those mentioned was a Latin edition of Vitruvius, presented by Mr. Cates. A hearty vote of thanks was awarded the donors on the motion of Mr. Hansard, who strongly appealed that donations of books and newly-published works might be made. A ballot then took place, and the following were elected as Fellows:—

Frederick William Tarring, 1, Woodland-road, New Southgate; Edward William Mountford, Associate, 22, Buckingham-street, Strand, W.C.; Stockdale Harrison, Associate, St. Martin's East, Leicester; Christopher Harston, 15, Leadenhall-street, E.C.; Nathan Solomon Joseph, 45, Finsbury-pavement, E.C.; John Salmon Quilter, Associate, 10, Brunswick-square, W.C.; William Henry Spaul, The Poplars, Oswestry; Philip Henry Tree, Associate, 59, London-road, St. Leonard's-on-Sea; Edward Henry Bruton, Associate, Glamorgan Chambers, 15, Queen-street, Cardiff; James Neale, F.S.A., Associate, 10, Bloomsbury-square, W.C.; Walter Augustus Hills, 149, Bow-road, E.; William Henry Thorp, Associate, 61, Albion-street, Leeds; Leslie Ower, 104, Commercial-street, Dundee; William Douglas Caroe, M.A. Cantab., 35, New Bond-street, W.; Leonard Aloysius Scott Stokes, Associate, 31, Spring-gardens, S.W.; Robert William Collier, Associate, 30, Lincoln's Inn-fields, W.C.; Frederick Atkinson Powell, Associate, 344, Kennington-road, S.E.; Stephen Shaw, 57, Highgate, Kendal.

The following were elected as Associates by show of hands:—

Herbert William Doe, 84, Prince of Wales-road, Ken-tish Town, N.W.; Frederick Moore Simpson, 9, Dean's-yard, Westminster, S.W.; Samuel Edward Wall, 16, Russell-square, W.C.; Herbert Stone Wood, Meadow View, Rectory-road, Beckenham, Kent; Bastick William Nunn, 5, Bath-street, Brighton; Thomas Edgar Eccles, Oak Hill, Roby, Liverpool; William John Mettam, 8a, Park-lane, Leeds; William Eaton, 31, New-walk, Leicester; Eustace Corrie Frere, 16, Great College-street, S.W.; Richard Thomas Beckett, West House, Hartford, Cheshire; Robert Stodart Lorimer, 1, Bruntsfield-cres-cent, Edinburgh; Henry Harold Hughes, 13, Drayton-green-road, Ealing Dean, W.; James Sivewright Gibson, 40, Albany-street, N.W.; George Harvey, 18, Ingersoll-road, Shepherd's Bush, W.; Samuel Bridgman Russell, 34, Craven-road, W.; Alfred Eustace Habershon, 10, Pevensey-road, St. Leonard's-on-Sea; William Brame Goodwin, 63, Florence-road, Stroud Green, N.; Henry Leonard Hill, 12, New-court, Carey-street, W.C.; Alfred Henry Hart, 23, Glasshouse-street, Regent-street, W.; Arthur Edward Ansonbe, Hazelbank, Harpenden, Herts; Edward Carter, Bradnor House, Surbiton; Arthur Harry Beron, 153, High-street, Uxbridge; Harold Arthur Woodington, 47, Endymion-road, Brixton-hill, S.W. As Hon. Associates: Alexander Stuart Murray, LL.D., F.S.A., Keeper of the Greek and Roman Antiquities, British Museum, 54, Gower-street, W.C.; Right Hon. Lord Savile, G.C.B., 28, South-street, Park-lane, W. As Hon. Corr. Member: Professor Johannes Otzen, Member of the Royal Academy of Arts (Berlin).

The next business was the presentation of the Royal Gold Medal, the gift of the Queen, to Mr. John Gibson, a past vice-president, for his works as an architect.

Mr. ALFRED WATERHOUSE, R.A., the president, said that of the 42 gold medals already awarded, 20 had been given to fellow-countrymen whose greatest claim to distinction was their success as practising architects, while seven other medals were awarded to Englishmen whose claims were rather that, as authors or archaeologists, they had done something noteworthy for the advancement of the architect's art. Of the fifteen foreigners who had received this honour, more than half the number had been distinguished for their buildings rather than for their books. He trusted that the fact of the choice of the Institute having fallen in 28 cases out of 42—or on two-thirds of the total number—on practising architects might be looked upon as matter for congratulation as a sign of architectural vitality and progress during her Majesty's reign. There was now a greater number than ever of men of capacity, merit, and sterling character, who were doing their best by their lives and practice to uphold the status of the profession, and make it appreciated by the world. Pre-eminent among those stood the colleague who had been chosen by the members of the Institute to be commended to her Majesty as the recipient of her gold medal in the present year. Mr. John Gibson entered the office of Sir Charles Barry as his articulated pupil in 1835. After serving a three years' term of pupilage, he remained with him for six years, and assisted him in his great work, the Houses of Parliament. Beginning practice in 1844, after so excellent a training, Mr. Gibson appeared to have entered at once on his most successful career. Mr. Waterhouse gave a

catalogue of Mr. Gibson's principal achievements, and said he had the greatest possible pleasure in handing to him the highest distinction which it was in the power of the Institute to confer, and which was presented to him with Her Majesty's most graciously expressed approval.

Mr. CHARLES BARRY added a few words of tribute to Mr. Gibson, who briefly expressed his cordial appreciation of the high honour done him. The proceedings of the session thus terminated.

## CONTEMPORARY BRITISH ARCHITECTS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THE fourteenth sheet of portraits of living British architects is that which we print to-day, and the following notes furnish a few particulars of each of those now represented:—

Mr. G. H. Hunt, of Gray's Inn-square, lately in partnership with Mr. Thomas Verity, is the architect of the Gloucester Municipal Buildings, now in course of erection. Among his former works which have been carried out we may mention Great Alne, Warwickshire; Avenue House, Bishopton, Stratford-on-Avon; Holly Mount, Evesham; Englethwaite, Cumberland; house for Sir Geo. Philipps, Bart., Birmingham; The Hall, Thornton-le-Street, for Lord Cathcart; Sand Hutton Hall, for Sir James R. Walker, Bart.; and the Gloucester Municipal Buildings, now in progress, which was won in competition. Jointly with Mr. Verity, Mr. Hunt built the Scarborough Spa Saloon, Nottingham Guildhall, and the Agricultural Hall improvements at Islington; with him he was also placed second in Admiralty and War Offices competition. His plans in conjunction with Mr. Bateman were placed second in the competition for the Birmingham Law Courts. Mr. Hunt's photograph was taken by Mr. Barraud, of Oxford-street.

Colonel C. O. Ellison was the first President of the Society of Architects, and also was the assessor of the Liverpool County Courts. He is the senior partner of the firm of Messrs. C. O. Ellison and Son, of Dale-street, Liverpool. He has designed a large number of commercial buildings and banks. The hospital for the Borough of Bootle, Eye and Ear Hospitals at Liverpool and Shrewsbury, another hospital at Belper, Derbyshire, and the Town Hall at Birkenhead, are among his chief works. He has built churches at Brighton, Rugby, Leeds, Bradford, Newcastle-on-Tyne, &c.; schools for the School Boards of Bootle, Toxteth, and Liverpool. He carried out the town improvements well known as the Loch Promenade, at Douglas, Isle of Man. He has been for some years Honorary Colonel of the 1st Lancashire Engineer Corps, of which he was the founder at the beginning of the Volunteer movement. He is now erecting Artisan Dwellings for the Liverpool Corporation.

Mr. John George Finch Noyes, F.R.I.B.A., was a pupil of Mr. William Burn, of 6, Stratton-street, and has been in practice for about 26 years. He was elected a Fellow of the Institute in 1876. He has carried on a considerable private practice in London and the country, and has been for some time past laying out a large building estate called Heathfield, at Handsworth, Birmingham, formerly the property of the great James Watt, the engineer. His principal works are Glenisland, Maidenhead; Chesfield, Hampton Wick; Green Park Residential Chambers, Piccadilly, W.; 21, Lennox-gardens, Pont-street, S.W.; Oakley Court, Windsor, alterations and additions, and new stables; Cefn Park, Wrexham, alterations and additions; Chippenham Park, near Newmarket, alterations and additions; Kingsclere racing stables; Branches Park Schools, Newmarket; Mapleton Lodge, Edenbridge, alterations and additions, and new stables; Llanwithwl Church, Brecon; new chancel, Chippenham Church, Cambs; rectories at Eakring, Notts; and Freston, Suffolk; vicarages at Scrivelsby, Lincolnshire, and Handsworth, Birmingham. Mr. Noyes has also built largely for himself, in the way of residential chambers in Half Moon-street, W., on the Sutton Estate. Mr. Noyes' portrait was taken by the London Stereoscopic Company, Regent-street, W.

Mr. Hugh Roumieu Gough, F.R.I.B.A., Past President of the Society of Architects, is well known to our readers as a pioneer in the cause of registration. He was elected chairman of the Architects' Registration Act Committee in 1886, a position he still holds. He is also a corre-

sponding member of some colonial and foreign architectural societies who are making efforts to obtain similar legislation. He succeeded his father, the late A. D. Gough (to whom he was articulated) in 1872. Amongst his principal works may be mentioned the completion of St. Anne's Church, Holloway (commenced by his father), the restoration and enlargement of St. Mary's, Walkern, Herts; St. Philip's, Islington; All Saints, Barmston; St. James's, Lissett; St. Oswald's, Methley; SS. Mary and Nicholas, Kippax; St. Giles's, Killamarsh; Marston, St. Lawrence, and Greatworth, Northants; cemetery chapel at Colombo; St. Stephen's, Gloucester Gate; St. Giles's, Crowhurst; SS. Michael and All Angels, Sheffield, and some others. Of new churches are St. Elgin, North Frod-ingham; St. Lawrence, Atwick; St. Agatha's, Shoreditch; St. Cuthbert's, Kensington; St. Lawrence, Catford Bridge; and the parish church of St. Paul at Hammersmith. This latter was built in conjunction with Mr. J. P. Seddon, of Westminster. The pro-cathedral for the diocese of Brisbane, now in course of erection, is also from his design. Amongst his school buildings we may mention Marchington, Woodlands, Staffordshire; St. Anne's Schools, Holloway; St. Philip's, Islington; Ardsley and Walkern, Herts; Board Schools at Micklethorn and Scholey Hill, Leeds; Langley, Horsemoor Green, and Middle Green, Bucks; Atwick, Yorks. Alterations, partial reconstruction, and entire redecoration of the Army and Navy Club, Pall Mall, was an important work, and St. Mary Magdalene's Home, Paddington. Mr. Gough did some works at the Health Exhibition for the Duke of Buckingham and Col. Sir Francis Bolton, the Lambeth and Finsbury Polytechnics, and St. John's Mission Hall, Hammersmith. Mr. Gough was one of the founders of the St. Paul's Ecclesiological Society, and is a member of other archaeological and architectural societies. He took an active part in the formation of the Society of Architects, and was its second President. He has recently taken into partnership Mr. Percy M. Roberts, of Sheffield. Mr. Gough's photograph was taken by Mr. Bassano, of Bond-street, W.

Mr. Walter Emden, of the Strand, was architect to the following buildings, viz.:—Dublin Exhibition, 1872; St. James's Hall Restaurant, Piccadilly; St. James's Hall entrances, Piccadilly; old Court Theatre, Terry's Theatre, Strand; new Court Theatre, Chelsea; Garrick Theatre, Charing-cross-road; and the Tivoli Music-hall in the Strand, all of which works have been erected from his designs. Beyond these works, he has carried out various alterations at the different theatres and music-halls, among others at the Oxford, the Aquarium, and the Globe Theatre. These works are exclusive of private houses, warehouses, and other classes of work executed by him. The new theatre at Ipswich is one of Mr. Emden's more recent buildings, and a market in Shaftesbury-avenue is proposed to be built from his plans. His portrait was specially taken for our series.

Mr. Arthur Billing, F.R.I.B.A., architect to Guy's Hospital, concludes our double-page plate. He entered Mr. Benjamin Perry's office in 1847, and was with him for several years, and after that was with Mr. Hardwick. Having been surveyor to this hospital for many years, he has designed several important additions to it, such as new large operating theatre, post-mortem room and dead-house, coroner's court, and various large classrooms for medical school, new houses, St. Thomas's-street, for the medical staff, &c., as well as large hop and other warehouses on the "Guy's" estate, Southwark, for Messrs. West, Jones, and Co., Thorn, Son, and Kenneday, Pattenden and Smith, Latter's, Hooper's; also new wharves and warehouses, Messrs. Barclay, Gray, and Co.'s Oil Mills, St. Saviour's Dock; wharf and warehouses, Messrs. Talbot and Sugg; Gladdish's, Shad Thames; Colonel Beresford, Brown and Elmslie, Davis's Wharf, Messrs. Carbutt's Rice Mills, Shad Thames; Dunn's Warehouse, South-street; warehouses, St. Thomas's-street, &c. The following new churches have been built by Mr. Billing:—Parish church, Kidmore End; Christ-church, Deptford, galleries; St. James', Kidbrooke, near Blackheath, tower; Christ Church, Somers Town, galleries and tower, and school for 600, with residences; All Saints', Hatcham; St. Matthew, Stepney, tower; St. Peter, Paddington, tower; Holy Trinity, Penge; St. Luke, Homerton, tower; St. Andrew's,

Fulham, tower; St. Peter, Eltham-road, Lee; St. Thomas, Islington, galleries; parish church, Hammerwich, near Lichfield; Meyringen Church (English), Switzerland; St. John's, Chelsea; St. Andrew's, Newington, tower; St. Paul's, Old Ford, small tower; St. Augustine's, Stepney; and St. Peter's, Fulham. The following ancient parish churches he has restored or enlarged:—St. Dunstan's, Stepney, Middlesex; Dingley, Stanford, Berks; Garveston, Norfolk; Caversham, Oxon; St. Magnus, London Bridge; St. Sepulchre's, Holborn, London; St. Margaret's, Ridge, near St. Alban's; St. Michael's, Hernhill, Kent; St. Mary's, Finchley, Middlesex; Seddlescombe, Sussex; St. Lawrence, Reading, Berks; Wrotham, Kent; and St. Peter le Poor, Broad-street, City, now in progress. Of parsonage houses and schools:—St. Olave's Rectory, Southwark; St. Paul's Vicarage and Schools, Southwark; Rectory House and Schools, Berkhamstead; Vicarage House and Schools, Kidmore End, Oxon; St. John's Vicarage, Blackheath; St. Simon's, West Kensington; Stoke Rectory, near Chichester; Seddlescombe Parsonage and Schools, near Hastings; St. Peter's Vicarage, Lee; Thatcham, near Newbury, &c. Mission Halls at St. Luke's, Homerton; Crouch End, Hornsey; St. Mary's, Finchley; St. Matthew's, Wandsworth Bridge-road; College Park, Kensal Green; Parson's Green, Fulham; also the Burley Vale Mills, near Leeds; Westbourne Hall and Bayswater Athenæum, now appropriated to a very different purpose to what they were originally intended by Mr. Whiteley, the Universal Provider, Westbourne-grove. On the decease of his late partner, Mr. A. S. Newman, in 1873, Mr. Billing became surveyor to the St. Olave's Board of Works, Southwark, and held the appointment till the last four or five years. The photograph given is by Mr. Parker, of High Holborn.

# CARPENTRY AND JOINERY.—XXXI.

WINDOW FINISHING.—(Continued.)

ALL that has been written of window finishing has been introductory to what is now about to be entered upon—namely, a full-trimmed window. This used to be considered a kind of masterpiece for a joiner; as he who could lay down the working lines in plan and elevation, for soffit, back, elbows, shutters (including backfolds) with splay blocks, back boxing or wall lining, foxings, freezing beads, architraves, and some other odd

plaster—in fact, it is the same breadth as the shutter, which will be considered presently.

The back fits in between the two elbows, thus making it necessary that the elbows shall be first fixed (temporarily, at least).

Fig. 212 shows a front view in elevation of the elbow without any plinth or skirting. There are two stiles, showing equal width and of the

FIG 212

1 1/2" Scale

same thickness, and two cross rails, the bottom one being broader, so as to form a groundwork for the upper edge of the plinth to be nailed to. Now it will be best to detail one of the simplest kind of full-trimmed windows, so as not to perplex the reader or the somewhat inexperienced workman. So let the capping on the elbow have a 3/4 in. bead on its front edge; it will be plain then that the height of the elbow will be the distance from the floor to the top of the groove in the sill of the frame, less 3/4 in. for this capping. The depth of plinth or skirting will determine the position of the bottom rail; let it show from 3 in. to 4 in. of a rail above the plinth.

It will be noticed that the elbows and back are tenoned in the ordinary way, and the groove for panels is kept back from the face to suit the moulding.

Haunching has to be left on the top rail; 1 in.

FIG 213

1 1/2" Scale

will be sufficient, and this will tuck in the depth of the plough groove. It is not necessary to enter further into the particulars of the finishing of this framing, as it has been explained already how framing is mortised, tenoned, and finished. Of course the horns are left on the stiles above the top rail until the elbows are being fixed, and a floor line should be drawn on the face and edge

of stiles to serve as a guide in fixing; of course, this is not very necessary, seeing the joiner can work from the groove in the sill. The back will correspond in height with the elbows, and now its width requires to be fixed; well, then, the shutter shows 1/2 in. of a margin from the edge of the inside casing of sash-frame, so that when the thickness of the back is set out from the sill of the sash frame, and the measurement taken between the elbows along this line (face line of back) which gives the extreme width of the back, the stiles of the back should show the same width as the stiles of the elbows which are furthest from the sash-frame, and to refer again to the future shutter, the width of the stile of back may be obtained from it—the reason why this is stated being that the inner stile of each elbow is partly covered by the stiles of the back. The object of the elbow being framed, as shown, is to have the panel to correspond in width with the shutter; this, however, is not invariably done.

Of course, in framing the back, it is allowed to be a little larger than actually required to allow for fitting, &c.

Fig. 213 shows the elevation of that portion of the back which is shown in plan in Fig. 211. The whole back would be divided into two panels by the muntin, half of which is seen. The top and bottom rails are continuous throughout their entire length, and mortised in their centre for the muntin. The ends of the top and bottom rails are tenoned to fit the mortises in the stiles; haunching is required in the top rail, but the bottom rail may have its tenon the full width of the rail, less, of course, the plough groove; in other respects it is similar to the elbows. A dotted line is shown along the bottom rail, to indicate the line which shows the full breadth of the bottom rail; the continuous line immediately above it is the line of plinth. The shutters now command our attention, and their heights is arranged in this way: 1/2 in. of margin is shown all round from the baton slip or staff bead, and this includes the margin shown along the shutters, along the

FIG 214

1/2" Scale

soffit, and between the capping of the back & the baton slip; very often at this place 3/4 in. or 1 in. is shown. A freeing bead of 3/4 in. is usually put on the soffit just above the shutter, and this serves to prevent the shutters from rubbing on the soffit whilst being extended out to close the window, and folded back into the box again. All this means that the shutter in height is equal to, from the capping of the back to the soffit, less 3/4 in. for the freeing bead. It may only be repeated similarly to the description of Fig. 207, where a framed jamb-lining is treated of, that the shutter is framed with a top and bottom rail, the bottom rail being usually 1/2 in. wider than the top one. The middle rail occurs just opposite the meeting rail of the sashes, and the middle rail is usually twice the width of the top rail, and 1/2 in. bead or reed, which is worked in the centre of its width. Shutters usually, unless very long or high, are never more than 1 1/2 in. thick, and are put together with mortise and tenon as ordinary framing, grooved at a distance from the face to suit the moulding intended. It is not considered necessary to enter more fully into the framing of the shutters; nor is it thought necessary to give any elevation of the shutter. The width of the shutter is an important item, and, of course, is adjusted according to the width of the window. We will suppose, for sake of example, that the window is 3 ft. wide, then the shutters, which include front and backfolds, would be 3 ft. 1 in.—that is, 1/2 in. extra each side of a margin as previously stated.

This 3 ft. 1 in. will require to be so arranged as that the backfolds will readily turn in behind the front shutters, and the front shutters cannot be rebated in front. It will be found that, with front shutters 10 1/2 in. wide, the backfolds (backlaps) will readily fold back into the boxing.

Fig. 214 shows a skeleton plan of the shutters, no attempt being made to show the panelling or moulding of shutters, as in the Fig. The width, rebating, and arrangement of the shutters is what is wished to be thoroughly understood; note the rebating, and that it is the right-hand

FIG 211

1 1/4" Scale

items, taking off his quantities, prepare and fix same, had or has attained to a position which does not fall to the lot of every joiner. And, indeed, the joiner who has done all this can look at the completed window with some degree of satisfaction and pardonable pride, since he has perseveringly climbed the ladder so far.

It may be considered a slight digression, and even mis-quotation—

"Art is long, and life is fleeting,  
And our hearts, though strong and brave,  
Still like muffled drums are beating  
Funeral marches to the grave."

And true joinery is an art.

The reader who has followed thus far will now be initiated into the details of work, &c., connected with the above piece of workmanship. And, even at the risk of repeating a little of what has been stated before, it may be as well to keep this masterpiece intact. We will begin with the back and elbows, and it will be necessary to show one half only—that is, dividing the back by a central line, and showing one elbow.

Fig. 211 shows the plan of half the back and one elbow. It is seen that the elbow reaches into the sash frame and extends out to the line of

backfold which is the closing one, this being most convenient. The heavy dot shows the centre pin or pivot of the hinge. Usually beads are worked at the rebates so as to *hide the joint*.

Fig. 215 gives an enlarged section of the closing backfold, so as to show the beads. No mouldings are shown in this backfold, as very often in ordinary houses which have this style of finishing only the front face of the front shutters is moulded.

Fig. 216 shows the right-hand shutters and boxing complete, so as to give a thorough idea of the whole arrangement. It is readily seen from the figure how the backfold is turned in behind, and the *foxing piece* at right angles to the front shutter and *back boxing* keeps the front shutter from going in beyond its proper place; this *foxing piece* serves also to stay and strengthen the architrave between the elbow and the soffit, where otherwise it would have little or no support, the capping being the only support apart from a little given by the back boxing in some cases. The *back boxing* is, of course, fastened to the

grounds prepared for it, and is usually in narrow widths, which should show equal breadths between the *foxing piece* and the inner casing of the frame. It is seen also that the back boxing, if carried out as shown, gives additional support to the architrave. Here it may be stated that in ordinary cases there is no *foxing piece*, and the front shutter is kept from going too far in by two little blocks screwed either against the back of the architrave at the top and bottom of the shutter, or on the capping of the elbow and under side of soffit, just inside the architrave.

Having, then, all the shutters, back, elbows, and soffit ready for fixing, the workman will proceed to fix them. In doing so, of course, he will be guided by the plan laid down on his

drawing-board or *rod*. He will ground for the back boxing, if it has not already been done, fit it up, and he may *cross-groove* it for the freeing bead of the soffit and the capping of the elbow, and then firmly fix it.

Having bevelled the front shutters for right and left-hand side respectively (they are usually rebated before being taken from the workshop, except the centre, which is left so that if necessary a little may be planed off), they are hinged to show the proper margin; usually three hinges are required in the height for each shutter.

The hinges may be *tailed* into the inner casing where they occur—that is, the *knuckle* edge of the hinge is sunk fully into the edge of the shutter, except what is allowed for *hinge room* (freedom), and only one *tail* of the hinge on the opposite or plain edge of the hinge, the other tail being let into the inside casing as stated. Having hinged the front shutters, and placed them at the proper bevel, and *stayed* them temporarily, the back and elbows can be fitted and fixed. Splay the outer edges of the elbows and

tack them, allowing a little on each elbow so as that when the architraves are fastened to the elbows, the shutters will readily clear. When the elbows have been fitted and temporarily fixed, the back may be fitted between them; take all out and screw the elbows to the back in their proper position, and then firmly fix all in their place—viz., to floor and grounds. The capping may be fitted and fixed on back and elbows, the capping of elbows reaching into the groove of back boxing, and the capping of back into the grooves in the sill of the sash-frame.

If any scribing or mitring to the architraves is required in connection with the capping of elbows, that must be attended to. For instance, if the capping on back and elbows has a  $\frac{3}{4}$  in. bead on its outer edge, and the architrave have a  $\frac{3}{4}$  in. *returned* bead on its inner edge, then the capping is mitred into the bead of the architrave, although in some cases, for the sake of economy, the capping just abuts against the back of the architrave.

The soffit will now be fitted and fixed. A level soffit is still supposed, and when the soffit has been fitted, lines may be drawn on its under or face side to guide in nailing on the *freeing bead*, which, of course, is directly above the shutter at each side. The soffit is also allowed a little broader than the shutter on account of the architrave being fastened to it. When the front shutters have thus been hinged, and the back, elbows, and soffit fixed, and the capping on back and elbows, the stays may be removed from the shutters, and these turned round against the window, and the width of the backfolds obtained. The front shutters may be taken down again (it is not necessary to put all the screws into the tails of the hinges which go against the casings until the time for permanently fixing them) and the backfolds hinged to them, each in its respective place, and then, when hinged, cut and planed to the length of the front shutters. Should it be found that they are too wide, before the beads have been worked on at the centre joint, any alteration required may be made, and then they may be taken down and beaded and put up again permanently. The hinges used for backfolds are usually what are known as *backfold hinges*, which are sunk *flush* (level) into the stiles of the shutters; sometimes, indeed, *butt* hinges are used, but with light shutters they are hardly suitable.

The same number of hinges is required for each backfold as for the front shutter. A *shutter-bar* is used to fasten all together when the shutters are closed against the window; this bar is so simple to fix, and also in its working, that any joiner will know how to put it on when once he has seen it. The grounds being up for the architraves, they are next fitted and fixed; the *foxing pieces*, if any, are put in, or if they are *housed* into the capping and freeing bead, must be fixed before the architraves. If the architraves are capped, this capping is put on last; the plinth may now be put along the back and elbows, and the window is *trimmed*.

Some fix the architraves before fitting or hingeing the front shutters, but it will be found perhaps that the above method is preferable. One point must not be omitted: be sure to allow plenty of *box room* for the shutters—it is better to have  $\frac{1}{4}$  in. or  $\frac{3}{8}$  in. too much, than have it a case of *touch and go*, and remember also the room required for the shutter bar, and provide for it.

#### THE NATIONAL ASSOCIATION OF SANITARY INSPECTORS.

THE second annual meeting of this association was held in Manchester last Saturday. Mr. Pridgin Teale, president of the Yorkshire centre, occupied the chair, and delegates were present from various towns in Lancashire and Yorkshire. The report of the central council stated that the sanitary inspectors of Plymouth were considering the formation of a western centre. In the Manchester district there are 73 members, 6 associates, and 24 honorary members, and in Yorkshire there are 138 members, 12 associates, and 38 honorary members. The honorary members include 29 members of Parliament—11 in Lancashire, and 18 in Yorkshire. The President said that in time the association would become a powerful piece of machinery, by which the broad question of public policy would be brought before the Legislature with greater effect. With regard to the superannuation of inspectors, there was no chance of their getting anything from Parliament, and the inspectors

must themselves initiate and work out the plan. At some future time Government might be induced to give some help. Mr. C. C. Smith (Skipton), in a paper on defects of the Public Health Acts, urged that the Acts should be consolidated and made more uniform. Mr. Wilkinson (Derby), who read a paper on "House drainage—a duty neglected," believed that one-half of general sickness was due to insanitary conditions, and nearly the whole of the other half to careless living. He condemned the Sanitary Registration of Buildings Bill as a measure drafted in the interests of the proposed licentiates, and deemed the entire scheme unworkable.

#### FIREPROOF FLOORING.

MESSRS. MARK FAWCETT AND CO.'S system of fireproof flooring is finding favour with architects and builders, and the firm call our attention to the fact that their system (patented February 25, 1888, which at the time was an entirely new departure) is now being imitated by others, and as these imitations at first sight appear equal to theirs, they point out that the main advantages of their system are covered by their patents, and are not embodied in the imitations referred to. They claim, for instance, that (1) their concrete bears directly on the bottom flange of the joist, and so relieves the fire-resisting material of the floor load; (2) the bottom flange of their joist is completely encased—this can only be effected by their diagonal fixing, as a square fixing requires play, and therefore leaves an open joint; (3) their system provides for the passage of a current of air under the bottom flange of the joist, which keeps the iron comparatively cool; (4) in barracks, warehouses, stables, &c., their tubular lintels are fixed in zigzag arrangement, and make a finished ceiling without plaster. The cost of their floor is less than the imitations in competition.

The floor invented by Mr. Mark Fawcett was patented in February, 1888, and first used by Mr. J. Douglass Mathews at Barclay and Fry's new factory in the Grove, Southwark. About 150,000ft. has since been used in twenty-nine different buildings, and the firm has about 110,000ft. in hand at the present time. It has been used three times by Mr. J. D. Mathews, and twice each by Mr. Somers Clarke, Mr. E. Vigers, and Messrs. W. and E. Stone. The tubular lintels are manufactured at Reading, and Messrs. Mark Fawcett and Co. are building a new factory and two kilns for burning. They are selling about half the tubular lintels they manufacture to builders and using the remainder themselves, and are also doing the constructional ironwork. One of the works at present in hand is the Children's Hospital, Great Ormond-street (Mr. Charles Barry, architect), and the patentees have his permission to invite architects and the Press to inspect this work.

#### A SAFEGUARD FOR WORKERS IN COMPRESSED AIR.

IT has been found by sad experience that work in compressed air, such as has to be done sometimes in sinking foundations, or in driving subaqueous tunnels, often results in serious injury to health, and sometimes even causes death. The danger does not appear to lie so much in the application of the pressure as in its too rapid removal, especially after being exposed to it for too long a time, and it has been observed that if a workman who has collapsed on coming out of the air-lock is promptly put back in the chamber, and the pressure then reduced very gradually, he will suffer little, if any, ill effect from what might otherwise prove a serious matter. Noticing this circumstance, and finding frequent occasion to employ such treatment for the men engaged under his charge on the Hudson River Tunnel, the resident engineer in charge of the work, E. W. Moir, determined to make a special arrangement for such cases, as the gradual reduction of the pressure in the air-locks often consumed so much time as to interfere with the progress of the work. He has, therefore, designed a separate pressure chamber, in which any man who shows symptoms of suffering from too rapid release of pressure on coming out of the air-lock can be at once placed, and the pressure relieved as slowly as need be, while, at the same time, opportunity is given for the entrance of a

Messrs. A. D. STEWART, J. M. MACLAREN, and W. DUNN'S Design; 1,200 feet high. (Placed First.)

Messrs. J. J. WEBSTER and J. W. HAIGH'S Design; 1,300 feet high. (Placed Second.)

Mr. MAX AM ENDE'S Design; 1,550 feet high. (Awarded Honourable Mention.)

physician, and no interference with the working air-locks is necessary.

The apparatus consists of a cylinder of  $\frac{3}{4}$  in. boiler plate some 6ft. in diameter and 16ft. long, lying on its side. The airtight door opens inward at one end, and in the middle is a partition, with a similar door. Light is given by some bull's-eyes in the sides, and the structure is designed and braced for a pressure of 40lb. per square inch. The patient is carried in on a stretcher and placed in the inner chamber, the middle door is then closed and the air pressure turned on, which is afterward allowed to slowly escape. Should it be necessary for a physician to enter, the outer chamber will answer as an air-lock for that purpose; or, in the case of emergency, it can accommodate another patient on a stretcher. The chamber is being built by the Cockburn Barrow Company, of Jersey City, and it seems reasonable to expect that it will materially increase the safety and comfort of work in the tunnel.

#### THE LONDON TOWER COMPETITION.

THE committee of jurors, having made their examination of the competitive designs submitted for the Great Tower for London, after consideration have decided to award the prizes as follows:—First prize, 500 guineas, to Messrs. A. D. Stewart, J. M. MacLaren, and W. Dunn, 21, King William-street, Strand, W.C., joint authors of design No. 37. Second prize, 250 guineas, to Messrs. J. J. Webster and T. W. Haigh, 67, Lord-street, Liverpool, joint authors of design No. 51. As a whole the arbitrators say:—"The designs were of very varying merit, and, although there were good points about many of them, we must confess to a feeling of disappointment on the whole as to the result of the competition, there being no single design which we could recommend as it stands for execution." We give illustrations of the two premiated designs, and also of the one awarded honourable mention.

#### ARCHITECTURAL ASSOCIATION EXCURSION, 1890.

THE annual excursion of this society will take place from August 9th to 16th, and the South of Oxfordshire has been chosen, with Oxford as a centre. A more deservedly popular district could hardly have been selected, and it will afford a good contrast to the country round King's Lynn and the Wash, visited last year.

The details of the programme have not yet been settled, but the following places will probably be included:—Witney, Coggs, Minster Lovel, Asthall, Burford, Cumnor, Stanton Harcourt, South Leigh, Eynsham, Iffley, Sandford, Dorchester, Ewelme, Wantage, Abingdon, White Horse Hill, Uffingham, Horsepath, Cuddesdon, Great Milton, Great Hurley, &c. Mr. Herbert D. Appleton, F.R.I.B.A., is the hon. sec. of the excursion, and Mr. Mardon Mowbray, F.R.I.B.A., of Oxford, has assisted in the arrangements, we understand. Given fine weather, the trip should be both enjoyable and instructive, rich as the district is in examples of English architecture.

#### BOOKS RECEIVED.

*Pavements and Roads: their Construction and Maintenance* (the *Engineering and Building Record*, New York).—This is a reprint of a valuable series of contributions compiled by E. G. LOVE, Ph. D., with the object of collecting data and arranging information for the use of the surveyor or engineer. The subject is treated without reference to mere local conditions, though the streets and roads of England, France, and other countries have been studied and placed under contribution. For this purpose Mr. Love visited Europe, and his work is a *repertoire* of all that has been done or written on road construction in Europe and America. The work of over 400 pages will be found to contain in a condensed form, and one easy of reference, particulars of construction, specifications, cost of construction and maintenance in connection with stone pavements in Liverpool and New York; wood pavements in London, Paris and other European cities; asphalt pavements in the United States, Paris, London, and Berlin, &c.; brick pavements, tramways, kerbs maintenance in London, Liverpool, and other towns; the construction and maintenance of country roads, and various notes of value. Engineers and others who wish to have a record of wood paving done in London and Paris will find Chapter II. a very fair *résumé* as regards construction, cost, and durability. The author "inclines to the opinion that it is undesirable to lay blocks of a greater depth than will provide for a life of seven years, as very few pavements retain a good surface after about seven years' wear." As regards cost, it is stated (in Mr. Stanton's paper) that the annual cost of constructing, repairing, and renewing wood pavement subject to traffic of 500 to 700 tons per yard width per day of 16 hours, and leaving it in a

good condition at the expiration of 15 years, does not exceed 1s. 9d. per square yard, which compares favourably with the cost of macadam. Much valuable information will be found on contours. Steep gradients are especially objectionable, as in this direction the blocks abut close to one another without any joint, and thus little foothold is obtained. The notes and cross sections of streets like Great George-street, Westminster, and Sloane-street are useful; also the information given in the reprint and discussion of paper by George Henry Stanton, Assoc. M. Inst. C.E. The notes on "top-dressing" are to the point. The chapter on asphalt pavements contains also some important reports on asphalt paving in Paris, the specification and instructions issued by the Department of Bridges and Roads, and on the asphalt pavements in New York and other cities.

#### CHIPS.

The Ashton-under-Lyne Town Council had under consideration last week the question of a site for a technical school, for the erection of which £10,000 was recently given. The Corporation have to find the land, and it was decided to give £2,750 for a plot adjoining the Armoury in Old-street. Several members urged the desirability of acquiring an adjoining piece of land, so as to provide for extensions, and the committee promised to consider the matter. Messrs. Eaton and Sons, a local firm, were appointed architects.

Mr. James Forsyth has been selected as the sculptor to execute the recumbent effigy of the late Dr. Parry, Suffragan Bishop of Dover, which it is proposed to place, by public subscription, in the nave of Canterbury Cathedral.

A Local Government Board inquiry has recently been held at Midhurst, Sussex, by Colonel J. Ore Hasted, R.E., one of the Inspectors, with reference to an application by the Rural Sanitary Authority for the borrowing of £700 for sewerage works. Plans of the proposed works were submitted by Mr. H. Howard, surveyor. Some opposition to the scheme was made by two ratepayers.

The chancel of Knutsford parish church has been reopened after having been closed three months. New choir stalls have been erected, and also a rail to divide the chancel from the body of the church. The work has been done by Mr. W. Downes, of Knutsford.

The foundation-stone of the first lunatic asylum built for the "County of London" was laid at Claybury, near Woodford, Essex, by Earl Rosebery on Thursday, the 12th inst. The asylum is being built from plans by Mr. G. T. Hine, of Nottingham, and will house 2,000 patients.

CONTEMPORARY BRITISH ARCHITECTS.—SCULPTURE AT THE ROYAL ACADEMY.—ORGAN, PARISH CHURCH, PAIGNTON.  
—NEW BANKRUPTCY COURTS, LINCOLN'S-INN.—MARBLE PULPIT AT GENOA.—CCLXXXII. STRAND.

## Our Illustrations.

CONTEMPORARY BRITISH ARCHITECTS.

(See description on p. 862.)

SCULPTURE AT THE ROYAL ACADEMY, 1890.

CONTINUING our series of photographic illustrations from the sculpture galleries at Burlington House, we give to-day a double-page plate of characteristic examples. The first of these is Mr. Hamo Thornycroft's diploma work, entitled "The Mirror," an exquisitely delicate relief in marble. "Hypatia," by Mr. F. J. Williamson, of Esher, Surrey, is perhaps one of the most heroic figures shown this year. The statue is represented in illustration of the following words of Kingsley:—"She shook herself free from her tormentors, and springing back, rose for one moment to her full height, naked, snow-white against the dusky mass around. . . . One long white arm was stretched upward toward the great still Christ." The "Genius of Sculpture," also a group in marble, stands in the Lecture Theatre, near the "Angel of Death," which we illustrated a few weeks ago. The winged boy, mallet and tool in hand, sits on the block of rough marble out of which he is creating a beautiful female face, himself the personification of grace and elegance of form, rendered with freedom of touch and a reserve of repose so essential in successful sculpture. "Old Marjorie," a grand bust by Mr. George A. Lawson, is in every way worthy of his masterly hand, full of force; an ideal rendering of character, rugged with time's full measure, energetic still, though tempered with experience.

NEW ORGAN, PAIGNTON CHURCH, DEVON.

THIS grand organ, of which we give a detail elevation and two plans from the drawing now on view in the Architectural Gallery of the Royal Academy, has been built by Mr. C. Martin, of Oxford, from the designs of Mr. A. Mardon Mowbray, F.R.I.B.A., at the cost of Mr. Paris Singer, as a gift to the parish church of Paignton, near his Devonshire residence. The instrument is situated in a gallery constructed to receive it, and every care has been taken to secure a rich and highly decorative case worthy of the church and its organ.

NEW BANKRUPTCY COURTS AND OFFICES.

THE above buildings, which are now being erected on a site which lies between the garden ground on the south-western side of the Royal Courts of Justice and King's College Hospital, are intended to provide accommodation for the Courts and Departments of the Registrars in Bankruptcy, now in Lincoln's Inn Fields, and for the Departments of the Chief Official Receiver in Bankruptcy, now occupying hired offices in Carey-street. The front of the new building

facing towards the Strand, and the returns next Clement's Inn and Carey-street, from both of which there will be entrances, will be of Portland stone, the back next King's College Hospital being of plain brickwork. The building will be of fireproof construction throughout, the iron, tile, and concrete floors of Messrs. Homer and Rodgers having been adopted, and the interior will be kept quite plain and suitable for the business of the departments, glazed brick being freely used for all the public portions. The two courts, with registrars' rooms adjoining, will be placed at the back of the building on the ground floor, and will be both top- and side-lighted, the Official Receiver's public meeting room being in the front, on the first floor. With the exception of these special provisions, the building will be constructed to meet the ordinary official requirements of the various departments, large storage accommodation for papers being provided on the basement floor. The cost of the building complete will be about £61,500. The foundation works were carried out by Messrs. John Mowlem and Co., Millbank-street, Westminster, and the contractors for the superstructure are Messrs. Foster and Dicksee, of Rugby, the date for the completion of their contract being August, 1891. The architect is Mr. John Taylor, of H.M.'s Office of Works, &c., and Mr. Dyer is the clerk of the works.

## ARCHITECTURAL STUDIES IN ITALY.

MR. WM. J. ANDERSON, the first "Alexander Thomson" student, and President of the Glasgow Architectural Association, has just published a handsome folio of sketches and measured drawings photo-lithographed from his studies made during the tour through Italy, which he undertook in fulfilment of the conditions of the studentship in 1888. The trustees of the fund suggested the Classical Renaissance as the chief subject for Mr. Anderson's attention, and the Central Period, which in Italy was nearly coeval with the first half of the 16th century, was chosen for the greater number of his drawings, thus brought together in the book before us.\* The author says, "The work of this, the perfected period of the whole Classic revival, is marked by the equal attention given on the one hand to the refinements of proportion and to design in the mass, and on the other to the proper subordination and homogeneity of the details. The general effect is never lost sight of in the elaboration of detail, which, if less delicate and original than that of the Early period, is generally more simple and appropriate." A considerable portion of the plates represent designs by the architect, Baldassare Peruzzi, of Siena, whose work is the best in his time. Roman and Greek remnants, mostly from the museums in Rome, occupy some of the sheets. The great feature of the book, however, is the careful way in which the detail is delineated and measured up, in which part of the undertaking Mr. Anderson was helped by his travelling companion, Mr. D. B. Burnie, of Edinburgh. The frontispiece represents a view of one of Alexander Thomson's last works, and one of his best—the church at Queen's Park, Glasgow, and the book is dedicated to the trustees of his memorial fund. We have chosen, by way of an example of the type of the Later work illustrated, Mr. Anderson's drawings of the marble pulpit in the church of Sant' Annunziata, at Genoa, and have arranged them in one sheet of illustrations to-day to another scale, to accommodate the drawings to the proportions of our pages. The interior of this church at Genoa is well known as one of the best and richest specimens of the Late Renaissance. The pulpit, in marble and costly stones of various colours, is placed near one of the nave piers, as indicated by the small-scale study. These are simple Corinthian pillars of white marble inlaid with red, which, without intervention of any entablature, receive the pier arches—an arrangement not so common as might be expected, although the simplest, and, in this instance at least, having a grand effect. The drawings describe themselves, and the dimensions are given in plain figures. Among other specimens of work in this capital collection is the Cortile of the Palazzo-Massimi alle Colonne at Rome, the best and most complete piece of Baldassare Peruzzi's architectural design. A similar set of measured drawings is with equal care devoted to the church of San Salvatore del Monte, by Il Cronaca, the architect (A.D. 1504), the last of the Early Floren-

\* "Architectural Studies in Italy," by WM. J. ANDERSON. Glasgow: Macure, Macdonald and Co.

tine School. Besides the geometrical plan, elevations, and sections, with details, two views of this truly grand church are given. The Campanile of St. Mark's, Venice, drawn in water-colour, serves to give variety to the volume, with kindred studies of the Palazzo Fava, Bologna, and Pal. Cornaro, Venice. The Palazzo Albergati Façade, Florence, is diligently measured, with the end entrance set out at large in elevation. A perspective sketch in pen and ink follows of the portal of the Palazzo Prosperi (Sacrat) Ferrara, and the Roman gateway at Verona figures in a rough pencil sketch. Como Cathedral is rendered in a washed study; but we think Mr. Anderson is more happy in detailed work, such as the sheet of capitals in Plate 41, the last page in the book. Plate 1, too, has many admirers for the freedom of the brush sketches there given of two Campanili in Genoa. They certainly are crisp and suggestive, without being crude, though it must be confessed that such impressionist studies hardly go well by the side of such elaborated and measured delineations as those forming the chief parts of Mr. Anderson's collection, and to which we have already referred with so much profit and pleasure. The line views of houses in Siena (Plate 16) are much more to the purpose, and certainly far more useful to the architectural student. The volume is well got up on good paper, bound in an artistic cloth case, and the plates are admirably printed.

## THE SOCIETY OF ARCHITECTS.

THE Seventh Annual General Meeting of the Society of Architects was held at St. James's Hall, Piccadilly, W., on Tuesday evening last, the chair being occupied by the president, Mr. Robert Walker, A.M.Inst.C.E.

Five nominations for membership were announced for ballot at the next meeting, and the following were duly elected as members of the Society.

Charles George Scott Acock, Ashburton, Devon; Frank George Billingham, 15, Market-place, Devizes; Thomas George Price, Victoria-buildings, Temple-row, Birmingham; Albert Edward Pridmore, 2, Broad-street-buildings, E.C.; John Augustus Sant, 24, St. John's-crescent, Canton, Cardiff; Edward Jenkin Williams, 15, Queen-street, Cardiff.

A vote of condolence was passed with the relatives of the late Mr. William Rickwood (Member), and various votes of thanks were passed to the officers and members of council for services rendered during the past year, a letter being also read from Mr. R. P. Sharp (Member), describing the timbers of British Columbia, and discussions arising upon several matters of minor importance.

Messrs. S. Marsland and G. F. Burr, acting as scrutineers, declared the following to be elected as the—

OFFICERS AND MEMBERS OF COUNCIL FOR THE YEAR 1890-91.

President: Robert Walker, A.M.Inst.C.E., 17, South Mall, Cork.

Vice-Presidents: Edwin Clerk Allam, Romford; George Soudan Bridgman, Torquay and Paignton, Devon.

Council: Henry Adams, F.S.I., M.Inst.C.E., M.Inst.M.E., 60, Queen Victoria-street, E.C.; William Allport, 36, Southampton-street, Strand, W.C.; Charles William Bevis, Whittington Chambers, King's-road, Southsea; Robert Cruwys, 451, Brixton-road, S.W.; Arthur Richard George Fenning, 46, Lincoln's Inn-fields, W.C.; Edwin James Hamilton, 70, Ship-street, and 13, Wellington-road, Brighton; John C. P. Higgs, 44, Bedford-row, W.C.; Samuel Couch Johns, The Limes, Crowmarsh, Wallingford; Reginald George Pinder, F.R.I.B.A., Avenue Chambers, Bournemouth; Percy Morton Roberts, 12, Carlton Chambers, Regent-street, S.W.; Edward Tidman, Connaught Mansions, Victoria-street, S.W.; William Robert Wells, A.R.I.B.A., 10, Farrant-avenue, Wood Green, N.W. (Note.—The Past Presidents are *ex-officio* Members of Council).

Treasurer: Charles Henry Searle, 12, Southwark-street, S.E.

Honorary Secretary: Edgar Farman, 39, King-street, Cheapside, E.C.

Honorary Corresponding Secretary: Charles Edward Gritton, A.M.Inst.C.E., 20, Bedford-street, Strand, W.C.

Secretary: George Alexander Thomas Middleton, A.R.I.B.A., St. James' Hall, Piccadilly, W.

Auditor: Henry J. Pain, 19, Buckingham-street, Strand, W.C.

The Bishop of Gloucester and Bristol consecrated on the 29th ult. the first portion of a new parish church, dedicated to St. Stephen, Cinderford, Forest of Dean, the plans of which were made by Mr. E. H. Lingen Barker, of Hereford. The completed part of the work comprises a wide and lofty clerestoried nave, portions of the chancel, south and north aisles, baptistery, north and south porches. The materials of walls are Forest of Dean stone and Bath stone dressings. An illustration appeared in these pages towards the end of 1888.

## WAYSIDE NOTES.

VISIONS of the regal splendour and palatial magnificence of old banqueting halls arose before me when I read that the Queen had decided to erect an addition to Osborne House for the purpose of State repasts. Great roofs of carpentry, at one and the same time massive and delicate; high, panelled walls; oriels with long, mullioned windows and vaulted ceilings; dais, bright with tapestry; oaken tables, and wide-spreading fireplaces arose in my imagination, and carried me back to the crackling yule-logs and merry feasting of our goodly ancestors. Yet had I but commenced my day-dream when I remembered the nature of the architecture of the Royal residence that looks out over the placid waters of the Solent. Italian campaniles and balustrades broke in rudely upon these visions and memories of the past. I must, perforce, rather reflect upon the sombre stateliness of the building in Whitehall, for even in these advanced days we do not tack on Gothic additions to Renaissance conceptions. Such proceedings would have been bold even in the time of the Second Revival, so there is not much chance of our beginning at this time of life.

All that those not privately informed know of the proposed work is that it will be of truly magnificent proportions, and that on the lawns west of Osborne House will arise a banqueting hall of noble mien, fitting the dignity of the occasion. Thanks chiefly to the recent visit of the German Emperor to the Queen, the necessity for the new provision became very evidenced, and as the necessary works are to be proceeded with at once, Osborne will in a very short time possess that which it should perhaps have had from its original foundation. To those who know the Queen's marine "villa," it may be interesting to learn that the new building will almost convert the open space fronting the private entrance into a quadrangle, the pleasant lawn that now exists being destined for some months to be the scene of building operations. As these latter were not, within the memory of man, known to have been conducted without noise and dust and disturbance, and as the Queen is due at Osborne at the end of next month, one can only conclude that the ring of the trowel and its various more or less melodious accompaniments will have to be silenced for a season—during, that is to say, her Majesty's usual visit to the Isle of Wight.

I read of the proposed formation of a decorative arts guild, "founded by a number of well-known artists for the purpose of helping people of moderate means to create homes of taste." It is intended to establish a central bureau in the West-end, and a householder will, by paying a fee, be able to secure "the best of advice in every department of furnishing and decoration." Further than this, the householder in question "may either place the whole business in the hands of the guild, which will turn him out a house from kitchen to garret, or he can do the work himself, having first been guided by the guild." Among the names mentioned as likely to be on the consulting committee are those of Mr. Marks, Mr. Aitchison, A.R.A., Mr. Seymour Lucas, A.R.A., Mr. Alfred Gilbert, A.R.A., and Mr. Dendy Sadler. The business ought to be good; for although the names proposed to be connected with the concern are so well known and respected, and although the term "Decorative Arts Guild" is high-flown enough for anything, the affair will be of a purely mercenary and commercial character, if, as asserted, the managers will be prepared to turn out a house "from kitchen to garret." Did the proposed "guild" merely seek to advise on matters connected with house decoration, and to spread abroad a knowledge of decorative principles, one would deem the object most laudable; but if a company of artists, art decorators, and architects form themselves into a corporation to do the work of an architect proper, it shows that art and architecture and the allied arts are indeed coming down from their high estate, and being transformed more and more into purely money-making pursuits. It is early now to judge of the merits of this proposed Decorative Arts Guild, and, after all, the source from which I gather my scant information may be untrustworthy; but, as architects, we have to put up with so much that is detrimental to the interest of the profession, that we become distrustful of

new concerns dealing with our own work. Conceived and managed in a proper spirit, nothing could be more useful than a Decorative Arts Guild, while a general architecture-mongering company would be a most deplorable infliction.

We often come down low enough; but, thank goodness, we haven't quite reached the depths indicated by your correspondent from the Antipodes. We draw the line at bill-posting. With all our faults, we do not invite communications "from parties knowing anyone about to build," and although "universal providers" provide architecture (of a sort) at the lowest possible terms for cash, and leading firms of architects in the city of Edinburgh do work for 1 per cent. or less, we do not prepare bills of quantities free of charge. There would thus appear to be something original in the composition of the redoubtable firm of Messrs. R. C. Shearman and Co., of Wellington, N.Z., whose peculiar methods of seeking to develop an already "established practice" were set forth in your columns last week by Mr. F. de J. Clere, the Wellington diocesan architect. The firm might, however, improve their methods by employing the modern system:—"Shearman and Co.'s architecture. Have it in your houses—the only genuine, &c., &c." and "Who are Shearman and Co. & Co.?" As to the extra competition that New Zealand architects will suffer from Messrs. S. and Co.'s posters, I don't fancy it will be very incommencing. The advertisement is more likely to act on the boomerang principle. It would, of course, in this country; but whether or no in a Colonial city like Wellington I am not in a position to say. The chief harm to be feared by the Wellington architects is that caused by the habit of generalisation, common and natural to all men in all countries. We know that in this quarter of the globe, when someone calling himself an architect advertises in such a manner as to be clearly derogatory to the profession, we do not fear that he will get all the work, but that his advertisements will create an impression on some persons that his ways are representative of the average architect. If I were working in a town where any person calling himself architect made a constant practice of acting unprofessionally, I should endeavour to get the whole of my brother professionals practising in the same town, to issue a public disclaimer of any connection with the individual in question.

The Tower Company (Limited) has received the report of the jurors appointed to award the premium offered in connection with the recent competition, the designs for which were exhibited at the Drapers' Hall. It is not surprising that the report should state that, in the opinion of the jurors, no design could be recommended as it stands for execution. The weak point of the whole exhibition was, as most critics pointed out, an absence of sound constructive principles. Where any evidence of skill in this direction was apparent, there was an accompanying negative quantity in respect to comeliness of appearance, and where pretty pictures were made, the construction was generally treated as a matter quite beneath the designer's notice. So, as I say, there will be little surprise that the assessors in this competition find no scheme worthy of being carried into execution. Personally, too, I must confess to surprise at the awards, neither of the prizes going to a design I should have put forward. As it is, the first premium comes to London, and the second premium to Liverpool. Messrs. A. D. Stewart, J. M. MacLaren, and W. Dunn get the 500 guineas; and Messrs. T. T. Webster and T. W. Haigh take the 250 guineas. Of whatever opinion we may severally be as regards the issue of the competition, no one will deny that the successful competitors have well earned their money. Mr. Max am Ende's design is honourable-mentioned by the jurors. Many will hope that this will be the finish of the Watkin Tower business, and that the promoters, if sadder, will be wiser men in the future. Supposing, however, that they are very much in earnest, it is to be concluded that they will get the London design amended by its authors, so that, in the opinion of the experts acting as assessors, it may be safely carried into execution.

It is not every architect who, in his youthful days, laboriously constructs a cardboard model of some building, minutely to scale and as complete as 'prentice hands are able to make it. It

is, therefore, no little satisfaction to me to remember how I once erected, from plinth to chimney-top, a model of a house to a 3<sup>rd</sup> scale, showing nearly every brick and tile, cutting out in cardboard window-frames, barge-boards, porch, and balconies of elaborate woodwork, endeavouring conscientiously to build out every moulding, and modelling to scale every projection and reveal. And many an evening's work it proved! I remember, too, that this was not my only model; for, previously to commencing the house, I tried my hand on a pair of simple cottages, which, being completed, I essayed the larger work. Much I was proud of the latter when finished, and oft was it displayed to admiring friends! I have the miniature house yet, although, not having surveyed it for many years, cannot at the moment say whether it is in good and tenantable repair. Being my own contractor, however, I can answer for it that there was no jerry-building, only the best and most suitable paper being used for the manufacture of the cardboard, and only the best paste and glue employed in putting together the various parts; and although professional modellers would smile in a superior manner at the mitring and joining of roofs, I am not ashamed of the model I made in my pupil days. The style of architecture, it is true, is somewhat *passé*, but that does not affect the work as a model.

I cannot say that I have in after years derived much benefit from the long and numerous evenings spent in working upon this model. It was a recreation at the time rather than a study, and so my good master essayed to hint. A certain deftness in cutting-up and carving cardboard may be put down as the most noteworthy accomplishment acquired during the construction of the model, and, farther, a power to know a good model when I see it. I believe I am, therefore, more than ordinarily competent to appreciate the excellence of the models constructed by your correspondent Mr. Thwaite, who wrote you last week. A contemplation of those which he has prepared with more than usual care, at all times affords me much pleasure. But, as an architect, I really do not think that there is much value in models in museums, except for special purposes, and that space occupied by them may often be more usefully employed for the exhibition of good photographs. Anyhow, I am also of the opinion that if models are employed, they are out-and-away the best if constructed by Mr. C. N. Thwaite. All who can judge as to the merits of a model will hold the same opinion.

In the matter of the A.A. changes a friend writes me as I bring these paragraphs to a conclusion:—"If you are commenting upon the present crisis in your 'Wayside Notes' this week, and would kindly bear in mind the following, I shall be obliged, as the true facts are apt to get lost sight of unless one attends the meetings. The committee have themselves (unconsciously, no doubt) brought about this present deadlock, so to speak. They deferred bringing up the Report of the Special Education Committee until the *very last* meeting in the session, which they had to adjourn into June (against the rule which says the session shall end in May), in order that their proposals might be voted upon and become law. In the mean time, they hold a special business meeting and adjourn it, and both at the meeting and the adjourned meeting requests are made for an appeal to members by means of voting papers. The committee merely meet these requests by pointing out it is against the rules to vote by papers. The natural outcome of all this is that at the resumed general meeting in accordance with the rule a requisition is presented to alter rule 43 in order that each may be furnished with a voting paper and vote thereon upon the proposed change in the constitution. This requisition was signed by some two-dozen members, amongst them being Messrs. R. W. Edis, J. D. Sedding, H. C. Boyes, R. P. Spiers, H. Stannus, Wm. White, L. P. Crace, F. H. Collins, and R. Needham Wilson."

The above from an old member is worth more than any comment from myself, and should be borne in mind by those attending the meeting at Conduit-street at 7 p.m. *this evening*.

GOTH.

The tenth annual autumn exhibition of modern pictures in the Castle at Nottingham will be opened on the 6th of September next.

Fig 8

## SHADOWS.—II.

WE will still continue to follow the system for shadows thrown by simple mouldings before proceeding to the more complicated forms.

In Fig. 5 we have the quarter hollow, and in Fig. 6 the reversed ogee, crowning the projecting block as in the preceding example. By following the system already shown, there will be no difficulty in establishing the shadows thrown in Figs. 5 and 6.

Draw in the elevation (Fig. 5) at  $45^\circ$  the lines  $OP$ ,  $AB$ ,  $CD$ ,  $EF$ ,  $RGH$ ,  $IK$ ,  $MN$ , and in the plan the lines  $mn$ ,  $ik$ , and  $cd$ . Raise the perpendiculars  $nN$ ,  $kK$ ,  $dD$ , thus determining the points of intersection and the shadows thrown by the points  $MIC$ . Draw the horizontal  $NK$  for the shadow of  $MI$ ; and the horizontal  $HF$  for the shadow  $RE$ . The line drawn at  $45^\circ$  at the point  $O$  determines the point  $P$ , the distance of the shadow thrown by  $O$ , and the horizontal line  $PG$  the shadow thrown by  $OR$ .  $B$  on the perpendicular  $BK$  is the shadow of the point  $A$ , a portion of the shadow of  $AS$  falling on the upper surface of the moulding.  $DF$  is the shadow of  $CE$ , and  $HK$  that of  $GI$ . The whole of the quarter hollow  $OPGE$  being thrown into shadow by  $OE$ , will of itself throw no shadow;  $EG$  being thrown into shadow by  $ER$  will also cast no shadow,  $ER$  casting its shadow over and beyond  $EG$  as the horizontal  $HF$ ,  $GP$  being the shadow of the remaining portion  $RO$ . It is quite unnecessary to demonstrate the shadow of Fig. 6; we have only to follow exactly the method already employed for the preceding examples. We will notice, however, after drawing the tangents at  $45^\circ$  at  $OP$  and  $QR$ , that a portion of  $PQ$  of the moulding not being covered by any shadow will itself project a shadow at  $DF$ .  $SG$  is thrown into shadow by the projecting lighted portion of the moulding  $ST$ , the horizontal  $FH$  is therefore the cast shadow of  $ST$ , and  $GR$  the shadow of the remaining portion  $TQ$ .

Let us now find the shadow cast by a simple entablature, following exactly the same system and being always careful to remark the various shadows thrown on to the mouldings by the upper projecting portions of the same mouldings. These shadows are to be regarded as natural shadows, and not as cast shadows; the latter (the cast shadows thrown by the mouldings on to retreating planes) are always darker than the shadow proper to each moulding.

We must always proceed to draw, firstly, the lines at  $45^\circ$  in both elevation and plan, and secondly find the intersections of the projections of these lines. The shadow of  $A$  is at  $B$ ,  $C$  is thrown into shadow by  $X$ , which throws its own shadow at  $D$ . The shadow of  $E$  is at  $F$ ; the portion  $CE$  of the ogee being in the light will cast its shadow at  $DF$ . The mouldings from  $I$  to  $L$  are thrown into shade by the projecting slip  $IW$ , the shadow of  $IK$  is therefore at  $JM$ , the remainder  $KW$  projecting to  $LZ$ . The lighted portion  $LU$  of the frieze throws its shadow at  $MS$  and a portion on the upper surface of the architrave. The reversed ogee  $U$  of the architrave, being partly in the light and partly in shadow, will cast a shadow as at  $V$ .

The student would do well to draw the various mouldings to a large scale, and then find the shadows thrown by each individual moulding, carefully remarking the different portions in light and shade; in such a way great facility will be acquired, and he will be enabled to do without a large number of the constructional lines we are now employing in order to establish the various shadows.

In tinting the natural shadows of each moulding, it should be observed that, proportionally as the curve of the moulding approaches the horizontal, the shadow becomes darker, the reverse taking place as the curve approaches the vertical. Thus, in Fig. 6A, the shade is darker at  $B$  than at  $A$  or  $C$ . This is the effect of the natural shadow of the moulding; but this effect varies in the case of reflected light or cast shadow. In Fig. 5 the shadow at  $OP$  gradually becomes lighter on approaching  $P$ . The rays of light striking full at the point where the tangent at  $45^\circ$  touches the moulding, a line of light should, in tinting the shadow, be left at this point, the whole length of the moulding, as at  $P$ ,  $Q$ , and  $U$ , Fig. 7. In all rounded mouldings (even when in shadow) this fillet of light should be left more or less bright; in this way brilliancy of effect and transparency of shadows will be obtained.

We now come to the system of shadows thrown by a projecting body on to planes retreating more or less from the plane of the body casting the shadow. We have remarked above that the size of a shadow is in proportion to the distance of the plane receiving the shadow; thus the shadow of the projecting wall at  $aA$  (Fig. 8) is larger when thrown on to the wall at  $F$  than when on to the

planes  $DC$  or  $B$ , projecting more or less from the wall surface  $F$ . To establish the shadow of Fig. 8, we draw the lines at  $45^\circ$  at  $A$   $I$   $J$   $KL$ , &c., in both elevation and plan.

The shadow  $af$  of the projecting wall meets the first step at  $b$ ; we raise the perpendicular and so find  $B$ , the point where the shadow is stopped in the elevation. It is the same with the points  $cde$  and  $f$ . The point  $f$  being the point of contact of the shadow thrown by  $a$  with the wall, the perpendicular raised from  $f$  will establish the points  $F$  and  $H$ . The projecting band  $GO$  throws its shadow as far as  $P$ , therefore at  $P$  we draw the horizontal  $FPQ$ , the shadow of  $GO$ .

We obtain the shadows of the steps  $IJKL$  by means of the intersection of the projection of the lines at  $45^\circ$  at these points in both plan and elevation. The remaining shadows are easily found.

ARTHUR VYE-PARMINTER.

Palais des Beaux Arts, Lille.

## NOTES FROM EDINBURGH.

THE open winter has been very favourable for steady work, and the succeeding months have shown no abatement in the prosecution of building operations, which are extensive, through the fulfilment of a few heavy contracts, the usual speculative building, and a fair amount of alterations. Some large works are in the near future. One of the largest schools, and the most complete of all yet erected by the Board, will shortly be commenced; to cost about £20,000. The plans for the new Caledonian Railway station at the west end of Princes-street have been made, but their ultimate shape will not probably be fixed till the issue of the present application for the extension of the line to Leith has been determined. If sanctioned, the proposal to tunnel under Princes-street will occasion sundry alterations, greatly for the better, at the east end of the thoroughfare, and the works will probably give two years' employment to a large number. The proposal, when first made public, occasioned only alarm, and especially amongst the proprietors and tenants of the princely thoroughfare, where the foundations would be dislocated, and fine architecture damaged. The vibration, besides, would inevitably disturb the slumbers of hotel visitors, and stop every chronometer, whilst the air would be polluted with the smoke from ventilating shafts. Ground for these alarms was not altogether wanting, as experience

showed in the case of the Scotland street tunnel, where many houses have been somewhat injured in appearance—a disadvantage probably counterbalanced by the effective drainage of the basement floors. Opinion, however, has now gone round to the opposite quarter; the dangers and difficulties of construction and ventilation have disappeared, and the unquestionable advantages to the public of fair competition may overcome the strong N. British opposition to the scheme.

Notwithstanding the gift of probate duty towards free education in the five standards, the school rate is to be raised. It commenced with 4d., and will next year stand at 7½d. For some years one or more new schools have been erected by the Board—or additions made to the existing schools; and one is disposed to agree with the American visitor to the city, who thought there were more boys in it than any other he had seen. The new school erecting this year contains accommodation of a varied character, including gymnasium and swimming bath, for 1,900 children. People are beginning to see that something is not yet perfect in the system of such costly education, and though the rate cannot be held to be excessive, the sixth standard of attainment is poor compared with what was often obtained under the old and irregular system. As a rule, the buildings of late years have been fairly economical in their design, and the expenditure moderate for a system which is undoubtedly in its tentative and transition stage. The International Exhibition is not drawing as yet the crowds expected, being less of a novelty. There are some exhibits of architectural interest, but not so many as in 1866.

The new University tower and McEwen Hall is making some appearance now, having passed the first-floor stage, and being considerably above the dentil stringcourse which marks the second floor throughout the building. It is interesting as a specimen of the very best system of construction, and will certainly be standing, perhaps entire, when Macaulay's New Zealander comes to sketch the ruins of London. The plan of the hall appears to be the best possible in adaptation to its purpose. The side next the large building contains a recess, in front of which is the body of hall, stretching past it on either side, with segmented periphery on opposite side. The basement story is furnished with white glazed brickwork in the walls and windows. Two entrances on the ground floor give access to a corridor about 12ft. wide, separated from the hall by an inner wall, the height of the gallery floor, and which carries arcading to the roof. This corridor is finished with good facing bricks on the walls, and will probably have concrete vault. It is lighted by large circular windows in each bay. The interior of the hall shows pedestals or podiums of ordinary sandstone; but the piers or pilasters and pillars over these are in red sandstone, and the walls have decorative finishing in ornamental tilework. Externally the effect of the hall, which completes the eastern end of the University, is a great improvement, with the tower, to the somewhat monotonous façade of the Lauriston-street frontage. It is broken up by massive piers of good projection, with deep couch canopied recesses for statuary, on both first and second floors. These are carried all round to meet the tower on the north and the court of the building on the south. A good circular staircase is placed about the centre of the corridor for access to the gallery. The exterior of the new National Portrait Gallery is at last completed, and the pavement in front only remains to be made. The inscription states that the building is devoted to illustration of the history of Scotland, and probably, at least for many generations, some other appellation than that of the National Portrait Gallery would be more appropriate. The apartments on the highest floor above the hall and portrait gallery are now open to the public, and contain a very large and complete collection of very fine and interesting engravings of eminent characters in both Scotch and English history. Among these, there are two of Oliver Cromwell, which show him to much greater advantage than the oil painting. It is interesting to compare the engravings of several others with the portraiture in oil on the floor below. The rooms contain also a large collection of busts. The light is from the roof, giving the largest possible amount of wall for the exhibits. The apartments below the portrait gallery have been fitted up as a temporary home for the Geographical Society—that is, the north being a hall for public meet-

ings, and the south library and committee-room. The arcade which forms the division has been formed into a partition, and makes a convenient recess for library shelving. There is still, however, a good amount of work to do towards complete finishing of the many interior apartments east and west of the larger rooms.

There is much elaborate decorative detail in the front, especially in the angle turrets; but there is also a great want of buttress projection at the piers, which have something of a weak look under the heavy mass which they support, and the large windows of the ground floor would have been much better with ordinary transom bars than the preposterously heavy lintels—which serve no ornamental or useful purpose—at the impost level.

The Free Library will shortly be opened in all departments to the public. The opening ceremony, however, is over, and the appearance of the interior is very satisfactory in all details of the finishing, and the great essential requisite of good light is well provided for.

Professor Blackie has been writing strongly against the decoration recently adopted for the Balmoral Hotel, a large building partly in red stone in Princes-street, and which now stands out conspicuously white beside its somewhat dirty-grey companions. It will probably soon be grey, but stone-colour would have kept better, and the dirty-white, already visible below, is not suggestive of cleanliness within. White, however, is better than the black system of decoration adopted in the Princes street arcade, a glance at this funereal embellishment in passing being quite enough for most people, who prefer the sunshine of the street.

It is worthy of note, as an incident marking the complete change of public sentiment in the matter, that the architecture of the church was, probably for the first time in its history, mentioned as matter for congratulation in the closing address of the Moderator of the General Assembly of the Church of Scotland. Hitherto, and for generations, the Cistercian feeling, that there is virtue in a plain, if not an ugly, edifice, has prevailed. This feeling, reinforced by the instinctive love of economical disbursement, had brought nearly all the parish churches to a very low standard of architectural adornment, and it was considered really beneath the dignity of the supreme council of the Church to interfere. The Moderator of the Assembly this year was the well-known essayist, "A. K. H. B.," whose hearty appreciation of bishops and fine churches is conspicuous in all his interesting works. In his characteristic and happy way he compliments the Church on the improvements in the fabrics and the service, and says, "Where great cost is impossible, one often finds a simple beauty, pleasing and helpful. Lath and plaster are being banished. In many churches you find chairs. The communion table is not now carried in and out again. The font, too, of suitable dignity, is part of the furniture of most churches. In some the pulpit is used only for preaching from," &c. This is the subject seen, *coulour de rose*, from the clerical standpoint, as appears from the delusive hope that lath and plaster are ever likely to be banished from church walls of average thickness in the cold northern clime, or that people generally will prefer chairs that they may really kneel, and have their weddings in the church. Economical considerations will continue to prevent the comfortable width for kneeling, and the instances of church celebration of the marriage tie are very rare as yet.

With the opening of the west wing of the Industrial Museum, there has been a rearrangement of exhibits in the great hall, and some interesting architectural ones have been added. Of these, the most notable is an exact copy in plaster of the lofty tabernacle of a church in Belgium. It is of gigantic proportions, and would require steps to reach the ciborium. The height is about 54ft., open work in an octagonal pyramid above the ciborium stage, with 300 figures. The design is Gothic in construction, carried out with Renaissance detail, and is said to have been built in 1552 for 600 florins. It contains nine stages above the steps of the base—the lowest, curiously placed, on the imitation of a thin cushion with corner tassels. Another addition is a copy of the pulpit in Pisa Baptistery by Nic. Pisano. It is a hexagon resting on seven pillars, with one in the centre, and three of the angle pillars on couchant lions. The sculpture of the panels, especially the one representing the Day of Judgment, is a very

elaborate and quaint assemblage of figures, which would no doubt tell its story better in 1260 than now.

There is also a copy of a very fine carved stone altar-piece and Crucifixion from Bromsen Chapel, of St. Jacob's Church at Lubeck, of the 14th century; a copy of the Norman south door of Barfreston Church, showing the flints. Not less interesting is the frieze (in enamelled brick) of the Palace of Darius the Great, at Susa, from the original in the British Museum.

There are also good specimens of ironwork from Paris and Vienna, and Messrs. Powell and Son, of London, have presented some valuable exhibits in stained glass. There are some pieces of old Venetian and Flemish glass, with a sample of the modern Munich work; but the exhibits in this department are very limited.

The west wing contains, on ground floor, some interesting machinery and ship models, and the floor above has a splendid collection of the art and industry of savage nations. The models in plaster of the cave dwellings of Colorado and Arizona are very curious samples, very different from those of Petra, with better provision for air and light.

#### ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

MIDLAND INSTITUTE.—The first excursion of the archæological section this year took place on Saturday to Coventry. Mr. W. G. Fretton, F.S.A., conducted the party. The first place visited was Cheylesmore Manor House. Proceeding through the ancient gateway, the party next visited Ford's Hospital, dating from the year 1529, and in excellent preservation, thanks to the care bestowed upon it. Proceeding through Greyfriars-lane the party arrived at the newly-restored Church of St. Michael. In this church were at one time eleven altars, and the mercers, drapers, armourers, cappers, girdlers, and other trade societies had chapels in it. After noting the parvise over the porch, the curious inclinations of the apse walls, the "Gwillington monument" (which has been described by a county historian as that of a gentleman with his two wives, but which is really that of a lady—Dame Gwillington—and her two husbands); the old carved church chest, dating from about Henry VIII.'s time; the misereres in the Drapers' chapel, carved with figures illustrating the "Dance of Death"; the old stained glass which had been preserved in the windows of the apse, and other curious objects of interest—all felicitously described by Mr. Fretton—the party left St. Michael's, noticing the ten bells (one of which weighs about 32cwt.) standing on the floor of the church, and awaiting the decision of the authorities as to their future habitation. A hope was expressed that they would not be hung to endanger by their ringing the restored tower. A move was next made to the site of the old cathedral, the western wall and respond-piers of which were unearthed when the Bluecoat School was erected. Holy Trinity was next visited, and was found no whit less interesting than St. Michael's. The ancient parvise, or priest's dwelling, on the north side; the constructional skill displayed by the buttressing-up of the central tower by the arches of the nave arcade; the stone pulpit, rivalling that at Wolverhampton, built up with the masonry of the tower pier; the old cast-brass eagle lectern, the monument with the canting heraldic crest to Moreton (a Moor's head on a tun or barrel) in the archdeacon's chapel, the old black-letter Bible in the vestry, the beautiful modern stained-glass window on the north side of the chancel-aisle, with other objects, were much discussed and admired. Proceeding through Earl-street to Whitefriars, Mr. Fretton spoke of the number of vaulted cellars, or crypts, that existed in Coventry, and said that he was aware of no less than 60. At Whitefriars the party was agreeably surprised to find that the old eastern limb of the monastery cloisters had been preserved and put to use as a refectory for the inmates of the workhouse, while over it was the dormitory, an oriel window in which was pointed out as that from which Queen Elizabeth made her celebrated pithy speech to the citizens. On leaving, a hurried visit was made to the Charterhouse. Much interest was displayed in some remains of fresco-painting on the walls of the old refectory—one picture representing the Crucifixion, the other very graceful Renaissance scrollwork. After tea at the Queen's Hotel, a hasty visit was paid to St. Mary's Hall and crypt on the way to the railway-station.

## Building Intelligence.

**BOOTLE.**—The corner-stone of the new police-courts and offices in Oriel-road, Bootle, will be laid on Monday. The architect of the new buildings is Mr. C. J. Andersson, of 36, Dale-street, Liverpool, the contractors being Messrs. George Woods and Sons, of Bootle. The building will be Classic in style, and with a frontage of Manera stone will match the museum and town hall which adjoin the site. On the ground floor there are placed the cells, and offices will also be provided for the administrative department, including chief-constable and detective offices and a charge-room. In the basement will be a recreation room. On the first floor are two courts, a magistrates' room, rooms for magistrates' clerks, and a waiting-room for witnesses. Spacious dormitories, fitted up on the cubicle principle, will be provided to accommodate some 20 policemen. Housekeeper's apartments are also included in the arrangements. The heating will be on the hot-water principle chiefly. The cells are to be lighted and ventilated by gas pipes. The contract is undertaken for £10,600. The first estimated cost was £8,500; but enlargements and improvements on the original plan have necessitated an increased outlay.

**BOW (NORTH DEVON).**—Bow parish church, which has been undergoing restoration, was reopened on June 12. The work at present carried out is the restoration of the nave, north aisle, and interior of tower, and the erection of a new chancel. The old "cradle" roofs of oak have been repaired *in situ*, and the roofs boarded and slated. The old windows have been repaired, and new tracery put where required. The old lancet window on the south side has been restored. Six of the windows are filled with stained glass. The chancel walls are of Itton stone and the windows of Hatherleigh stone. The reredos and choir stalls were made by Mr. Harry Hems, Exeter. The main work of the restoration has been carried out by Mr. H. Geen (Okehampton) and Mr. J. M. Ash (Sampford Courtenay), from plans prepared by Messrs. Medley, Fulford, and Harvey, architects, Exeter. The cost has been about £800.

**COVENTRY.**—At the annual meeting of St. Michael's Church Council, Coventry, held on Tuesday night, the vicar said he understood that a gentleman who signed the memorial against a new bell-tower was now in favour of it, and was willing to give £1,000 to meet Mr. Woodcock's offer of £5,000, or half the cost of the new tower should it exceed £10,000. The present position was this: The bells could not possibly be rung with safety in the old tower, and they had good authority that chiming could not be carried on above the groining with safety; and no one would be so mad as to propose to put in a wooden chamber, and make a coal-hole in the tower as before. And then no provision would be made for the clock and chimes, which the whole of Coventry was anxious to have back again. People were rapidly becoming converted to the bell-tower scheme; and at a meeting of the restoration building committee last week, the south-west corner of the church was suggested as a site, and it was thought by Mr. J. Oldrid Scott that a most magnificent group of towers and steeples could be formed. It was proposed that there should be competitive plans, and a committee of architects and lay assessors to make a selection; but at present nothing whatever had been decided. A long and discursive discussion took place, and a resolution in favour of a new bell-tower, and of accepting Mr. Woodcock's generous offer, was unanimously passed.

**DORSTONE.**—The parish church of Dorstone was reopened on Friday last after thorough restoration. The new building comprises nave, chancel, chancel aisle, tower, and porch. The stone of the old wallings has been re-employed, eked out with new stone of the country. For the dressed work Bromsgrove stone has been employed. The chancel roof over the sacristy is under-vaulted after the fashion of a baldacchino, and is panelled with moulded ribs, encircled with carved-oak bosses at the intersections. The south porch is constructed of oak, for which some of the timbers saved from the modern roofs were utilised, and the same material was converted for making up the chancel stalls, choir desks, and doors. The designs were prepared and the works superintended by Messrs. Nicholson and Son,

architects, Hereford, and the operative work has been carried out by Mr. Price, builder, of Hay.

**GATESHEAD.**—On Wednesday the new baths at Gateshead were opened. The building consists of the large bath and office, and manager's house. The large bath is 80ft. by 30ft., and varies from 3ft. 6in. to 6ft. in depth. On each side there are dressing rooms, 42 in number. There are eight warm baths, and also two shower baths. The other compartments are an office where money will be taken and tickets given, the manager's house, and the boiler-house. Externally, the bath building has been constructed of brick, with brick piers and stone cornices, with balustrade over. The office and house are constructed of brick, with stone dressings, and carved caps and columns. The building has been erected from designs by Mr. Bower, borough surveyor, and Mr. Mackenzie and Mr. Smith have carried out the work under the instructions of Mr. Bower.

**HUYTON.**—The new Congregational church at Huyton, Liverpool, was opened on Tuesday. The total cost of the new building, which accommodates over 500 people, will be £9,000. The general character of the building is English Gothic of the 13th century. Sandstone throughout, red without and a warm yellow within, treated with wide joints, varying courses, and a strongly-tooled surface. The structure has a nave consisting of three aisles of nearly equal height, divided by stone arcades. On the north side is a transept. The top of the spire is about 130ft. from the ground. The contractors were Messrs. Hughes and Stirling, of Bootle; the clerk of the works, Mr. Clydesdale; and the heating was carried out by Mr. John Grundy, of London and Tyldesley. Mr. W. D. Carroll, of London, is the architect.

**LEEDS.**—On Saturday afternoon the foundation and memorial stones of new Wesleyan Methodist Sunday Schools, to be built in connection with Hanover-place Chapel, Leeds, were laid. In addition to the Hanover-place Sunday schools, the project includes the provision of a new chapel at Cardigan-road. The total cost of the whole project has been approximately estimated at £6,450. The Sunday schools will be of brick, with stone dressings. The large schoolroom will be 70ft. in length by 35ft. wide, and capable of accommodating 500 adults. Further accommodation will also be provided by seven classrooms, an apparatus-room, kitchen, and store-rooms for tables, &c. The schools are being erected from the designs of Mr. George F. Danby, architect, Leeds, selected in a limited competition. The cost of the buildings will be about £1,700. Mr. P. Stather, builder, is carrying out the work, and Mr. J. Ledgerd will execute the joiner's work. The new school which has been erected at Richmond-hill by the Leeds School Board was formally opened on the 12th inst. The structure, built with red bricks with stone dressings, occupies an elevated site, and has a frontage to Accommodation-road. Classical in style, it is of two stories. The accommodation for the infants and junior scholars, on the ground floor, comprises four large classrooms 45ft. by 22ft., divided by glazed sliding partitions, and four classrooms 24ft. by 16ft. Accommodation is provided for 345 infants, 329 junior boys and girls, and 732 senior boys and girls, or a total of 1,406, exclusive of the central halls. In the centre of the front of the building there is a tower, with an illuminated clock, and bell. The roofs are covered with dark Westmoreland slates. The classrooms and central hall on the ground floor have wood-block paving. The architects were Messrs. Kelly and Birchall, of Leeds and London.

**PRESCOT, NEAR LIVERPOOL.**—Designs prepared by Mr. Thomas W. Cubbon, architect, of Birkenhead, have been adopted for a new congregational memorial church and schools about to be erected in memory of the late Mr. Richard Evans, Colliery Proprietor, of Haydock, by his daughter, Miss Ruth Evans, of Briar's Hey, Rainhill. The buildings will be erected at the Holt, Prescott, on a site containing about 3,000 square yards fronting the main road to Rainhill, and will include a church providing seating accommodation for about 650 on the ground floor, having organ chamber, vestry, cloak-room accommodation, &c., in connection therewith; also school buildings, including large assembly-room for about 300 children, having four classrooms at the rear, each for about eighteen scholars. The buildings are Decorated Gothic in character, the church being cruciform,

having transepts and chancel, the latter being fitted with rostrum and communion. Three main entrances are provided. The clerestory will be carried upon handsomely moulded arches and octagon pillars having richly moulded caps and bases, which, together with chancel and other internal arches, will be of Cefn stone. The whole of the buildings will be faced externally with local red sandstone. A handsome tower and spire occupies the south-west angle of the building, and reaches an altitude of over 120ft. The schools, which harmonise with the larger building, have an octagon bell turret to the right of the main gable, from which it is corbelled out and carried upon red granite shafts. A contract has been entered into with Messrs. Hughes and Stirling, of Bootle and Liverpool, whose tender was the lowest submitted in a limited competition. —A new public swimming-bath, designed by Mr. Thomas W. Cubbon, architect, of Birkenhead, is now in course of erection at Prescott for Miss Ruth Evans, proprietor of Haydock Collieries, and consists of swimming-bathroom 50ft. by 23ft., having 11 dressing-boxes, all being fitted up in the best style and with all modern conveniences and fittings. The design is Gothic, all the external walls being faced with local red sandstone, the internal walls faced with selected bricks, the sides of bath lined with white glazed bricks, and the bottom laid on concrete bed with heavy white tiles all set in cement. The internal woodwork is of pitch-pine varnished, roof lights glazed with Hartley's rolled plate and slated with Vellenhilli slates. Louvred ventilators are provided in roof, which may be opened and closed at will. The contract is being carried out by Messrs. Hughes and Stirling, of Bootle and Liverpool, under the architect's superintendence. —A new gymnasium, club house, and coffee tavern are about to be erected at Prescott from the designs of Mr. Thomas W. Cubbon, architect, of Birkenhead, for Miss Ruth Evans, of Rainhill and Rhyl. The buildings will include public gymnasium, 51ft. by 21ft., having dressing-room and all necessary conveniences attached; billiard and reading rooms with lavatories and cloakrooms, &c.; coffee tavern consisting of large refreshment-room, handsomely fitted with serving-bar, seats and tables, bicycle shed, verandahs, &c. The buildings, which are Gothic in character, are of two stories, and are faced externally with red sandstone from local quarries. All internal woodwork is of pitch-pine varnished. The whole of the buildings are being erected by Messrs. Hughes and Stirling, contractors, of Bootle-cum-Linacre, and under the supervision of the architect.

### COMPETITIONS.

**SHEFFIELD MUNICIPAL BUILDINGS.**—The design submitted in this competition by Mr. E. W. Mountford, A.R.I.B.A., of 22, Buckingham-street, has been selected by Mr. Alfred Waterhouse, R.A., the arbitrator, and will be recommended for adoption to the Town Council. The other competitors were Mr. James Lindsay, A.R.I.B.A., 246, West George-street, Glasgow; Messrs. W. Harvey, F.R.I.B.A., and Bernard Smith, of Whitehall-place, S.W.; Messrs. Flockton and Gibbs, St. James-row, Sheffield; Mr. Henry T. Hare, A.R.I.B.A., of 3, Lombard-court, E.C.; and Mr. F. H. Tullock, A.R.I.B.A., 5, Lancaster-place, Strand. We shall illustrate the selected design next week.

### CHIPS.

The town council of Sheffield, having decided to adopt the Technical Instruction Act, have allotted to the Firth College a sum of £1,700 on account of annual expenditure for the year ending March 25, 1891, and £2,100 on capital account for extensions and providing fittings and apparatus.

The first sod of the Kelvin-side section of the new Central Glasgow Railway was publicly cut on Wednesday week at Kirklee-road, Kelvin-side. Mr. A. H. Boyle, of Banknock, N.B., is the contractor.

The work of canalising the Seine, which has been in progress for fifteen years, is still being actively pushed forward. According to the engineer, M. Bouquet de la Grye, the cost will not exceed £5,150,000 sterling. The object of the work is to deepen the river another 10ft., so that vessels of 2,000 to 2,500 tons, which at present have to stop at Rouen, may go to Paris. It is intended to reconstruct an arch of each of the bridges across the Seine to allow of the passage of the vessels.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 3frs. 30c.). To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

## NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII., XLVI., XLIX., L., LI., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—R. P. W.—G. J. and Co.—B. of T.—H. L. B.—J. T.—R. L. and Co.—M. M.—J. L. B.—S. S. and Co.—T. W. W. and Co.—R. Bros.

JOHN BROOKE (That is a matter for your own architect and solicitor. It is impossible for us, for obvious reasons, to undertake the responsibility of advising how close you can build to an ancient light, especially from such rough data, and in total ignorance of the surroundings.)

## Correspondence.

## WESTMINSTER ABBEY.

To the Editor of the BUILDING NEWS.

SIR,—The new round window of Westminster Abbey is so similar in principle, or in its leading lines, to the celebrated one in the south transept of Chartres that one can hardly help comparing them. Photographs and pictures of it are so common that we may assume its general construction to be known. The first striking resemblance is the peculiarity (for this country) of the outer ring consisting of semi-circles instead of circles or pointed arches. The next ring consists of circles at both Chartres and Westminster; and again within that is a wheel with the same number of spokes. But at C. the central member is a large cusped circle, while at W. it is another wheel of spokes. The number of elements in all the several rings is 12 at C. and 16 at W., though the C. window is considerably larger. Thus far they are all but identical in structure. But there comes in a striking difference in details towards the outside. At C. the 12 circles touch each other, and so do the 12 semicircles of larger radius, which surround them radially—i.e., the centres of every circle and semicircle beyond it lie on the same radius of the whole window. Consequently the "eye" between them lies between four touching circles, and is a fairly large one—large enough to form a strong feature and to have four cusps. At W. the 16 circles do not touch each other, but leave small gaps between. Nor do the semicircles touch, which also lie not radially, but each touching two circles, and, therefore, they are much smaller

relatively than the C. ones, besides the smallness due to the greater number.

The consequence of all this is that the features of the C. window expand nobly outwards, whereas those of W. are more and more crowded together. Also, against the 12 large and cusped "eyes" at C. there are two sets of 16 small square ones at W.; and what detracts further from their effect, they do not lie diamondwise, but square to the radii and the rim of the window. Or, to sum it up, there are 88 lights in W. (omitting smaller eyes) against only 49 in the much larger window of C. The C. window was designed mathematically, or the size of every member, except the central circle, is absolutely fixed by the size of the window and the number 12. The W. one may be said to have been designed arbitrarily, or the gaps between the circles and the semicircles might as well be anything else. And yet it is difficult to see what has been gained by that escape from mathematical rules, while much has been lost by the smallness and crowding of the outer members through leaving those gaps. Moreover, there is always something unconsciously pleasing to the eye in the appearance of mathematical relations in such structures, and especially in windows of the Geometrical Decorated style—the essentially mathematical one. The new arcading above the window is pretty and well done; but it has the same defect of being crowded or filled with too many members, and therein is an unpleasant contrast to the beautiful and bold Early English arcades inside both transepts. It is no use complaining now; but if criticism is worth writing, these are plain matters of fact for critics to reflect upon.—I am, &c., X.

## CHIPS.

The designs and estimate of Mr. Benjamin Johnson, manufacturer of portable steam cranes, Mill-lane Works, Bramley, near Leeds, have been accepted by Mr. Harry Hems, Ecclesiastical Art Works, Exeter, for the erection of a 10-ton Goliath overhead crane in his statutory yard. The space covered will be 207ft. by 25ft., with 26ft. clear lift.

The tender of Messrs. Treasure and Son, of Shrewsbury and London, has been accepted for the erection of the Government Telegraph Factories and Water Tower, Mount Pleasant, Clerkenwell, E.C. The architect is Mr. Henry Tanner, 12, Whitehall-place, S.W.

Extensions to the Industrial School, Shustoke, for the Corporation of Birmingham are now being carried out by Mr. Daniel Arkell, architect, Birmingham. The builder is Mr. William Hopkins, of Latimer-street, Birmingham. The work will cost between £3,000 and £4,000.

At the Workhouse, East Preston Union, Sussex, additions have been made to the infirmary, with a covered way and improved drainage to the block, from plans and under the superintendence of Mr. H. Howard, surveyor. The foregoing have been carried out by Messrs. Snewin Bros., builders, of Littlehampton, at a cost of about £900.

A two-light window was unveiled at the Charles-town Congregational Church, Broughton Road, Pendleton, on the 12th inst., in memory of the late pastor of the church, the Rev. Neal Jordan, B.A. The subjects represented are "Our Lord as the sower," and "The angels reaping." The subjects are without canopies or other ornament, with the exception of a base of ornamental character. The work has been carried out by Mr. A. O. Hemming, of London, under the superintendence of Messrs. E. and F. Hewitt, architects, of Manchester. Below the window is placed a memorial brass, lettered in black and vermilion.

On Wednesday week the foundation-stone of the public offices now in course of erection by the New Swindon Local Board in York-place, New Swindon, was laid by the chairman of the board. The building will cost about £10,000. Mr. J. Reed, of Plymouth, is the contractor, the architect being Mr. Brightwen Binyon, of Ipswich. The building will be in the Renaissance style, and will be built of brick, relieved with stone, and the roof slated. There will be a tower 102ft. high. The two principal rooms will be a board-room, 52ft. by 28ft., and a public hall, 70ft. by 33ft.

The Tottenham Local Board of Health were summoned before the magistrates at Edmonton on the 12th inst. by the Lea Conservancy Board for neglecting to discontinue the flow of sewage matter into the river. The defendants denied their liability, alleging that the responsibility had been transferred to a Joint Committee of their Board and the Wood Green Local Board. The magistrates held that the Joint Committee was responsible, and therefore dismissed the summons.

## Intercommunication.

## QUESTIONS.

[10300.]—Camp Shedding.—Will any reader be so kind as to give me a description of camp shedding and its uses?—F. B.

[10301.]—Concrete.—Would some reader kindly inform me how to obtain the necessary thickness of a concrete foundation to resist a certain weight, and would concrete, say, 2ft. thick take twice the weight of that borne by concrete 1ft. thick? Also, taking bricks as tested by Mr. Kircaldy, which required 120 tons to crush 1ft. super., the bricks being bedded between pieces of pine 1in. thick, and allowing a factor of safety of one-tenth, would it be safe in practice to load brickwork built of these bricks till the weight reached was, say, 12 tons on the foot super.?—W. H. E.

[10302.]—Schools.—Will any of your readers kindly inform me the best books on school buildings, and where there are first class examples of schools to be seen or illustrated? In a school to hold 200, what would be the area for each child? This, with any further information, will oblige.—EVANS.

## PARLIAMENTARY NOTES.

THE SEWAGE IN THE THAMES ESTUARY.—Major Rasch asked the President of the Board of Trade last Friday whether, as owing to the deposit of London sewage in the vicinity of the Nore Sand the fishing grounds of the Thames estuary were being injured, he would arrange for the station of a Government ship in the neighbourhood, in order that the sludge might be deposited according to agreement east of, and no higher up the river than, Knock Buoy. Sir M. Hicks-Beach: No agreement such as is suggested by the hon. member has come officially to my knowledge, and there seems some difficulty in taking any action in the matter until it has been under the consideration of the committee of the recently created Kent and Essex Sea Fisheries district, who will have power to deal with it.

HANKEY MANSIONS AND HIGH BUILDINGS.—Viscount Hardinge, on Tuesday, called attention to the excessive height of the Hankey Mansions, which seriously disfigure the adjacent public buildings, and asked whether some amendment of the law might not be practicable to meet such cases. The noble lord recalled what had happened with reference to buildings at Albert-gate, which were carried up to an enormous and quite unnecessary height. He also referred to buildings at the corner of Piccadilly and Arlington-street, which shut out light from adjoining houses. Again, on the Thames Embankment there were houses that were unnecessarily high, and dwarfed public buildings. The evil had even extended to the designs for the new War Office. The time had arrived when something ought to be done by legislation to stop these enormously high buildings. Lord Henniker warmly sympathised with the noble viscount in what he had said about the hideous buildings that were now defacing the metropolis. But at the same time the Office of Works had no power to deal with the evil. The question was not one for the Office of Works at all, but no one would welcome the initiation and carrying through of legislation to prevent the defacing of London and the buildings and parks under the Office of Works by the erection of those monster buildings than the First Commissioner and those who acted with him.

THE LADIES' GALLERY.—Mr. T. Healy, on Tuesday, asked the First Commissioner of Works what was the height from the ground floor of the House to the Committee Rooms and the Ladies' Gallery, and would it be possible to put up a lift or lifts for the convenience of members and of ladies visiting the House. Mr. Plunket: I find that the height of this building, from the ground floor to the Committee Rooms, is 39ft. 3in. It would be possible to introduce a small lift to contain three people, but it would be an expensive undertaking. Sir G. Campbell asked whether there did not already exist a lift which was used for the coals; and whether the ladies could not be substituted for the coals. Mr. Plunket: Such a lift does exist, and it certainly could be used either for the ladies or the coals, but it would be very difficult to combine the two. Mr. T. Healy asked whether the right hon. gentleman would examine into the matter in the recess. Mr. Plunket: I have no objection to examining into the question.

Alterations have been made to the Withington Workhouse, Manchester, embracing the improvement of the ventilation, for which Boyle's latest improved self-acting air-pump ventilators have been used.

Mr. Edwin J. White, F.A.I., of 145, Holborn Bars, London, E.C., who has been established upwards of a third of a century for the supply of goods at lowest trade prices for cash, has just opened a new department at 46, Gray's Inn-road, W.C. (opposite Gray's Inn-gateway), for marble, enamelled slate, wood and iron chimney pieces, marble and tile hearths, &c.

## LEGAL INTELLIGENCE.

**"GOLD" MEDALS.—AN INTERESTING CASE.**—At the Leeds County Court last Friday, Messrs. Powell Brothers, artists in stained glass, Park-square, Leeds, sued Mr. Joseph Davis, who is manager of the Leeds Exhibition, and who was also manager of an exhibition held at York last year, to recover a gold medal, or £21, its value, together with damages amounting to £5, for non-delivery. Mr. Davis sent out a circular in connection with the York Exhibition which stated that special gold medals, of the value of 20 guineas each, would be given in various classes, including one for the best specimen of stained glass for ecclesiastical purposes. Upon that the plaintiffs took space at the York Exhibition, for which they paid £9, and incurred considerable expenses for preparing glass for exhibition. Towards the close of the exhibition they received a circular from the defendant informing them that a diploma for a gold medal had been awarded them. As the plaintiffs had not received a gold medal last December, they wrote to the defendant asking when they might expect to receive it. The reply was, "If you will kindly read the award, you will note that a diploma for a gold medal was sent you, which is equivalent to a gold medal award." Messrs. Powell then consulted their solicitor, and in answer to a letter threatening proceedings, Mr. Davis wrote stating that no unnecessary delay had taken place in awarding the medals, and added that he had had them in his possession for five months. He further stated that in the course of the following week he would have the medals engraved and issued to those entitled to them. After a month had elapsed a medal was sent to the plaintiffs, who had it tested by Messrs. Pearce and Sons, Mr. John Dyson, and Messrs. Bell, who found that the gold was of a low quality. Its intrinsic value was less than £4, and the cost of the die, amounting to £25, divided amongst eleven medals, would bring the cost of the one received by the plaintiffs to about £6. Mr. John Pearce stated that the medal was composed of pure gold and pure silver in such proportions that the quality was not more than 9 carat. He would, he said, be prepared to supply eleven such medals at £10 each. Further evidence of a similar kind was adduced as to the value of the medals. On behalf of the defendant it was submitted that for exhibition purposes the medal was worth £20. It might not realise that sum if placed on the market, but it must be borne in mind that only three medals were struck from the die, and the jury had no right to take the metal received by the plaintiffs at its melting-pot value. Witnesses were called, who stated that the medal was worth £20 for exhibition purposes. One of them stated that its intrinsic value was £10. The jury found that the value of the medal was £10, and his Honour gave judgment for the plaintiffs for £11, with costs, in addition to the medal.

**NEGLECT TO GIVE NOTICE.**—North London Police Court, June 12, 1890, before Mr. Montague Williams.—District Surveyor for East Hackney, North, v. Anthony and Co., Limited.—The defendants were summoned for neglect of giving notice. They had erected, on the front of the old Town Hall, Hackney, a wooden advertisement framing in two parts, each part measuring about 18ft. by 12ft., supported on wooden brackets driven into the walls and fixed with iron holdfasts, some with and some without screws. The district surveyor relied on sections 9 and 14, and section 26 rule 1. The defendants contended that the Building Act was only intended to apply to what was a part of a building and not to such things as advertisement boards and brewers' signs. The defendants, who were represented by counsel, were ordered to pay a penalty of 10s. and 12s. 6d. costs. The magistrate refused to grant a case.

**THE REREDOS IN ST. PAUL'S.**—In a Divisional Court of Queen's Bench on Tuesday, before the Lord Chief Justice and Mr. Justice Wills, Mr. Moulton, Q.C., on behalf of Sir Christopher Robert Leighton, Bart., and others, moved for a rule calling upon the Bishop of London to show cause why he should not forward and proceed with a representation presented to him regarding the idolatrous character of the images of the Crucifixion and of the Virgin Mary on the reredos of St. Paul's Cathedral. Counsel said a mandamus had been granted by the Court on this very subject, and the matter had gone up to the House of Lords on appeal. This was a fresh representation by different people, and in addition to the allegations in the previous representation that the images tended to induce superstition and idolatrous reverence, the present representation said that they had, as a matter of fact, produced such idolatrous reverence. The Bishop declined to proceed, on the ground that the other representation was before the House of Lords, and the promoters wanted the rule in order that both points should be before the House of Lords at once.—Their Lordships granted a rule nisi.

The Smethwick Burial Board have sealed a contract with Mr. Hurley for erecting the cemetery chapels for £1,217.

## Our Office Table.

The steady progress made by the plumbing classes is one of the most satisfactory features of the movement for the registration and training of plumbers. Among the latest and most successful classes is that established last session at Greenock in connection with the District Council for Glasgow and the West of Scotland. This class, which commenced in October last, and has just terminated for the session, was held in the Mearns-street Public School. A report which the teacher of the class has furnished to the District Council shows that out of the total number of 36 students the average attendance was 30. The happiest results of the work done by the class have been apparent in the increased intelligence manifested by the rising generation of plumbers in executing their work. During the preceding session many of the Greenock students received elementary instruction in the plumbing class connected with the Glasgow Technical College, and they have, therefore, been given advanced instruction in the Greenock class during the past session. The result of the examinations held at the close of the session were eminently satisfactory, the students taking the 2nd and 5th prizes out of five prizes with medals offered to plumbing students in the United Kingdom.

The annual meeting of the Association of Municipal and Sanitary Engineers and Surveyors will be held at Liverpool on Thursday, Friday, and Saturday next, 26th, 27th, and 28th June, 1890. The members will assemble at 11.30 o'clock on Thursday, the 26th June, in the Council Chamber of the Town Hall, when the annual meeting of members will be held, and a reception by the Mayor (Mr. Thomas Hughes, J.P.) will follow. The president's address will be delivered, followed by paper and discussion on "The London Sewage Question," by Crawford Barlow, B.A., M.Inst.C.E. At 1.30 p.m. there will be an adjournment for luncheon in the Town Hall, to which the members are invited by the Mayor. At 2.30 p.m. papers and discussions will follow on "The Mersey," by W. Spinks, Assoc.M.Inst.C.E.; "The County Management and Maintenance of Main Roads," by E. P. Hooley, Assoc.M.Inst.C.E.; "Traction Engines and their effect on Roads and Buildings," by J. H. Burton. The annual dinner will take place at Eberle's Restaurant, Eberle-street, Dale-street, at 6.30 p.m. for 7 p.m. On Friday and Saturday visits will be paid to various surrounding places and objects of interest.

The paper by Prof. W. C. Roberts-Austen, C.B., F.R.S., on the "Use of Alloys in Art-Metal work," read before the Society of Arts and printed in the journal of that Society, is of particular interest to those interested in metal-work. Professor Austen pointed out how the Japanese used their alloys to produce relief, colour, and texture. Many beautiful specimens were shown in which the effect of texture in metal is given. The alternate layers of copper and shaku-do produce the appearance of wood grain. Two particular alloys which the lecturer named as worthy of admiration were those to which the names of moku-me (wood grain) and miyu-nagashi (marbled) are given. The Japanese art consists in taking thin sheets of these and other alloys soldered together in alternate layers, and then by drilling conical holes, hammering and cutting off prominences, beating and other processes, to obtain the effect of strata or variegated bands of colour. Sometimes the thin sheets or layers are beaten up from behind, and the surface filed flat, and the most varied and ornamental designs are produced. The Japanese are truly wonderful artists in metal, and their artistic employment of alloys is worth study. Their chief object is to produce decorative relief and colour—not to imitate other textures for the mere sake of imitation.

The "emergency door," for use in theatres and other public buildings in case of fire, invented by Mr. F. J. Lancaster and Mr. Edwin Nixon, appears to be designed on the right principle. The door is constructed in two halves, one overlapping the other, held by a spring at the foot operating a catch. Another spring forces the doors open directly the bottom catch is withdrawn, which is done by the pressure of the foot of a person who approaches the door from within. For this purpose a small platform, which can be

depressed by the weight of any one, is sufficient. Thus a panic-stricken crowd rushing out of a building would find every emergency door fly open directly they got near the doors. The idea is a good one—the two halves of the door slide, as they always should in doors fitted up for public buildings.

Zinc and spelter are following the boom in copper, zinc having advanced £3 a ton during the past fortnight—from £24 to £27 delivered in Birmingham. Spelter has risen about 30s. The advance in both zinc and copper has largely increased the cost of brass, whilst the enhanced value of spelter is seriously checking the recent improvement in the galvanising industry, large orders for galvanised sheets having been withdrawn. The rise in spelter is attributable to the operations of a Belgian syndicate, who are gambling in this metal.

## MEETINGS FOR THE ENSUING WEEK.

**SATURDAY (TO-MORROW).**—St. Paul's Ecclesiastical Society. Visit to Waltham Abbey, under guidance of J. Arthur Reeve. Train leaves Liverpool-street 2.50 p.m., returning from Waltham Abbey 6.52 p.m.

**THURSDAY.**—Annual meeting of the Association of Municipal and Sanitary Engineers and Surveyors at the Town Hall, Liverpool. 11.30 a.m.

**FRIDAY.**—Visit of Association of Municipal and Sanitary Engineers and Surveyors to the Docks at Liverpool. Assemble at Harbour-Master's Office, 9.30 a.m.

**SATURDAY.**—Visit of Association of Municipal and Sanitary Engineers and Surveyors to various places of interest in and near Liverpool. Assemble at Municipal Offices, Dale-street, 9.30 a.m.

**Architectural Association, 9, Conduit-street, W.**—The Special Business Meeting of June 18 has been adjourned by resolution till Friday, June 20, at 7 p.m.

FRED. R. FARROW. } Hon. Secs.  
ERNEST S. GALE. }

## Trade News.

## WAGES MOVEMENTS.

**LIVERPOOL PLUMBERS' STRIKE.**—At a representative meeting of master plumbers, held at the rooms of the association on Friday last, the question of the demand made by the operatives was fully discussed. It was stated that the reports spread by the men that a large number of employers had granted the advance was inaccurate, as only a very small number, employing one or two men, have given way, which they say they have been forced to do under special circumstances. The following resolution was passed:—"That this meeting considers the employers' offer of 3d. per hour advance is ample, and pledges itself not to increase the offer, but to take every legitimate means to fill the shops with men from outside sources, unless the men return to work."

**STATE OF THE BUILDING TRADE.**—According to the *Board of Trade Journal*, during the past month the building trades continued to show improvement, and the percentage of unemployed was but 1.6 as against 2 during the previous month. The cabinet-making trade is reported good; but the number of unemployed has been very largely increased by strikes at Manchester and at Beith.

**WOULDHAM.**—After a lock-out of a fortnight, which arose from a dispute with the Bargemen's Union, the hands employed at Messrs. Peter's Cement Works at Wouldham, on the Medway, resumed work on Monday.

The successful design in the competition for the Great Tower for London embodies a scheme of lifting machinery specially prepared by Messrs. Archibald Smith and Stevens in accordance with the requirements of the designers. It is of a somewhat elaborate character, and comprises some novel features.

The extensive Seamen's Barracks which have just been erected at Portsmouth by Her Majesty's Government are warmed and ventilated throughout by means of over 30 of Shorland's warm-air ventilating patent Manchester stoves with open fires, supplied by Mr. E. H. Shorland, of Manchester, who is constantly supplying his stoves for similar Government and other public buildings throughout the country.

A company has been formed for the purpose of erecting a suitable town-hall at Crickhowell, and at a meeting of the directors, Mr. E. A. Johnson, of Abergavenny and Newport, was appointed architect for the new buildings.

\* Accepted subject to modification in the works.

JENNINGS' PATENT "TIP-UP" LAVATORIES

Are fixed in all the principal Mansions, Clubs, Hotels, Railway Stations, Hospitals, Asylums, Schools, &c., throughout the World.

By an IMPROVEMENT in the construction, the Basin can be "LIFTED OUT" and replaced without THE SLIGHTEST TROUBLE, which permits of cleaning the receiver beneath. Many other IMPROVEMENTS have also been effected, which stamp it as being the SIMPLEST, CLEANEST, and MOST EFFICIENT Lavatory ever produced. Made to suit any position, with Tops of PLAIN SLATE, ENAMELLED SLATE, or MARBLE, and with or without Wood Enclosure.

AWARDED THE GOLD MEDAL, PARIS EXPOSITION, 1889.

To prevent disappointment and trouble, the public are respectfully requested to see that the Basins bear the NAME and ADDRESS of the Patentee,

## SHEFFIELD MUNICIPAL BUILDINGS COMPETITION.

THIS week we commence our series of illustrations of the six designs sent in for the final competition, by publishing the perspective view and plans of the selected design, of which Mr. E. W. Mountford, F.R.I.B.A., is the architect. Next week we shall give other illustrations. All the drawings have been on view this week in the Jappin Art Gallery at Sheffield, and naturally have attracted considerable interest. A new feature in the history of competitions has resulted from the contest for which we do not remember any precedent, and, at this juncture, it is not quite easy to foresee what will exactly follow as a consequence. Anyway, Messrs. Flockton and Gibbs, one of the unsuccessful firms who competed, have notified to the Corporation, since the publication of the award, that they patented that portion of the original design, submitted in the primary contest, by which, in the words of the author's patent specification, "Each set of offices for a department is made complete in itself, the entrance for the public being into, and by way of, the general or enquiry office, from which access is easy and direct to a corridor in which are the private offices. These corridors give the officers the means of communication with each other without entering the general office, and also with the general office at different points." Messrs. Flockton and Gibbs further say: "The advantages of this plan over the usual arrangements of public corridors consist not merely in the feature that no facilities are given for the public to seek admittance where they are not wanted, but that the private offices are rendered more quiet and undisturbed, the intercommunication more easy, and the control by the heads of the departments more perfect," and add: "The arrangement has, so far as it is known to us, never been adopted in municipal buildings where there is a combination of such departments; so that our design, as originally submitted, was entirely novel in this respect." They then, in their letter of claim to which we refer, express their opinion that the self-evident advantages of this novel arrangement of plan led to its being made a condition of the final competition, and its consequent incorporation in Mr. Mountford's final designs, which were modified in accordance with the "supplemental instructions" issued to competitors. Thus it will be seen that the Corporation, if this allegation be correct, have already adopted Messrs. Flockton and Gibbs's patent plan in preparing the official conditions, and, therefore, these two gentlemen have intimated their intention of once completing their patent, after which they express a willingness to make "arrangements for its incorporation in Mr. Mountford's design." The dispute clearly, whatever its merits, lies between the Sheffield authorities and Messrs. Flockton and Gibbs. Mr. Mountford simply followed his instructions, and right well has he realised the intentions of the promoters. The whole of the six designs are unquestionably of considerable merit, and Mr. Waterhouse must have had no little difficulty in deciding which of them deserved the palm, seeing that no one design exhibits exceptional architectural ability. Five, at least, out of the six would have formed an imposing addition to the municipal buildings of any city, and the Sheffield Corporation are to be congratulated upon

their good fortune in having chosen so admirable a plan for their new offices as Mr. Mountford has supplied. We print in another place his description of the salient points of his scheme, which follows on plan the frontages of the site bounded by Pinstone-street, Surrey-street, Norfolk-street, and Cheney-row. His tower, decidedly the chief and most successful feature of his composition externally, boldly marks the angle at the junction of the two main thoroughfares. The simplicity implied by the three main gables of the principal front, divided as they are by a plain breadth of unbroken roof line, is another great advantage; but the excessively pronounced effect of vertical lineation, chiefly due to the ugly proportioned and elongated pilasters which cut up the façade from basement to parapet, is much to be regretted. In execution no doubt the undue prominence given to them in the drawings will be lost, though the flutings in the upper stages and the panels below necessarily exaggerate the excess of line. The composition fails in general terms from a want of breadth, and we cannot say we think the winter-garden looking building and the staircase turret lean-to at the base of the tower add either to the merit of the building or the dignity of its leading feature. The detail throughout is in accord with the type of style adopted. The report of the referee mentions no design as second in order of merit; but the marked originality of Messrs. Flockton and Gibbs' treatment leaves little doubt as to which of the remaining designs is likely to attract the most attention. By compacting their plan considerably within the confines of the site, and by disposing of the chief front almost diagonally with the present frontages, these architects were obliged to greatly increase the height of their building, thereby rendering staircases a great feature. The ability of the design no one can question; but the great central tower is the least satisfactory part of the composition, overlaid, as it is, with windows and other details, though we do not agree with a local description of the design as the "Jubilee monolith." The great feature of the plan is embodied in the subject of the patent, already referred to, with the several official departments ranging round a great central hall, "combining all the features of separate buildings embraced into one." The cost was estimated at £77,571, cubed at one shilling per foot. Mr. F. H. Tulloch's design has an exceedingly clever and dignified plan combined with well balanced and broadly-conceived elevations, having a big tower at the end of the Surrey-street front. The council chamber is situated in the centre of the site, with wide areas on both sides for lighting the offices on the ground floor. Architecturally, this is one of the best designs, clever rather in detail than in general outline; though it is not wanting in breadth. The absence of a base or plinth is a marked fault, which the perspective only intensifies. We prefer the Surrey-street front to that facing Pinstone-street. Viewed from Fargate, this design would have been very imposing, and the main gables would look better when seen in sharp perspective. Mr. H. T. Hare's design also has a dignity and breadth about it which we find wanting in the front elevation of Mr. Mountford's composition; and although we much prefer the tower of the chosen design, we must confess a preference architecturally for the loggia treatment for the main façade adopted by Mr. Hare. The entrance, too, is more pleasing, and the value of plain wall space is more fully recognised. The central turret is ugly, perhaps, and no doubt the plans in detail are somewhat crude, leaving, for instance, great spaces to be cut up at will. The author of this design, with more attention to detail, should find himself on the road which leads to fame. Messrs. Harvey and Smith trust less than the other competitors to the im-

portance of a tower, a feature which was made optional, if we remember rightly in the original conditions. They place theirs on the Surrey-street front in the centre, and thus mark the entrance to the Water Departmental Offices. The chief feature of the Pinstone-street façade is comprised of three arches inclosing the reception-room windows, loggia-like in treatment, and excellent in their detail, which is of a rich Renaissance character. The lofty roofs and crowning flèche surmounting the whole add greatly to its imposing effect. The remaining design is by Mr. James Lindsay, of Glasgow. It is essentially Classical in spirit, with a rusticated plinth, and enriched with columns of the Corinthian order, masking the arched windows of the chief apartments. The columniated centre is flanked by pedimented wings, and a well-proportioned massive tower stands at the angle of the chief fronts. The leading features of this design are not sacrificed to details, though these are well studied and suitable. The practical air of the drawings, too, attracted many admirers, though it was evident from the first that the want of concentration in the plans would tell against an ultimate chance of success. The offices of the accountant and waterworks departments are too scattered. The council chamber is situated in the centre, and the approaches are conveniently arranged. In the exhibition all the original competition designs sent in by the six final competitors are exhibited by the side of their completed plans; thus all alterations and deviations are readily noted.

## THE OWNERSHIP OF PLANS.

THE value which an architect sets on his plans ought to be that of their actual use to him. When a building has been executed from a set of drawings, their use has, it is thought, been fulfilled, and they have served their purpose. They can be of little further use to the architect except as documents of reference in the case of alteration or additions. These are the arguments that may reasonably be expected to come from a building owner who wishes to retain the plans of his own building; but the architect attaches another value to his design besides their actual use to him in carrying out the building. The design is a kind of prescription of what might be done under similar circumstances, the plans are records of thought and experience, the elevations artistic expressions of these ideas. Apart from the actual value of these records, whatever it may be, there are two other considerations which weigh heavily in the minds of the architect. First, the retention of the plans by the owner enables him or any of his friends to make use of them without employing their author; second, they yield up evidence to the owner that may be prejudicial to the architect. That these are considerations of weight cannot be denied, hence the legal decree which vests in the owner the property of plans has always been a bitter one among the profession, and its objections are valid. We may suppose the plan is for a house detached: the same arrangement can be adopted in a similar site elsewhere. If it is the plan of a house in a street, a similar use can be made of it. Perhaps the design may be for a labourer's cottage, a school, or a model farm, in which case the drawings would be of value to anyone who contemplated erecting any of these buildings. Slight alterations only would be required to make the same plan suit another site. Why should an architect part with the instruments of his calling, if they can be used a second or third time, or the same plan multiplied indefinitely? He was paid a commission for designing and carrying out a building for a certain individual. Is it fair that the same plans should be made use of without payment in other cases, either by

the same individual or by others? In reply it may be said that the architect is paid to prepare a design, and if this design be repeated it does not follow he should receive another commission. The payment he receives covers the design, which becomes the property of the owner who employed him, and who is at liberty to utilise the idea. There are thus two ways of looking at a set of plans: the architect regards them as embodying his own ideas or invention, which he prescribes for a particular purpose, and to which prescription he has an individual right, and that therefore he is entitled to charge for every time they are used, just as a patentee of an invention has a right to compel everyone who uses his invention to pay a royalty. The lawyer's view is that of the public generally. The design or plans are considered to be a marketable commodity, and once being paid for, belong entirely to the employer, who can thus repeat the design as often as he pleases, or lend it to others to use. Which of these views is the right one?

The sooner the question of ownership of plans is settled, the better it will be for the peace of mind of the profession and the public. The decision in the case of the plans made for the Houses of Parliament, and the reported case of "Ebdy v. M'Gowan," represent the legal mind on the question, and have indeed made it illegal for an architect to refuse to give up the plans that he has made and been paid for. But though, in the face of these decisions, it would be difficult for an architect to refuse to give these documents up, he is not obliged to agree to such an arrangement. The custom of retaining them has been pronounced not to be reasonable; but that is no argument why architects should submit to the ruling of the Courts, and make no special provision on the subject. Every now and then we hear of a disagreement between a professional man and building owner on some question of contract, or as to the carrying out of the work in some particular; sometimes it is a question for arbitration, and the owner to support his case has to produce evidence. The plans and specifications are all important witnesses to prove the owner's contention, but the architect refuses to render up documents that may weaken his own case. The owner thereupon says he has paid for the plans: they are his property, and he ought to have them. How is the architect to act under these circumstances? Is he compelled to part with documents which may be as valuable to him as to the owner? Can he destroy them without making himself amenable to the law, as an architect did the other day, and which was the subject of a case ("Clarke v. Macnamara") heard at the Altrincham County Court? The decision of the judge in this case was to the effect that the architect had a very mistaken view as to his rights, and that the plaintiff might have claimed vindictive damages if the action had been one of trespass, because to destroy the property of another person was a very serious offence which the law visited with ample damages. The architect, at the suggestion of the judge, agreed to make tracings of the duplicate plans deposited with the local board, and to meet the plaintiff in all that was required. The points of the particular case to which we are referring were reported in these pages June 13 (p. 854). The plaintiff employed defendant to prepare plans and specifications and superintend the erection of two villas. Litigation arose about something in the work, and the defendant architect was applied to for the plans and specifications, they being necessary to have the work checked. The architect refused to give them up until he was paid his charges, which was one of the points in dispute. The result of the litigation was favourable to the plaintiff, who was awarded £25 damages

by reason of breach of contract, and he thereupon renewed his application for the plans, the defendant replying that they were destroyed. The architect, however, paid three guineas into court, which was thought insufficient by the plaintiff, who valued the plans at ten guineas. The payment into court was an admission of liability. These facts only support the decisions hitherto given as to the building owner's right to the plans; they also indicate the value set by owners on these documents. The intrinsic value of the plans was a point raised. The plaintiff sued defendant for £10, which he estimated their value to be to him, and £5 for detention. The judge said their value could be appraised by calling in an architect or builder! A very commercial way of looking at the matter, certainly. Apart altogether from the merits of the case decided, the architectural profession has some cause for complaining of the circumstances. That an architect should be called upon to give up his drawings to enable his employers to substantiate a claim against him is certainly a proceeding which is rather aggravating. A number of disagreements might arise during the erection of a building, and at each juncture it might be argued that the architect ought to deliver up the plans to the owner. A point might be raised as to the dimensions of a certain room or the thickness of a wall. It would be preposterous for the client to demand the plans at such a stage, as the architect is the only and proper judge of what he intended. Demands of this kind are often made by clients when they happen to quarrel with their architect about the execution of a part of the work or some detail. We remember one instance where an architect in good practice, A., received a letter from a brother professional, B., saying that Mr. A.'s client had placed the matter in dispute between himself and A. in his hands, and requesting him to hand over the plans and specifications to enable him to check the work about which the dispute had arisen. Mr. A. was astonished at so unprofessional and unbusiness-like a proceeding, and, of course, declined to adopt this mode of settling the dispute, which by the terms of the contract he alone could do.

If these documents are by law held to be the property of the building owner, what is there to prevent him demanding the plans whenever he is so disposed?—a course of action that would subject the architect to an immense amount of trouble and inconvenience unless duplicates were prepared in each case. Every architect would resent such a claim during the performance of the work and before he had given his final certificate. The client, if of a cantankerous disposition, might be continually comparing the executed work with that described in the plans and specification, and be finding out all manner of trivial and fancied discrepancies. It would be preposterous and detrimental to imagine such interference during the time of carrying out a contract; the architect would no longer be the arbiter between the contracting parties if the client wished every now and again to pass his judgment on the work. Therefore we conclude that the ownership of plans ought not to be claimed, or the right to claim them ought at least not to take place till after the completion of the building, and the architect has discharged his obligations to client and builder. It is not, certainly, till after completion that the claim for plans is generally made, and as the architect's use of them has been then served, he can, with more magnanimity give them up to his client. Tracings of them at least can be made for the owner, having reference mainly to the drains or other matters required for examination or future alterations. Unfortunately, it is not often a voluntary act, but a compulsory rendering up of documents, generally made for getting some advantage,

and resisted on the same grounds. A more decided authority on the question is necessary in the interests of both parties. The profession can do something towards the matter by making it a stipulation in an agreement with their clients, that the plans are their property, and that if copies are required for reference as to drains, &c., they may be had on payment of a small fee. The matter would then be made one of contract, and no possible difference could arise. If a client expressly makes it a condition that he should have copies of the plans after the work is completed, it ought to be stipulated that they are not to be used for any other building without the architect's consent, but only for reference. If stipulations of this nature were more generally adopted, there would be fewer disagreements between architects and their clients. As the custom of ownership of plans stands, there is some uncertainty as to its prevalence. Cases in the law reports are not to be found, and the only decision that is of any value is that in which it was held that the custom referred to is not a reasonable custom—namely, that plans prepared by an architect whose services are not required, should remain his property after being paid for. The profession would be strengthening its position if it can show a more united opinion on the question.

#### FREE PUBLIC LIBRARIES.—II.

IN our first article we described a few of the buildings which have been erected in the Metropolis under the Free Public Libraries Act, and we now propose to enter a little more fully into the design of libraries, and have selected a few typical arrangements to illustrate our remarks. The design of a library is so directly related to plan that it is not too much to say that an ill-planned library will be a source of continual vexation and expense, as no architectural exterior will atone for an arrangement that cannot be altered without a radical reconstruction. As we have hinted, the main departments of a public library, the news-room and lending room, ought to be easily accessible, and, if possible, on the ground floor. The news-room ought at least to be so situated. When the library forms a part of a municipal building, as it does at Leeds, it is often necessary to devote one wing of the building to the purpose. In the Leeds Municipal Offices, by Mr. Geo. Corson, the news-room, lending library, and reference library form one wing of the main building, and have a separate entrance from the side street, quite distinct from the official department. The news-room, on the ground floor, is 80ft. by 40ft., or a double square, and is divided into a centre nave and aisles by arcades of six arches, carried upon polished granite pillars. The ceiling consists of a series of segmental vaults, transversely placed, their springings resting on transverse wrought-iron girders. The vaults are finished underneath by a kind of mosaic of hexagonal-shaped bricks, as described in our former article. The tables in the news-room are placed transversely under each vault, the central division having tables about 16ft. long, and the side aisle tables about 6ft. long. The light comes from one side, each of the six bays having a window, and between each column and window-pier there is a bookcase. The lending library over has these transverse bookcases arranged in the same manner between the shafts and window piers, forming a series of bays or alcoves on each side. The centre, or nave, is open, and forms a large space, or lobby, for the public, a counter being fixed all round before the arcades, thus inclosing the aisles which contain the books, only accessible to the staff. The reference library, on the top floor, has a semicircular roof, divided into bays by iron principals carried on stone corbels. In the Belfast Free Library the

ground floor is entirely devoted to the libraries and reading-rooms. The reading-room measures 52ft. by 36ft.; next, on the right, is the lending library, 37ft. by 29ft. 6in.; a ladies' reading-room, 28ft. by 25ft., and committee room in front. On the left side is the general library, 50ft. by 34ft., and in front the select library and librarian's room. The upper floor is devoted to art picture galleries. The plan is an economical distribution, no space being wasted in corridors. We recommend this arrangement where a large site can be acquired, and where picture galleries form a portion of the building.

On the smaller sites, which are more frequent in towns, especially in the Metropolis, two floors, at least, are necessary for the accommodation. First, we may take an area in which the building may be isolated and lighted all round. The plan of the Rochdale Free Library (Fig. 1) is an example of a very simple and effective plan. It is divided into three bays—a central hall with reading-rooms on each side; the lending and reference departments behind. The reading-room on the right hand is used as a general reading and reference room, with two rows of tables and a counter at end. On the left-hand side the front portion of the room is devoted to a ladies' reading-room during the day and a boys' room in the evening, one plan of making the most of a small area. The back portion of this room and the centre bay are filled with bookcases. The counter across the hall is convenient. The basement is utilised partly for storage for the specifications of patents under the general reading-room; a committee and librarian's room is below the centre bay, and under the other reading-room are repairing and attendants' rooms and heating apparatus. Fig. 2 represents the new Free Library at Norwood, which we have generally described, p. 789. Here the building forms one of a

row of buildings in a road. The hall and counter occupy the space within the entrance; the librarian has supervision of the news and reference rooms behind by two small openings or desks, also the lending library in front. The two former rooms are top-lighted. The plan is a good example of compactness, the public rooms being entirely on the ground floor and the librarian's private rooms above, access to which is gained by a staircase in front. The Chelsea Free Library (plans 5 and 6) we have also described, p. 789; it occupies a similarly shaped piece of ground, but open on its sides. A similar general arrangement is adopted, a central hall giving access to the news and lending departments. The space for the public is inclosed by a counter at one corner of the lending library, is conveniently situated for the supervision of the librarian, whose room has access to it, also to the boys' reading-room in front. Doorways communicate between the news-room and library. The arrangement of tables, seats, and bookcases is shown in the plans. The upper plan shows the reference library, 63ft. by 24ft. 6in. Side windows for the lower rooms and a domical roof and end lights for the upper room are provided. Boyle's air-pump ventilators are placed over the reference library; the lower rooms are ventilated through apertures in coves of ceiling leading to an extract shaft passing through book stores above, with an air-pump ventilator at the top. Air inlets are provided at the corners of rooms. The provision for receiving and lending books is worth notice; the counter round the space for the public at the end of lending library has two small desks, one for receiving and one for issuing, the intervening spaces being fitted with indicators to show whether any book be in circulation or not.

A noticeable type of plan for a square isolated site, to which we have referred, is the Edinburgh Public Library, opened last week

by the Earl of Rosebery (on plan 3). The plan is based on a Greek cross, the arms of which form recesses or bays for bookshelves, the square area in the centre being occupied with tables and chairs. Each of the recesses or bays is set apart for a special department of literature. The news-room is on the third floor, well lighted on its four sides by three-light windows, with panelled roof carried on eight Ionic columns. The walls are lined for 8ft. high with faience tiles; opening from the news-room is a reading-room for juveniles. The stands are of ash, stained, 50 in number. The lending library (on plan 3) is on the George IV. bridge level, the counter, of oak, 110ft. in length, inclosing the three sides of the hall, which provides for 48,000 volumes. The reference library is on the top floor, with a dome in centre carried on arches on each side of room. The library is to be lighted by electricity, and the installation is intrusted to Mr. A. Miller, of Glasgow, both arc and incandescent lights being used—the former of the Thomson-Houston type, for lighting the large halls, each of 2,000 candle-power. We shall refer in more detail to this library and its heating, lighting, and decoration. The plan is ingenious and economical. The architect is Mr. George Washington Browne.

A small, commodious, and compact plan is shown in Fig. 4, the Gilstrap Free Library, Newark-upon-Trent, Mr. W. Henman architect. All the accommodation is on one floor, consisting of a borrowers' hall, general, reference, and ladies' reading-rooms, lending library, and librarian's room, &c. Between the hall and library is a borrowers' counter, with indicator. The hall is central between the main rooms, and well arranged for supervision. The rooms are well lighted, and the bay windows in the reading-rooms afford the retirement for students so essential to sustained reading and thought. The cost was £8,000. These plans, espe-

cially the more compact ones, serve to illustrate the principles of arrangement necessary in library buildings on town sites. The accommodation on three of them is obtained on the ground floor; the principal public departments are grouped round a central hall, which forms a borrowers' lobby. The rooms have easy access and are generally lighted on one side, if not top-lighted. The librarian and his assistants are in three of them—Nos. 2, 4, 5—situated so as to command the chief departments of the library. The three functions of administration, control, and supervision ought, if possible, to be concentrated in one portion of the building. When there is more than one floor it becomes necessary to have an assistant on each floor, and a readily accessible staircase in communication with the librarian's room. At Chelsea a staff staircase shown affords easy communication between the lending library and reference library, and stories above. There is a gallery round the reference library, half-way up the walls, to afford access to the upper shelves, and a small spiral stair is provided to reach this gallery. The lending library has also a gallery round it and a stair near the librarian's room. Alcoves for reading are, we consider, valuable aids to quiet research and study in connection with a reference library at least. At the Edinburgh library these are afforded easily by the plan adopted; in other cases, one or more bay windows could be utilised, and the projections can be made the most of architecturally. A library may also be made to include separate rooms, as lecture or classrooms, and we probably one day, when free libraries have developed their capabilities as public educational buildings, shall see them not only united to museums and picture galleries, but to schools for the free education of the people.

#### LIMITS AS TO HEIGHT OF BUILDINGS.

THE absolute necessity there exists for restricting the height to which buildings are carried in the Metropolis was again adverted to in the remarks made by Viscount Hardinge, in the House of Lords on Tuesday week, respecting the serious disfigurement of adjacent public buildings by the Hankey Mansions and other erections, at Albert-gate, and at the corner of Piccadilly and Arlington-street, the Thames Embankment, and other parts. On a former occasion we have dwelt on the injury inflicted on the public by the erection of monster buildings in our streets. Not only do those who have property adjacent to these buildings suffer from the interruption of light and the injurious dwarfing of their premises, but dwellers in the immediate neighbourhood are deprived of that necessary amount of space and sunlight which are essential to health and occupation. The erection of seven and ten-storied blocks in a street, the houses of which are not more than five stories in height on the average, must cause a considerable deterioration in property. In a street of private houses the grievance would be intolerable, and have the result of destroying the street for residential or letting purposes. Very few people like to live near a large block of business premises or monster clubs, residential chambers, and hotels, and we may point to Victoria-street, Westminster, as a proof of the falling-off in the number of private tenants. The ever-present danger of fire in blocks of these unmanageable proportions is a cause of well-merited alarm. Capt. Shaw has pointed out the outside limits of buildings that can be safely controlled during a fire. These dimensions would be greatly exceeded by buildings of the altitude reached by many of recent construction—in fact, of the three dimensions, that of height is the most un-

controllable by the ordinary fire brigade appliances, and the next dangerous dimension is that of depth. The small distance between the backs of houses and warehouses of recent erection is a source of extreme danger and unhealthiness, and calls for immediate legislative action. Section 14 of the Building Act Amendment Act, 1882, leaves a space behind which is positively useless to check the spread of fire, and of little benefit from a health point of view. As we have pointed out, instead of the frontage being the rule of area it should be height, so that the higher the building is, the more space it should have in the rear. The area at least should equal in depth the height of the building, so that a warehouse or block of shops 60ft. in height should have a back area of the same dimension in depth.

Indeed, as far as it can be legitimately applied, the basis of height, rather than frontage, should become the leading principle of determining area in front and in the rear of buildings; therefore it is of chief importance to determine a schedule of maximum heights for buildings in towns. In Paris the heights of all structures are regulated by the width of the street, or in proportion thereto. The Imperial decree of 1859 defines the heights of façades abutting on the boulevards according to this rule. Thus for streets under 25.58ft. in width, the height is 38.37ft.; for streets above that width up to 31.98ft. in width, 47.88ft.; and for streets above 31.98ft., a height of 57.56ft. Those 65.6ft., or 20 metres, in width, the height may be carried to the same dimension, the condition being that, including the entresol, there are not more than five square stories above the ground floor. These refer to the vertical walls of buildings; above the façade the roof is not to exceed a height equal to half the depth of building in those carried up to the full extent, and the profile of it must be within an angle of 45°. In Germany the width of street is also made the governing limit of height. No building may exceed 22 metres, or about 72ft. These rules prevail in Munich. A similarly constructed schedule is certainly called for in the Metropolis, where the heights of new buildings are often far in excess of the limit above described. The statutory heights of buildings in new streets does not touch the majority of erections in London, and in this way the Act has been of very little practical benefit, as the loftiest buildings are generally erected in old streets. What is required is a rule for old as well as new streets, and one that is flexible enough to take into account particular situations. Indeed, it would appear, taking varying circumstances into consideration, that a hard and fast rule would not be so desirable as one that would admit of variation to suit the site and existing buildings around it, and perhaps the discretionary powers of a committee of the County Council would be the best course to avoid monotony. The design of the building, its form of roof, the proximity of other buildings, the requirements of light to particular premises, and the architectural surroundings generally, should be taken into consideration. At present buildings of the most undesirable elevation and character are allowed to be erected before or at the side of structures of an architectural character, which need plenty of light. For instance, a block of workmen's tenements of great height is erected close to a vestry-hall or a church, or near a row of high-class residences, or a huge warehouse may completely overshadow a line of shops or business premises for which ample light is required. The instances referred to by Viscount Hardinge, in which lofty blocks of mansions and chambers have been allowed to dwarf public buildings and obstruct light, as at Albert Gate, Oxford-street, the Embankment, are conspicuous examples of a total disregard of these conditions. The hideous and deforming skylines of some of those new erections which appear as blots on

the sky are, apart from other objections, fatal to any street architecture.

Those who have remarked the recent building in Oxford-street, Piccadilly, and other main thoroughfares, must have seen the spoliation caused by huge flanking walls and roofs of certain structures. Of what use is it to make regulations for lines of frontage and party-walls, if monster buildings are allowed to be erected that completely destroy the perspective? The new block of buildings in Arlington-street, for example, throws into the shade the premises on the eastern side. It would be different if the design of these lofty structures were in harmony with the buildings they abut against, or if their contour of roofs were designed to gradually lead up to a central feature; but they are generally designed with abrupt party-walls, in total disregard of the premises on either side. It is time the Legislature interfered to prevent the Metropolis being ruined by these monster erections, and the sooner the County of London amend the Building Act by introducing a limit as to height the better.

#### THE ARCHITECTURAL ASSOCIATION.

THE special meeting of the Association to consider the changes in the rules, necessitated by the adoption of the Special Committee's recommendations, was resumed, by adjournment from the previous week, on Friday evening; the President, Mr. Leonard Stokes, in the chair. Letters were read by Mr. Farrow, hon. secretary, from Messrs. W. L. T. Browning, H. L. Florence, J. A. Gotch, F. G. Hooper, W. S. Jackson, H. Lovegrove, and William White, who were unable to attend, chiefly with reference to the reasons for the resumption and the issue of voting papers. Mr. C. H. Brodie, who reopened the discussion, proposed that consideration of the proposed alteration to Rule 43 be postponed till an early date next session, as the present time was most inopportune for the change. He deprecated the issue of voting papers to members. Mr. H. O. Cresswell thought that if the postponement of consideration of this rule were adopted, it would necessitate the leaving over of all the other changes till next session. Mr. M. Garbutt proposed, as an amendment, that Rule 43 read thus: "That all voting be by show of hands, but in the case of alteration of rules or change in the constitution of the Association, a majority of two-thirds of the whole members voting at a meeting be required." This was seconded by Mr. T. E. Pryce, and supported by Mr. Hugh Stannus. Mr. A. Needham Wilson objected to allowing the small proportion of members present at any meeting to have the power to alter the rules; but even if voting papers were issued, he feared many members would be too indifferent to return them. Mr. Cole Adams believed that a vote ought not to be given without hearing the arguments on both sides, and if voting papers were issued an abstract of the discussion ought to be sent with them to each member. Were they prepared to meet the expense this would involve? He suggested that the question should be postponed for a year for further consideration. Mr. H. Sirr, believing that adjourned meetings continued after the session was ended were a mistake, supported Mr. Adams's suggestion. Mr. A. Beresford Pite would go further than Mr. Adams. Many of the rules needed altering, and as they had not been revised for fourteen years, he proposed that a special committee be appointed to consider and revise the rules. Mr. Stannus appealed to Mr. Garbutt to withdraw his amendment in favour of a plan he was about to propose, but he declined. Mr. A. Earle hoped all would oppose any alteration whatever to rule 43. Mr. Douglass Mathews said he was surprised to hear Mr. Cole Adams hold such unconstitutional views. The extra expense of sending out printed *pros* and *cons*. could easily be met, as there were many ways open for cutting down outlay. Mr. Farrow said the Association had at various times modified its mode of working, and whenever this had been done the method of taking a show of hands had been adopted, and this had been successfully carried out. Those who were actively engaged in the working of the Association, and who attended the meetings, were naturally unwilling that the voting should be by papers issued to retired members.

He thought Mr. Garbutt's amendment the best solution of the problem, and believed that on a question of raising the subscriptions no change should be made except by a two-thirds majority. Mr. Hudson said some who were well posted up in the proceedings could not always attend the meetings. Those who wished, like himself, to alter Rule 43 would vote for part, and, perhaps, the whole, of the scheme proposed. Mr. Owen Fleming remarked that though in favour of the amendment, he wished the whole scheme sent round to the members. Their business was to convince the general body. Mr. A. B. Pite appealed to Mr. Garbutt not to press his amendment, for if it were carried the voting by two-thirds would come into operation that evening, and as they had not a two-thirds majority, the scheme would be wrecked. Mr. Garbutt, having declined to withdraw, the President put the amendment to the meeting, when it was defeated by a very large majority. Mr. Stannus expressed a hope that a *modus vivendi* would be discovered, and moved as an amendment:—"That a special committee be appointed by this meeting to revise the whole body of the rules, and that all suggested alterations be referred to it, and that it shall report at an early date next session." Mr. Cole Adams seconded the amendment, expressing at the same time a hope that no further amendments would be proposed, whatever the fate of this one might be. Mr. John Slater intimated that as the mover of the original resolution he should offer no objection to the amendment. Mr. Farrow pointed out that the adoption of the amendment would involve delay in the starting of the new scheme, and would afford an opportunity for other bodies to step in and do the work. The Association must not hesitate to become the educating body for England. After some remarks by Messrs. Brodie, Mathews, and Slater, the President put the amendment, which was carried with but one or two dissentients. Mr. Pite proposed and Mr. A. N. Wilson seconded that "It is desirable that printed voting papers should be sent out to all members." The President pointed out that the three first words would certainly prevent such a resolution from being binding, and, on being put, the voting was: For, 36; Against, 36, a large number remaining neutral. The result was greeted with laughter. Mr. Bernard Dicksee moved and Mr. Stannus seconded, that the special committee consist of nine members, five to form a quorum, and, after some discussion, the President and Messrs. Cole Adams, F. R. Farrow, A. B. Pite, W. H. Pratt, H. Sirr, J. Slater, R. Phené Spiers, and H. Stannus were appointed on the committee. A vote of thanks to the President and Committee brought the proceedings of the session to a close, after a meeting of two and a half hours.

#### ARCHITECTURAL ANTIQUITIES.\*

THIS volume comprises a number of surveys of old buildings and protests against their destruction, printed anonymously in the *Gentleman's Magazine* during many years, and the authorship of which was announced in that periodical after the death of the author, John Carter, in 1817. In the majority of cases, of course, the contents are purely of antiquarian interest; in some, however, a practical value attaches to the descriptions of buildings about which time or the restorer has since been busy. Mr. Gomme has wisely left out much of Carter's matter, and has the advantage of Mr. J. T. Micklethwaite's assistance in the inspection of his labours and the contribution of various notes. John Carter, who was born in 1748, was principally known in his day as the illustrator of the *Builders' Magazine*, a long-defunct architectural periodical which was carried on by Newbery, the St. Paul's Churchyard bookseller, from 1774 to 1786. Carter also illustrated and originated other architectural works of some importance, many of which are familiar to some of our readers. He was a man of inferior education, and of no regular architectural apprenticeship, but his love for architecture seems to have been considerable. A curious instance of architectural piracy is related in connection with Carter's *Builders' Magazine* illustrations. It seems competition scandals were as rife a hundred and fifty years

ago as now. When it was determined to build the present Clerkenwell Sessions House on the site of the old "Hicks's Hall," designs were advertised for, and Carter himself competed. His design was rejected, but he had the mortification of seeing a design accepted which was sent in by some person who copied it from one Carter had himself contributed to the *Builders' Magazine* for a sessions-house. The architect who got the job was a clever adapter in his day and generation no doubt; but the Clerkenwell Sessions House certainly remains, as Mr. Gomme says, "a further proof of Carter's talents as an architect," which perhaps, after all, is not saying much. It is a mercy, no doubt, in these days, bearing in mind the curious competition designs which editors of some architectural publications depict in their own pages, that architects are more honest—possibly because hopeless of winning by means of any such assistance.

#### CONTEMPORARY BRITISH MANUFACTURERS AND ART-WORKERS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THIS double page is the third sheet of portraits given in our series under this head. It commences with a photograph of Mr. Alfred W. Darby, the senior partner of the Coalbrook Dale Co.

Mr. Alfred E. W. Darby, the principal partner of the Coalbrookdale Company, is the present representative of the family of that name, and he is the lineal successor of the first Abraham Darby who originated the business of the Company, which has continued in the family in unbroken succession since that time, which dates from about two centuries ago, when the successful manufacture of "three-legged pots" first attracted attention to this metallurgical industry. Coming down to modern times, the works and business of the Coalbrookdale Company are found to have greatly expanded, and the variety of their productions become enormously varied, ranging as they do from a tenpenny three-legged pot, or a humble matter-of-fact frying-pan, to a powerful motor, a superbly-artistic gateway, or a metallic Venus de Medici. The Company have three brick and tile works, located at different points in the Dale, producing quantities of ordinary bricks and tiles, "Broseley" roofing tiles, ridge tiles, flooring tiles in a great variety of patterns in red, blue, brown, and buff, boiler seating, grate bricks, &c. The Coalbrookdale fire-bricks have a reputation for their ability to withstand the actions of fire and acids. Much of the ornamental tile work produced is largely used in connection with the Company's chimney-pieces, grates, and stoves. At International Exhibitions, from the first great World's Fair of 1851 onwards, they have been uniformly successful as exhibitors, particularly at the Paris and Vienna Exhibitions.

Mr. Harry Hems is a native of Islington. He was born in 1842, and was educated in that parish. At 14 he went to Sheffield, and was apprenticed to the late Mr. Arthur Hayball, a carver, who was awarded a medal at the 1851 Great Exhibition. As an apprentice and working for his master under Messrs. Weightman, Hatfield, and Goldie, architects (now Hatfield and Son), of Sheffield, he restored all the fine 15th century oak miserere stalls, screens, &c., at St. Mary's, Ecclesfield, Yorkshire. This, in 1860, was the first church he worked at. In 1863 he left Sheffield for London to seek work, and arrived in the Metropolis with less than ten shillings in his pocket. Trade was depressed at the time, and at length he procured work at a furniture carver's named Lambert, in Worship-street, E.C. Everything was done by piecework, and he was given some rosewood piano brackets to do at 4½d. each. After a short stay there he left, and went with the late Mr. Conquest, of Kempston, Bedford (now Foster), at that time largely engaged in church renovation. In this employ he quickly became foreman of carvers at Higham Ferrers Church, Northamptonshire, then being restored, under Messrs. Slater and Carpenter, architects (now Carpenter and Ingelow). The next year (1864) he went to Italy to study the antique, and worked in Florence, Carrara, and Milan. But wages were poor, and at last his stock of money being exhausted, he walked the best part of the way home to England, tramping over Mont Cenis, in the depth of winter. The first work Mr. Harry Hems carried out on his own account was early

in 1866, when he executed sculpture and carving at Bramley Hill House, Croydon, under the late Mr. Charles Henman, architect, of that town. Later in the same year he went to Exeter, and with that city his name has since been identified. Ten years afterwards he exhibited at the Philadelphia Centennial Exhibition of 1876, and was awarded medals for both sculpture and wood-carving. In 1881 he built his present works, one block of which, erected from the designs of Mr. R. Medley-Fulford, F.R.I.B.A., has been illustrated in these pages (March 30, 1883). During the last twenty-four years he has carried out works in, or for, something like a thousand different churches, and some cathedrals, in all parts. Amongst the most important of his undertakings may be mentioned the renovation of the high altar screen at St. Alban's Cathedral, under the direction of Sir Arthur W. Blomfield, A.R.A., and the filling of its seventy-eight niches with statuary (see illustrations in BUILDING NEWS, Nov. 19, 1886, and June 28, 1889); the colossal equestrian statue of King William III., carried out for the Orangemen of Ireland, and erected at Belfast; the restoration of St. Andrew's Church, Plymouth, under the late Sir Gilbert G. Scott, R.A. (1874); at the Church of St. John the Baptist at Bere Regis, Dorsetshire (1875), and Dunster Priory and parish church, Somersetshire (1876), both under the late Mr. Geo. E. Street, R.A.; at St. Andrew's, Fort William, N.B., perhaps the most beautiful church in Scotland (1880), under Mr. Alexander Ross, architect, of Inverness; at Lord Revelstoke's sumptuous Church of St. Peter the Fisherman, Noss Mayo, Devon (1882), under Mr. J. Piers St. Aubyn; at St. Denis' Church, Warminster, Wilts (1888), under Sir Arthur W. Blomfield, A.R.A., &c., &c. Mr. Hems' two eldest sons, Messrs. Greville C. and Harry T. Hems, are at present associated with their father in the business. Mr. Hems has been a collector, and his residence is filled with rare books, engravings, weapons, and interesting curios, besides a painting of himself, presented to him, together with an illuminated address, signed by the members of his staff, on Oct. 9, 1886. He was a member of the City Council at Exeter for six years. Mr. Harry Hems' portrait is by Mr. J. F. Long, of High-street, Exeter.

Mr. P. Stuart is the head of the well-known firm of Stuart and Co., Limited, granolithic manufacturers, of London, Liverpool, Dublin, Belfast, Glasgow, Dundee, and Edinburgh, with agencies in the States, Canada, and Europe. Mr. Stuart is the inventor and patentee of sixteen different patents in Great Britain, France, Spain, and the United States. One of the patents, the speciality of the firm, is Granolithic stone, which has revolutionised footpath paving, and become the paving of the world. The following are a few of the many important works carried out by the firm: City Hall Buildings, Philadelphia\* (largest buildings in the world); Oddfellows' Hall, California; Pennsylvania Avenue, Washington; City Park, New York; Hyde Park, the New Market, and the Corporation Buildings, all in Sydney; the Rue de Rivoli, Paris; Duisberg, Germany; Platforms of general station, Perth; Platforms of Exchange station and Edgell stations, Liverpool; Bold-street, Liverpool; St. George's landing stages, Liverpool; N. B. Ry stations, Glasgow; altar steps of graving dock Glasgow; great sheds of the Leith Dock Commission; Princes-street, Edinburgh; George-square, Glasgow; grand staircase, &c., Presbyterian College, Edinburgh; Carnegie Library, Edinburgh; Callender's model tan works; grand staircase, Conservative Club, Birmingham; fire-proof construction of large sheds at Bristol and Avonmouth; Technical Institute, London; Egham College, founded by the late Mr. Holloway; staircases, Queen Anne's-mansions, Westminster; Industrial-dwellings, for Lord Rothschild, London; Lyle's great sugar refineries, Silvertown; Esplanade, Brighton; Hotel Métropole, Brighton; Imperial Theatre, London; Cardiff Exchange; Barry Docks; Nottingham and Essex County Asylums; Corporations of Edinburgh, London, Dublin, Belfast, Londonderry, Liverpool, Worcester, Gloucester, Hereford, Maidstone, &c., and many local boards; the school boards of London, Birmingham, Liverpool, Edinburgh, Glasgow. Messrs. Stuart and Co. have an interesting display at their stand at the Edinburgh Exhibition, now open. In connection

\* Illustrated in the BUILDING NEWS June 6th last.

with the operations of the firm, there are about 2,000 men employed—including their home business. The photo. is by Mr. Strauss, of St. Louis, United States.

Mr. John Grundy was born at Tyldesley, near Manchester, in the year 1844, and was educated at the Leigh Grammar School. His father was a corn merchant at Tyldesley, and it was about the year 1865 that he first conceived the notion of heating buildings with a diffusion of pure warm air by a system hitherto unknown to the public. Being one of the chief officers of the church, and superintendent of the Sunday-schools, both of which buildings were close to the house in which he resided, he sought and obtained permission to heat the church and schools at his own expense by way of experiment. The scheme proved a success, and Mr. Grundy forthwith patented the apparatus, and in the course of a few years gave the patent to his son, who is the subject of this portrait. By sheer pluck and indomitable perseverance, that patent, and the various and valuable improvements which his experience has from time to time enabled him to make, are well known and extensively used throughout the United Kingdom, and many foreign countries. At his native place, and for many miles round, Mr. John Grundy's name is a household word, for not only are the large heating furnaces and apparatus made at the Tyldesley Ironworks, of which he was the founder, and is the sole proprietor, but his well-appreciated patent warm-air ventilating fire-grates have found their way into many homes in the North of England. The testimonials for efficiency in warming and ventilating, which Mr. Grundy has received, number thousands, many of which are from the nobility, clergy, and most eminent architects of our time, and are mostly unsolicited. A hobby of Mr. Grundy's is to invite all the aged people of his native town who are 60 years old and upwards to an annual entertainment. About 700 to 800 persons assemble on these occasions. The portrait is by Mr. T. C. Turner, of 17, Upper-street, Islington, London, whose studio is also warmed by the "Grundy Patent."

Mr. Charles Campbell (of the firm of Messrs. Campbell, Smith, and Campbell) was apprenticed in the year 1857 to Messrs. Harland and Fisher, the then leading firm of ecclesiastical decorators. After serving seven years, he became their designer and manager, at the same time keeping up study at evening classes of the Lambeth School of Art, the Life Class of the Architectural Association (first governed by E. J. Poynter, R.A.), Hetherley's in Newman-street, and the Hogarth and Langham Art Clubs. He has carried out many important works, and also has had the opportunity of working under the superintendence of the late Wm. Burges, A.R.A., who eventually advised his starting in life as a decorative artist, and offered him cartoons to make for two churches then going on in Yorkshire, Cardiff Castle, &c. Mr. Campbell is glad to have the opportunity of acknowledging how much he owes to Mr. Burges at this period of his life, as he has found the training whilst employed upon this work invaluable since. Thus having the opportunity of starting as a decorator and stained-glass worker, Mr. Campbell joined Mr. F. G. Smith in partnership, and together they carried out many large orders, of which the following are a few of the most important:—Cardiff Castle, Mount Stuart, and Dumfries House; house for Wm. Burges, A.R.A., Melbury-road; Studley Royal Church, Ripon; Directors' Library, Bank of England; Council Chamber, Guildhall; decoration of Old London street, I.H.E.; Grand Hotel, Charing Cross; Holborn Restaurant, Constitutional Club, Portman Rooms; Irish Exhibition, Olympia; Town Hall, Dover; Town Hall, Hull; Grand Hotel, Brighton; Star and Garter, Richmond; St. Marylebone Church; Haileybury College Church; St. Paul's, Great Portland-street; St. Augustine's and St. Faith's, City; St. Stephen's, Gloucester-road; St. Nicholas Cole Abbey, E.C.; Dining Hall, Worcester College, Oxford; Albert Gate Mansions; Lyceum, Haymarket, Olympic, Gaiety, Grand, Criterion, St. James's, Lyric, Her Majesty's, Opera Comique, Alhambra, and Empire Theatres. Mr. Campbell's portrait is by Mr. Fall, of Baker-street.

Mr. Alfred Octavius Hemming was born at Merrywood Hall, Bristol, in 1843, and is the eighth son of the late Lieut. Samuel Hemming, Royal Engineers, H.E.I.C.S., afterwards Member of the Institute of Civil Engineers, and a contemporary of Brunel and Stephenson. Mr.

Alfred Hemming was educated in Edinburgh, and commenced life as an architect, but soon took up decorative art in preference. He entered the studios of Messrs. Clayton and Bell in 1868, where he remained till 1883, when he took studios of his own in Margaret-street, Cavendish-square, and has been most successful in his chosen career in the art of stained glass and mural decoration. In our issue of Oct. 5, 1888, we illustrated some work of his in Helmsore Church, Manchester, and his windows may be seen in many other parts of the kingdom, as well as in the United States, where he has executed large and important commissions. His design for the east window of St. Hilda's, Darlington, recently executed, is now being exhibited in the Royal Academy, as is also his design for the glass and mural decoration of the north wall of Folkestone parish church, the pictures illustrating the "Stations of the Cross." These are all 8ft. in height, and vary in length from 5ft. to 12ft., and are painted on mahogany panels; the object of this is two-fold, chiefly that they may be worked at in his own studio, and also that they may not be affected by the climate when let into the wall. A drawing of this work is now on view at the Royal Academy, and we illustrated it in the BUILDING NEWS for May 30 last. Mr. Hemming's photograph was specially taken for us by Messrs. Elliott and Fry, of Baker-street.

#### URBAN RATING.\*

THE important question of the proposals to assess the owners of ground-rents has been made the subject of a treatise by Mr. Charles Henry Sargent, M.A., Oxford, and of Lincoln's Inn, Barrister-at-Law. Mr. Sargent has studied the question from a legal point of view. His reasoning is sound in the main, and his experience on the questions of leasehold enfranchisement and ground-rents have made him well able to deal with the question of the rating of ground-rents. The chief grounds upon which the author rests his arguments are, that the measure involves a breach of contracts, and throws the burden on one class to secure benefits to another. The work before us enters into the subject in a methodical manner. It discusses the origin and nature of ground-rents, in which the principal systems of covering land with houses are described, the manner the price or rent of building land is fixed, how ground-rents have already paid rates, proposals to rate ground-rents, rating between building owner and occupier, the rating of vacant land. Into these several chapters we will not enter, but confine ourselves to the main reasons which are given by the author why the proposals to shift rates from the building owner to the owner of a fixed rent-charge or ground-rent are considered unjust. With respect to existing contracts, it is asserted (1) that upon the determination of existing rent charges and ground-rents rates have already been deducted to an extent far exceeding the rates on these charges or ground-rents themselves; (2) the building owners have, for good consideration, entered into an express contract with the landowners to defray all the rates; (3) this contract is reasonable, and not forced on the building owners, and it is impossible to say whether the rates actually existing are greater or less than those estimated; (4) the most prudent and deserving investors would be mulcted of a considerable part of the income and capital of their investments by the change; (5) the result of the change would be, especially in the poorest quarters, to benefit, not the occupier, but the middleman. As regards future contracts, it is said the change would result in a rise of rent-charges and ground-rents equal to the rates they would have to pay; the utmost difficulty and trouble would be caused by the various deductions and allowances that would have to be made between every payer and receiver of rent; consequently, all cheap and trust capital would be driven from investment in buildings, and rents would rise. Further, as regards both kinds of contract, it is affirmed that the owner of a building subject only to a fixed rent-charge or ground-rent, is the owner of the whole interest as if he held subject only to a mortgage, and that, as he takes the whole of every benefit to the building, he should discharge the whole, and

not a proportion, of every burden on it. Thus, as between building owners and the owners of fixed rent-charges and ground-rents, it is contended by Mr. Sargent, it is unjust in the case of existing contracts, and inexpedient in the case of future contracts, to relieve the former of any portion of the rates at the expense of the latter. Again, the author asserts that, apart from contract, the hardship in the reversion being benefited by the expenditure of rates in permanent improvements which falls on the building owner, is one of a very trifling nature, and applies only to an insignificant proportion of the rates. Any enactment casting certain parts of the rates on reversions would, it is continued, drive cheap or trust capital out of investment in houses. The author considers these aspects of the question. 1. How, independently of any covenant to pay rates, ought they to be adjusted between the building owner and the owner of fixed rent-charge or ground-rent? 2. Whether there is sufficient reason for prohibiting by legislation the ordinary covenant that the building owner is to pay the rates? 3. And if there is sufficient reason for setting aside existing covenants to this effect? Answering these questions, Mr. Sargent argues that, as the landowner does not receive a certain proportion of the rents and profits of the building, but a fixed sum which participates in no increase or decrease, therefore he is not the owner of any part of the house, and is in the same position as a mortgagee or annuitant only entitled to a fixed sum out of the income not entitled to any share in the profits. Since, in fact, "he does not share in the advantages or profits, he should be relieved from any share in the burdens of ownership." No doubt the popular idea is misleading in thinking that the man who *was* the landowner is still the landowner, for after the property is divided, the owner of the land becomes only entitled to a fixed ground-rent issuing out of ground and building alike. The ordinary contract which covenants that the building-owner is to pay rates is argued to be a proper and reasonable arrangement on the above ground. But it is needless to go farther. Mr. Sargent has made out a strong case; his arguments appear sound, and he bases them on the assumption that when land is let for building at a rent-charge, or ground-rent, the land and building become one—the man who builds the house becomes the owner of both, subject only to a fixed charge, or ground-rent; but the assumption that the building owner is the owner of land is a gratuitous one, and there seems to us no conclusive reason why an adjustment of rates between the two owners should not be made. Why the usual covenants as to rates should be allowed to remain is, we think, hardly made out; and certainly the ground landlord, or owner of ground-rent, who has a tangible reversion in the land and building, and improvements thereon, should share in the burdens. We have no space left for further examination. Mr. Sargent's treatise is well worth an attentive study by all those interested in land and the burning question which he deals with.

#### WOOD-CARVERS AND THE KENSINGTON SCHOOL.

THE third annual report of the Executive Committee of the Wood-Carvers of London states that, although the committee have not yet seen their way to getting up an exhibition of wood-carving, they have obtained from the Carpenters' Company the concession that their board of examiners in the annual exhibitions of carving and joinery in a competition for prizes under the Harbans Gift will be strengthened by the addition of three carvers appointed by the Institute of British Wood-Carvers. A more important work has been to demand that "all technical classes for wood-carvers supported or assisted by public funds shall be for the benefit only of persons already in the trade, and that the trade itself shall have a voice in choosing the instructors." The committee state that there had long been a very pronounced opinion that the influence exerted on the craft by the Kensington School of Wood-Carving, in connection with the City and Guilds of London Institute, was a baneful rather than a beneficent one, and they accordingly resolved to combat the evil. They point out that the Kensington School enjoys the advantages of the occupation of handsome and convenient premises, in which to carry on its work, free of rent, and with the addition of a

\* Urban Rating. By CHARLES HENRY SARGENT, of New College, Oxford, M.A., Barrister-at-Law. London: Longmans, Green, and Co.

## NEW SANITARY CONVENIENCE

AND  
STREET REFUGE

Hammersmith Vestry.

munificent annual money grant; and that those advantages are accorded to it for the ostensible purpose of furthering the technical education of London carvers—whereas, as a matter of fact, the benefits of the institution have practically not reached the trade at all, but the students have, almost without exception, been persons previously quite unacquainted with the craft. Further, it sends out instructors all over the country—themselves merely amateurs—thus monopolising the most lucrative portion of the carvers' calling; and, what is more important still, that it competes for orders in the ordinary way of business, thus taking the work out of the hands of the legitimate tradesman; in short, that it is in reality a subsidised competitive workshop instead of being, as it purports to be, an educational institution. "The effect of its action on our craft has been," the committee contend, "distinctly of a deteriorative rather than an elevating tendency, because instead of undertaking the higher training of the existing personnel of the trade, utilising for that purpose the workshop practice already acquired, its effect is that of foisting upon the trade persons with nothing but a dilettanti training; and after ten years' work the school has not turned out one student capable of commanding the average wage paid in the trade." Owing to the movement started by the committee, there has been a considerable reduction in the amount of the grant to the Kensington School, and a promise has been given that it will shortly be entirely withdrawn.

NEW SANITARY CONVENIENCE AND  
STREET REFUGE, HAMMERSMITH.

THE Vestry of the parish of Hammersmith have recently constructed a new sanitary convenience, with street refuge above, in the Broadway, Hammersmith, opposite the District Railway Station, and during the past week it has been thrown open to the public. The convenience is approached from the level of the street refuge by an artificial stone staircase, which is divided into an entrance and an exit, each of ample width. It has been faced throughout with white glazed bricks, relieved with a coloured dado. The accommodation includes twelve urinals, three water-closets, and a comfortably fitted lavatory, besides a convenient attendant's office in the centre of the structure. The urinals are of the latest approved lip pattern. The automatic flushing cisterns are formed of enamelled slate and are timed to discharge the water at regular intervals. The water-closets are inclosed by pitch-pine doors, with chamfered frames and lower panels. The sanitary fittings are of

Doulton's "Combination" flush-out pedestal pattern with trap, in white glazed ware, with polished mahogany balance weight seat. The attendant's office has a pitch-pine front, with plate-glass panels. The floor of the convenience is paved with grano-metallic stone. A service tap, nozzle, and hose are provided for the attendant's use in washing out, &c. The interior of the convenience is carefully protected from observation from the roadway above by screens fixed at the bottom of the two staircases; these insure privacy without interfering with free locomotion, or interrupting the attendant's view of the convenience. The roof, or that portion of it which forms the street refuge, is constructed of York landings and Hayward's patent pavement lights, affording perfect daylight, on substantial girders. The refuge is inclosed by 12 by 8 dressed Aberdeen curb, and protected by six guard posts. The staircase is fenced in with an ornamental wrought-iron railing, fixed upon a dressed coping of Aberdeen granite, and a pair of entrance gates. An ornamental lamp column, carrying a 5-light lamp, is attached to the centre of the refuge, thus affording light upon the three main thoroughfares upon which it shines. Ventilation is obtained by means of gratings inserted with the pavement lights of the refuge, and by the staircases. The foul and heated air will also be drawn up to the interior of the central lamp, where an upward current is formed by means of a gas jet which it is intended to keep burning at its base. The drains are laid on the separate system, and are disconnected from the sewer by an intercepting trap. The whole of the work has been carried out from designs by, and under the immediate supervision of, Mr. H. Mair, Assoc. M. Inst. C.E., Surveyor to the Vestry. Most of it, in fact the whole of the heaviest portion, has been executed by the Vestry's own men.

TAMWORTH TERRACOTTA AND  
GLAZED BRICKS.

THE strides made of late years in the manufacture of high-class English terracotta and clay ware, is a gratifying proof of the enterprise of manufacturers in obedience to the demand caused by recent developments of architectural style in England. Nowhere else, probably, has this demand been more energetically and intelligently responded to than at the old and well-known works of Messrs. Gibbs and Canning, of Tamworth, one of the very oldest potteries, we believe, in the kingdom.

Their products are many of them amongst the most beautiful and interesting specimens of what science and art applied to industrial manufactures

can accomplish. The out-put at Tamworth includes several specialities, but three deserve the attention of architects and builders generally, viz., architectural terracotta in buff and red, white glazed bricks, and cane-colour glazed sinks. In the first named material, Messrs. Gibbs and Canning have executed some of the largest and most important works in the United Kingdom, such, for instance, as the Natural History Museum, South Kensington (under Mr. Waterhouse), than which no better proof could be desired of the excellence of the firm's manufactures both in regard to material and workmanship. They are also at the present time busily engaged in the manufacture of the buff terracotta for the New Victoria Law Courts at Birmingham, now in course of erection, under Messrs. Webb and Bell, architects, Mr. Waterhouse being consulting architect for the building.

The white glazed bricks manufactured by the firm are also of admirable quality, and are very largely used; and a similar remark will apply to the cane-colour glazed sinks, which are made in sizes varying from 15in. in length up to 4ft. These are manufactured from their buff terracotta clay, which they believe is "without doubt, the finest in this country for richness of colour and extreme durability."

The "Tamworth" pipes made by Messrs. Gibbs and Canning are noted for their metallic hardness and durability as well as their capability of resisting extreme pressure both internal and external. Their brindled bricks are especially adapted for railway work, being also extremely hard and durable. Besides the Natural History Museum referred to above, fine examples of their work may be seen in the Technical Institute; the Prudential Insurance Office, Holborn; Kensington Court Mansions; St. Margaret's Mansions, Victoria-street, Westminster; the Royal Aquarium, Great Yarmouth; the Birmingham Theological College; the Dock Offices, Bristol; and many other places all over the country. Their works, which cover a large area, are situated at Glascote, about two miles from the Tamworth railway station, but they have direct communication with the Midland and London and North Western railways, as well as canal communication with all parts of the country, and are thus enabled to deliver their specialities at the earliest possible date after receipt of instructions.

## A PAINLESS, GREEN OLD AGE.\*

THIS extremely interesting and useful book is by Mr. Joseph Constantine, the senior member of the firm of J. Constantine and Son, of Manchester, whose work on "Hydropathy at Home" is well known to most readers, and whose experience in the designing and construction of heating apparatus has probably been utilised by many more. Some twelve years ago Mr. Constantine made the acquaintance of Mr. Isaac Holden, M.P., whose diet and general habits attracted his attention. Mr. Constantine says he found Mr. Holden knew how to live better than any man he had ever met, and so deemed it his duty to let the world know something about it. As far as diet is concerned, Mr. Holden evidently shares the views of Dr. de Lacy Evans, Dr. Densmore, and others, which are just now attracting some attention in the pages of the *Weekly Times* and *Echo* and elsewhere, and which, briefly summed up, are in favour of fruit as the best food for man on account of its richness in the alkaline salts which dissolve out of the body the lime which abounds in cereals, and ossifies and clogs up the fine capillary blood-vessels, and causes early death. There is much other matter in the book, however, than as regards diet, and we recommend all who value health and long life to read it.

The new church of St. Mary the Virgin, Davy-hulme, was consecrated on Monday by the Bishop of Manchester. The edifice is cruciform in shape, and has been erected from the designs of Mr. G. Truefitt, of London, the builders being Messrs. Southern and Sons, of Salford. The distinguishing feature of the church is an octagonal lantern open to the roof. The materials used are Yorkshire par-points, faced with Runcorn stone. The estimated cost is £4,000. We illustrated the church in our issue of May 3, 1889.

\* Health and Activity in Middle and Later Life. By JOSEPH CONSTANTINE. London: Sumpkin, Marshall and Co.

## WAYSIDE NOTES.

MR. HENRY TATE has made a munificent offer to the nation, and it is to be hoped that the conditions which the liberal donor imposes will not be found a barrier to the acceptance of the fifty odd gems of modern English painting. Some people think that the offer should have been made free of all restrictions; but it appears to me to be only natural that anyone making a gift of valuable works of art, to a country that for so many years stood by with cold indifference and saw a collection of national portraits wandering about without any permanent home, should be disposed to obtain some assurance that his gift will not be similarly treated. Whatever may be the objection to other stipulations in the proposal to establish this National Gallery of British Art, I see none to that which requires the establishment of a building or gallery that will insure the collection against a similar nomadic existence to that led by the national portraits.

If the Government accede to Mr. Tate's terms, it will become a question what position the gallery will take up. The energetic vicar of St. Jude's, Whitechapel, was early in the field, suggesting in Tuesday's *Times* that no part of the Metropolis is so suitable as his parish for the establishment of the gallery, while another correspondent demonstrates that the pictures might be well located in St. James's Palace, seeing that the Parisian Luxembourg Gallery, on the lines of which it is Mr. Tate's desire that the proposed gallery should be established, is founded in an old Royal Palace. Now, my own idea is that a new gallery should be erected neither in Whitechapel nor in St. James's Palace, but in some suitable central district, and be of such size as to be available for the exhibition of such other modern examples of English painting as the trustees may be able to obtain from time to time. This I believe is the intention of the donor. And although, as pointed out by a *Times* correspondent, Mr. Tate has been in a measure forestalled by the late Mr. Sheepshanks, in the founding of a gallery of British pictures, there is yet a vast field for good work in the same direction. The Sheepshanks gallery is only a fragment of what might be accomplished in this way. A national gallery for purely English works, and of modern schools only, would be a most interesting institution. If the Government think favourably of Mr. Tate's offer, there is now an opportunity for establishing such an institution. All artists will hope that the scheme may go through, and that the fifty-seven pictures will become the nucleus of a collection that may some day be the pride of the nation.

Mr. E. W. Mountford is to be congratulated for his success in the Sheffield Municipal Buildings competition. It has been a hard-earned fight, and he well deserves the honour and renown that will be inevitably his portion. A more severe, genuine, and taxing competition I think it would be difficult to instance. In the first or preliminary struggle a really formidable array of architects took part, and we may rest assured that the remaining five who participated in the final competition strained every nerve to make their designs as perfect as possible. Mr. Mountford's success, therefore, is more honourable than that which accrues in the ordinary run of competition. The matter has been throughout under the supervision of Mr. Waterhouse, whom everyone acknowledges to be our first assessor. Pure merit has decided the struggle, and complainants among competitors will not, in legal phraseology, "have a leg to stand on."

The announcement from the Stockport Corporation in reference to the proposed sewage-outfall scheme has the merit of a certain amount of originality. I suppose engineers must regard it as a sort of feeler preliminary to a competition—that is to say, if the corporation do not in the mean time decide to make other arrangements. As corporations rather like competitions, I would go as far as predicting that a competition will come off in this instance; so engineers of experience in sewage works may begin to sharpen their pencils in anticipation.

The Guildford Town Council have at last come to a decision with regard to the new sewerage scheme for their town, and I am glad to see that Mr. Laily, the engineer of the Acton Sewage

Works, is to have the work. Mr. Laily deserved to be appointed in this case, as all will think who remember my paragraph on the doings of the Guildford Town Council with reference to this matter. The system to be adopted in the Guildford drainage scheme is that known as the "International." This method of sewage disposal seems latterly to have grown in favour. It is a system whereby the sewage is purified, and what is commonly described as a wholly inoffensive liquid runs off from the last of the receptacles for purification, the solid particles being caused to subside in a proper tank by throwing in a chemical precipitate. Under this method of sewage disposal the picturesque county town of Surrey should greatly benefit from a sanitary point of view, as also would hundreds of other pretty country towns where at present the demon of typhoid lurks about the open, festering sewers. Sewage engineers, indeed, should do very good business in years to come. The sanitary rage has got well hold of the public, and is gradually improving the arrangements for sewage disposal, towns, small and large, becoming dissatisfied with happy-go-lucky methods, and adopting those based on scientific principles.

Among the most coveted of appointments for the architectural profession are the surveyorships to the various and "worshipful" City companies. They all prove nice comfortable berths, always something going on, either on the companies' premises, or their properties, or schools, &c. If there is not the "hall" to decorate in the City, there are some premises owned by the company to rebuild, or some enterprise or another to carry into execution, and be realised in bricks and mortar. Then there are, I believe, other engagements to occasionally fulfil of a prandial nature, and altogether an appointment of this description is calculated to produce changes in the physical development of the fortunate surveyor. From a lean, harassed-looking individual our architect is transformed, by virtue of an appointment as surveyor to a City company, into a sleek, contented citizen, and what looks like a small cupola begins to put in an appearance behind the lower portions of his waistcoat, forcibly reminding us of poor old Sir Horace Jones's style of architecture. He grows fat, and his hair curls—he is rid of many of the cares of an ordinary practice. Peace and contentment reign in his offices, and his staff (let us hope) take their share of the benefits that have accrued. Verily, a City company surveyorship is to be coveted overmuch.

There has lately been a chance for architects in this way, for those, at least, between the ages of thirty and forty years. The Worshipful Company of Leathersellers are in want of a surveyor, and they have offered a salary of £300 per annum for such a servant. Now the difference between this £300 salary and most other £300 salaries is that it does not preclude private work. Hence the desirability of the appointment.

A certain Mr. W. Cowling wrote to an evening contemporary last week as follows:—"Qualifications of an architect. Can anyone inform me what are the qualifications necessary to become an architect? Is good drawing absolutely necessary? Is there any school where to be taught? Must I understand building before I can become one?" This is very refreshing. It would be interesting to know more about Mr. C., who thus, at one and the same time is so desirous of becoming an architect, and so sweetly innocent of his work. If this should meet Mr. C.'s eye, I might suggest that a little drawing would be found no actual hindrance to his architectural practice, and that some slight knowledge of the rudiments of building construction would be no harm—it might, indeed, be beneficial.

The Architectural Association makes the venerable town of Oxford its head-quarters for this year's annual excursion. I hope by the time the month of August comes round that there will be a little of the ancient work left among the old colleges, &c.; but there is no knowing. I read an alarming account of "The Stones of Oxford." Mr. Thackeray Turner, the Secretary S.P.A.B., writes to the *Pall Mall Gazette* a doleful tale as to the proposed destruction of old buildings in Oxford, and I am really sorry to learn that it is intended to pull down some of the ancient houses in Holywell-street, and that the entire destruction of the old Mitre Hotel is con-

templated; and further, that an ancient house in the Corn Market is to make way for a new bank. This certainly seems doing things in a wholesale manner, and we shall all—except the architects of the new buildings—be glad if the S.P.A.B. can prove itself an effective body in this matter. It will come as a pleasing surprise.

Mr. Turner, in the same communication touching the "stones" of Oxford, runs full tilt against the architects who have been engaged on buildings in the town. He finds that they are guilty of erecting structures out of all harmony with the works of the old builders. Nothing that has been done in this way pleases him, and one red-brick and tile building would appear to have given him superlative offence. In fact, Mr. Turner forgets that old buildings didn't "grow," like the little negress in "Uncle Tom's Cabin." Contrast between old and new there has been in buildings from time immemorial—the new against the hoary old, and the tumble-down against the plumb and true. We can't stand still even in Oxford. There may be cases where "loud" buildings have been erected in the old university town, but it is preposterous for any one to bring a wholesale charge of want of taste against the architects who have lately been engaged there, for some of the most respected members of the profession have recently done work at Oxford—and excellent work too. A society for the protection of ancient buildings should be a most useful institution nowadays, and I cannot understand how it is that the S.P.A.B. invariably makes an unhappy muddle of things whenever it goes into action. Properly directed, its aims might be of great service to the community. As it is, it manages to alienate sympathies all round. I would advise the society to concentrate its attention on the saving of old buildings doomed to wanton destruction and to making public the nature of the restorations at St. Alban's. It can safely leave the modern works of modern architects to the critical faculties of other persons, more especially where well-known gentlemen are concerned. The *Pall Mall* letter is a good instance of the way in which the S.P.A.B. blunders along. Instead of selecting some town where evident injury has been done by vulgar and obtrusive building, it pitches upon Oxford, where much careful and painstaking work has recently been carried out, and thus instantly makes enemies of people who would be its best friends. Let the society take hold of the old buildings in Holywell-street, the old "Mitre" hotel, and the house in the Corn Market. It can safely save itself the trouble of running amuck against the architectural profession.

Work in connection with the restoration of St. Saviour's, Southwark, has commenced in earnest. A hoarding is being erected round the nave, and the attack upon the ignoble architecture has begun by pulling out two of the north windows. It is a good work, and will, I hope, prosper. GOTH.

## CHIPS.

The owner of ten houses in Tiger-yard, Denmark-hill, was summoned to Lambeth Police-Court on Saturday, at the instance of the Vestry, on account of the condition of the buildings. It was stated that the drains were stopped, there was no water, and the houses were in a dilapidated and filthy state, quite unfit for occupation. The magistrate made an order for the requisite repairs to be done.

The Bishop of Ely has caused all the ancient records of that diocese which have hitherto been scattered in various places to be removed to the episcopal palace, where they are deposited in a spacious muniment room, so as to be available for future historical research.

On Saturday week the foundation stones of a new Church Sunday school were laid at Kirkby Woodhouse, Notts. The school is situated between St. John's Church and the Board School. It will accommodate about 200 children, and will be of red brick with Mansfield stone dressings. The builder is Mr. Tate, of Annesley Woodhouse, and the plans are by Mr. Thomas Mart, Kirkby Folly.

Captain Oates, the borough surveyor and sanitary inspector of Helston, has left the town for upwards of a fortnight, unknown to his friends and the authorities, and his whereabouts, it would seem, cannot be ascertained. In consequence of this his situation was declared to be vacant by the town council at their meeting on Monday week. There are several candidates in the field for the post.

BUSINESS PREMISES, DAVIES-STREET, GROSVENOR SQUARE.

THESE premises, now in course of erection as showrooms and factories, for Messrs. Bolding and Sons, plumbers and sanitary fittings makers, will form, when completed, an important block at this end of the Duke of Westminster’s estate. There is a scheme for widening the approach to Davies-street from Oxford-street, which will have the effect of making a great improvement in this quarter. The work has been divided into two parts, the lower portion having been built by Messrs. Wall, and the upper part, from the street level, is now in hand by Messrs. Pattinson, of Sleaford. The terracotta is by Messrs. Clark and Rea, and the constructional ironwork is in the hands of Messrs. Lindsay and Co., of Paddington, Messrs. J. T. Wimperis and Aber, of Sackville-street, Piccadilly, being the architects. Our illustration is taken from a drawing now being exhibited in the Royal Academy.

THE YOUNG SOPHOCLES LEADING THE CHORUS OF VICTORY.

THIS statue, by Mr. John Donoghue, is now on view at the Royal Academy. It represents the celebrated tragic poet of Athens, who was the rival of Euripides and the truest representative of the *καλοκαγαθός*, at the highest period of Athenian culture, trained in all gymnastic and warlike exercises, and in the lighter accomplishments of music and the dance. In the Lateran there is a famous life-size draped statue found in 1839 in Tarracina (Anxur), and presented by Count Antonelli to Gregory XVI., who placed it in the museum. Mr. Donoghue has represented his Sophocles leading the mimetic dance—the ancient art of gesture wherein, by the poetry of motion, the thoughts of the heart found adequate and appropriate expression. The artist has realised this ideal with considerable success.

SHEFFIELD MUNICIPAL BUILDINGS.—THE SELECTED DESIGN.

LAST week we announced the result of Mr. Alfred Waterhouse’s award in this competition. His report was read at the Town Council meeting on Monday last, when the award was confirmed, Mr. Edward W. Mountford being appointed for the work. The following is the referee’s report:—

Sheffield, 19th June, 1890.

To the Improvement Committee.—Gentlemen, —I have very carefully examined the six sets of

designs sent in for the final competition:—1st. As to their conformity to the instructions. These I find have been observed, with a few slight exceptions of a trivial character, and which I consider ought not to be viewed as substantial infringements. 2nd. As to their excellence of plan. This more especially (a) in the grouping of the various departments; (b) in facility of access to each department from the street, and intercommunication between the offices themselves; and (c) in the adequate lighting of rooms and corridors. 3rd. As to their architectural merit without and within. 4th. As to their costs; and—5th. As to the facilities they present for future extension. I recommend the design No. 4 (59 in the first competition) for your adoption, as in my opinion combining these varied excellences more fully than any of the others. I consider that all the other designs are of great merit in one or more of these particulars, if not in all, and that there is every reason why their authors should receive the premium of £100 for each design, which was to be awarded to them in the final competition.—I have the honour to be your obedient servant,

ALFRED WATERHOUSE.

Mr. Mountford’s design was accompanied by a full descriptive report from which we take the following particulars of his plan:—The points to which I would invite the attention of the Council and their assessor are as follows:—1. The various rooms of the respective departments, with the few exceptions specified in the “Instructions,” are invariably placed upon the floor therein assigned to them. 2. Each of the four fronts having a central entrance, with a closely adjacent staircase, direct access to every part of the building is obtainable from either of the surrounding streets. Moreover, each department, being contained wholly in the space between two of these entrances, or the stairs leading therefrom, may be reached without the necessity of traversing any other department. 3. The whole of the official or state apartments, including the three large committee rooms and the grand staircase, may be shut off and used independently of the remainder of the building without in the least degree interfering with the working of the business departments. 4. All rooms and corridors are thoroughly well-lighted throughout. I believe, as an absolute certainty, that there would not be a dark corner in the building, excepting in certain unimportant parts of the basement, and this without the necessity of using “borrowed” light. 5. Future extension is amply provided for, as is shown upon both plans and elevations, and, forming part of the general scheme, will be an absolute improvement to the building both internally and externally. Exclusive of corridors 2,270 square feet additional space is provided, upon each of four floors, equivalent to 28 new offices, each measuring 20ft. by 16ft. *Architectural Character.*—The style may most safely be described as Modern Renaissance, and as far as possible it is English in character and detail. So far as I know the design is as original as may be in the nineteenth century—that is to say, no existing building has been consciously copied either in whole or part, excepting, of course, in the matter of detail of doors, windows, &c. My idea has been to obtain the dignity essential for the municipal buildings of a great town, combined with the utmost convenience of internal arrangement and the largest possible amount of light for the interior. The first consideration has always been the convenience of plan, and in no case has this been sacrificed in order to improve the elevations. But these have not lost by this course of procedure, for, growing as they do naturally from the plan, they indicate externally the internal arrangements, and thus gain considerably in interest and variety. Throughout I have endeavoured to group the parts, so that they may look best in perspective, and upon this grouping, with its contrast of light and shade and general picturesqueness of skyline, I depend for my effect. My tower is 25ft. square externally, and rises to a height of 175ft. above the pavement; very moderate dimensions, but quite sufficient for the purpose. The lower part is kept plain and massive; higher up the design gradually becomes lighter and more picturesque. The clock has four dials, 8ft. in diameter, and would no doubt be an advantage to the neighbourhood. Beneath its shallow balconies are provided, giving ready access to the dials, of which they would not obscure the view. The upper story is open on all sides, and would

contain the bells, upon which the clock would chime the hours and quarters. The dome and surmounting fleche would be roofed with copper, and the whole crowned by a bronze statue representing Sheffield. I have suggested a figure of Vulcan as being very suitable. The small building and open gallery at foot of the tower is very useful in giving scale and apparent height to it, while the lightness and ornamentation of the gallery afford a pleasant contrast to the heavy masonry of the base of tower. *Principal or First Floor.*—This contains the mayor’s apartments and the rooms for town clerk, and is approached by four staircases, one from each entrance. The principal staircase (9ft. wide, with a rise of less than 6in. to each step) leads direct to the council-chamber and mayor’s reception-hall. The alteration in plan of this stair, in deference to your suggestion, is undoubtedly an improvement both to the staircase and hall, the latter being made much more open and dignified. The mayor’s apartments occupy the whole of the Pinstone-street front, the three state-rooms measuring together 157ft. by 35ft., exclusive of bays, with a clear height of 23ft. These can all be thrown into one grand hall when required, and, if desired, the openings between them may be made very much larger than shown in plans. A corridor, 11ft. wide, well lighted by windows and lantern-lights, as well as from the grand staircase, communicates with all these rooms, to facilitate the circulation of guests. An open gallery, entered from the mayor’s reception-room, is provided over principal entrance and another, opening out of dining-room, at the corner of the Pinstone and Surrey street fronts. These galleries, whilst adding considerably to the appearance of the principal front, would be extremely useful at elections or other similar occasions, as well as at large receptions or banquets. The council-chamber, approached directly from the grand staircase, occupies the centre of the site, measures 64ft. by 39ft., and is 30ft. in height. It is lighted by two large traceried windows at each end, and three upon the east side. The ceiling is flat, with moulded and enriched panels. The various committee and sub-committee rooms are placed in one corridor, close to the town clerk and council-chamber. The three large rooms adjoin the official or state apartments, and may be used *en suite* with them, while by closing the door across the corridor, near the head of the town clerk’s stairs, these, with the official apartments, are entirely severed from the departmental offices, and can then only be approached by the grand stairs. These committee rooms have, after the official rooms, the finest position in the building, and may, under ordinary circumstances, be readily approached from either of the four entrances. A business room for the mayor communicates with the suite of large committee rooms on the one side, and the town clerk’s office on the other, and is close to the council-chamber. The rooms are all close together, the town clerk’s own rooms being placed between his general office and the mayor’s business room, and at the same time close to the council-chamber and committee rooms. The department communicates, by means of the staircases, directly with the Surrey and Norfolk-street entrances, and is also accessible from the grand staircase, and that from Cheney-row. The committee rooms and town clerk’s offices are 14ft. in height. The engineer’s office, drawing office, and plan room, with lavatory, are placed on this floor as directed in the original instruction. They are close to the head of the stairs leading from the other offices of this department. *Ground Floor.*—The principal entrance from Pinstone-street is 20ft. in width, and 16ft. in height, having an inner glazed screen with swing doors in addition to the outer doors. Directly in front of entrance are the grand staircase and hall, the latter being 44ft. by 40ft., and 45ft. high. The domed ceiling of the hall is surmounted by an arcaded lantern light, having inner and outer skylights, the inner one panelled and filled with tinted glass. The borough accountant’s department extends from the left of the principal entrance to that from Surrey-street, being thus equally accessible from either. The general office is 62ft. by 47ft., exclusive of bay, and 16ft. high. The borough surveyor’s department is placed between the Surrey and Norfolk street entrances (approached from the latter by the stairs). The borough surveyor’s rooms now adjoin those of the district surveyor, having the clerk’s office upon the other side, with the drawing office beyond. All these rooms have a north light. Two strong rooms

are provided for this department, one in the basement (close to the foot of the stairs), and one on the ground floor. The sample room is amply lighted for use as an ordinary office. The water-works department occupies the space between the principal entrance and that from Cheney-row, the latter being useful for the workmen. The general office is 40ft. by 47ft., and 16ft. high. The rooms for general manager, assistant manager, and chief clerk all open directly out of it, as do also the strong room and telephone room, while the rooms for accountant and auditor adjoin each other, and are entered from the general office. *Materials.*—I have come to the conclusion that the most suitable stone for the outer walling is some one of the Huddersfield quarries. They have been well tested in Sheffield, and seem the best for resisting the influence of the smoke, while they have a very satisfactory appearance. In the internal courtyards I should like to face the walls with red brick and dressings of pink terracotta, but possibly a glazed brick of cream colour would be more suitable. The roofs I propose to cover with "brown" Broseley tiles, the fleche on upper part of tower as well as the smaller ones on roofs with copper, such of the wood framing as shows externally being of oak. Internally, the walls of entrance hall and grand staircase would be lined with stone, probably Bath and Doulting. The council chamber walls would be lined with oak panelling to a height of 13ft. from the floor, above that with stone ashlar. The traceried windows are proposed to be filled with coloured glass representing occurrences of local interest. The ceiling would be of fibrous plaster, panelled and enriched, and having an enriched cove. The floor would be of oak, and the fittings of the same material. In the principal fronts the lower parts of the windows would be filled with plate glass, the upper portions with leaded glass, the reception rooms having heraldic devices worked therein. *Heating and ventilating.*—I should heat this building on the low-pressure system of steam heating. The boilers, placed in the heating chamber shown on plan, would be of the Cornish type, with cross tubes and set in brickwork. Pipes would be carried in trenches under the basement floor, and thence in chases in the walls would rise to the radiators in the various corridors, staircases, and rooms to be heated. I should propose to use patent radiators, proportioned to the sizes of the room or space to be heated. *Drainage.*—The whole of the drainage would be arranged upon the most approved modern system. The pipes would be of glazed and socketed stoneware, jointed in cement, laid in a bed of concrete, and everywhere possible kept outside the building. At the principal junctions man-holes or inspection chambers would provide easy access to the drains, while there would be proper inlet and outlet ventilators, the latter carried above the roofs at all desirable points. *Cost.*—Foundations, £5,000; tower, £5,000; cubic contents of main buildings, 1,683,833ft. at 10d., £70,159—total, £80,159. Next week we shall illustrate other drawings, and thus continue until all the six competitive designs have been given.

#### MESSRS. DAVID NUTT'S NEW SHOP IN THE STRAND.

In consequence of the terms of a long lease and the requirements of increased business, it was found necessary last year to considerably alter and rearrange the two buildings which have so long been in the occupation of Messrs. David Nutt, the well-known foreign and archaeological booksellers in the Strand. The premises at the rear were entirely rebuilt, and a new staircase and lift were erected between the two houses. The old shop gave place to the new one, which we illustrate to-day. It is divided into two, one for retail and general business, the other for wholesale trade. The woodwork of the front is in dull polished oak. Above the transom the lights are in lead, quarry shaped patterned glazing in clear glass. An arrangement for sun blinds is specially contrived. Messrs. Allen and Sons, of Kilburn, were the builders. Messrs. Burt and Potts supplied the metal casements. Mr. Maurice B. Adams, F.R.I.B.A., was the architect.

#### NETHERALL.

This house was built a few years ago for Sir William Thomson, the eminent Professor of Natural Philosophy in Glasgow University, who is also well known for his discoveries and inventions connected with electricity. It is built near Largs, Ayrshire, on steep ground, commanding

an extensive view of that part of the Firth of Clyde. The walling is of a dark bluish grey whin, neatly dressed, and key drawn or pointed to the individual shape of each stone. The dressings are of dark red freestone, and the roofs are covered with green slates. The style is of that French character which was early seen in Scotland, in which the characteristic crow-steps are wanting; but their place is supplied by plain skews or water tables, and a roll at the apex of the gables. Not far off are the stable offices, about half-way between the house and the gate lodge. We give a view of the house from the south-east, showing the conservatory and the stair from the drawing-room down to the garden terrace; also a sketch plan, and a sketch of the entrance front of the gate lodge. The cost of the whole work was about £12,000, and it was carried out from the designs of Mr. Campbell Douglas, F.R.I.B.A., of Glasgow.

#### A PUPIL TEACHERS' CENTRE.

The drawing published this week is that of a pupil teachers' school, which has been erected by the School Board for London at Hackford-road, Brixton. It consists of three classrooms on the ground and first floors respectively, the classrooms being planned with left lighting, and being fitted with single desks, and containing accommodation for 216 pupils. On the ground floor the classrooms open into a hall 44ft. 6in. by 30ft., and on the first floor the space over the hall is occupied by a large chemical laboratory separated from the classrooms proper by a wide corridor. On the upper floor is a drawing classroom with an open and covered gymnasium. There are separate staircases for male and female students, with cloakrooms, lavatories, and rooms for instructors and general superintendent. The sexes are mixed in the classrooms, but are separated directly they get beyond the proper rooms for instruction. The building was erected from plans by the board's architect, Mr. Thos. J. Bailey, in 1887—8, at a cost of £6,325 10s. 4d.

#### CHIPS.

The foundation stone of the new town-hall for Cleckheaton was laid on Saturday. The building is being erected at the junction of Church-street and Tower-street, and will cost £8,120. It is of stone, Free Renaissance in style, and includes, besides municipal offices, a hall seated for 1,000 persons. It is being built from plans by Messrs. Mawson and Hudson, selected in competition, and was illustrated in our issue of the 25th April last.

On Monday week the memorial stones of a new Wesleyan mission hall were laid at Old Hednesford. The building is of red brick, with tiled roof, and will find accommodation for about 200 people. The estimated cost when completed is over £400. Mr. T. Mason, of Hednesford, is the builder, and Mr. F. W. Wheatley the architect.

Mr. T. R. Dickinson, A.M.I.C.E., deputy city surveyor of York, has been appointed borough surveyor, waterworks engineer, and inspector of nuisances to the Corporation of Hertford. Eighty-eight applications for the post were received.

Mr. Justice Mathew and a jury tried on Monday an action for slander brought by Mr. A. Millar, clerk to the vestry of St. George's, Southwark, against Mr. J. G. Tatum, who had been contractor to the vestry for smith's work. The defendant had made accusations against the plaintiff, arising out of the vestry ceasing to accept his tenders, and the jury gave a verdict for the plaintiff, with £20 damages.

A systematic investigation of the Roman city of Silchester, near Reading, the inclosed area of which is nearly a mile and a half in circumference, was commenced on Monday, under the direction of Mr. G. E. Fox, Mr. Mills Stevenson, and Mr. W. K. Foster, Fellows of the Society of Antiquaries of London. Mr. Walter Money, F.S.A., local secretary of the society for Berks, and a member of the executive committee, was also present.

On Wednesday week, at the Town-hall, Cardiff, Mr. Samuel Joseph Smith, of the Local Government Board, held an inquiry on the application of the Cardiff Town Council for powers to borrow £8,900 for purposes of street improvements and the reconstruction of sewers. Mr. Harpur, the borough engineer, gave evidence to the effect that the reconstruction and deepening of the sewers in Butetown was absolutely necessary, the present sewers being too congested, and the offensive smells which come from them highly injurious to health. While the streets are disturbed in reconstructing the sewers, the pebble roads will be repaved with macadam. The other improvement contemplated is the widening of Penylan-road.

#### COMPETITIONS.

**BRISTOL.**—At a meeting of the Finance Committee of the City Council held on Monday, the members had before them the subject of the municipal buildings, which came up upon the presentation of a ground plan of the Council House site, including the portions running into Small-street, where it is thought the sanitary section of the buildings might be placed, and all the property which the Corporation have in Broad-street. It was resolved to advertise for plans in open competition, and having in view the importance of the work, the committee further resolved to give substantial premiums. It is believed that plans will be invited for buildings to cost some £80,000.

**LEEK.**—The sub-committee appointed to deal with the erection of the new police station at Leek has reported to the Standing Joint Committee of the Magistrates and County Council upon the designs submitted by several leading Staffordshire architects in response to the Committee's invitation. We learn that the report, which was, we believe, adopted by the Joint Committee at its last meeting, recommends the engagement of Messrs. W. Sugden and Son as architects for the new buildings in Leonard-street, subject to certain modifications of details in their plans proposed by the Chief Constable and the County Surveyor, without increase in outlay beyond the original estimate. Besides a large administrative block, there will be superintendent's and married sergeant's houses, and stabling, &c.

**LINCOLN.**—The directors of the Lincoln Liberal Club Company recently offered premiums for the best plans for their proposed new club-house, and seventeen architects competed for the sums offered—viz., £20 for the best selection and £10 for the second, sending in all twenty sets of plans. On Tuesday week a general meeting of the members was held, when the choice of the directors was approved of. The mottoes accompanying the various plans were then opened, and it was found that No. 1 set had been sent by Messrs. T. Sington and B. W. Brameld, of Manchester, and No. 2 set by Mr. J. H. Cooper, of Lincoln, who was the only local architect competing. The first-named firm forwarded three sets of plans. The estimated cost of a club built to their selected plans is £2,000.

**WATFORD.**—Designs by Mr. C. P. Ayres, of Watford, architect, have been selected in a limited competition by the Watford School Board for new schools, which are to be erected at once.

New banking premises for the Bucks and Oxon Union Bank (Limited) were opened last week at Thame. Mr. C. P. Ayres, of Watford, was the architect; Mr. Kinglerlee, of Oxford, the contractor; and Mr. H. G. Rogers acted as clerk of works.

A reredos, which has been placed in St. Catherine's Church, Scholefield-street, Nethells, Birmingham, as a memorial of the first vicar of the parish, the late Rev. T. H. Nock, was dedicated on Saturday. The reredos is executed in wainscot oak, and has been erected by Messrs. Jeffery and Son, of Forster-street, Birmingham, from designs by Messrs. Osborn and Reading, architects, Bennett's-hill, in the same city, who were the architects of the church. It consists of an upper and a lower series of Gothic panels, in harmony with the style of the church, the upper panels having crocketed gables, terminating in foliated finials. On the largest four panels are inscribed the Ten Commandments, the Apostles' Creed, and the Lord's Prayer. On one of the lower panels there is a memorial brass bearing an inscription.

Messrs. C. Isler and Co., of Southwark, have recently completed artesian bored-tube wells for the following brewers:—Mr. J. A. Chadwick, Burton brewery, Wrexham, where the depth reached is 331ft., and the water rises 10ft. above the surface; at Mr. J. W. Wright's brewery, Leeds, an inexhaustible supply has been tapped a few yards deeper than the depth of the original well—formerly the supply could be exhausted after a few hours' pumping; at Messrs. Ridley, Cutter, and Firth's, Manor brewery, Newcastle-on-Tyne, an inexhaustible supply has been obtained; also at Messrs. Carter and Co.'s Mineral Water works, Bristol. At Watford, close to Messrs. Wells' brewery, a 120ft. tube well has been completed in a little over a week. Among the other works Messrs. Isler are engaged upon may be mentioned the Ely Brewery Company, Ely, near Cardiff; the Kelsterton Brewery Company, Kelsterton, Flint; Mr. Kops's brewery, Fulham, S.W.; at Sturry, near Canterbury; and at Northfleet, Kent.

## Building Intelligence.

**BRADFORD.**—On Saturday the new church of St. Chrysostom, Bolton-road, Bradford, was consecrated by the Bishop of Ripon. The new church, which has been erected at a cost of £2,000, from designs prepared by Messrs. T. H. and F. Healy, Bradford, is in the Perpendicular style. It occupies a prominent position on the valley side of Bolton-road, just above the junction with Wapping-road. The site being a disused quarry, there were special difficulties to contend with in forming the foundations, which extend to a depth of 40ft. below the floor of the nave. The interior arrangement is that of a nave of five bays, with a south aisle and shallow transepts, a chancel and side chapels, the organ being placed in the northern chapel. There is also a small clergy vestry, with stair which conducts to a larger vestry for the choir, and a parish room in the basement. Adjacent to the south chapel is a turret, hexagonal in form, battlemented and crowned with a slate spire. The church affords seating accommodation for 590 persons. The seats, which are open, are of pitch-pine, but the chancel stalls and fittings are of oak. The pulpit is of stone, traceried and carved in accordance with the style of the building. Mr. G. H. Elliott was the clerk of works.

**CHEPSTOW.**—The parish church of Chepstow is about to be re-seated and restored from plans prepared by Messrs. Seddon and Carter, of Westminster and Cardiff. The works will include the restoration of the 12th-century nave, and its lowering to the original level, the rebuilding and extension of the chancel, the restoration and rebuilding of the transepts, the building of new aisles on the old foundations, the removal of the organ from the west gallery, reopening of the tower arch and west window, and the external repair of the tower. The church is also to be re-seated. This will necessitate the loss of a few seats; but the accommodation at present being 1,156 in a population of 3,000, the reduction will be scarcely felt. The estimated cost is: Nave, £1,050; transept and chancel arches and roof, £1,200; and chancel £2,000—total, £4,250. Towards this amount £1,650 is in hand. It is proposed to proceed with the work as funds permit, beginning with the nave and continuing with the crossing of the transepts and chancel and the transepts and aisles. It is expected that the work will cover several years. A faculty for the works in the nave and chancel was granted by Mr. Chancellor Ollivant on Friday.

**EDINBURGH.**—The plans for the enlargement of Dalry Public School have now been approved by the Scottish Education Department, and the work is to be commenced at once. At present the building can accommodate 985 pupils, on the ten and eight square feet basis, but when the alterations are completed no fewer than 1833 pupils will be provided for. The enlargement, the plans for which have been prepared by Mr. Robert Wilson, the architect for the Edinburgh School Board, consists in the erection of an additional story, the present building being restricted to the ground flat. Though the area covered by the building will remain practically the same, a good deal of re-modelling will require to be carried out upon the existing walls and floor, the new plans including the introduction of a large central staircase. There will be in all twenty-one class-rooms—eleven on the ground-floor and ten upstairs. Messrs. Kinnear, Moodie and Co. have the contract for the entire alterations, which will involve an expenditure of £10,978.

**HERNE BAY.**—The new R.C. Church of "Our Lady of the Sacred Heart," Herne Bay, was opened on the 26th inst. The plan consists of nave, sanctuary, baptistery, and two aisles, and contains three altars and two confessionals. There is a priest's sacristy with organ chamber over. In addition there is a large refectory for the community, with choir over and a tribune opening on to sanctuary. The interior length is 90ft., the width 44ft., and the height to apex of ceiling 40ft. The spire is 97ft. high. The church is built of Purbeck stone, with Bath stone dressings, and the style of architecture adopted is Early English. The architect is Mr. Albert Vicars, of Somerset Chambers, 151, Strand; the contractor is Mr. Adams, of Herne Bay.

**LONDON COUNTY COUNCIL.**—At the weekly meeting of the County Council on Tuesday, the Main Drainage Committee reported that they hoped before this to have received the report of Sir Benjamin Baker and the chief engineer upon the sewerage system and upon the approximate cost of conveying the sewage to an outfall upon the coast. But the committee did not now expect that this report would be received before the recess, or that it could be in their possession in time to admit of Parliamentary notices being given in November if any scheme shall be recommended and accepted requiring such procedure. The committee, therefore, were forced to the conclusion that no alternative system, if such were constructed, could be in operation before the expiry of six years from the present time. Meanwhile they were assured that the Crossness works would be completed and in full operation next summer. This had led the committee to consider the provision of another sludge vessel, and they recommended, "That tenders be obtained for the construction of a sludge vessel upon the model of the older and less costly ship, with certain modifications to be described by the engineer." The recommendation was agreed to. It was decided that the salary to be paid to the Superintendent of Parks and Open Spaces should be £500 a year, and that it be not a necessary condition that he should be a professional landscape gardener. Lord Compton explained that the Housing of the Working Classes Committee had refused to sell a piece of land to the Guinness Trust without first seeing the plans for the dwellings to be erected thereon; and as the trustees declined to show the plans, the negotiations came to an end. The Council sustained the action of the committee.

**ST. ANNE'S.**—The new Catholic church at St. Anne-on-the-Sea was opened on the 15th inst. When completed the edifice will consist of chancel, nave, and two chantry chapels, baptistery, tower, and sacristies. The style is pure Early English, and the whole is designed on a massive scale. Up to the present the portions completed are chancel, chapels, chantries, five bays of nave, and sacristy, the latter being connected with the new presbytery by a covered corridor. The walls of the building are Haslingden shoddy with Longridge stone dressings, and the roof is of oak. The church accommodates about 250 worshippers. The work has been carried out by Mr. W. Eaves, of Blackpool (Messrs. Challoner and Sons being the sub-contractors for decorating and plumbing), from the designs of Messrs. Pugin and Pugin, of Westminster, under the personal direction of Mr. Paul Peter Pugin, K.S.S. It is estimated that the cost of the whole building will be over £7,000.

**SOUTH SHIELDS.**—The formal opening of the Marine Parks at South Shields took place on Wednesday. They cover a site of about thirty-one acres, divided in the centre by the pier promenade, thus affording the means of providing two distinct parks, known as the North and South Marine Parks respectively. The former has been laid out under the supervision of Mr. John Burns, and the latter under that of Mr. J. Peebles. When the work was commenced, the Corporation let the contract to the late Mr. Marshall for levelling and preparing the ground, and for this purpose a great quantity of ballast from the adjoining hills was removed. After this had been done the Corporation undertook the work, and were enabled to employ nearly 300 men who had been thrown idle during a serious trade depression. The outlay has been about £2,200. Between the parks is placed the memorial to William Wouldhave, the inventor of the lifeboat, designed by Mr. Morton and carved by Mr. J. F. Scott, of South Shields. It is three stages in height, and contains a clock with four dials, the work of Messrs. Potts and Sons, of Leeds. This memorial was also unveiled on Wednesday.

**SOUTH SHORE, BLACKPOOL.**—The new church of St. Cuthbert, in Lytham-road, was consecrated on Sunday. The church under notice has been erected to meet the wants of South Shore, a part of Blackpool which is rapidly growing. The building is Gothic in style, and consists of a lofty nave and chancel at one height, with aisles, divided off by polished granite columns with red-stone capitals; each aisle terminates in a side chapel. An organ gallery runs across the end. Yorkshire wall-stone has been used for the exterior, with Rainhill dressings and a plinth of Longridge stone. Mr. O'Byrne, of Liverpool,

was the architect, Messrs. Brown and Son, of Salford, being chief contractors, and Mr. Howarth, of Blackpool, clerk of works. The present accommodation is for about 500 worshippers, but the site will permit of a large extension southwards, and the addition of a tower. The outlay to date has been £6,500.

**SWANSEA.**—The memorial chancel and transepts just added to St. Thomas' Church were consecrated on Tuesday week by the Bishop of St. David's. The nave and aisles of this church were built in 1887, and the portions now added (which have been contributed entirely by Mrs. Llewellyn, of Baglan Hall, in memory of her father) consist of chancel, chancel aisles, south transept, tower, and spire. The chancel is 42ft. by 20ft. 6in., making the total length of the church 133ft. The chancel arch opening to the nave is 25ft. high and 17ft. wide. The tower is finished with a spire, and its total height from the ground is about 115ft. Erected within the tower is a set of Harrington's tubular bells and a public chiming clock with dials on each face of the tower. The style of architecture is that obtaining in the reign of Henry III. The architects were Messrs. Nicholson and Son, Hereford, and the builder Mr. John Wood, Malvern.

## ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

**ARCHÆOLOGICAL AND ARCHITECTURAL SOCIETY OF DURHAM AND NORTHUMBERLAND.**—The second meeting for the year 1890 was held on Friday last at Edlingham, in the uplands of Northumberland. The members assembled at Alnwick Station about noon, and drove from the White Swan Hotel to Edlingham. Here they examined the church and the castle, of which the president, the Rev. Canon Greenwell, gave a lucid account. Afterwards the party proceeded to Whittingham and inspected the church, where the lower portion of the tower still retains some characteristic pre-Conquest features. In the village is one of the fortified houses, usually called pele towers, so frequent on the Border. The party then drove back to Alnwick, and dined together at the White Swan Hotel.

**BRITISH ARCHÆOLOGICAL ASSOCIATION.**—At a meeting of the local committee of the 47th annual congress of this society, to be held at Oxford on Monday, the 7th of July next, the Mayor of Oxford in the chair, it was resolved that the mayor should invite the Earl of Jersey, as Lord-Lieutenant of the County and Lord High Steward of Oxford, to preside at the opening of the congress and deliver a short address, in the place of the Earl of Carnarvon, D.C.L., the president of the society, whose recent severe illness will prevent his lordship from undertaking the duty. The proposed programme of the ten days' doings was also settled.

**LINCOLNSHIRE AND NOTTINGHAMSHIRE ARCHITECTURAL SOCIETY.**—Holbeach was this year the head-quarters of the annual excursion of the Lincolnshire and Nottinghamshire Architectural and Archæological Society. The proceedings commenced on Wednesday week, and concluded yesterday (Thursday). On the morning of the first day a short service was held in Holbeach Church. After a brief inspection of the church the party proceeded by the 8.58 a.m. train to Luton Church. After a stay of ten minutes here the journey was resumed to Long Sutton. At the station there were conveyances waiting. A start was made, and in 25 minutes Tydd St. Mary was reached. A description of the church was given by the Bishop of Nottingham. The party then proceeded to Long Sutton, Gedney, Fleet, Whaplode, All Saints' (Moulton), and Weston St. Mary churches. The annual dinner was held in the evening at the Chequers Hotel, the Bishop of Nottingham presiding. The annual meeting was then held. Mr. Foster read a paper on "Moulton," and the Rev. G. W. Macdonald one on "Holbeach." A paper was also given on "Rood Screens." On Thursday the churches visited were Terrington, Walpole St. Peter's, West Walton, and Walsoken.

**SOUTH WALES ART SOCIETY.**—The members of this Society to the number of 60 had a field day on Saturday at Margam Abbey. The mansion adjoining the ruins is Tudor in style, and was built half a century since for the late Mr. R. C. M. Talbot; it contains some oak furniture of great interest, paintings by Paul Veronese,

Vandyck, and other masters, and the main staircase is hung with Flemish tapestries. Assembling in the roofless chapter-house of the abbey, the members were addressed by Mr. T. H. Thomas on the inscribed stones in the grounds, the largest group of early carved stones in the Principality. Mr. Edwin Seward, R.C.A., afterwards gave a short history of Margam Abbey. Margam was, he said, once one of the most important abbeys in the kingdom. The present church occupied the site of six or eight bays of the original edifice, of which the only relic now was the chapter-house in which the party were then standing. It was founded about 1147 to 1150, and probably occupied 20 to 25 years in building, the chapter-house being later work. Robert, Earl of Gloucester, was its founder, and it was occupied by the Cistercians. The building was an example of simple and chaste Early English in its purest style, and up to within a year of the present century the chapter-house made a picture such as imagination could now only suggest. In 1799 the whole mass of the vaulted roof fell in, and the place became a ruin, whereas the outlay of a small sum would have saved it. The abbey itself was of noble dimensions, having been 250ft. in length. It was purchased, at the Dissolution of the Monasteries, by Sir Rice Mansel, an ancestor of the present possessor, and he, in 1552, altered part into a dwelling-house; but in 1772, seventeen years before the chapter-house fell in, the dwelling-house was demolished. Unless something were done to prevent the ravages of the ivy and trees growing on the ruin, there would in fifteen or twenty years be very little left. Neglect in years long past had led to grievous loss of so much that was beautiful and valuable, and he thought it would be wrong of them to see the danger impending and yet to utter no warning.

#### CHIPS.

The parish church of Quinton, near Birmingham, was reopened on Thursday, the 19th inst., after partial restoration. The whole of the floor has been taken out and new substituted, that of the chancel being laid in Ruabon tiles, with steps of Hopton wood stone. The church has also been re-seated, and also other much-needed work executed. The architects were Messrs. Osborn and Reading, of Birmingham, and the contractors Messrs. James Smith and Sons, also of Birmingham.

The County Council of Perthshire have elected Mr. James S. Robertson as road surveyor for the western district.

A reredos has just been erected in St. Peter's Church, Westleigh, by Messrs. T. Brown and Son, of Manchester.

Mr. G. D. Leslie, R.A., has just completed a signboard for the Row-barge public-house in St. Leonard's-lane, Wallingford. The signboard represents an old State Barge rowed by six oarsmen; underneath the canopy in the stern are seated the Mayor and Corporation, and the mace-bearer is in the bows, while a large red flag, with a portcullis, the arms of Wallingford, identical with Westminster, flies behind.

The London and North-Western Railway Company have consented to pay £450 to Mr. Evan Griffith, contractor, Tanygrisiau, Festiniog, who, in October last, had his leg fractured, through the collapse of an omnibus belonging to the above railway company, and has since been unable to attend to his duties.

The old Golden Lion public-house at Plymouth has been reconstructed and converted into an hotel. Mr. J. H. Keats, architect, prepared the plans for the rebuilding of the premises. Messrs. A. R. Lethbridge and Son, builders, secured the contract for the sum of £3,200. The premises were pulled down and no less than 2,500 tons of rubble and shellert excavated for the purposes of constructing cellars. They are ventilated with special air shafts, and are 105ft. long, 23ft. wide, and 9ft. 6in. deep. The building is of four stories. The principal bar extends the width of the whole site, and is 64ft. long, is lit by means of a lantern and dome, and is furnished in mahogany and pitch-pine.

We understand that the Queen intends to build a State banquetting-hall at Osborne on a grand scale. This is believed to be on account of the great inconvenience which is experienced when Her Majesty entertains distinguished personages, and which was particularly felt at the time of the German Emperor's visit last year. We believe that operations have already commenced and that the site is on the west side of Osborne House, and that the building will almost form a quadrangle of the space in front of the Queen's private entrance.

#### TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

#### TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India (via Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

#### ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 6s.

#### SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

#### NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XLII., XLVI., XLIX., LI., LI., LIV., LVI., and LVII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

## Intercommunication.

#### QUESTIONS.

[10303].—Area of Segment of Circle.—What is a simple method of obtaining the area of a segment of a circle?—ARTHUR SHAW.

[10304].—Architects and Art Decorators.—F., a firm of art decorators, are invited by B., an architect, to submit designs, working drawings, and estimates for elaborate internal fittings. B. hands tracings of same over to the contractor, who executes the work from F.'s designs and drawings. What remedy has F. against B. or his client?—F.

[10305].—Chemical Action in Roof Metals.—I should be obliged if one of your experienced readers would inform me what, if any, chemical action would take place in the contact of iron, zinc, and lead in the case of a glass roof composed of iron bars and zinc capping, with a lead capping at end bossed round same and extending over ridge, and what would be the result if any action took place?—LUX.

[10306].—Tall Chimney.—I would feel greatly obliged if some of your readers (perhaps Messrs. Bancroft) would kindly inform me as to which are the best materials to employ in the construction of ornamental top of a tall chimney 180ft. high; heat at top about from 600° to 700°. I would like opinions re advantages or otherwise of terracotta.—J. T.

#### REPLIES.

[10301].—Concrete.—There is no reliable rule to determine thickness of concrete foundations, because the strength of a beam of concrete, which we may suppose the foundation to be, would depend on the bearings or nature of subsoil, or the distance apart of two points of support. A thickness of 2ft. would certainly be twice as strong for the same width as a thickness of 1ft. A tenth of the crushing weight might be used with safety for brickwork; but care should be taken that the bricks have all been tested to the required strength.—G. H. G.

[10302].—Schools.—Robson's work on Schools will furnish "Evans" with examples. The Education Department gives 800ft. as minimum space per scholar, or 8sq.ft. for the floor space. For senior schools the floor area is about 10ft. For classrooms the requirements allow not less than 15ft. super. of floor per pupil.—G. H. G.

#### LEGAL INTELLIGENCE.

ATTEMPT TO SET ASIDE AN ARCHITECT'S AWARD AS ARBITRATOR.—A motion was heard on Monday by Mr. Justice Grantham (sitting by consent with all the powers of a Divisional Court) to set aside an award in the arbitration between Ward and Cave. E. J. Cave employed one R. Julian in large building operations, and advanced him sums from time to time. In August last Julian became bankrupt, and Cave took up the buildings himself and continued them. Questions arose between Cave and Ward, Julian's trustee in bankruptcy, as to certain omissions and additions by Julian in respect of 16 houses in High-street, Hampstead, and 19 others in Fitzjohn's Promenade, Finchley-road, and as to certain jobbing work and removal of clay. In October, 1889, these questions were referred to the arbitration of Mr. B. Catherwood, architect, who in March of this year found in favour of Ward for seven or eight thousand pounds. After taking into account the sums advanced, there was claimed by Ward under the award a sum of £3,348. The grounds on which it was sought to set the award aside were that the arbitrator had, on various occasions, allowed his clerk, Windsor, to go round the buildings in company with Julian, and without, on behalf of Cave, measuring and inspecting, and that the arbitrator had acted on his report; also that the arbitrator ought to have made a personal inspection of the premises, instead of deputing the work to his clerk. There was also the objection that the award was not final. The affidavits in support of the motion stated that a representative of Mr. Cave was always present with Julian when he and Windsor were together on the buildings. These affidavits also negatived most of the other points set up. Mr. Justice Grantham observed that it was often the case that when an award was given against a man for a larger sum than he expected, he grumbled. The mere fact that Julian was on the premises with the arbitrator's clerk did not show that evidence was taken behind the back of the parties. The arbitrator, who had made an affidavit in support of the award said, in cross-examination, that he thought he was at liberty to ask Julian whether he admitted matters on the list of omissions furnished by Mr. Cave, even though Mr. Cave was not there and not represented. He had held meetings on February 21 and 22, when he went through with Mr. Cave those items on the list that Julian disputed. He had the drawings, and he could tell without going into the houses what ought to be allowed for each. The list of omissions was almost correct. There were very few cases where the question of the quality of the work was raised. As to one of the sets of houses, Mr. Catherwood admitted that he had not been inside, and that as to what was actually done in them he had no other information than what his clerk Windsor had given him. Counsel for Mr. Cave then addressed the Court as to the finality of the award. One question left to the arbitrator was as to the sum to be allowed for certain jobbing work. The arbitrator had recited in his award, though he had not mentioned it in his affidavit or in his evidence, that this question was withdrawn by consent from his consideration. Another point left to him separately was "the allowance proper to be made to Mr. Cave in respect of getting out and carting clay for foundations of the above-mentioned houses." As to that the award found as follows:—"There is no sum proper to be allowed to the said E. J. Cave in respect of getting out and carting clay for the foundations of the above-mentioned houses, other than and so far as the same is taken into account in the sums before awarded in respect of the several sets of buildings." It was urged that it was the arbitrator's duty to find the "proper allowance." This finding did not do that, and what was the "proper allowance" was a matter left undecided, or, at any rate, uncertain. If an award was not final or uncertain it should be set aside. Mr. Justice Grantham refused to set the award aside. It was a case where a considerable sum was found against a man, who now tried to get a case against the award. Judgment was then by consent ordered to be entered for the £3,348 on the summons for that purpose, which had been adjourned to come on with the motion to set aside.

THE PERILS OF A TIMBER YARD.—GILBERT V. AVISS.—In this action, held on Monday, before Mr. Justice Mathew and a special jury, the plaintiff, J. C. Gilbert, builder and contractor, sued Robert Aviss, timber merchant, Putney, for damages in respect of personal injuries sustained by the former by reason of alleged negligence on the part of the servants of the latter.—The defendant denied such negligence, and alleged that the plaintiff was himself to blame.—According to the plaintiff's case, he went to the defendant's yard in August last to get some boards, entering the yard at the invitation of the defendant's foreman, and while the boards were being looked out by himself and a workman at a particular stack of timber, another stack, in consequence of defective stacking, fell upon them, injuring both his legs, one of which was broken. The case for the defendant was that the plaintiff was in the yard not by the invitation of the defendant or his servants, but in the face of a notice

exhibited on a board warning people, in case of accidents, not to go into the yard, and that it was through his own handling of the timber, and not through defective stacking, that the stack fell upon him and caused the injuries complained of. A board bearing the notice referred to was produced in court; but the plaintiff said he had not seen it. —The jury, after consultation, returned a verdict for the plaintiff for £75. —His Lordship gave judgment for the plaintiff, with costs, but stayed execution in view of an appeal.

**RE R. A. AND J. STEWART.** — This failure occurred in March, 1887, the bankrupts trading as timber merchants in Fen-court, City, and at New Brunswick. Proofs have been put in for £192,894, and a dividend of 3s. 4d. in the pound has been paid. The bankrupts recently applied for their discharge, and judgment was given on Saturday by Mr. Registrar Linklater. —His Honour said that the hearing had occupied eighteen days owing to the complicated nature of the case and the voluminous matters with which the Court had to deal. The bankrupts' course of trading was impeached upon various grounds, it being alleged that they had been guilty of rash and hazardous speculation, of trading with knowledge of insolvency, and other offences. Charges of fraud were also made. Prior to 1878 the bankrupts were in partnership with Mr. Guy, and in that year the partnership was dissolved, the Stewarts thenceforward trading in London as Stewart Brothers, and in Canada as R. and A. Stewart, their capital amounting to £40,000. Mr. Guy also went into partnership with Mr. Bevan, and the two firms carried on business separately until March, 1882. At first the Stewarts prospered, but not so the Guys, and in that year the business of the latter was taken over by the former. After reviewing the bankrupts' course of trading, the Registrar held that charges of fraud had been recklessly made, and he entirely acquitted the bankrupts therefrom. With regard to the charge of trading with knowledge of insolvency, he was of opinion that at the end of 1885 the bankrupts were insolvent, and if they did not know it, it was because they wilfully blinded themselves to their position. This charge was established, and the bankrupts had brought on their failure by rash and hazardous speculation in having improvidently taken over the business of Guy and Bevan in March, 1882, and in having embarked on a gigantic venture in relation to the Ottawa property. The bankrupts had more on hand than they could properly attend to, they were labouring under a mass of indebtedness, and their stoppage was inevitable the moment their credit was withdrawn. The charge of contracting debts without any reasonable expectation of being able to pay them had fallen to the ground, but the charge of having given an undue preference to the New Brunswick Trading Company had been made out. The failure was most disastrous for the creditors, and the bankrupts' course of trading was unjustifiable, but he was glad to be able to acquit the bankrupts of all charges of fraud. Their discharge would be suspended for five years from July, 1889, when the application was set down for hearing.

#### CHIPS.

A large clock with chimes has just been erected in the parish church tower, Oldbury, near Birmingham, which is fitted with all modern improvements so as to keep time with great accuracy. The dial is illuminated, and automatic apparatus is attached to turn the gas on and off. Messrs. John Smith and Sons, Midland Clock Works, Derby, have carried out the work.

On the 19th inst., Christ Church, the Quinton, Worcestershire, after restoration and rearrangement, was reopened by the Hon. and Rev. Canon Pelham, rector of Lambeth (formerly rector of Halesowen). The works have been carried out under the superintendence of Messrs. Osborne and Reading, architects, Birmingham, by Messrs. J. Smith and Sons, contractors.

A reredos has been placed in the church of St. Catherine, Nechells, Birmingham, as a memorial of the first vicar of the parish, the late Rev. T. H. Nock. The dedication was on Saturday last, when a sermon was preached by the Bishop of Worcester. The reredos is oak in panels, having carved canopied and crocketed gables between buttresses, and has been constructed by Messrs. Jeffery and Son, from designs by Messrs. Osborn and Reading, architects, Birmingham.

A new vicarage has just been completed at St. Arvan's, near Chepstow, Monmouthshire. The architects were Messrs. Osborn and Reading, Birmingham, and Mr. James Morgan, of Rockfield, Monmouth, was the contractor.

The scheme for making Berlin a port has come nearer to realisation of late. Its originators have just received permission to begin the preliminary works, with a view to connecting the capital with the Baltic and the North Sea by canals.

#### STATUES, MEMORIALS, &c.

**TAVISTOCK.** — By the will of the late Miss Bredall, directions were left that Mr. Harry Hems, of Exeter, should be commissioned to erect a memorial in the south or Clothworkers' Aisle at Eustachius parish church, Tavistock, in memory of the Bredall family. Mr. Hems has so far proceeded with the work that he has modelled the principal panel, which will be of white statuary marble, sculptured in high relief, and representing our Lord, just outside the city gate, bending over a poor woman who crouches against the wall with a child apparently sick unto death in her arms. The architectural accessories will be of polished and variegated alabaster, the whole being surmounted by the family arms and crest. The work is to be completed this year.

**THE SELLARS MEMORIAL.** — The memorial which has just been erected in Lambhill Cemetery, Maryhill, in memory of Mr. Sellars, one of Glasgow's best known architects, and who was the designer of the Glasgow International Exhibition, was unveiled last Friday. Designed by Mr. John Keppie, the memorial, which is Egyptian in character, is of red and grey granite, 14ft. high by 6½ft.

#### STAINED GLASS.

**BRISTOL CATHEDRAL.** — An addition is about to be made to the stained glass memorials in this cathedral, the Dolphin Society having undertaken to provide a new window in the north transept to the memory of Bristol's great philanthropist, Edward Colston. The new window will take the place of the existing window in the north transept, the removal of which is necessitated by its decayed condition. The design is by Mr. J. L. Pearson, R.A., architect to the Cathedral Restoration Committee, and the stained glass work has been entrusted to Messrs. Powell and Sons, of London, whose drawings have been submitted to the Dean and Chapter, and have received their approval. Running along the lower part of the window will be the memorial inscription, and above the six panels containing shields representing the arms of Edward Colston, the arms of the Society of Merchant Venturers, the badge of the Dolphin Society, the arms of the See of Bristol, together with those of the City of Bristol, and of Christ's Hospital, where Colston was educated. These shields will be surmounted by the Colston motto, "Go and do thou likewise," in connection with the six scenes of the parable of the Good Samaritan. The next tier will illustrate the Sermon on the Mount and Christ blessing little children, each subject being illustrated in three lights, and above this again there will be representations of six New Testament philanthropists — viz., the Centurion, St. John the Apostle, Joseph of Arimathea, St. Barnabas, St. Paul, and Cornelius. The canopies of these figures and the subjects below will be studies from examples of the 14th century. The upper tracery of the window will contain a design illustrative of Christ on His Throne surrounded by the symbols of the Four Evangelists. The new window will be of fine proportions, the dimensions being about 35ft. by 16ft., and a space of 17ft. will be allowed between the floor and the base. The work is already in hand. The Dean and Chapter have it in contemplation to re-open the long-closed north transept porch.

New electric works have been erected at Bushbury, and special attention has been paid to the ventilation, the latest improved form of Messrs. Robert Boyle and Son's patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air, and fresh air admitted through their improved air inlets.

The improvement commissioners of Mansfield considered at their last meeting a report on the water supply of the town, submitted by Mr. George Hodson, C.E., of Westminster and Loughborough. He condemns the present site of the works on the Southwell-road, and recommends that trial borings be made in the direction of Rainworth into the Bunter beds.

The Committee of the House of Commons to which the London County Council (General Powers) Bill was referred, decided on Tuesday that there was no reason for exempting the City from the operation of a Clause which provides that no building shall be erected above 70ft. in height without the written consent of the Council.

At the sale of the Perkins collection last week, Sir Frederick Burton purchased, for the National Gallery, a portrait of a Venetian nobleman for £289, by Pordenone, and "Ecce Homo," by Carlo Dolce, for £535 10s.

Mr. W. H. Stubbs, of Manchester, chief engineer to the Manchester, Sheffield, and Lincolnshire Railway Company, died suddenly on Monday while staying at Blackpool.

#### WATER SUPPLY AND SANITARY MATTERS.

**CARDIFF.** — The annual inspection by the Cardiff Corporation of the new reservoir in course of construction at Taff Fawr took place on the 19th inst. Mr. J. A. B. Williams, water engineer, explained the progress of the work, and stated that the operations, which had been going on for 4½ years, will be completed in about two more years. The contract was taken by Mr. John Mackay for £83,000, and the cost of the entire scheme will be about a million and a half. The Blackrock reservoir at Treherria, one of three balancing basins, was also inspected; it is of concrete, and is 120ft. by 70ft., and 12ft. in height, having a storage capacity of half a million gallons.

**STAPLEFORD AND SANDIACRE WATERWORKS.** — These works are now commenced, and a good supply of water has been found in the Bunter sandstone at a considerable depth. A steam-pump has been used to test the quantity of water, and 240,000 gallons a day has been pumped without any appreciable diminution. The engineer to the works is Mr. W. H. Radford, C.E., of Nottingham, and the contractor is Mr. W. Cooke.

**TAUNTON.** — Last week Mr. Arnold Taylor, an inspector of the Local Government Board, held an inquiry relative to an application from the Town Council for permission to borrow £9,000 for the construction of a new reservoir and other works in connection with the water supply of the town. The town clerk made a statement as to the population and ratable value of the town. He also mentioned that the receipts from water rates amounted in 1886 to £3,130, whereas in 1889 they reached the sum of £3,809, showing an average annual increase for the three years of £238. Mr. J. N. Taylor, engineer, explained his plan of the proposed new works.

**THE WATER SUPPLY QUESTION IN LONDON.** — Last week a conference was held at the St. James's Vestry Hall, Piccadilly, to secure to London municipal control over the water supply. The St. James's Vestry had convened the meeting, and presented an exhaustive report on the value of the water supply undertakings, with suggestions as to the acquisition of the powers now held by companies. A resolution was adopted, upon the motion of Mr. J. Beal, of the London County Council, seconded by Sir William Farrer, by which the meeting affirmed the necessity of the water supply of London being placed in the hands of a municipal body representative of the Metropolis. Mr. J. Beal moved a second resolution for requesting the Government to introduce forthwith a Bill to enable the London County Council to acquire the undertakings of the eight water companies now supplying London, or some of them, by agreement, or failing agreement, to create a board of arbitration to settle the terms of transfer by compulsory powers, or, failing both, to give powers for the establishment of an independent supply. This was seconded by Mr. May, of Islington, and the motion was adopted with several emendations.

#### PARLIAMENTARY NOTES.

**TRANSFER OF GAS AND WATER UNDERTAKINGS.** — In answer to Mr. O. V. Morgan, Sir M. Hicks-Beach said, last Friday: I am not aware that local authorities have any power to transfer gas or water undertakings acquired by provisional order or Act of Parliament without statutory authority; but provisions have been inserted in the Electric Lighting Orders, granted this Session, authorising local authorities to transfer their powers and liabilities to any company or person with consent of, and upon terms to be approved by, the Board of Trade. I am advised that such provisions are not *ultra vires*.

**FOOT PAVEMENTS.** — In answer to Mr. Rankin, Mr. Ritchie said, on Friday last: My hon. friend is, no doubt, aware of the decision of the Queen's Bench Division on the question as to the repair of footways of streets when such streets are main roads. I have no information as to whether it is the intention to appeal against the judgment in that case. But, however that may be, I cannot hold out any expectation that the Government will propose legislation on the question during the present Session.

The new altar cross which has been presented to St. Paul's Cathedral by the Duke of Newcastle is now in use. It is placed upon the high altar, and is upwards of 6ft. in height. The new wing or grille to the north side of the reredos has also been completed. The work consists of beaten iron and brass upon a base of dark-green marble. Both are from the designs of Messrs. Bodley and Garner.

The foundation-stone for the new building for the Royal College of Music, to erect which Mr. Samson Fox, of Leeds, lately gave £45,000, is to be laid by the Prince of Wales on July 8. It will be built on a site near the Albert Hall, the architect being Sir Arthur Blomfield.

## Our Office Table.

A MEETING will be held on Thursday next at 3 p.m., at the Mansion House, in support of the seventh International Congress of Hygiene and Demography, which is to be held in London in 1891. The International Congress of Hygiene and Demography has been held (biennially as a rule) in each of the following cities:—Brussels, Paris, Turin, Geneva, The Hague, and Vienna. The last of these was held at Vienna in 1887. Before the close of that congress a Permanent International Committee was appointed to decide on the time and place of meeting of the next congress of the series. On account of the fact that it had been decided to hold a Hygienic Congress in connection with the Paris Exhibition in 1889, it was resolved that the next International Congress of the series should be held in 1891, and London was chosen as its place of meeting. The time has now arrived to form a definite organisation, and to raise a fund to defray the necessary expenses. The aim of the congress is to awaken public interest in the progress of hygiene and demography, by which latter term is understood the study of the life conditions of communities from a statistical point of view; to afford persons interested in these subjects an opportunity of meeting, with the object of advancing their progress; and, by conference and debates, to elucidate questions relating to hygiene, demography, and public health.

THE 51st anniversary dinner of the Artists' Benevolent Fund, held on Wednesday night at Freemasons' Tavern, under the chairmanship of Sir Richard Temple, M.P., passed off very successfully. The annual report stated that during the past twelve months 49 widows and 16 orphans received annuities amounting to £1,077, and that since the institution of the fund a sum amounting to upwards of £53,000 has been distributed in relieving distress. Earl Derby responded, as president of the Fund, to the toast of the evening proposed from the chair, and a list of subscriptions and donations amounting to nearly £100 was announced.

An important improvement has been carried out at Gloucester Cathedral, at the suggestion of Sir J. E. Dorington, Bart., M.P., in the repair of the dilapidated and dangerous floor of the south transept. The whole floor has been taken up, the vaults repaired and filled in where necessary, and the entire surface of the transept levelled and covered with a bed of concrete 6in. thick. Every monumental slab that could be replaced has been so treated, and when from their perished condition this was impossible, they have been removed for preservation to one of the chapels of the crypt. The one remaining property required for the purpose of the improvement of the Cathedral approach has now been purchased; the company that has undertaken the widening of College-street will probably commence operations by the beginning of August.

A PICTURESQUE old tenement at the east corner of Cockburn-street and High-street, Edinburgh, is about to be demolished to make room for the new offices of the National Bank of Scotland. The old premises were built in 1689 by Robert Mylne, a nephew of the "master mason to the king," whose tomb stands in Greyfriars Churchyard, and himself held that same office. In its cellar it is said the Deed of Union was signed and sealed by the Commissioners, who had been driven out of Moray House by an infuriated mob. The building to replace it has been designed by Mr. J. M'Lachlan, York-place, Edinburgh, and is in the Scottish Baronial style, having the frontage to High-street of 30ft., and to Cockburn-street 60ft. An octagonal tower will be placed at the corner of the High-street and Cockburn-street, and will be carried up above the fifth story and finished with an embasured parapet. To the east of this, on the High-street front, a boldly projecting line of oriel windows is carried up from the first to the top floor, and is finished off with a crow-stepped gable. The oriels are each to be surmounted with a varied pediment, and on the first-floor level between the oriel and the tower is an open balustrade. We trust the building will be worthy of its interesting and important site.

THE death has been announced of Mr. Thomas Brown Jordan at the age of 82. Mr. Jordan, who was born in Bristol, began life as an artist, and, after turning his attention to physical

science, he established himself in Falmouth as a mathematical-instrument maker, and effected improvements in the dipping needle and the miners' dial. When Sir H. de la Beche was engaged on the geological survey of Cornwall, he made the acquaintance of Mr. Jordan, and obtained his appointment as keeper of the mining records, a position he held until 1845. Mr. Jordan invented a method of carving by machinery, for which he received the gold medal of the Society of Arts in 1847.

## Trade News.

### WAGES MOVEMENTS.

BRADFORD.—The dispute between the Bradford plasterers and their employers as to the demands made by the men for an advance of wages to 8d. per hour still continues. At a meeting of the master plasterers on Saturday it was decided to resort to arbitration, and this decision was communicated to the officers of the Plasterers' Association, who called a meeting of the men on Monday morning, when they resolved to stand out for their demand. The masters have previously offered the men 7½d. an hour, but this has been refused by them, their determination being to have the 8d. conceded. Originally there were about 200 men affected by the dispute, but now there are only 83 men on the books of the strike committee.

NORTHAMPTON.—A strike occurred on Saturday, affecting all the members of the National Operative Plumbers' Union in this town. The Master Builders' Association attempted the enforcement of a code of working rules to apply to all sections of the building industry. The plumbers claim the right to separate the code, in which the chief demands are for pay and a-half for overtime, not more than one apprentice to two men, not more than three apprentices in one shop, and five years' apprenticeship. The Central Union promises support to the men, who are hopeful of success.

### CHIPS.

The board schools, St. Alban's, are being warmed and ventilated by means of Shortland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester.

Among the adjudications in bankruptcy announced in Tuesday's *Gazette* the name appears of Hildebrand Attwood Wooster Reeves, of East Grinstead, architect.

The Oswestry Castle Grounds, which have been restored and adapted to the purposes of a public recreation ground and arboretum, chiefly by public subscriptions in commemoration of Her Majesty's Jubilee, were formally opened on Tuesday.

The parish church of Mexborough is about to be restored and enlarged by the addition of a north aisle. Mr. E. Isle Hubbard, of Rotherham, is the architect.

For the erection of a new ear and throat hospital in Edmund-street, Birmingham, the tender of Messrs. Gowing and Ingram has been accepted at £4,800. Messrs. Cossins and Peacock, of Colmore-row, Birmingham, are the architects.

The hotel erected by the Joint Station Committee at Perth was opened for business on Monday. Built from plans prepared by Mr. Andrew Heiton, architect, Perth, and costing about £12,000, it is Flemish in style.

The new Wesleyan chapel at Swinton, in the Irwell-street circuit, Manchester, of which the foundation-stones were laid on Saturday, will cost £6,100, and will provide accommodation for 870 worshippers.

The corner stone of the new police courts and offices for Bootle was laid in Oriel-road by the Mayor of that borough on Monday. The buildings will cost about £12,000, and are being erected from plans by Mr. J. C. Anderson, Mr. G. Woods being the contractor.

The authorities at Freiburg, Switzerland, have given permission for an electric-power station to be opened in October, for distribution to small surrounding industries. From the waterfall there are 300H.P. available, two-thirds of which will be distributed for running electromotors of a quarter to 25H.P., and the remainder will be used for electric lighting. The price for motive power to customers is 200fr.—about £8—per horse-power per annum.

A new Catholic church has just been commenced in St. Mary's-street, Crewe, from the design of Messrs. Pugin and Pugin, of 117, Victoria-street, Westminster, S.W. Messrs. Treasure and Son, of Shrewsbury and London, are the builders.

The partnership between Messrs. Parker and Ellis, of Manchester, architects, has been dissolved.

Holloway's Pills purify the blood, remove all obstacles to its free circulation through the lungs, relieve the engorged air tubes, and render respiration free, without reducing the strength, irritating the nerves, or depressing the spirits: such are the ready means of escaping from suffering when afflicted with colds, coughs, bronchitis, and other chest complaints.

## BILLS OF QUANTITIES & PLANS.
